A criticism which can justly be made of most schemes to relieve traffic congestion is that they are too ambitious for practical purposes. More and wider streets are frequently urged as a remedy. Whether this would really improve matters or only encourage more vehicles to use the streets is problematical. Aside from that, the great defect of such a plan is that it would take years to carry it out. Immediate relief is needed. Rather than devoting their attention to plans to relieve congestion 5 years, 10 years or 50 years in the future, municipal authorities should consider what can be done now. After partial relief has been secured the future needs can be studied.

In addition to the elimination of left-hand turns several other partial remedies could be put into effect at once at small cost. By limiting parking to the left-hand side of narrow, one-way streets and forbidding vehicles to park two abreast on any street a considerable gain in useful street capacity would be had. Loading and unloading of delivery trucks could be regulated to leave the street free for moving vehicles. Some inconvenience would undoubtedly result from the enforcement of such rules. On the whole, however, it would probably be less than the inconvenience incident to the ever-recurring delays under the "do as you please" plan so generally in effect now. Certainly no intolerable hardship would be inflicted on any one.

Regulations of this kind are not a complete and permanent solution of the problem. Elimination of all parking in the congested area would be far preferable to partial elimination. Such simple remedies as that recommended by the committee on relief of traffic congestion, however, can be put into effect without arousing antagonism. After this has been accomplished it may be possible to follow up with other more far-reaching measures. It is better to take a step in the right direction now than to hesitate simply because the ultimate goal seems a long way off.

Census Report, Just Out, Contains Much Interesting Information

ALTHOUGH very late in appearance, the census report of electric railways for 1922, just published, will prove of great value to electric railway companies. One reason for this is that no other agency than the Census Bureau compiles such extensive data in regard to the industry. Another reason is that the census figures for 1922 are directly comparable with those for the preceding electric railway census years of 1917, 1912, 1907, 1902 and 1890. A digest of the report, including reproductions of eleven tables of special interest in the 1922 census, is contained in this issue.

In general, the figures confirm those on the status of the industry, as shown in earlier unofficial figures compiled by independent observers, including this paper. There has been no increase in electric railway trackage in the 5-year period. In fact, there has been a slight decrease, since most of the recent extensions by railway companies have been made by buses. There is also a reduction in the number of passenger cars. This may be explained by the destruction by many companies of a considerable number of obsolete cars within the last few years. A lower value of road and equipment is shown in the balance sheet for 1922 as compared with 1917. This is perhaps explainable through the reorganization of several large companies and the fact that better times have enabled the companies to put their balance sheets in better condition. Clearer evidences of a more prosperous condition are an increase in number of revenue passengers of 12.2 per cent, of railway operating revenue of 42.3 per cent, of net revenue from railway operation of 7.9 per cent, of net corporate operating revenue of 12.3 per cent, of operating income of 6 per cent and, finally, of net income of 1.3 per cent.

A study of the operating expenses in 1917 and 1922 shows that the expenses in all of the primary accounts have increased greatly, the range being from 18.7 per cent for the small item of "traffic" to 83.9 per cent for "maintenance of way and structures." The average increase in expenses during the 5-year period was 60.8 per cent. The primary expense account showing the largest increase in dollars was, of course, "conducting transportation," owing to increases in wages paid. But it is an evidence of the economical measures introduced by railway companies to note that during each half decade since 1902 there has been a constant increase in number of revenue passengers carried per car operator (car operator in this case being understood as including conductors, motorman and one-man car operators, but not elevated railway and subway guards). In the last half decade this number increased from 83,010 passengers in 1917 to 97,267 passengers in 1922. Expenses beyond the power of the railway to control have also gained in magnitude, the taxes having gone up 35.6 per cent during the last 5 years considered in the report.

Managing Director Appointed for American Association

Advisory Council Recently Formed by Executive Committee Creates New Office — Lucius S. Storrs, Selected to Fill This Important New Position, Is Widely Known in the Industry—Appointment Effective April 2

FOR some time past it has been felt that the American Electric Railway Association has not been tied in closely enough with the owners of the electric railway properties. It has been the operating men, the managers, engineers, superintendents, accountants and claim agents who have carried on the greater part of the association activities, both at conventions, in committee work, and even in the councils of the association. There have been questions of policy under discussion that are vital and of far-reaching importance. At times these have been of such a character that they could not be handled adequately by operating men. Yet the organization has not provided the opportunity for financial men and owners to take their place in the councils of the association.

This situation has been fully realized by President Shannahan and the executive committee. Complete recovery and modernization have been considered essential if the industry is to take the place it should hold among the industries of the country. This, it was felt, depended on the wholehearted backing of the owners. Accordingly, the executive committee of the association, at a meeting held on Nov. 20, 1924, passed a resolution authorizing and directing the organization of a new committee to be composed primarily of owners of the electric railway properties. This new body, termed the Advisory Council of the American Electric Railway Association, was at once appointed by President Shannahan. It consists of 23 members with B. C. Cobb, a man prominent in utility financing, as chairman. The full personnel of the committee is given on page 287 of this issue.

The council held its first meeting in New York on the evening of Feb. 3, with a large attendance. It was apparent at once that there was an opportunity to do a fine piece of constructive work. But in discussing

PRESIDENT J. N. SHANNAHAN

ways and means of procedure it soon became evident that there must be some one who could be charged with the duty of working out whatever policies were decided on. Such a man would of necessity have to speak, not alone for the advisory council nor for the association, but he actually would have to represent the industry itself.

A position such as this demands a man of the highest type—one with courage, vision, tact and industry. Representing both the owners and the operators, intimate knowledge of

LUCIUS S. STORRS

details of management, of financing, of public relations, are all essential.

The man selected for the place, Lucius S. Storrs, president of the Connecticut Company, is felt by all to be the man for the place. His choice will make available to electric railway managements and the public the services and advice of a transportation executive with wide experience. The company with which he is associated is one of the largest electric railway properties in the world. Its electric cars and buses operate practically in all parts of the State of Connecticut. That the people of that State have faith in Mr. Storrs is evidenced by their attitude. In return for square dealing, clean cars and good service, they have given his company better fares, protection against jitney competition and relief from paving charges.

During the last 6 years Mr. Storrs has devoted much time and energy to furthering the recommendations of the Federal Electric Railways Commission, which, under appointment of President Wilson, investigated all angles of the traction situation. Outstanding among its recommendations were frank dealing with the public, improved service and fair returns to the companies.

According to a statement made by leaders of the industry, the foremost problems now confronting it are modernization of equipment, new financing, and co-ordination of bus and electric railway service. It is maintained that best service and most reasonable fares will be provided to communities through the consolidation of all local transportation under suitable public regulation.

Mr. Storrs will retire from his position as president of the Connecticut Company, but will remain as a director. He will assume his duties on April 2, with offices in the Johns-Manville Building, Madison Avenue and 41st Street, New York City, on the floor adjacent to the new offices of the American Electric Railway Association.

Transportation Topics Considered at Midyear Meeting

Fares, Merchandising Methods, Improving the Quality of Service and the Place of the Bus Were Among the Subjects Discussed by Prominent Speakers at Washington—Attendance Was Unusually Large

ONE OF the liveliest Midyear Meetings ever held by the American Electric Railway Association took place at Washington, D. C., on Feb. 16 and 17. Transportation topics were discussed by men representing the operating companies, the manufacturers, the public and the regulatory bodies. The bus played a prominent part in the discussions. Meetings of committees of the association took up the first day, while the second day was given over to addresses by prominent speakers.

The morning session Tuesday was called to order by President Shannahan, who introduced Col. J. Franklin Bell, chairman Board of Commissioners of the District of Columbia. Colonel Bell welcomed the association to the "town meeting," stating that Washington is the nation's town, and so every one has a right to be there and enjoy its facilities.

Senator William B. McKinley, Champaign, Ill., greeted the association as a former electric railway man. Next to fire, he said, our greatest discovery is that of electricity. In a few words he sketched the growth of the electrical industry from its beginning up to the present time.

The association was welcomed also by Elliot H. Goodwin, vice-president of the United States Chamber of Commerce. He said that the Chamber of Commerce is representative of all the business interests of our country, among which is the American Electric Railway Association. He explained briefly that the new Chamber of Commerce Building in Washington is available as a contribution to the work of the various civic organizations represented in the national body.

In his presidential address Mr. Shannahan reviewed the status of the electric railway industry for the year 1924. He showed that the electric railways have improved their condition both in a material and in a financial way. He quoted figures to show that the industry had held its own during the year and that the outlook for the present year is even better. These figures were embodied in a statement given out to the daily newspapers some time ago by him and referred to at the time in ELECTRIC RAILWAY JOURNAL.

The formal address of the meeting was delivered by Interstate Commerce Commissioner John J. Esch. He sketched the regulation of interstate commerce as defined in the Constitution of the United States. The development of the various interstate industries of the country was shown, covering the entire history of the nation. The portion of Mr. Esch's speech dealing specifically with electric

Owen D. Young's Tribute to Mr. Storrs

I SHOULD like to join General Tripp in congratulating the president of the association and the association itself in gaining as your managing director Mr. Storrs.

As I have been thinking about it, you have an industry, but perhaps you haven't an art; you have a trade, but perhaps you haven't a science, and I take it, it will be the business of your managing director to develop the science of transportation in your field. That is to say, to collect that body of things known in order that you all may benefit. And it is the kind of thing which is always done when need arises. We suffered from typhoid fever, from diphtheria, from malaria, and finally the time came when we suffered no more from those diseases. Great heroism and suffering had been shown to avoid those plagues. People had prayed and suffered, but the plagues existed. Nothing really happened worth while

OWEN D. YOUNG

until a man whose business it was to find out about that particular difficulty sat down in his laboratory and his study and devoted his time and attention solely to that particular job, and when he did, the germ was isolated, the specific ways found, and the disease disappeared.

Now, to the extent to which you have diseases in this business, you are adopting that same policy, and that policy will succeed. It depends only upon the capacity of your reserve worker and, fortunately, of that we have no doubt, and second, it depends upon the confidence and belief of the administrators of the properties in the man and the specific help which he proposes, and of that you are assured.

Typhoid would not have been eliminated if the physicians of the world had not confidence enough in it to inoculate. So Mr. Storrs can render you no service unless you at least try to follow the formula which he proposes. If you will do that, and give him your support, then I am sure that your difficulties will be solved—not tomorrow; you must be patient about it, but ultimately they will be solved.

And so I congratulate you on this step forward. And difficult as the job is, I congratulate Mr. Storrs upon the opportunity which its very difficulties present.

Digitized by Google

railways is abstracted elsewhere in this issue.

A spirited talk in characteristic style was given by Peter Witt, traffic consultant and formerly street railway commissioner of Cleveland. Mr. Witt recited many of his experiences in the street railway business, some of which indicated opportunities for great improvement. Mr. Witt's address is abstracted elsewhere in this issue.

Following Mr. Witt's address the meeting adjourned to the south lawn of the White House, where a picture was taken with President Coolidge.

Afternoon Session

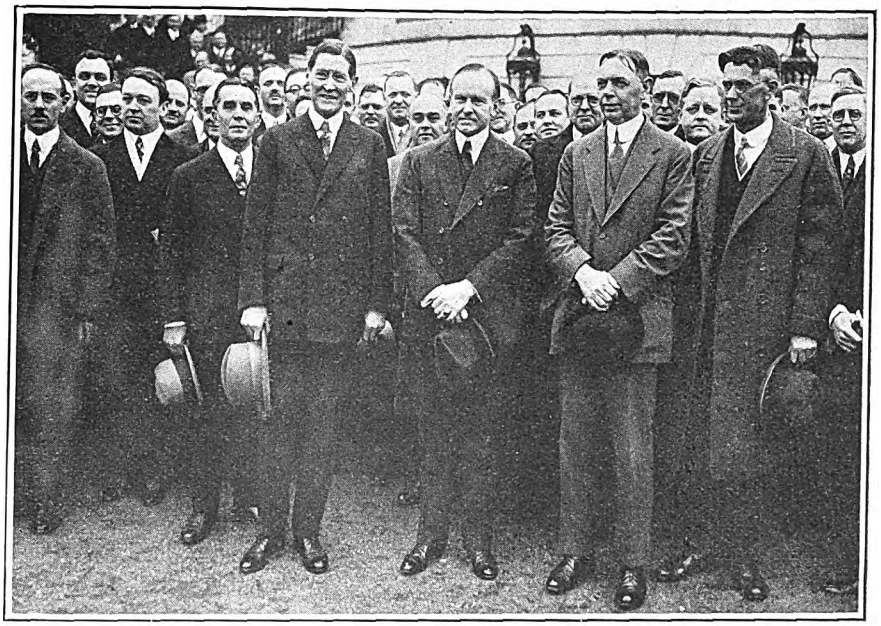
At the afternoon session, J. G. Barry, vice-president General Electric Company, read a paper outlining the views of the manufacturer relative to the electric railway industry, with particular reference to the view of the electrical manufacturer. This is abstracted elsewhere.

A rising vote of thanks was extended to Mr. Witt and Mr. Barry for their contribution to the program on motion of C. E. Morgan, vice-president and general manager Brooklyn City Railroad. Commenting on Mr. Witt's talk, M. B. Lambert, manager railway department Westinghouse Electric & Manufacturing Company, said that in paying deserved tribute to Mr. Birney for his work in developing the safety car Mr. Witt had failed to give credit to himself for the car which has been called by his name. Mr. Lambert also said that credit was also due to P. N. Jones, late general manager Pittsburgh Railways, for the development of the low-floor car. Development of a small number of standard trolley car designs with standardized equipment was advocated as a means of improving conditions in the railway industry.

Referring to the talk of Mr. Witt, Mr. Morgan called attention to the importance of having electric railway executives ride in their own cars. From his own experience, he said, great benefit is derived by the railway manager from this first-hand contact with employees and customers. An opportunity is available for individual contact with the men in charge of the car and valuable suggestions may frequently be obtained by contact with the passengers.

Miss Helen Sterner of Lorain, Ohio, discussed the subject of electric railway service from the standpoint of the feminine passenger and entered a plea for consideration of the woman's viewpoint in judging the character of service being rendered to the public.

Continuing with this topic of improving service, C. D. Emmons, president United Railways & Electric Company, Baltimore, Md., discussed briefly the work of the service department in his company. Its primary object, he said, was to get the viewpoint of the car rider. After getting this viewpoint, and in adopting steps to improve service, promptness in applying a remedy is considered one of the most important factors. "Do it now" is the motto of this department. Mr. Emmons added that so far as service department work is concerned this motto is based on the thought that things promptly done are twice done. On the subject of standardization, he said that improvements in the apparatus used on cars were one factor responsible for the large number of types developed, and that lack of standardization is largely attributable to this cause.



PRESIDENT COOLIDGE GREETS THE LEADERS OF THE INDUSTRY AT THE MIDYEAR MEETING

Speaking from the car rider's viewpoint, Walter Drey, vice-president and general manager *Forbes Magazine,* said that many small incidents and conditions may affect the car rider's impression of electric railway service. He mentioned the matter of illumination in cars as a subject that was worthy of serious study. Contact between trainmen and the public is particularly difficult, according to Mr. Drey, because it is a group contact rather than that of individuals. Situations which might readily be handled between individuals become productive of irritation and bad feeling when the contact is with larger groups. He advocated study of crowd psychology as a means of determining methods of improving public relations of the industry.

W. H. Sawyer, president East St. Louis & Suburban Railway, called attention to the attendance at the meeting and compared this with the conditions regarding previous electric railway conventions attended by Mr. Witt. Mr. Sawyer called this another day, and he referred to the audience as a 1925 group of electric railway operators. He also recorded the fact that it was a representative of the public, in the person of Mr. Witt, who during the morning session had advocated zone fares and who had criticised public service commission regulation of electric railways.

President Shannahan prefaced his introduction of the newly elected managing director of the American Electric Railway Association by saying that the need for this step had been developed from a realization of the lack of a direct tie between the owners of electric railway properties and the activities of the association, which are carried on primarily by the managements of these properties rather than by their owners. In handling situations of national importance, he said, there is a limit beyond which the operator or manager cannot go. In the administration of the National Electric Light Association he pointed out that a policy committee had been formed to overcome just this situation. The advisory council of the American Gas Association performs the same function. The American Electric Railway Association executive committee had therefore decided to take a leaf from the experience of these other associations and had formed an advisory council which consists of the following members: B. C. Cobb, Owen D. Young, Guy E. Tripp, Samuel Insull, Randall Morgan, L. S. Storrs, H. G. Bradlee, Nicholas F. Brady, Britton I. Budd, F. R. Coates, Samuel M. Curwen, Frank L. Dame, Henry L. Doherty, C. D. Emmons, P. H. Gadsden, Thomas N. McCarter, S. Z. Mitchell, J. H. Pardee, H. Hobart Porter, Paul Shoup, R. P. Stevens, A. W. Thompson, and J. N. Shannahan, president American Electric Railway Association, ex officio.

At the initial meeting of this council, held in New York City on Feb. 3, 16 members were present. It was apparent at this meeting that an opportunity existed for doing widespread constructive work in improving the situation of the electric railways. It was also apparent that this work must be put in the hands of some one individual to direct and co-ordinate. Mr. Shannahan announced that Lucius S. Storrs, president the Connecticut Company, had been elected to this newly created position, with the title of managing director of the American Electric Railway Association. Mr. Shannahan went on to say that this new activity will give the industry an opportunity for taking up nationally the problems affecting its interests just as soon as it becomes evident that such questions are of national significance. He said that the advisory council has agreed to underwrite the cost of this work until it could be distributed among the individual companies who are to receive its benefits. Steps will therefore be taken to distribute the expense resulting from this new activity.

Digitized by Google

At the conclusion of President Shannahan's remarks, Mr. Lambert said that the association and the industry owed its president an expression of appreciation for his initiative and action which had resulted in the formation of the advisory council and in the election of a managing director of the association.

Motor Buses Discussed

A paper on motor buses from the electric railway viewpoint was read by H. A. Mullet, assistant general manager the Milwaukee Electric Railway & Light Company in the absence of the author, S. B. Way, vice-president and general manager of the same company. Mr. Way's paper appears elsewhere. At the conclusion of the paper Mr. Mullet answered a number of questions relative to the operation of buses in Milwaukee. He described the conditions under which seven-passenger sedan automobiles are run in competition with the electric railway company's service, and the system of fare collection used on buses of the railway company. He said that in interurban service the buses had shown earnings which paid the entire cost of operation and depreciation, together with a slight return on the invested capital.

The motor bus was considered from the motor vehicle viewpoint in a paper by T. R. Dahl, secretary the White Company, representing the National Automobile Chamber of Commerce. This paper appears elsewhere.

Following the presentation of the paper, President Shannahan commended Mr. Dahl on his extremely fair view of the relation between the automotive and the electric railway industries and said that the association and the electric railway industry owed Mr. Dahl a vote of thanks for his able presentation of this subject.

Then followed a consideration of the need for co-operative treatment of the transportation requirements in a city, and a spirited discussion ensued on the relations which should exist between an electric railway company and an independent bus company operating on the same streets. The principal speakers were Col. A. T. Perkins, manager for the receiver United Railways Company of St. Louis, and T. S. Wheelwright, president Virginia Railway & Power Company, Richmond, Va. At its conclusion President Shannahan declared it to be the policy of the association to stand for fair tactics between rival transportation systems.

J. C. Thirlwall, General Electric Company, discussed the development of the electric bus drive recently perfected by his company. He said that in general the trend today is toward bigger and bigger buses, both of the single-deck and double-deck type. The bigger vehicle has compelled the use of a bigger power plant. The six-cylinder engine of greater horsepower is being generally adopted. Using the mechanical drive that has been a standard part of automotive equipment on these larger vehicles with their larger power plants has developed difficulties that were never apparent in the pleasure car or in the smaller and earlier forms of the bus. It is almost amazing to the average railroad man who takes up bus operation for the first time, the terrific maintenance cost and the comparatively brief life of the driving mechanism when he compares it with his rail car expense. In analyzing the cost of maintenance, it is found that the mechanical drive itself is largely responsible in the hands of the average operator. The gear shift and clutch, handled by the ordinary driver, is a weapon of mechanical assault and battery on the engine itself, on the clutch, on the gearing and on the axle and tires.

It was to minimize the terrific shocks and strains that are inherent in the mechanical drive that the gas-electric drive for buses was recently developed and perfected.

Electric drive simply means taking out the gear box, the transmission gearing and the clutch, and in some instances taking out the differential drive and substituting for it a dual drive, removing parts that are inherently short-lived and high maintenance parts and replacing them with an electric generator, directly connected to the engine and with a motor or motors of the ordinary railway type.

By actual tests, he said, it has been found that in city service the engine revolutions per mile are reduced from 15 to 21 per cent; that the maximum engine speeds are reduced approximately 40 per cent; that the inspection of the engine, which many of the larger companies put on a 2,000-mile basis, can be stretched out to 4,000, 5,000 or 6,000 miles, which in itself saves materially in cost, and that, better than that, the electric equipment permits of an almost instantaneous test of the efficiency of the engine by connecting the generator to a water rheostat and taking ammeter readings at a given engine speed. That permits in a few minutes an exact determination of the condition of the engine which can only be had at the present time by taking the engine off the car and setting it up on a stand dynamometer test, which is a long and extremely expensive performance.

A bigger thing than maintenance, however, is the fact that it was found by an extensive series of tests that a higher schedule of speed could be maintained with the electric drive without abuse to the equipment or without discomfort to passengers than is possible with the mechanical drive, and as railway men I think we all realize that high schedules are not only the greatest economy that can be effected in railway operation, but they are also one of the best means of selling transportation. In answer to a question he said that he believed it possible ultimately to develop this type of drive so there would be little if any increased weight in the mechanical construction.

A resolution proposed by C. D. Emmons was passed expressing the thanks and the appreciation of the association to the speakers and various organizations which had co-operated to make the meeting a success, particularly the Chamber of Commerce, the management of the New Willard Hotel, the committees of the association on transportation, subjects and meetings, and dinner arrangements. Thanks to the local railway companies and to J. H. Hanna, vice-president in charge of operations Capital Traction Company, were also included in the resolution.

President Shannahan announced that the annual convention of the association would be held in Atlantic City during the week beginning Oct. 5, after which the meeting adjourned.

The last event on the program of the meeting was a banquet in the ballroom of the New Willard Hotel. More than 700 diners were present to enjoy one of the best sessions of the entire convention.

During the dinner the guests were entertained by a number of vocal selections. Much amusement was occasioned by the distribution of a four-page leaflet, "One Bell," made up to resemble a newspaper. The publication of this sheet was arranged by Robert Dougan, publicity agent Capital Traction Company, and printed with the assistance of the Washington *Times*.

After the dinner the guests listened to three speakers who discussed topics of interest to the electric railway industry. The speakers were G. F. Hamilton, president Capital Traction Company; Gen. Guy E. Tripp, chairman board of directors Westinghouse Electric & Manufacturing Company, and Matthew C. Brush, president American International Corporation. By special request of Mr. Brush, Owen D. Young, chairman of the board General Electric Company, spoke a few words of congratulation to the association and to Mr. Storrs concerning his appointment as managing director. These remarks appear verbatim elsewhere. At the conclusion of the speeches there was informal dancing.

AT THE MEETING of the executive committee of the American Electric Railway Association held in Washington Feb. 16 the following statement of principles regarding the motor bus was unanimously adopted:

Principles Regarding the Motor Bus

Recognizing that there is a place for the bus in local transportation, the executive committee of the American Electric Railway Association subscribes itself to these convictions:

1. No medium has yet been developed which alone can take the place of the electric railway in moving large numbers of persons during morning and evening rush hours in cities. There is a place for the bus in transportation as an auxiliary of or supplement to and, in some instances, substitute for electric lines.

2. Electric railways are in the business of providing transportation in their respective communities. It is their duty to supply all local transportation, both by electric railways and buses, essential to good public service. When supplying such service by rail cars, buses, or both, they should be protected against competition in the operation of all such lines.

3. Buses should be regulated by law as common carriers and the effort to make bus regulation uniform throughout the United States continued and encouraged.

4. Both buses and electric railways should bear proportionate taxes and other public obligations fairly chargeable to them as public carriers.

The Car Rider's Viewpoint*

By Peter Witt

Street Railway Consultant, Cleveland, Ohio

Observations on Railway Operating Methods in Nineteen Cities —Better Transportation Is Demanded Rather than Cheaper Transportation—Larger Field for Railway Service Pointed Out

I HAVE been in 19 cities and I have ridden cars until I was sore but satisfied. I have seen many things that the owners of transportation companies have never seen; and my advice to you is—get acquainted with your own product and you will be able to appreciate the feelings of the people that you are doing business with.

Most of the people who are engaged in transportation seem to look upon their customers as enemies. It is the most remarkable business that you can imagine, where every owner thinks that every fellow who gives him a nickel is his enemy. You sort of have an attitude toward him like a merchant would have if he put a bulldog in front of his store after he spent money in advertising a cheap product. It doesn't work that way.

Take your engineers and your master mechanics and general managers and send them around the country and let them see what other properties are doing. Don't go there announced, to be entertained by the other fellow, but go there as a stranger, because it is my observation, of course, that we do make progress, and you then will see the many things that I have seen in the 19 cities that I have been doing car riding in, and you will have many a good laugh.

Of course, the common thing that I meet in most places is that very few transportation people keep their track in good condition. It seems to be the universal rule that when a joint commences to show a break and the equipment starts to hit it, you don't send the man out to repair it, but you wait until the joint is gone and the rail on the opposite side is cupped. And after the equipment has pounded itself to pieces for 2 years, you go out and put in a new piece of equipment. That isn't the way a car rider ought to be treated.

You will become informed of many things if you will send your men around the country, so that they may observe how things are being done and come home and tell you, so that you may profit by it. In every town something is done better, and some things are done worse than in any other town; all you have to do is to pick up the good things and bring them home in a collection and then you will have all the good things for your own town.

I have ridden in street cars where I found transfers three weeks old. I have seen conductors punch transfers with a nail. I remember one city I got into, where I was waiting for the car to start. All of a sudden a fellow came along and I looked at him and I thought he was a curve greaser. He had on a pair of overalls—not even made of the checked stuff, but made of the plain blue. I looked at him and thought, "This fellow is riding the car with his grease bucket; I wonder if he keeps the grease off of the passengers." But I was mistaken; that wasn't the fellow who greased the curves, it was the conductor himself.

PETER WITT

Now, you wouldn't like, if you were riding the street car, to have a fellow in the uniform of a curve greaser come up to collect the fare, would you? Well, the chances are that that corporation in that particular city, through the individuals in control, did not like it, but the officers never rode a car, they didn't know the way the conductor was dressed.

In that same city I saw a thing that amused me very much. I noticed that the trail pullers running around in the daytime had a night shirt on them; they were dressed in a night shirt made out of canvas. Well, I never had seen a coupler incased in a canvas bag, and I said to one of the men operating the property, "What's the idea of putting canvas over the couplers?"

"Why," he said, "that will keep the dust off of them."

Now, that sounds funny to you, but I saw it with my own eyes, and saw the man take it off and then put it on. Imagine a railway spending good money in buying canvas bags to put over couplers to keep the dust off of them.

Can you wonder that sometimes the car-riding public doesn't take kindly to the trials and tribulations that you go through, when they see such nonsensical performances? That is patent, you know, when you go out if you merely observe those things. You can't observe them if you stay home; you can't get next to them if you go down to Young's Pier at Atlantic City, but if you travel all over the country you will become acquainted with them.

I have been in cities where the cars have a horrible appearance and are rusty for lack of paint. The operators are careful about having the carhouses, where the cars remain for 6 hours at night, nicely painted, but they will allow the cars, which are out on the street for 18 hours a day, go without any paint. Remember that it is just as important, if not more so, to keep the cars painted as it is to see that the carhouses are in good condition and painted.

To me, there was only one man in the United States who really ever understood the question of transportation, and that was George Pullman. When he conceived that wonderful thing that we now enjoy, known as a sleeping car, and took it to New York to peddle it, he was buffeted from one sidewalk to the other, and he was confronted with the statement by the people who had money that it wouldn't do, and that it would increase the cost of transportation. And to that, George Pullman had just one reply, and that one reply was that the people did not want cheap transportation, they wanted better transportation!

You can't make transportation too good. The better you make it the more car riders you will see, and the worse you make it the fewer car riders you will sell. Now, you have got to understand that you are merchants, that you are selling something that people must have, and that people are eager to buy if you will merely deliver the stuff that they want.

You are disturbed about the automobile. Now, I am not disturbed about the automobile. I think the privately owned automobile has been a boon to this industry. The private automobile, to the extent that it brings people down in the morning and takes them home in the evening, during the rush hours, is a benefit to you because it relieves you of part of the peak which is the unprofitable end of your business. Of course, at one time it was believed that that was the profitable end. You know, they used to write franchises which stipulated that people should be carried for so much a ride, but when the hour of heaviest peak came, then the charge was reduced, when it cost most. Now the privately owned machine is not hurting you, and when you realize in your cities that every fourth or fifth person is the owner of a machine, don't get into the frame of mind of thinking that he is going to hurt you, because he is not. And when you see 20,000 and 30,000 and 40,000 machines on the highway going this way and that, don't figure that is a loss to your business, because it is not. Don't assume for a moment that when a man has taken a pleasure ride in the car that he would be on the street car if he wasn't in the automobile, because he wouldn't.

The automobile has merely made it possible for people to take more rides that they wouldn't take if they had to use a street car. It is not a loss of business to you. Then, of course, after that comes the bus, which now is agitating this industry. I don't know what the bus can do, and neither do you. It is something new, and there isn't anything yet by which we can gage it. All that we can say about it

*Abstract of a paper presented at the Midyear Meeting of the American Electric Railway Association, Washington, D. C., Feb. 17, 1925.

is that the bus is an economic factor and that if you can transport people on rubber tires for less than you can move them on steel wheels on steel rails, the bus will supplant the street car, and nothing can prevent it.

However, I don't think that time ever will come. I know that there isn't anything in this world that is so frictionless as a street car, a steel wheel on a steel rail. I know that there are car bodies in this country that have been on wheels for 35 years. I know that no bus body will remain on wheels for 35 years, even if you carry three mechanics on every trip. I know that there are motors operating on trucks and under street cars in this country that have been obsolete for 20 years, but they are still turning around. And I know that there isn't an internal combustion engine made, or that ever will be made, that will run 35 years!

I know that I can take a pinch-bar and move a gondola with 80,000 lb. of coal; that tells me that there isn't anything as cheap as steel to steel. So I don't subscribe to the theory that seems now to be running rampant among this fraternity, that the day of the street car has passed and the day of the automobile is here, because it is not. The automobile or the bus can be used, of course. There is a place for it as well as for the street car, but it will never supplant the street car in the cities of this country, and it shouldn't, and it won't, unless it can do it cheaper—and only time will be able to demonstrate that to us.

Transportation Acts and the Electric Railways

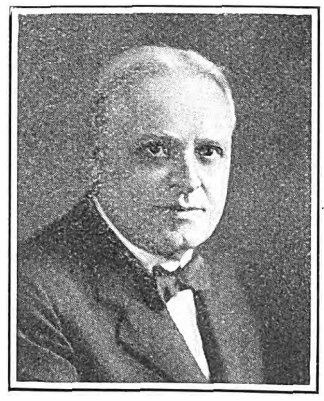
By John J. Esch

Member Interstate Commerce Commission

Despite Original Franchise Provision a Fare Higher than 5 Cents Is Now Deserved—Legitimate Advertising Will Improve Public Relations—Stock Ownership by Employees and the Public Gives Them a Stake in the Success of the Property

WITH reference to the immediate interests of the electric railway industry I might say that the original interstate commerce act in defining a common carrier declared that it was engaged in the transportation of persons or property by railroad. There is no distinction made in Section 1 of the original interstate commerce act as between the steam and the electric line, and ever since Frank Sprague of New York developed the practical trolley at Richmond, in 1888, electric interurban lines engaged in interstate commerce have been subject to the jurisdiction of the Interstate Commerce Commission. In numerous cases we have passed upon your rates and fares and charges, and they have gone to the Supreme Court and the jurisdiction of the commission has been sustained.

In the transportation act of 1920 there has been an exception made with reference to street, urban or interurban and electric lines which are not a part of a general system of steam railroad transportation. I remember distinctly that your people were not of one mind as to the scope of the proposed legislation. There were some of you who believed that you should come under the full provisions; others were opposed to such a proposition. Some were willing to come under title 3, the labor provisions; others were opposed thereto. With this contrariety of views, the committees of Congress formulated the



JOHN J. ESCH

transportation act as it is today. Each individual case, therefore, will have to be determined upon its own merits.

On Jan. 5 the Supreme Court of the United States handed down a very interesting decision with reference to two Ohio traction companies. The city of Wellsville and the village of Hebron brought action. The interurban lines supplying this city and this village also connected with cities in Pennsylvania and in West Virginia, thus making them interstate common carriers. The common carrier had an interstate level of rates. The intrastate rates were lower. It sought to have the intrastate level of rates raised to the level of the interstate. The commission granted the relief. This city and the village took the case to the Supreme Court, and that court affirmed the decision of the Interstate Commerce Commission, so that the carriers were enabled to raise the intrastate rates to the level of the interstate—and like relief may be granted in other cases where a like situation is presented.

Street and interurban electric lines have been suffering under two handicaps—the nickel and the jitney. The 5-cent fare was originally a part of your charter or your contract rights. Being incorporated in a charter or in a contract made with the Council, it was considered as immutable as the law of the Medes and the Persians, and for a long time, notwithstanding your presentation of increased costs of labor and materials, the 5-cent fare remained a constant.

You ought to increase the fare—and I have noticed in the address made by your president that the average fare now has attained something in excess of 7 cents. The nickel was considered as a sacred number, but I take it that 7 is more sacred because you will find it justified in Holy Writ.

Jitney competition, which was so severe a few years ago, is in a way resolving itself because you are laying your cards upon the table before common councils, your patronizing public, and the regulatory bodies; you are meeting them across the table, and to the degree in which you manifest frankness in every detail can you expect relief.

I am glad to note that the situation of electric lines is better than it has been in prior years; far better than it was during the war, during 1919, during 1920, during 1921, and even a part of 1922. Reading your proceedings in 1921, I noticed there was a tone of pessimism throughout the addresses and there was also in the statistics offered; but I think you have seen that the sun is shining through a gap in the range and that the slough of your despondency is now being brightened by the full sunlight. At least, I sincerely hope that that is being realized.

It would be my suggestion that you continue your plan of advertising what you have to sell, of taking the public into your confidence, of increasing your public relations to a point where there be mutual confidence between yourselves, the patronizing public, and the regulatory bodies. By doing that, there will be a better feeling between yourself and your employees. You have a right to tell the patronizing public that they owe you something; you have a right to tell them that by reason of these electric lines it has been made possible to relieve the congestion of the great cities and to give the man of moderate means a chance of buying a home out in the open spaces where he can raise his family at a reasonable cost. You have a right to tell the manufacturer and the merchant that because of your lines and your facilities you are bringing customers to their very doors. These are legitimate methods of advertising, and you have the full right of going to the uttermost limit in presenting your views to this public.

You have a right also to try to secure ownership in your securities, on the part of your employees and the patronizing public. Have you noticed the result of an experiment tried by

*Abstract of a portion of a paper presented at the Midyear Meeting of the American Electric Railway Association, Washington, D. C., Feb. 17, 1925.

Digitized by Google

the New York Central last week? It put out 35,000 shares of its stock, par value $100; first chance of purchase by employees. There were over 42,000 applicants for the stock. The company doubled the amount of the stock that could be subscribed, and the company today has 42,000 more stockholders than it had two weeks ago, and it has disposed of $6,800,000 in stock at par. What is the significance of that? It means that 42,000, practically one-fourth of the employees of the New York Central System, now have a financial stake in the success of that great railroad.

One Railway's Experience with Buses*

By S. B. Way

Vice-President and General Manager
Milwaukee Electric Railway & Light Company

Where, When and How They Should Be Employed — The Results Obtained by This Company Show that It Is Essential to Use the Best of Equipment and to Be First to Render the Service—Principles Found to Be Successful Are Enumerated

THE answer to the question "When, where and how should motor buses be used by electric railways?" can, from the experience of at least some of us, be compressed into a few words, namely: Anticipate demands and opportunities for bus service; be first to render such service; employ only the best equipment and personnel. Analysis of a particular situation will illustrate the point.

Take the case of an electric railway system operating something like 230 miles of city track and 260 miles of track in suburban and interurban service. The city tracks are practically all in paved streets. The suburban and interurban lines are largely on private right-of-way. This railway system serves a total population of about 800,000. The interurban cars reach the centers of the principal cities over tracks used also for local street railway service. The suburban and interurban lines are in every instance directly or closely paralleled by concrete or other hard-surfaced roads, and the area between these lines is in practically all instances further supplemented by similar hard surface roads. These hard surface roads extend to practically all towns within a radius of 100 miles or more from the principal center from which this railway is operated.

No Restrictions in State Laws

The state law is such that any one can go into the bus business either in the city or in the country, or both, upon the mere filing with the Public Utility Commission of a statement of the general route over which such buses are to operate, a proposed general schedule of hours during which service will be rendered and a general statement of the rates of fare to be charged. This statement must be accompanied by an indemnity bond for the payment of damage claims up to the amount of $2,500 for any one individual and $5,000 for any one accident.

S. B. WAY

The Public Utility Commission has substantially no discretion in the matter of approving such applications where accompanied by indemnity bonds. The law especially provides that the fact that the route parallels a street railway system shall not be taken into consideration by the commission in passing upon the adequacy of the application or the bond. After the commission has once discharged its rather perfunctory duty it loses jurisdiction unless notice is given by the bonding company of the cancellation of the bond, whereupon the commission is required to cancel its certificate. The commission has no means whatever of ascertaining whether or not the carrier observes his proposed route or operating schedule or even adheres to his filed rates of fare.

Under the law, cities and towns may require the payment of license fees by buses or so-called bonded carriers, which license fees, however, are limited to amounts reasonably to compensate the cities or towns for wear and tear on streets and bridges and for the cost of regulating traffic. The cities and towns are not permitted to levy a franchise tax as such. The only taxes assessed against such carriers are the taxes applicable to any business and property, the federal bus tax and the state auto license fee.

The only regulation of the service is that imposed by local sheriffs or police in respect to observance of rules of the road, speed ordinances and the like. The meager protection of the public against the operation of more or less irresponsible buses or common jitneys embodied in the requirement of the filing of bond, as described, was enacted only after one city in this state became infested with as many as 1,500 jitneys at one time and where the jitneys in some of the smaller cities practically ruined the street railway business. The cost of insurance coupled with the war activity, higher cost of automobiles and their operation, and the general and substantial advance in wages operated practically to eliminate the old fashioned 5-cent jitney or even the converted touring car operating at a 10-cent-fare.

In this situation and subsequent to the enactment of the bonded carrier or so-called jitney law, buses first made their appearance as a medium for extending interurban railway service to points beyond rail heads. These buses were first operated by individuals but were shortly taken over by the railway and operated in its own name. The small patronage enjoyed by these buses, the low earnings and the comparatively high expenses per bus-mile gave the railway officials the impression that buses were not likely to become extremely popular. These initial operations, however, were undertaken over gravel surfaced highways and with bus equipment not in any way comparable to later equipment in respect to comfort or attractiveness to passengers.

As soon as the first 36-mile stretch of concrete road paralleling one of the interurban railway lines was completed, a fleet of, at that time, relatively high-class buses was imported from a bus operating organization which had achieved a considerable measure of success in its operations between neighboring cities in a near-by state. These buses were operated by experienced bus men and the organization appeared to have a considerable measure of responsibility. As additional roads were completed, paralleling the interurban lines, these people experimented with different routes until they located their equipment on routes which would yield the largest revenues per bus-mile. It early became apparent that buses of this character operating on concrete or other hard, smooth-surfaced roads were taking away an appreciable amount of traffic from the railway.

Competition Could Not Be Ignored

The railway management early concluded that it could not afford to ignore the possibilities of such bus operation, particularly under these circumstances of total lack of protection by state laws or municipal ordinances, its obligation to operate regularly and safely at fixed rates of fare and the charac-

*Abstract of a paper presented at the Midyear Meeting of the American Electric Railway Association, Washington, D. C., Feb. 17, 1925.

Digitized by Google

teristic tendency of the public to prefer travel on rubber and soft leather cushions in modern vehicles. The situation was squarely put up as to whether the electric railway should lie down and take a good licking, or whether it should stand up and make an effort to remain the predominant factor in organized transportation service in the district served.

It was quickly recognized that it was impracticable to attempt to retain the business for the electric railway by attempting to compete with modern high-class buses operating on close headway with 15 and 20-year-old railway cars, well maintained to be sure, but nevertheless lacking much in the way of novelty and attractiveness of interior finish that was offered by the buses. It was believed that unrestricted, unregulated and uncorrelated free-for-all bus service, on magnificent hard-surfaced roads and operating substantially tax free, could result in but one thing—the destruction of the railway and the complete disintegration of organized and responsible transportation service.

Meeting Competition with Buses

There appeared to be but one course left open to the railway management, namely, that of meeting bus competition with buses. The railway proceeded according to its best judgment, procured buses which it believed were best adapted to meet the situation which confronted it and launched into the bus business. It started out with an announced policy of recognizing that a change in transportation methods had occurred, and that it was prepared and proposed to give the public the best transportation service of whatever character the public wanted and at the lowest consistent cost. The railway made numerous grievous errors in the initial selection of its equipment and rapidly awoke to the fact that time-honored ideas and prejudices of electric railway men could not be successfully grafted onto the bus business.

Bus companies multiplied in the district and the railway company was kept extremely busy keeping up not only with the rapid development of bus lines as fast as new highways were completed and opened, but also in keeping up with the rapidly changing styles in buses. Each new competing bus organization brought out a type of bus which it believed would be most attractive to the public and which would gain for it the lion's share of the patronage. The railway company utilized its inherent advantages of established credit and superior purchasing power and its experience in respect to standardized methods and training of personnel, all with the result that it rapidly acquired fleets of different types of buses, each carefully selected with respect to the particular class of service to be rendered. In each case the equipment was made the most attractive that could be devised with reasonable regard for practicability in operation.

This policy began to tell, and within a year from the time competition was first encountered in parallel bus operation, the first competing organization sued for peace and sold its equipment to the railway on the basis of the depreciated value of the equipment and with no allowance for going value, good will or the like. Numerous other competing organizations operating buses of various types have found the railway competition too severe, not from the standpoint of cutting rates, but from the standpoint of absolutely reliable, courteous and safe service in vehicles of the highest possible standard, with the result that they have one after another likewise sued for peace. The refusal of the railway to pay tribute to get rid of troublesome competition has, it is believed, deterred many bus men from entering the field.

Making Bus Service Pay Its Cost

In the meantime the railway has been able to operate its interurban bus service on a basis of recovering the full cost of operation, including depreciation, and with a substantial contribution toward a full reasonable return. It has not been able entirely to eliminate destructive competition as yet.

The latest development in such competition has been the utilization of high-class seven-passenger sedan cars, on which license fees and taxes are very light, which operate at extremely high speed and which offer the public carriage in what amounts to a private limousine. Careful study of this type of competition reveals the surprising fact that such buses can exist on revenues as low as 12 to 14 cents per bus-mile. This surprisingly low cost of operation is accounted for by the fact that buses of this type are quickly loaded and the loading is accomplished with few stops. When the buses are once loaded, they run practically without stops and at high speed from one terminal to the other. The high speed reduces the element of driver's wages per bus-mile and does not materially increase maintenance or other operating costs per bus-mile. Such cars are available at less than $2,000 each, and even in relatively hard service can be operated so as to keep the factor of depreciation down to about 1 cent per bus-mile.

Experience is demonstrating that this character of competition can hardly be successfully met by any of the conventional types of 15 to 30-passenger machines, and that where such competition exists the railway or other organized and responsible transportation agency must employ its purchasing power, operating organization and its best experience to meet the demands of the public in developing a high-speed small car service which the public will prefer to that offered by competitors.

While this intensive development was going on in the railway company's interurban and suburban territory, the operators of a bus line in another city connecting depots with a department store conceived the idea of procuring a so-called franchise for the operation of buses paralleling certain of the company's best city railway lines. Notwithstanding the law was fairly clear to the effect that cities could not give any franchise for the operation of buses, but could impose on bonded carriers procuring certificates from the public utility commission reasonable license fees to compensate for wear and tear on streets and bridges and for the cost of regulating traffic, these parties caused to be introduced into the city council an ordinance authorizing the exclusive operation of a line of buses and proposing to pay the city a license fee of $100 per bus. Prior to the filing of this application for a so-called franchise the railway company had anticipated that some one was likely to begin the operation of buses paralleling its best street railway lines. Demonstrated popularity of the interurban buses could lead to no other conclusion.

Considerably in advance of any talk whatever of the inauguration of local city bus service, the company accordingly placed an order for what were at that time the highest types of single and double-deck buses available in this country. In advance of the actual receipt of these buses, the company had filed its application with the public service commission for the necessary bonded carriers' certificates. Upon filing the application by these outside parties for the so-called franchise in the city, the company, with the cooperation of the manufacturer in hastening deliveries, immediately inaugurated service. Through a period of a year and a half the railway company continued and constantly improved its local operation in spite of many attempts to harass it.

Extending City Rail Lines

In the meantime, the company had not overlooked the places in its city transportation system where service was required but where the volume of traffic could not by any stretch of the imagination begin to justify the heavy initial outlay required for the construction of tracks, paving and other accessories of a street railway. These lines were generally in the outskirts and the locations were not in any way attractive to independent bus operators. In these situations, the company installed high-class bus service at railway rates of fare and exchanged transfers with the cars. These local city bus lines were at first operated at a net loss represented by the total cost of operating the buses, because in the beginning they did not produce any appreciable increased riding over what would have come to the railway without the buses. However, by keeping the bus equipment strictly high class and operating on regular schedules, good weather and bad, and practically independent of the quantity of snow, the public began to increase its patronage to the point that these lines can as a whole now be said to be at least entirely self-supporting in respect to the full cost of bus operation, exclusive of return. The surplus over and above this expense is making some appreciable contribution toward return. The main return from these buses, however, is in the improved position which the company occupies in the community, which is reflected by better patronage of its transportation system as a whole than would have been the case otherwise, and in the final conclusion of the city itself that it could not afford to invite outside bus operators to jeopardize the highly organized and complete local system of transportation.

Digitized by Google

In attempting to fulfill its mission of rendering a complete and properly correlated railway and bus transportation system, this railway has found it necessary and expedient to operate something over 750 miles of interurban bus route and close to 50 miles of city bus route. The operation of these several bus services requires 132 buses of all types. The number is yearly increasing.

Principles Found Successful

The experience here briefly sketched has led the management to the following conclusions:

That the time to operate buses is before the other fellow gets the jump on the job.

That the place is wherever buses can render a useful service on a self-sustaining basis, whether necessarily correlated with the railway system or not.

That bus service should be inaugurated wherever the so-called independent operators attempt to horn in on the railway company's transportation business without being willing to assume all of the responsibilities and burdens which the railway organization must assume and carry.

That to render satisfactory and profitable service to the railways the buses must be of at least as high class as individual or so-called independent operators could or would procure.

That buses must be operated by a carefully trained and especially selected and supervised personnel.

This experience has also taught that where the buses are operated as a part of the railway system, i.e., at railway rates of fare and exchanging transfers with the railway, it is desirable that the buses be operated under the supervision of the railway transportation department; that they be painted the car colors, that the men wear the railway uniforms and that everything else possible be done to identify closely the bus with the railway system.

Where, however, the buses are operated as a competing or auxiliary service rather than as a part of the railway, it is desirable to paint equipment distinctive colors and even to distinguish special classes of equipment by different colors, as, for instance, parlor cars from regular cars. Such operation cannot well be handled by the regular railway supervisory force, and best results are secured from the organization of a bus transportation department in charge of a superintendent carefully selected for his adaptability to this service.

Engagement of Operators

The value of special care in the selection and training of bus operators cannot be overstressed. It is interesting to observe that it is possible, through the observance of such a plan, to operate buses over a period of several years and many hundred thousand miles of service, with lower average costs for injuries and damages expressed as a per cent of operating revenue than are experienced in the same situation in a railway, where the same care is used in the selection and training of railway platform men and otherwise in promoting safe and satisfactory railway service.

Manufacturer's Contribution to the Electric Railway*

By John G. Barry
Vice-President General Electric Company

Many Technical Gains in Last Few Years Have Added to Earning Power of the Railways—Means by Which Operating Companies Can Help the Manufacturer Are Standardization, Anticipation of Requirements and Correct Shipping Dates

JOHN G. BARRY

IN A recent message to our stockholders the president of the General Electric Company said, in effect, that the problem of a manufacturing corporation is threefold, and that its accomplishments must be measured from three points of view: (1) Service to the public; (2) to the employees, and (3) to the stockholders. The first consideration is "service to the public," and it seems to me that if we render efficient service to the public, both employees and stockholders will benefit. We feel that the manufacturers have rendered valuable service to railway companies, and while it has not been all that we would like it to be or that we hope to make it, nevertheless it has been of distinct benefit. From an engineering viewpoint manufacturers are prepared to have their engineers study your problems. In the manufacturing end we endeavor to carry stocks of the more popular types and sizes of apparatus and so to equip our plants that reasonably early shipments can be offered on apparatus not carried in stock.

In addition, electrical engineers have made contributions, such as the introduction of the automatically controlled substation and the light-weight motor and control equipment for light-weight cars, which have improved the service to the public and reduced the expenses and increased the revenues of operating companies.

There has been marked improvement accomplished in the design and efficiency of generating apparatus. I quote from a statement issued Jan. 15 to stockholders of the General Electric Company:

> Twenty years ago the efficiency of conversion of the energy of coal to electricity was a little over 10 per cent. Since that time the efficiency of the turbo-generator has been greatly improved, much larger units have been introduced, higher degrees of steam pressure and superheat with better auxiliary conditions have been adopted, so that we now realize an efficiency of conversion of approximately 19 per cent, an increase of about 90 per cent. We now seek to gain a kilowatt of energy from a pound of good steaming coal, which means an efficiency of 24½ per cent in the conversion of coal to electric power. Looking forward to the introduction of the mercury boiler and turbine, it is expected that these will further increase the efficiency of this conversion to 33 per cent, or more than three times as much as 20 years ago. What this means to the industry, and more particularly to the public as a whole, may be gathered from the following. In 1919 the average of the electric central stations throughout the United States was 3.2 lb. of coal to produce a kilowatt of energy. In 1923 the efficiency of the turbines and other apparatus in use in central stations had been so increased that the average was 2.4 lb. per kilowatt of energy, an improvement of 25 per cent. This is equivalent to a saving of 15,000,000 tons of coal per year, or $50,000,000 in the cost of coal alone, not taking into consideration the attendant advantages that this saving implies in the freeing of labor—human effort in the mining, transportation and handling of coal—as well as the capital required for these operations.

There has been a similar, but not so pronounced, improvement in substation apparatus and car equipment.

Manufacturers do not claim that in making these contributions they have been actuated solely by altruistic motives, for with no one is the truth of the Rotary slogan "He profits most who serves best" truer than with the manufacturer. However, in order that we may "serve best" and that both operators and manufacturers may profit, it is essential that we receive the co-operation of operating companies, and I wish to suggest one or two means by which such companies can render effective assistance.

How Operating Companies Can Help

First, adopt as far as possible the standards of manufacturing companies. We believe they have standard apparatus that will be applicable to practically any condition of service, and it is hoped that railway companies will accept such standards, even though they may not embody all detailed features which may be desired by individual companies. Perhaps many do not realize the importance of this or the relatively large increase in expense and delay involved in what may appear a minor change from standards. Detailed engineering instructions must be prepared, drawings changed and frequently

*Abstract of a paper presented at the Midyear Meeting of the American Electric Railway Association, Washington, D. C., Feb. 17, 1925.

Digitized by Google

new patterns or dies made, with consequent increases in cost and in time for producing such apparatus. We believe that the large number of different types, sizes and varieties of cars, trucks and electrical equipment now desired by operating companies could be substantially reduced if careful study were given to standardization of such apparatus, thereby allowing manufacture on a quantity basis, and by so doing that manufacturing costs and selling prices would be materially reduced.

The operating company can help the manufacturer by anticipating as far as possible his requirements, not only as regards new apparatus, but also supply materials.

Another method in which railway companies can help not only the manufacturer but also other railways is by not specifying shipments materially in advance of actual requirements. It is not unusual for us to be advised that certain dates of shipment are required and then, after the apparatus is completed, to receive a statement from the customer to the effect that they were not yet ready to receive it and asking that it be held. Had we been advised earlier that this material would not be required on dates originally specified, it would have permitted us to concentrate our efforts on apparatus which was urgently needed and thereby relieve some other customer of a very trying situation.

The manufacturers are not only willing but anxious to do their part, and I believe that if we all pull together we can expect and deserve a continuance of the improvement which the railway industry has shown recently.

Relation Between Automotive and Electric Railway Industries*

By T. R. Dahl

Secretary the White Company, Cleveland, Ohio
Representing National Automobile Chamber of Commerce

Standardization of Design and Excessive Size of Buses Should Be Avoided—Co-operation of Railway with Motor Vehicle Associations Will Give Excellent Access to Public Opinion

THERE is no doubt of the bonafide operation of buses by electric railways today. In the past there has been a strong suspicion among bus operators that electric railways began bus operations for the purpose of killing that kind of public passenger transportation, having accomplished which they would again furnish only transportation by rail. They suspected that the railways put "trick" in "electric" as a warning to competitors. Present operations by electric railways have effectively removed that suspicion.

Certain conclusions as to the use of the bus can admittedly be accepted, for the present at least, as major premises. First, buses are no longer considered as a passing phase of public fancy. They are here to stay. Second, buses cannot supplant electric railways in handling peak loads in congested districts in large cities. The use of the bus by railways is, therefore, a question of determining the proper place for each service.

It is generally admitted that buses should be operated as extensions of car lines in extending service into new territories where the traffic does not justify the necessary capital expenditure for rails and power. This economic condition exists very generally, as the cost of existing trolley lines is often four and sometimes five times the amount of annual gross revenue, and this means that if 6 per cent is considered a fair return, 24 per cent of the annual gross income must be set aside to pay interest and dividends on invested capital alone. Buses should be used as feeders to the electric railway lines.

Urban population in the United States is increasing much faster than that of the country as a whole. New building developments are rife in all live cities, and as homes go up in the outskirts of the city, transportation facilities must be provided to serve them. The high cost of construction and maintenance of street railways makes it impossible to extend them into such outlying districts except under exceptionally favorable circumstances. The solution in such cases lies in the bus.

In a number of cities the electric railways themselves have replaced certain lines and in other cities replaced their entire systems with motor buses. This has been particularly true where an extensive paving program by the city has loaded an entirely unjustifiable charge upon the electric railway. Rather than capitalize that additional investment buses have been placed in service, replacing the street car.

The history of city public utilities consistently proves them monopolies. One has but to recall several street car lines, electric light companies, gas and telephone companies operating in the same city. They have been universally unsuccessful until combined and operated as a monopoly. The transportation problem of a city is as much a monopoly as the water, fire and police departments of that city. Transportation being a monopoly, the electric railway, as the established responsible and experienced carrier of passengers, should undertake to furnish all passenger transportation in its community.

Don't Standardize the Bus Body to Look Like a Car

You are no longer selling 5-cent car rides. You are purveyors of transportation. The riding public is appreciating to a greater extent than ever that it must pay a fare commensurate with service. It is willing and anxious to pay higher rates of fare to ride in buses. Do not jeopardize that earning capacity of your buses by too great a standardization of bodies, either as to form or appearance. Give no suggestion to the bus rider by standardizing the bus body to look like a street car that he should only pay a street car fare. The bus is regarded by the rider as a Pullman service for which he is willing to pay a Pullman charge. Do not take a chance of giving that rider a day coach impression, for as surely as you do he will demand a day coach rate.

In the operation of bus lines it should be continually borne in mind that your best prospective customer is the automobile owner. I do not know of any better way of antagonizing him than by forcing him off the pavement or frightening him by a bus which at least appears to be nearly as wide as the pavement itself. Manufacturers of buses engaged in competitive selling must pretty much give the purchaser what he wants. Consequently the initiative in keeping bus widths within limits must come from you. The danger is not limited to losing customers, but even more important is the danger of punitive legislation limiting widths to an extent that will interfere with economic operation through limited seating capacity.

Some Advantages of Limiting Bus Dimensions

This is no mere chimera. Some states have already limited by law permissible widths of buses below 90 in. The only manner in which to avoid the swinging of the pendulum from the present liberality in width limitation to stringent and unreasonable width regulation is by voluntarily limiting your bus body widths to conform to 18-ft. pavement limitations, as the 18-ft. pavement has been adopted as standard by the Bureau of Public Roads of the United States Department of Agriculture and applies to all federal aid projects.

This is true also of lengths of buses. A bus that requires the entire width of the street intersection in order to turn the corner not only violates every principle of traffic safety but antagonizes motorists who are held up and must get out of the way for that operation.

The Motor Vehicle Manufacturers Association and your association during the past year, through the work of representative committees, have agreed on all fundamental principles of law that should control motor bus operation. It is no longer open to argument that bus operations should be regulated as public utilities by state commissions in the same manner that electric railways are now regulated. We may still have some differences of opinion on such questions as the method of taxing

*Abstract of a paper presented at the Midyear Meeting of the American Electric Railway Association, Washington, D. C., Feb. 16, 1925.

Digitized by Google

the motor vehicle; but the present day extensive operation of buses by electric railways makes it essential that our attitude toward such questions should be one of co-operation.

The bus says it is overburdened by special taxes. The electric railway makes the same claim. We entirely subscribe to your claim that you should not be burdened with paving charges for two reasons. First, it is an anachronism, and second, the charge is a direct charge on the street car rider—the public. There is only one source from which relief from such charges can come, and that is public opinion.

Co-operation with motor vehicle associations will give you the greatest access to public opinion that there is in this country. Would you not admit that if you could reach every telephone subscriber in the United States that you would have access to an overpowering public opinion? Remarkable as it sounds, there are more motor vehicles in this country than there are telephones. That co-operation is offered you, but it cannot be one-sided. You also must appreciate that taxes levied on motor buses are a direct charge against the bus rider, and therefore our co-operative effort must be directed in reducing special taxes and charges levied on both the motor bus and the electric railway for the benefit of our customers who must bear this charge.

We as bus manufacturers have every desire to co-operate with you in another respect. You are our customers. We desire to sell you buses. Having sold you equipment we will not indirectly enter into competition with you by financing competitors' equipment. We do not believe it good business ethics to finance companies operating in competition with our customers, either through stock ownership or by time sales that are a mere subterfuge. In a competitive business where time sales are common and expected we, of course, are compelled to sell equipment on deferred payment plans. We have adopted a plan limiting both the minimum cash required and the maximum of time granted and we will live up to that plan. I am, of course, speaking for the National Automobile Chamber of Commerce, and I expect from your own experience you appreciate that there are "die-hards" in every association who do not live up to the principles agreed upon by their national organization. The best we can say for them is that with your help we will try to show them the error of their ways.

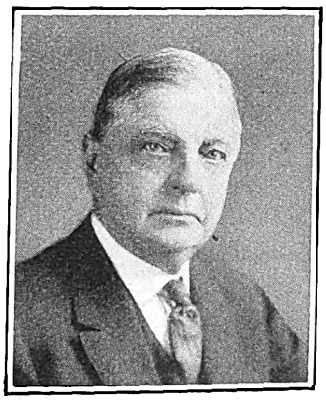
There is one more phase of co-operation that will have an important effect on how buses should be used by electric railways, and that is a national bus association. The American Automobile Association is offering to bus operators throughout the country its facilities as a going users' organization in forming a bus group and affiliating that group with the A. A. A. Independent operators have formed an organization committee to work out a national association of bus operators. Your association has a committee for the purpose of considering some kind of bus group or organization. Three such independent organizations would be fatal to legislative activities and the establishment of policies which the entire automotive industry could support. Haven't we had enough of divided and therefore dissipated efforts? Have we not found in our dealings with each other that when personal misunderstandings have been removed by personal contacts our competitors are, after all, business men with pretty much the same ideas as our own? Are we not big enough, broad enough and have we not had sufficient experience with the national organizations to appreciate that now, before these various organizations are formed, all representing pretty much the same business, that we should bring together the representatives of these three proposed national organizations of bus operators in an attempt to work out a plan for one national association, with fair representation for each type of bus operator that can successfully represent this great business? To accomplish this purpose the National Automobile Chamber of Commerce again offers you its wholehearted co-operation.

Opportunity and Responsibility of the Railway Executive*

By G. E. Hamilton

President Capital Traction Company, Washington, D. C.

The American Association Has Helped in Removing Difficulties in the Past—It Should Be of Even Greater Assistance to the Industry in the Future with Its New Organization Perfected



G. E. HAMILTON

THE electric railway with its allied industries has become one of the prime factors in the business and commercial life of our country. It enters into and carries forward urban and suburban growth and development. It promotes business and social intercourse, it populates towns and links city with city in the chain of commercial progress. It gives comfortable and convenient transportation to all. In it are invested billions of the people's money. It constitutes, in the aggregate, one of the largest purchasing powers in the country. It is, in very truth, a vital artery in the body politic and business life of the nation, and for its preservation and future advancement in usefulness and service it requires, on the part of its executives and executive boards, wise, prudent and honest direction within the law; on the part of the public a fuller understanding and closer co-operation, and on the part of the government, sound legislative policies and regulation that is constructive and not destructive.

This industry has grown to its present status of useful greatness by slow degrees and through difficulties and dangers met and overcome. At one time consisting of unrelated units, small and experimental, scattered over the face of the country, unregulated and operated as private enterprises, lacking often in sufficient capital and inspiring popular prejudice rather than confidence and support, the industry, because of its own mistakes and faults, perhaps, because of popular distrust and of legislative disfavor, was confronted with difficulties and dangers that threatened to destroy it.

At this crucial time, when the clouds were darkest and disaster seemed at hand, the American Electric Railway Association, with a vision broadened and made clear by its long, patient and comprehensive study of street railway management and relations, brought to the companies the counsel and confidence, the initiation and courage needed to meet and overcome the adverse conditions existing, to reorder their broken and faulty lines in policy and direction, and to lay the foundation of successful accomplishment.

Widely separated entities were brought together for conformity in policies, for improvement in operation and for mutual aid and protection through organization.

We have been taught the true meaning and purpose of a public service corporation; a fairer conception of our relations to employees; a fuller recognition of the rights of the people; a realization that reasonable regulation, rightly applied, is strength to the industry. The benefits that have come to us through membership in the association, especially during the last 10 or 15 years, cannot be fully measured or overestimated. It may confidently be expected that this success will be even greater with Mr. Storrs as managing director.

We have grown, and are growing, in the confidence of the people, of regulatory boards and legislative bodies,

*Abstract of an address at the Mid-year Dinner of the American Electric Railway Association, Washington, D. C., Feb. 17, 1925.

Digitized by Google

and this growth will continue and increase so long as we continue to recognize the rights of the people; to safeguard our stock and security holders, and to live within the law.

Let us then, knowing our duty and seeing our opportunity, endeavor to meet the responsibilities that come to us; let us sustain and strengthen the guiding hand of the American Electric Railway Association, to the end that we may better serve the people and the interests that are committed to our keeping

Both Buses and Cars Are Needed*

By Guy E. Tripp

Chairman Westinghouse Electric & Manufacturing Company

Maximum Transportation Efficiency Will Be Obtained by Co-ordinating the Two—Buses Should Provide Special Service at a Higher Fare—Trolleys Are Essential for Heavy Traffic

THE kinds of service offered by buses and by trolley cars are quite different. Buses are especially adapted to de luxe service in cities and to serving suburban regions where it does not pay to install trolley systems. Their operating cost is relatively high. On the other hand, nothing has yet appeared which equals the trolley car for serving great numbers of people at a low cost.

Local railway systems, or parts of systems, which furnish high-speed transportation by means of subways or elevated tracks hold, and probably will continue to hold, their places as natural monopolies. This is rapid transit of a character which is not open to competition from any radically different form of transportation and whose financial difficulties are susceptible of cure by the simple means of raising the fare charged. If such lines are not permitted to charge a rate which will support them, it is a form of confiscation, whatever may be their contractual obligations. No one else can operate them any better or cheaper than do the present owners, and if operation is undertaken by the people, the people must pay the deficit themselves.

Nothing can be gained for anybody by seizure under the law, because any loss to present security holders is sure to be included in the higher cost of new money in the future. In other words, so long as the physical properties exist and are a public necessity the public cannot escape from paying for the cost of construction and operation of them quite regardless of who owns certain pieces of paper.

Therefore, while the rapid transit problem is serious, the proper solution of it is simple, viz., a rate of fare which is sufficient to preserve good service. Now I approach more difficult ground. Your industry is confronted with the serious competition of automobile buses and that competition is of a character that cannot be met wholly by the simple remedy of raising fares.

In some localities there is actually a decrease in the number of car riders, and an increase in fare might in some cases accentuate this trouble. Therefore, this new problem of competition is in general a much wider one than the mere rate of fare.

©Underwood & Underwood

GUY E. TRIPP

I have called it a new problem of competition, but I would not have you infer that it is an unprecedented one, or that it is the first occasion when a public service, enjoying a natural monopoly, has been confronted with a rival service having quite different characteristics. Some of these rivals have been successful and some have been written off the books. The electric light and power industry threatened to drive the gas business into remote regions, but so far with a conspicuous lack of success. Another, the very recent wireless communication business, has also been a remarkably successful enterprise, but has completely failed to ruin the wire and cable lines. These successful ones, and in fact all successful ones, can only be successful in this day and generation if founded upon fair competition.

You would have an easy and profitable time with the automobile bus competition if it were unfair competition, because the law provides for treble damages in such cases. But is it unfair competition? It is obvious that unfair competition cannot be defined by metes and bounds which can be applied to all cases, but the principles have been laid down by Professor Stevens of Columbia University and the publication of his treatise while the Federal Trade Commission act was under discussion in Congress undoubtedly had a profound influence upon the legislation. He lays down the following standard:

> Fair competition in an economic sense signifies a competition of *economic or productive efficiency*. On economic grounds an organization is entitled to remain in business so long and only so long as its production and selling costs enable it to hold its own in a free and open market. . . . Unfortunately, competition is not always conducted under such conditions of equal opportunity in a free and open market. Productive and selling efficiency alone do not always permit an organization to survive owing to the introduction of methods and practice which destroy the freedom of the market, which hamper the production or selling efficiency of other units and which prevent efficient potential rivals from becoming actual rivals. Such artificial restrictions are clearly unfair, since they hinder or prevent other organizations from competing to the extent *which their productive and selling efficiency may warrant.* If there be a sound basis for competition it lies in the preservation of the economically efficient and the destruction of the inefficient. *It follows that methods which destroy the efficient along with the inefficient are economically unjustifiable and must be regarded as unfair.* . . . In many cases unfairness can not be determined except with reference to the consequence of a given act. The definition of unfair competition therefore should be general in terms. *Any act or method of competition which hampers, injures or destroys concerns which could compete on the basis of their productive and selling efficiency should be forbidden, as should also any method except productive and selling efficiency which prevents potential competitors from becoming actual competitors.*

Measured by these principles, it appears probable that you are not being attacked by unfair competition; and if this be so, then you are reduced to the process of painstaking comparisons between services rendered if you are to form judgment as to whether this new form of transportation will supplant or supplement the street railway or will itself pass into the shadows of unsuccessful business ventures.

The buses claim, among other things, greater comfort, high speed and public preference for their vehicles. Comfort is becoming a greater and greater factor in our daily lives. Steam heat and electric lights are by no means indispensable, but comfort demands them as it does a thousand other things, and if the bus ministers to the public good cheer, its adoption will be limited only by other considerations which outweigh the comforts.

What are some of the superior enjoyments offered by the auto bus? First comes the relief from the nervous strain of being compelled to board and alight from a vehicle standing in the middle of the street—a feat which only a very few years ago could be lightly attempted by any one in possession of his five senses, but which today in all our large cities has become an adventure to all those who have not become hardened to it by constant exposure. Add to this the disagreeable navigation of the space between the sidewalk and the track in bad weather, and you must conclude that it is more comfortable to have your automobile bus drive up to the curb and invite you to step daintily aboard.

Second, comes the enjoyment of rolling noiselessly along upon pneumatic rubber tires with an occasional toot of

*Abstract of an address at the Midyear Dinner of the American Electric Railway Association, Washington, D. C., Feb. 17, 1925.

Digitized by Google

the horn, as compared with the roar of metal against metal and the frequent clanging of the gong.

Third, comes the comfortable assurance that you will get a seat because, when the seats are full, no more passengers are taken on. Of course, you must wait for another bus, but you wait in comparative ease on the sidewalk, which is quite different from frequent round trips to the middle of the street in order to ascertain that there is no standing room in a car.

Yes, there is no denying these comforts, but one can get them all by being wheeled to and from his business in a boardwalk chair, and that introduces the other luxury which the public wants to a degree that ought to cause our ancestors to turn over in their graves. Speed is what we all want. This is the "step on the gas" era.

But the bus also claims speed, and I am bound to say that on well-paved city streets I see no reason to dispute the claim. The car is confined to its track, and when blocked not only must stay where it is but it also stops every car behind it, while the bus can meander around the scenery, making headway all the time. It is obviously more flexible in its operations, and it has been my observation that the gasoline motor is a sufficiently speedy contrivance in itself.

Now about the matter of public preference for the vehicles themselves from the standpoint of design. I am not so sure about that. Some of the buses are very beautiful, but a street car could also be made just as beautiful. You cannot tell about a public preference which is based simply upon style. It may be only a caprice, and we human beings are surprisingly fertile in caprice.

Be that as it may, I have granted about all the claims of the automobile bus, and if the case be closed at this point, we might look forward to a time when the street railway company would wrap its track and equipment in its franchise and put the package away in the garret among the spinning wheels and hair trunks.

However, the uncontested affirmative side of a case does not always present the true picture. This emboldens me to ask the bus a question and request a categorical answer.

"You can doubtless serve some of the people all of the time, and all of the people in some places, but can you serve all the people all the time in all places?"

The answer must be "No," and that opens the way for classification, segregation and other forms of dissection, and the important thing to bear in mind is that the thing to be classified is mass transportation—daily and regular moving of the masses of the people from one or more points to one or more other points. Private automobiles and taxis are not included, they are on the same relative plane as the officers' mess in the army, an organization of almost private household simplicity, while mass transportation may be compared to the quartermaster's vast organization, with rigid discipline controlled by inexorable rules and regulations, all of which are necessary if a great army is to be fed at all.

Broadly speaking, the bus gives either a special or a de luxe service which will cost more to operate than the street car and must, therefore, in the long run, charge a higher fare. There will be no difficulty in securing a widespread belief in this statement in view of the astounding fact that every seventh person in the United States owns an automobile. Nevertheless, there will be a demand for this service because the increasing average incomes of the people permit more and more luxuries, and perhaps the principal limitations to the growth of this particular service will be the fixed capacity of the streets and lack of capacity of the bus to handle "rush-hour traffic."

But when the bus has completely occupied its field, there will still remain millions of people to whom a low rate of fare is a necessity, millions who must be served at those most important hours of the day—the rush hours—and nothing has yet appeared to perform this service except the electric car.

Therefore, it seems clear that the people will demand or need both classes of service. There is nothing unique in that. You may today go to New York in a perfectly comfortable day coach, or by paying more you may ride in a parlor car with the luxury of a Nabob.

Such differentiations are easily dealt with when the whole service is rendered by one company, and that is the solution of the traction difficulty which I have been discussing. The whole transportation service in a locality should be centered in one organization, which can increase or diminish each class of service according to necessity, and should one class temporarily run into the red ink of adversity, its more prosperous partner may be able to support it through to better days.

Hereafter it should be the established policy of our cities and towns that no bus franchise will be granted to any one unless it is an integral part of a comprehensive plan for rendering a complete transportation service to the people, and that can only be successfully done by one transportation company.

When that policy shall have been adopted by the municipalities and when all the street railway companies recognize, as many of them now do, that the problem of furnishing mass transportation to the public is one which it is their duty to solve by the use of any method which the progress of the times and development of the art may demand, then there will be inaugurated a new era in urban transportation, which will make it a profitable business, but, aside from that, beyond the mere profits in dollars and cents there will be the satisfaction to you of being engaged in a work which is vital to the civic development of the future.

Transportation Men Should Run Transportation Systems*

By Matthew C. Brush

President American International Corporation

The Same Fighting Spirit and Determination to Succeed that Are Used to Combat Storms and Mishaps Should Be Directed to Securing a Square Deal for the Electric Railways

I REALLY am on the outside looking in at your wonderful industry, your marvelous accomplishments, the tremendous value of your business to the country and your earnestness of purpose. I cannot help but feel that you yourself at times do not fully capitalize your position. Your industry is only 37 years old, a mere child. I don't admit yet that I am old, and I remember very well indeed in 1889 on Fourth Avenue in Minneapolis when the first electric railway was constructed. I was a kid, but you must realize that this industry has been completely built up within that period. There are many men in this room tonight who have been actively engaged in its creation from the day of its birth.

You went through the toughest, most discouraging, crude, vicious, trying and heart-breaking experiences of any great industry. Times that tried men's souls. You fought, worked, wept, laughed, pulled, pushed, argued and explained, and did all of those things that apparently are so necessary to accomplish anything that is worth while.

In your pioneering engineering period you showed a marvelous determination to win against terrific odds—some physical, some financial and some political. You thereby necessarily developed a class of help—men who did things; men who became rugged, mentally and physically, men who are fearless because they are honest and who are working in a high and worthy cause to produce beneficial results for mankind, men who know their business and should be justifiably proud of their accomplishments.

Your industry has very properly been lifted out of the position of a football for politics. There were times not long ago when most public utilities were the victims of political expediency and those concerned in their operation and service suffered accordingly. The situation has shown substantial improvement in this regard, but there is still much to be done.

Now the message I want to leave with you is this: Stand up on your

*Abstract of an address at the Mid-year Dinner of the American Electric Railway Association, Washington, D. C., Feb. 17, 1925.

Digitized by Google

hind legs and throw your chest out and realize and capitalize and carry into your every effort the heritage that is yours by being the creators of the electric railway industry of this country. You have had so many wallops, many of you, that you are inclined to duck when some uninformed or unkindly individual or group takes a crack at you. Don't do it. Your whole endeavor is honorably and efficiently to discharge your multitude of responsibilities, and when you are sure you are right stand up and don't be afraid to assert the justice and the merit of your position. You not only have the right but the duty to carry your responsibilities with your head up.

You are the trustees for the employment of more than 300,000 men, receiving approximately $500,000,000 yearly. You are the custodian for practically $6,000,000,000 worth of the people's money. A million and a half people have $6,000,000,000 in your business!

And you also are equally the consumer of approximately $150,000,000 worth of manufactured material, and in that respect you are responsible for the employment of those additional men. You called upon the investors last year for about $300,000,000 for additions, betterments and improvements. You carried approximately 16,000,000,000 people. Now, therefore, you have an army of millions of citizens represented by investors, employees, direct and indirect, by passengers, property owners, and so forth, all of whom are entitled to a square deal not only at your hands but at the hands of those who make the laws and regulations governing your work.

You are directing an essential industry, a public utility that is strictly dependent for its necessary authority to live upon legislative authority, subject to millions of laws, regulations and restrictions, by billions of men, municipal, state and federal, elected and appointed. You are subject to the strictest subserviency of legislative and congressional action, and the advocacy of fair, intelligent, constructive regulatory action cannot be too strongly emphasized. Our form of government, however, is a representative government, those holding governmental power being selected by those governed, and 16,000,000,000 people last year rode on our cars, and they are part of the people that are being governed, and 300,000 men worked for you, and they are part of the people that are being governed.

With such a large percentage of those being governed vitally concerned in just and fair treatment of your industry, are you not negligent and betrayers of your trusteeship if you fail properly, legitimately, intelligently, forcefully to make every effort to select for high places those who by training and ability are qualified to pass upon the problems with which you are constantly confronted and then keep them thoroughly and constantly informed? This tremendous power should function through some well-organized, highly efficient, intelligent, simple organization whereby each of your companies can benefit by the experience of all the rest. I confirm the previous speakers in saying that I know of no man in your industry better qualified to carry out the spirit of what he is undertaking than our good friend "Lu" Storrs.

There are men in this room who were in the horse car business, and when the electric car came along they became electric railway men. Practically every electric railway man in the beginning of your industry, in 1888, '89 and '90, was previously a horse car man. As time went on, the necessity of transportation in your communities developed subways and elevated lines, and the same men who had been in surface car work became

© Underwood & Underwood

MATTHEW C. BRUSH

subway and elevated men. No one could possibly have anticipated in the early days of the street car the development that has occurred in subway and elevated transportation in the last 5 or 10 or 15 years.

Now I would like to have you all change your name. I don't like to hear you called street railway men or electric railway men. I like to hear you called transportation men. You have been trained in it, practically all of us here have been in the transportation business directly or indirectly since we were pretty young boys. It is perfectly ridiculous, it is criminal to you, to your heritage and to the community, for men who have had such training as you have had in the handling of men in the transportation business, in the handling of the public, in dealing with commissions, in dealing with the finances of a transportation proposition, to step aside and be superseded by 100 per cent novices, because the particular thing which they run happens to be run by a gallon of gas instead of a few kilowatts.

If there is to be in the community in which you now operate electric railways, under the ground, on the ground, or overhead, any means of transportation which the community justly demands and requires, then you are the men to run it and not some taxicab driver.

I don't think you have any right—and I say you because you are a part of the body of citizens who select the men who make the laws and regulations under which you work—you haven't any right to take my investment as a stockholder in an industry that I have made sincerely and that has been put into a steel rail or into a car, under the supervision of a publicly appointed body, a commission, at a price specified by the commission, and tell me that because the community demands a wheelbarrow or an airplane I am to lose my money and go out of business and Heinie Kabibble or John Jones is to come in with his vehicle and take my business. I have never found in my experience a commissioner, a superintendent of streets, a Congressman or any publicity appointed or elected man who could stand up and face a genuine, honest-to-God meritorious truth if you will pass it to him, but if you don't pass it to him, you have no kick coming as to what they do to your property.

And I have always found in my limited experience that I never got anywhere with a commission or with a legislator or with anybody before whom I appeared who had the power of regulation of the situation with which I was responsible for unless I kept my 52 cards face up on the table and fought like hell to get a square deal.

There is no reason on earth that you shouldn't do it. You are entitled to it, and it is yours. If by some superhuman means you could put in it your determination to use all the power you have, legitimate power, to secure, first, in offices elective and appointed, the type of man that sits over in the White House, and, secondly, would then fight for the square deal to which you are entitled for your investor, who is your neighbor, and for your employee, who is dependent upon you for his livelihood, and for your passenger, who is entitled to decent and good transportation, with the spirit that most men in this room have fought a snowstorm or wreck, you would raise the percentage of successful companies in this country 50 per cent inside of a month.

There isn't a man here who has been in the electric railway game who hasn't crawled under a motor, crawled under a car, put a car back on the rails, who hasn't fought a strike, who hasn't carried a gun, who hasn't sat up 36 hours fighting a snowstorm, who hasn't been through the hell that goes with this industry. Fortunately you have a breed of pups in the industry that fight for something else besides money or you wouldn't have them, but that tremendous determination to succeed, that pride of accomplishment which makes you run the street railways and carry 16,000,000,000 people in this country is the type of guts that I want you to put into your scrap to get a square deal, to see that you get a square deal from those that tell you what you have got to do.

I pray and genuinely and sincerely beg you to stand up and throw out your chest. If you are crooks you don't belong in the business, and if you are on the square you are entitled to a square deal. And I will give you my word from my own personal experience you will get it, but you will never get it if you duck every time somebody takes a crack at you. If you are right, fight your heads off for it; you are entitled to it, you can get it, and with a close, viciously well-knit together, clean, magnificent team, headed by a corking, thoroughly well-informed, courageous, honest, fearless captain there is no reason why every single electric railway in the United States shouldn't be on the basis of a government bond investment.

Many Committees Meet at Washington

American, Engineering, Claims and T. & T. Executive Committees Head List of 18 Sessions Held in Connection with Midyear Meeting— Much Important Business Transacted

THE Midyear Meeting at Washington was the occasion for sessions of many of the American Association committees and several from the affiliated associations. In all some 18 meetings were held, including the executive committees of the American, Engineering, Claims and Transportation & Traffic Associations. The new management and operation committee, combining the work of last year's city operation and interurban operation committees, held its first meeting. Detailed reports of many of the sessions are given below.

American Executive Committee

A REGULAR meeting of the executive committee of the American Association was held at the Chamber of Commerce Building, Washington, on Feb. 16. Members present were President J. N. Shannahan, chairman; J. W. Welsh, executive secretary; F. R. Coates, L. S. Storrs, W. H. Sawyer, H. D. Briggs, T. C. Cherry, L. H. Palmer, J. H. Hanna, E. F. Wickwire, C. S. Hawley, Harry Reid, C. E. Morgan, E. P. Waller, B. A. Hegeman, Jr., C. D. Emmons, C. L. Henry and E. C. Faber representing Barron Collier.

F. R. Coates, chairman of the policy committee, recommended that the association co-operate with various utility associations through the committee on education in the preparation of instructional matter regarding the utility industry.

It was recommended that Secretary Welsh write a letter to each manufacturer member calling attention to the basis on which dues are assessed, since some members are not entirely clear on the subject. The recommendation was approved.

For the national relations committee Harry Reid called attention to a meeting to be held the same afternoon at which the question of regulation of buses in interstate service was to be discussed. The committee hopes to cooperate with the steam railroads and the motor vehicle industry in studying the subject for the purpose of bringing the regulation of buses under the Interstate Commerce Commission.

Mr. Emmons, for the publication committee, gave a résumé of the status of *Aera*. The magazine is making satisfactory progress. A ballot was taken among member companies as to the size of page desired. Out of 147 replies only 58 desired a change, so it was voted to retain the present page size.

Myles Lambert suggested that the publication committee give some attention to the preparation of articles of a popular type such as would appeal to non-technical readers.

For the committee on company and associate membership Mr. Palmer reported that four manufacturers had applied for membership, the Fisk Tire Company, Chicopee Falls, Mass.; the United States Tire Company, New York City; the Lee Tire & Rubber Company of New York, New York City; the Pressed Steel Car Company, Pittsburgh, Pa. The applications were approved.

The individual membership has increased 11, according to Chairman Morgan, being 831 at the present time. His committee proposed that membership cards be issued to individual members. This was approved.

Motor Bus Policy Discussed

A statement of the policy of the association with regard to motor buses, which was worked out in conjunction with the motor vehicle industry, was read by Mr. Storrs. This was a corollary to a similar statement of policy of the automotive industry with respect to the bus, in which the association concurred in every respect. The resolutions adopted by the American Association are published in full elsewhere in this issue.

Considerable discussion followed the presentation of Mr. Storrs' report. It was felt that the resolutions provide that the industry should be protected against unfair competition, and the association is taking a real step forward. The resolutions represent the best thought of leading electric railway and bus men. Following the discussion the code of principles was adopted as read.

Newly Formed Advisory Council Appoints Managing Director

President Shannahan announced that the advisory council appointed at the last meeting of the executive committee met on Feb. 3. B. C. Cobb, chairman of the advisory council, reported that at that meeting arrangements had been made for the appointment of a managing director of the American Electric Railway Association. In view of the serious problems that confront the railway industry, the advisory council, representing in the main the owners, had given the matter much thought, and had decided that the work of the association could be furthered very much by this move. Mr. Cobb announced that Lucius S. Storrs, president of the Connecticut Company, had been selected for the position of managing director. Inasmuch as he will need the strongest financial support that can be given, members of the advisory council had signed an agreement to underwrite the cost of the new office. This cost, he said, eventually should be distributed over the entire industry, but the underwriting of the movement guaranteed that it could be carried forward. By taking this step, the advisory council feels that the transportation industry can be put where it belongs in the affairs of the nation.

President Shannahan said that it would be necessary to get the association to adopt changes in the constitution. As such changes require a publication of 30 days in advance of action, it was considered necessary to handle the situation temporarily through the executive committee and later put the entire matter before the membership with a vote to be taken at the October convention. The annual surplus existing in the association's finances for the last few years has been taken up by the absorption of the publicity work formerly carried on under the direction of the Committee of 100, and by the growth in the association work, one indication being the change to larger quarters for the New York offices. The new movement will have to be an entirely separate proposition. He felt that each electric railway, large or small, will be so benefited that it should be glad to contribute a proportional amount of the expense.

In the advisory council, said Mr. Shannahan, are men who have not been actively associated with the American Electric Railway Association, but they have come out strongly in favor of the movement. Owen D. Young, for instance, said that there is hard work ahead, and unless everybody stands back of it the movement will not be effective.

Mr. Sawyer moved that in accordance with the recommendations of the advisory council, and until suitable changes can be made in the constitution of the association, the position of managing director be created. The motion was adopted unanimously.

Mr. Storrs Elected

Upon motion of Mr. Morgan, Mr. Storrs was elected to the position by a rising vote of the association.

Mr. Sawyer congratulated the executive committee on taking this step and Mr. Shannahan for initiating and carrying the movement to a successful conclusion, stating that it is the most outstanding progressive and constructive work that the association has done.

Mr. Storrs replied briefly, expressing his thanks and stating that it would be necessary for him to get the duties of the new office outlined before it would be possible to make any definite statement of the policy to be adopted.

Mr. Cobb stated that he expects the

Digitized by Google

manufacturers to do some of the underwriting of this new move. Several of the leading manufacturers have already agreed to make substantial contributions, and it is known that others will follow.

ATLANTIC CITY AGAIN CHOSEN FOR CONVENTION

Mr. Sawyer, chairman of the committee on convention location, requested Mr. Morgan, chairman of the subcommittee, to present his report. Mr. Morgan stated that after investigating several cities which had been proposed for the next convention, Atlantic City had been agreed upon by the committee. The terms will be practically the same as those of last year, except that additional facilities will be provided to make possible the exhibit of electric railway cars on the pier, or adjacent thereto. Mr. Sawyer moved that an exhibit be held in connection with the convention and that Atlantic City be chosen as the location of the meeting and that it be held the week beginning Oct. 5. The motion was adopted.

Mr. Hanna extended the greetings of the city of Washington to the association on the event of the Midyear Meeting.

As chairman of the special committee on referendum 44 of the United States Chamber of Commerce, Mr. Hanna made a report covering postal rates, postal salaries, and the possibility of providing an emergency fund for the Postmaster-General.

President Shannahan read a letter from the Electric Truck Transportation Corporation dealing with the matter of store-door delivery in connection with electric railway service. Mr. Reid stated that the same matter had been brought to the attention of the Central Electric Railway Association. Mr. Morgan said that it also had been taken up with the New York State Electric Railway Association. After some discussion, Mr. Reid moved that the Transportation & Traffic Association be authorized to make a study of the subject. The motion was carried.

Secretary Welsh stated that the Department of Commerce wants figures of monthly traffic of electric railways in connection with its survey of current business. This was desired in the form of an index figure of all companies that can be included in such a survey. On motion of Mr. Lambert, it was decided to instruct Mr. Welsh to prepare such information as was needed for the Department of Commerce.

Mr. Henry made a report on the action of the Interstate Commerce Commission in the Lackawanna case, in which section 15A of the interstate commerce act was involved. Under the decision this company was brought under the clause. He suggested that all electric railways study the decision.

President Shannahan announced the membership of the exhibit committee, with C. E. Morgan as chairman, and the entertainment committee, with S. J. Cotsworth as chairman. The complete personnel of these committees will be announced later.

It was decided to hold the next meeting in New York City on April 3, beginning at 10 a.m.

Special Taxes

A MEETING of the committee on special taxes of the American Association was held at Washington, D. C., on Feb. 16. W. H. Maltbie of Baltimore acted as chairman. Others in attendance were: A. C. Watt, A. G. Neil, A. W. Flor and F. W. Doolittle representing Edwin Gruhl. Mr. Maltbie reviewed the previous work of the committee, after which methods were considered of bringing the electric railway tax situation to the attention of the industry as a whole and the public at large.

Location of Next Convention

THE committee on place and date of the next convention met in Washington on Feb. 16 and decided to recommend to the executive committee that the annual convention be held in Atlantic City during the week of Oct. 5. The committee had canvassed the situation in several other cities and concluded that the greatly increased facilities which will be provided for exhibiting electric railway cars this year at Atlantic City made it practicable and desirable to hold the convention there again. The details as to these added facilities will be announced later but they have been definitely provided for, and the committee therefore urged that railway companies and car builders lay plans for an extensive railway car exhibit in October.

Co-operation with Manufacturers

A MEETING of the American Association committee on co-operation with manufacturers was held in Washington on Feb. 16. The members present were E. F. Wickwire, chairman; G. A. Barnes, C. L. Hancock for W. D. Blatz, W. H. Boyce, David Cameron, E. C. Faber, E. E. Kretschner, H. H. Lloyd, Herbert Metz, J. C. McQuiston, George R. Rowland, C. N. Uhl, and C. L. Van Auken.

It was suggested by Mr. Lloyd that the committee on purchases and stores be enlarged to admit purchasing agents of manufacturer members. This suggestion was made because of the similar character of problems of purchasing of railway companies and manufacturing companies. It was thought that this would also make possible closer co-operation with the publicity work of this committee.

There was some discussion of changes in the form of stickers used for shipments made by manufacturer members. These stickers recently have been supplied in quantity to manufacturers by the publicity committee. Another subject along the same line was the discussion of signs to be placed on carload shipments.

Another suggestion was that stuffers be prepared for packages going into the home from manufacturers. This would include such merchandise as electrical goods and similar equipment manufactured for household use.

A suggestion was made which it was considered would be of considerable benefit. This was that letters be written by manufacturer members to realtors, merchants and others in their cities calling attention to their dependence for prosperity on the type of transit available and the prosperity of the electric railway industry. The absolute necessity of protecting the electric railway companies so that they would be able to give the necessary type of service should also be pointed out.

National Relations

THE committee on national relations of the American Association met in its office in the Munsey Building in Washington, Feb. 16. Chairman Harry Reid presided. Members present were: H. G. Bradlee, C. D. Cass, F. C. Hamilton, C. L. Henry, W. V. Hill representing Frank Karr and H. A. Mitchell, D. W. Snyder, Jr., and A. F. Van Deinse.

Some discussion of the various amendments to the Federal law relating to the inspection of steam locomotive boilers led to the appointment of a sub-committee to handle the interests of electric railways in taking up this subject with the Interstate Commerce Commission.

It also was decided to send a copy of the examiners' report in the Lackawanna case before the I.C.C. under Section 15-A of the transportation act to each member for his information and study.

Selling Transportation

AT A meeting in Washington on Feb. 16 the committee decided to draw up no conclusions, but to have the members in the near future submit in writing their individual views as to the more practical steps that can be taken to make railway service more attractive to the public. The committee is hopeful that from these reports enough material can be taken to compile a pamphlet which can be placed in the hands of all engaged in the conduct of electric railway operations.

Bankers are requiring evidence from railways of merchandising enterprise just as they require it from their borrowers engaged in mercantile pursuits, it was said. They are not going to be impressed with efforts that get no further than signs on the exterior of cars or such publicity as can be secured gratis in local newspapers. Signs on the outside of cars are all right as one means of getting business, but they should not be on rough-looking boards. General appearances should be kept up to the highest point possible even where atrocious looking fenders are required.

ATTRACTIVE VEHICLES ATTRACT PATRONS

Varnish and the upholstery play no small part in attractive business to the bus. Cars should be kept well painted. It was suggested that the color might be changed each time the exterior is repainted. Interiors should be made more ornate. More stress should be placed on cleanliness. Noise should be reduced. Manufacturers of cars should be encouraged to do more research in the effort to produce a vehicle as nearly noiseless as possible.

The 1910 street car is no more attractive than is the 1910 automobile. Records show that new equipment increases receipts. While all cars cannot

Digitized by Google

be of the 1925 model, 1925 service ideals can be applied generally.

The privately owned automobile is the principal competitor of the electric railway. Means must be devised to prevent further losses of traffic to the private automobile and to get back as much as possible of that already lost. Some of the larger properties may believe that congestion is solving this problem, but means are being found to relieve congestion and progress in that direction may be expected to become more marked. Convenient routing, greater frequency of service, greater average speed, plus the great advantage of lower cost, all will tend to accomplish this end. The bus can be used to great advantage in attaining these objectives. That vehicle should not be regarded as a feeder only. It offers an opportunity to furnish a different class of service, supplementing that furnished on the rails. It offers new possibilities in de luxe and express services. The bus is a new baby in the transportation family. It is just as sure to stay in the family as is the human infant.

The public is getting the idea that the electric railway is doomed. This is making financing more difficult. The fallacy of this conclusion should be offset by educational efforts. Electric railways now must go out after business, and this is calling for greater managerial ability as well as for specialists in merchandising. Higher salaries must be paid so as to attract the best executive talent.

The committee decided not to devote time at the meeting to the discussion of freight and express services as these subjects were dealt with quite fully last year.

In the absence of Chairman Wood, G. H. Clifford of Fort Worth presided. Other members in attendance were: J. A. Dewhurst, C. A. Graves, H. Etheridge, J. P. Griffin, C. D. Smith, E. S. Wilde and W. H. Boyce.

Company Membership

THE committee on company and associate membership met in Washington on Feb. 16 with chairman L. H. Palmer presiding. Other members present were: F. G. Buffe, J. H. McClure, W. J. Harvie, F. C. J. Dell, W. K. Archbold, J. W. Hancock, J. H. Drew and Harry L. Brown. The list of non-member railways was gone over. Each one considered a prospect was assigned to a member of the committee for attention.

Insurance

THE committee on insurance of the American Association developed its program for the year at a meeting at Washington on Feb. 16. Paul Wilson of Cleveland, chairman of the committee, presided. Members in attendance were O. H. Bernd, C. H. Bourne, F. J. Petura and B. L. Tomes.

It was decided to have two sub-committees. The first, under the chairmanship of Mr. Daniels, will consider the general subject of fire insurance, i.e., what the principal hazards are on electric railway properties, the principal available precautions in connection with them and the effect of "good housekeeping" in connection with electric railway risks.

The second sub-committee, under the chairmanship of Mr. Bernd, will study the present status of the industry as regards fire insurance, and will collect data in regard to losses and what is actually being done to prevent fires. These committees will report before the next general meeting of the committee, to be held probably in June.

Management and Operation

THE first meeting of the newly organized committee on management and operation of the American Electric Railway Association was held at Washington on Feb. 16. Those present were F. R. Coates, chairman; R. F. Carbutt, vice-chairman; G. C. Hecker, secretary; E. S. Wilde, H. L. Mitchell, C. D. Porter, R. W. Emerson, G. W. Welsh, and D. E. Blair, regional directors; C. A. Graves, A. J. Stratton, D. J. Locke, H. B. Potter, G. M. Alexander, B. C. Edgar, J. P. Ingle, J. B. Stewart, Jr., R. J. Lockwood, J. M. Bosenbury representing D. W. Snyder, Jr., D. L. Fennell, J. P. Griffin and W. V. Hill, members; J. N. Shannahan, L. S. Storrs, C. D. Emmons, J. W. Welsh, J. W. Colton and Morris Buck, guests.

After the meeting was called to order by Chairman Coates, he presented Mr. Storrs, the new managing director of the association. Mr. Storrs addressed the meeting briefly, stating that he could not think of anything that can be more constructive from the managerial side—which means also the ownership side—than the work of this committee, with the opportunity it gives for the exchange of ideas.

Executive Secretary Welsh explained how the work of this committee can be tied in with the work being carried on at association headquarters. Mr. Hill felt that personal contact between members of the committee and the properties they visit is necessary to get results that will be beneficial.

President Shannahan Tells Committee of Its Opportunity

Addressing the committee briefly, President Shannahan said that scarcely any of the other committees of the association have the opportunity for effective work that this one has. Originally, he was skeptical of what could be accomplished, but a year's contact has shown him the value of the work that has been done and can be done. The greatest benefit, he believes, accrues to the men who make the visits to the properties. For the association these men act as liaison officers and provide a means for getting more active support of the association. The benefit, he said, far outweighs the cost in effort and money.

Mr. Emmons said that he wanted members on the committee to take back the message to the presidents of their companies that he is sold on the value of the work. Any possible resentment from managements who might feel that the visits of committeemen are an unwarranted interference should be allayed by the character of the members and the message they carry to the properties.

Chairman Coates said that when he agreed to accept the position on the committee he had done it with a reservation that a vice-chairman be selected who would be able to carry on the work in the same manner as he would do it. He said that the vice-chairman was fully as capable of doing the work as he was, and having had the experience of last year was probably better qualified than himself.

Plan of Organization and Procedure Presented

Mr. Carbutt then took the chair. He presented for the consideration of the committee a tentative plan of organization and procedure, which has been prepared by an advisory board. This board, consisting of Messrs. Carbutt, Blair, Boyce, Emerson, Riddle, G. W. Welsh and Wilde, had held a meeting with the regional directors on Jan. 30, and had given its approval of the organization plan. Mr. Carbutt outlined the contents of the plan and then placed it before the members for open discussion.

Mr. Fennell raised the question of the overlapping of work of this and other committees, stating that the question had come up at the meeting of another committee the same morning. Mr. Carbutt explained that there was no overlapping and that the functions of this committee were entirely separate from those of committees which were making separate investigations, either by questionnaires or by personal contact.

G. W. Welsh stated that in preparing the handbook there will necessarily be some duplication, but any other committee can go out and get the information. The most important change in the organization of the work for this year is the appointment of regional directors, formerly known as regional vice-chairmen. Last year these men had to do all of the work of visiting properties, while this year the plan is to have all of the members active and to have them divide the work of making the visits to properties. He feels that it is impossible to get much information of value by correspondence, so that the personal visits are of greatest importance.

Mr. Mitchell felt that members of the committee should be informed as to whether companies listed for visits are members of the association or not. It was suggested that on page 5 of the "Plan of Organization of Procedure," par. F (a) should be modified to read: "Co-ordination of electric railway and motor bus and truck service for all transportation requirements." Mr. Stewart moved the adoption of the report. This was seconded and carried.

Mr. Emerson said that no arrangement has yet been made for dissemination of the information that is being collected by the committee. Mr. Carbutt explained that arrangements have been made for editing the material at headquarters. The method of publication will be determined later, depending on the amount of material and the time at which it is received. It was pointed out that in obtaining information from

Digitized by Google

companies, one important idea was to get a list of available men for a personnel file of individuals available for committee appointments.

It was suggested that meetings of the advisory board be planned for April 25 and July 15. Mr. Emerson suggested that a deadline be established at April 15, when the portion of the reports that are to be considered at the April 25 meeting should be available in New York. Mr. Lockwood felt that this date was too soon for the complete report, but that a part of the work can be ready at that time. Mr. Fennell felt that the date was rather early, but will do all he can.

Mr. Blair proposed that the attempt be made to get a report written by some one in the company visited who is vitally interested in the work under discussion. It was felt by the members that this method is desirable wherever practicable.

Valuation

THE work of the committee on valuation of the American Association since the last convention was reviewed at a meeting at Washington, D. C., on Feb. 16. F. W. Doolittle of New York, chairman, presided. The other members present were: Thomas Conway, Jr., C. W. Gillespie, F. C. Hamilton, W. H. Maltbie, Albert S. Richey and E. Stenger.

The subject that was first discussed was a progress report of the subcommittee on terminology, of which T. E. Francis is chairman. This subcommittee was appointed for "the study of elements of value claimed from time to time by public utility companies, looking toward the preparation of a list of terms with their definitions, which would be suggestive to the members of the American Electric Railway Association who are at any time confronted with the preparation of a valuation case." One purpose of this study was to reduce unnecessary and more or less meaningless terms, for the sake of clarity and definiteness. Another purpose was to list the principal elements of reasonable and fair value which otherwise might be overlooked in a valuation case. The members of this sub-committee, besides Mr. Francis, are J. A. Emery and James Walker.

The valuation committee also considered the possibility of compiling index numbers of electric railway construction costs, and other topics.

Engineering Executive Committee

THE executive committee of the Engineering Association met in Washington on Feb. 16. Those in attendance were: President C. H. Clark, chairman, R. C. Cram, R. H. Dalgleish, F. H. Miller and G. C. Hecker. Considerable time was devoted to a discussion of standardization work and committee procedure. A sub-committee of the executive committee was appointed, consisting of R. C. Cram, chairman; M. B. Rosevear and Charles R. Harte, to study the entire procedure of standardization of the association, including the plan suggested several years ago of a unit method of voting on the adoption of standards.

President Clark reported that the proposal to organize a committee on rail corrugations was approved by the executive committee of the American Association and that the executives of several companies expressed their desire and willingness to appoint representatives on the committee and bear their proportion of the expenses of a trip of inspection of the various properties throughout the country to study rail corrugation.

It was announced that the executive committee had approved by letter ballot the proposal to assign this year to the power transmission and distribution committee the subject of radio interference.

The secretary announced the completion of the draft of the bibliography on heavy electric traction by Professor Warner, and the bill for his services in this connection was approved. The matter of publishing the bibliography will be referred to the committee on heavy electric traction.

Announcement was made of the approval by the executive committee and indorsement by the association of various recommendations of the Division of Simplified Practice, Department of Commerce, among which were sizes and gages of sheet steel, steel lockers, reinforcing bars for concrete work and others. Announcement was made also that the committee on purchases and stores is studying the standard purchasing department forms recommended by the Division of Simplified Practice and that their recommendations would be presented for consideration of the executive committee at a later date. A special committee consisting of H. H. George, chairman; P. V. C. See and W. F. Graves reported favorably on the recommendations of the central lumber standards committee, and the executive committee authorized formal indorsement by the association of those recommendations.

The secretary announced the appointment of various members of the association on committees of the American Engineering Standards Committee, and reported the status of the work of the sectional committee on tubular steel poles, which was organized under the association's sponsorship.

Welded Rail Joints

A FIVE-HOUR meeting of the committee on welded rail joints was held at the Bureau of Standards on Feb. 16, in the morning and afternoon. Various types of testing apparatus for use on railway track were examined by the members. At the time of the meeting the repeated impact testing machine was out of service on account of failure of one of the mechanical parts.

Co-operative study with the General Electric Company in the matter of otheograph tests was described by E. M. T. Ryder. No great progress has yet been made, but arrangements are under way looking to joint study with the track committee of the American Railway Engineering Association. It is hoped to develop information as to stresses caused by the passage of a car over a defective joint.

It is hoped also that valuable data on stresses in rails and across joints will be developed by means of telemeter tests. Apparatus used for this purpose was described in ELECTRIC RAILWAY JOURNAL for Feb. 14. It is expected that the information thus secured will be helpful in guiding the work of the committee.

Progress report No. 3 of the committee will probably be issued late in February and will bring up to date the results of tensile tests, as well as give information on the results being obtained from the repeated impact testing machine. Outlines were given of five separate investigations of features connected with the problem of seam-welded joints.

A newly developed contact pyrometer designed by C. O. Fairchild of the Bureau of Standards was exhibited at the meeting. Its use will assist the study of actual rail temperatures at different stages of the welding process.

A special report was made on a series of tests of seam-welded joints prepared at Baltimore and at Boston. These tests were made for the purpose of studying the effects of preheating and postheating. The report was presented by R. B. Fehr, development engineer Rail Welding & Bonding Company, and will be included as an appendix to Progress Report No. 3.

Those present at the meeting were: E. M. T. Ryder, C. H. Clark, R. H. Dalgleish, A. P. Way, R. C. Cram, H. H. George, H. M. Steward, C. S. Kimball, J O. Handy, R. B. Fehr, A. F. Blaser, C. W. Bolton, R. R. Seward, W. V. Armstrong, J. H. Deppeler, R. C. McCloy, E. W. Carruthers representing the Pennsylvania Railroad, William Spraragen, and G. K. Burgess, chairman. Other representatives of the Bureau of Standards were: H. L. Whittemore, J. R. Randolph, R. S. Johnston, C. O. Fairchild and O. S. Peters.

A sub-committee on examination of broken test specimens met at the Bureau of Standards on the preceding Saturday afternoon and examined all of the test joints which have thus far been subjected to tensile tests in the Emery testing machine. It is the intention to include the report of this special sub-committee in the forthcoming Progress Report No. 3. Those present at this meeting were: S. W. Miller, R. B. Fehr, E. M. T. Ryder, H. F. A. Kleinschmidt, J. H. Deppeler, R. C. Cram, William Spraragen, H. L. Whittemore and R. S. Johnston.

Transportation and Traffic Executive

IN CONNECTION with the Washington meeting, the Transportation & Traffic executive committee held a session on Feb. 16. Those present were Chairman T. C. Cherry, president of the association; G. H. Clifford, J. V. Sullivan, Samuel Riddle, W. H. Boyce, Edward Dana, E. M. Walker, Paul E. Wilson, and E. J. Murphy of the association staff. C. W. Chase was also present representing the accident prevention committee, of which he is chairman. Mr. Boyce pre-

Digitized by Google

sented the report of the committee on selling transportation in the absence of Chairman Wood of that committee.

A. H. Ferrandou, chairman of the committee on bus operation, and G. B. Anderson, chairman of the committee on traffic congestion, presented reports.

It was decided to request of the American Association that no committee be permitted to send out questionnaires that overlap the field of work being investigated by the committee on traffic congestion.

President Cherry named a program committee for the annual convention, which consisted of G. H. Clifford, chairman; Samuel Riddle and Joseph V. Sullivan.

Relief of Traffic Congestion

A DESCRIPTION of the plan which the Los Angeles Railway proposes to follow to secure relief in that city was given by G. B. Anderson at a meeting of the committee on relief of traffic congestion of the T. & T. Association held at Washington Feb. 16. He said that a very satisfactory system of traffic regulation had been in force during the holiday season, but that it had been repealed immediately thereafter. Until recently the merchants and the automobile interests have opposed parking restrictions. Lately, however, the former have begun to see that unlimited parking is a handicap to their business. Only the street car riders are unrepresented in discussions of this subject, and it is therefore the duty of the railway to represent their views. In Los Angeles the railway is endeavoring to present to the public the facts concerning traffic congestion, and to create a sentiment favorable to measures of relief.

Conditions differ in various places, in the opinion of W. S. Bell, who said that ordinarily relief cannot be secured if it is thought by the public to be primarily in the interests of the railway. The situation must be allowed to work itself out, he said, which it will do in time. Already pedestrians are becoming much incensed at the disregard shown by automobile drivers. W. E. Thompson agreed to this view and said that it was best to allow civic organizations to take the initiative in matters of traffic regulation.

Relief can best be secured by going directly to the local police in the opinion of E. S. Rider.

J. E. Heberle spoke of the difficulty of securing relief in Washington, due to the fact that the personnel of the Public Utilities Commission and the District Commission is the same, and these men are extremely busy. The necessity of securing Congressional approval also complicates matters. In general, he thought that best results are secured by sitting in with other bodies.

It was decided on motion by D. L. Fennell that the efforts of the various railways to secure relief of congestion be carefully observed, and that the American Electric Railway Association keep the member companies posted concerning the results.

Major R. J. Lockwood. assistant manager United Railways of St. Louis, suggested that the committee study as soon as possible the recommendations of the Hoover conference on highway safety. A motion to this effect made by Mr. Fennell was carried. It was the sense of the committee that in order to avoid duplication the subject of city operation, so far as it applies to traffic congestion, be left to this committee for study. It was further thought that this committee should undertake to furnish full data on the subject of congestion to the publicity committee, to facilitate its work.

It was the sense of the meeting that, in so far as possible, left-hand turns at intersections and in the middle of the block should be prohibited in congested districts.

The next meeting is to be held in St. Louis, some time in April, at the call of the chairman. Those present were: W. S. Bell, W. E. Thompson, D. L. Fennell, E. S. Rider, J. E. Heberle, J. P. Tretton, F. R. Latta, W. H. Maltbie, C. L. VanAuken representing J. A. Grieg and G. B. Anderson, chairman.

Accident Prevention

THE first meeting of the new joint committee on accident prevention of the Transportation & Traffic Association and the Claims Association was held in Washington on Feb. 16. Members representing the T. & T. Association were: C. W. Chase, president Gary Street Railway, chairman; A. B. Miles, J. A. Jarvis and J. B. Stewart, Jr. Those representing the Claims Association were: G. R. Whitmore, Wallace Muir, E. J. Paige, W. H. Hyland, C. W. Giltner, H. E. Cady, R. A. Sears and Samuel Riddle. J. J. Reynolds, J. B. Stewart, Jr., J. S. Kubu and S. G. Herrell were also present.

Wallace Muir opened the meeting in the absence of the joint chairman, C. B. Hardin, and asked Mr. Chase to preside. Mr. Muir explained that the purpose of the formation of the joint committee was to avoid duplication of work by two separate committees, one in each association. He outlined the recommendations adopted by the committees last year as a guide to the new committee in planning its work.

It was decided that the work of collecting accident statistics be continued this year, and a motion was passed authorizing the chairman to appoint a special sub-committee of three members with E. J. Murphy of association headquarters as chairman.

Highway Crossing Safety Discussed

Mr. Muir recommended that a subcommittee be appointed to draft a bill for regulation of automobiles and the improvement of highway and crossing safety, with a view toward getting this uniform bill adopted by the various states throughout the country. It was proposed that the American Electric Railway Association undertake to obtain the approval and support of the National Safety Council for this bill, and that the association and the Safety Council jointly take the subject up with the United States Chamber of Commerce in an endeavor to get that organization to sponsor this bill as its own. It was suggested that an effort be made to get the Chamber of Commerce to send a copy of the bill to the Governor and Attorney-General of each state, urging them to submit the bill to their respective legislatures for adoption as uniform legislation throughout the country.

This suggestion was questioned by R. A. Sears, general claims attorney Boston Elevated Railway, on the ground that the work started by the recent Hoover safety conference had already assumed a much wider significance than could such a movement as that suggested and that a definite set of principles for the formulation of safety regulation legislation had come out of the Hoover conference with the full approval of the many varied interests represented, including the automobile and railroad industries.

A general discussion ensued of the merits of various plans for working out the idea. It was finally decided to delegate Mr. Muir to outline the main features of his plan to the presidents of the Transportation & Traffic Association and the Claims Association, and to request them to discuss this subject with the executive committee of the American Association.

Discussion of the subject of following up trainmen to check the observance of safety rules led to a number of suggestions for improving the results obtained. Mr. Stewart outlined some of the methods used on the Youngstown Municipal Railway for stimulating safety work and said that the results accomplished by the application of the Louisville safety contest plan had been highly successful.

Mr. Sears outlined the plan used by the Boston Elevated Railroad of presenting safety discussion in a new form. He explained the use of a series of pamphlets in which a report of an imaginary meeting between the men, the general manager and the claim department is given in such a manner as to stimulate the interest and imagination of the employee reading the pamphlet.

After an afternoon session a motion was passed instructing the program committee to secure outlines of the work done by eight or nine railway companies which had made outstanding records in accident prevention. These are to be used as the basis for articles to be published and subsequently reprinted in pamphlet form and distributed to the executives of operating companies.

Claims Executive

AT A brief meeting on Monday afternoon the committee expressed its approval of the uniform motor vehicle law suggested by the accident prevention committee. Some time was given to consideration of subjects suggested for discussion at the annual convention, but no definite action was taken. It was decided to hold the next meeting of the committee in New York on April 3. Those present were: S. J. Herrell, G. T. Hellmuth, E. L. Lindemuth, J. S. Kubu, C. B. Proctor, H. E. Fisher, W. H. Hyland, J. J. Reynolds, Wallace Muir, and H. D. Briggs, president of the Claims Association.

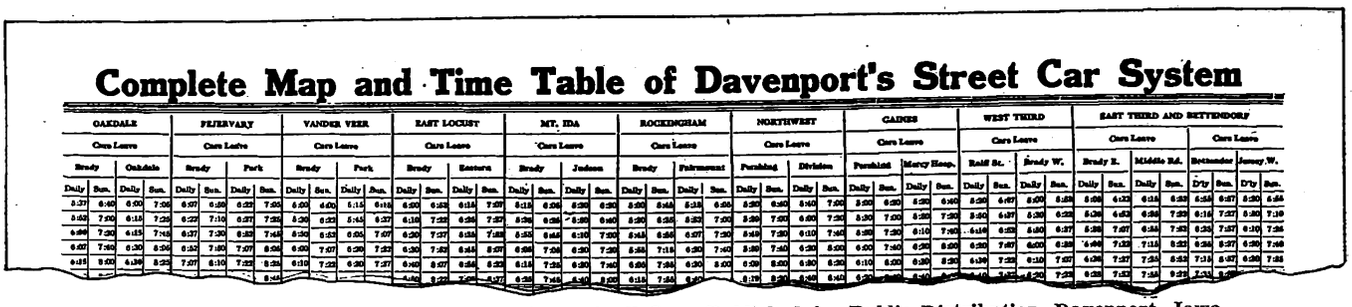
Complete Map and Time Table of Davenport's Street Car System



Upper Part of Time-Table of Running Times of All Cars, Published for Public Distribution, Davenport, Iowa

Complete Time-Table for Public Distribution

FOLLOWING the adoption of a system of rerouting its lines in Davenport, Iowa, some time ago, the Tri-City Railway issued a complete time-table for public distribution. There are altogether seven routes, but as some of them pass through or loop about the center of the city, the time-table shows eleven lines, so as to give the leaving times at the outer terminals and at the center of the city, as at Grady Street or Pershing Avenue. A footnote on the time-table explains that the Oakdale cars, whose leaving times are shown by heavy face type, go only as far as Lombard Street.

The time-table is printed on a sheet 15 in. x 18 in. and also contains a route map of the lines in Davenport and other appropriate information. A reproduction of the upper part of the time-table is published herewith.

Advertising a New Line in Detroit

ON SUNDAY, Nov. 9, 1924, the Department of Street Railways, Detroit, inaugurated service on a new route known as the Mount Elliott line. The total length of this route is 4.35 miles, partly over old track and partly over new. Though mostly double track, a part of the line is single track with turnouts, and the operation of the cars over this section is controlled by automatic signals. Until the traffic warrants larger cars, the service is being furnished by one-man safety cars.

The new route connects eight lines and passes the plant of the Dodge Brothers Motor Car Company, where there are 16,000 employees. To facilitate the problem of receiving and discharging passengers at these works a loop has been built within the Dodge Works, and part of the Mount Elliott line service is routed over this loop. In addition, during the morning and evening peaks a number of tripper cars from several other lines use this loop to take care of motor plant employees.

The Dodge company has co-operated in this traffic improvement by supplying information to its employees in regard to the new service. A copy of one of the posters put up in the Dodge plant is reproduced. A schedule card was also distributed to show from what lines cars would be operated over the loop.

BETTER STREET CAR SERVICE

To improve street car service for Dodge Brothers' employees, the Department of Street Railways has established very fine street car service on Conant Road. This will do away with the crowding on Joseph Campau Ave., and the service has been arranged so it will be easier for you to travel to and from work.

We recommend that you patronize this service at once as we are sure it will work out to your advantage.

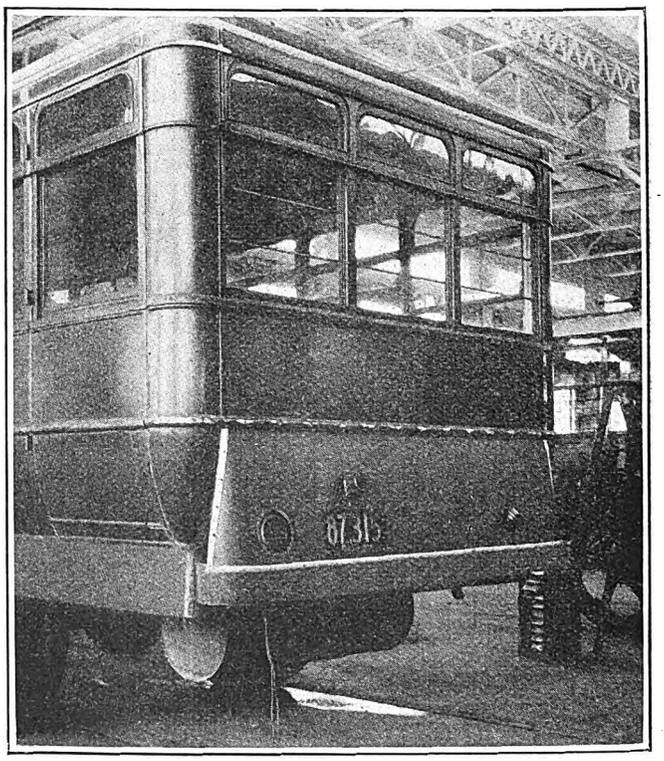
Manufacturer Advertises a New Car Line

Apron Prevents Riding on Bus Bumper

THE rear of the body on the Mack buses operated by the Boston Elevated Railway is protected from collision with a tree or pole and from damage by another vehicle crashing into the bus by means of a bumper which projects out several inches. It was found, however, that this provided a handy place for urchins to sit when stealing a ride. In order to prevent this a sheet metal apron has been installed in a manner similar to that used on the bumpers of street cars. This has effectually prevented riding on the bumper. In the accompanying illustration the apron has received only a priming coat and therefore appears to be a slightly different color from the rest of the body. After the painting job has been completed, the apron is the same color as the rest of the bus and is inconspicuous.



This Bumper Apron Is Similar in Purpose and Construction to Those Used on Street Cars

Census Report Shows Status of Electric Railways

Tables and Other Statistics from the Census Report Just Made Public Give Interesting Facts About the Growth in Traffic of the Electric Roads Between 1917 and 1922

PRELIMINARY figures of the status of the electric railway companies of the United States contained in the census report for the year ended June 30, 1922, have been published in this paper.* The complete census report on electric railways has now been made public and has been issued from Washington. The report is printed on a page of more convenient size than previous issues, the page being 6x9 in. instead of 9x11½ in. There are 256 pages in the report. The period covered by the operating statistics is generally the calendar year 1922. The statistics for equipment and balance sheets relate to Dec. 31, 1922, and for number of employees, June 30.

Statistics on electric railways have been compiled by the Census Bureau every five years since 1902. The census is primarily of street and interurban railways,

*See ELECTRIC RAILWAY JOURNAL for Oct. 6, Nov. 3, Nov. 10, Dec. 1, Dec. 22, 1923, and Feb. 9, 1924.

TABLE I—PRINCIPAL STATISTICS: 1922 AND 1917

	1922	1917	Per Cent of Increase[1]
Number of companies	1,200	1,307	—8.2
Operating	858	943	—9.0
Lessor	342	364	—6.0
Miles of single track operated, all tracks[2]	43,931.86	44,835.37	—2.0
Running track	42,450.09	43,364.83	—2.1
Main track	40,364.33	41,446.67	—2.6
Road or first track	31,264.26	32,547.58	—3.9
Second track	8,796.33	8,656.08	1.6
Other main track (third, fourth, etc.)	303.74	243.01	25.0
Sidings and turnouts	2,085.76	1,918.66	8.7
Track in carhouses, storage yards, etc.	1,481.77	1,470.54	0.8
Miles of motor-bus lines (one-way)	685.36	[3]	.....
Rolling stock:			
Cars, number	99,255	102,603	—3.3
Revenue cars	88,707	91,448	—3.0
Passenger	77,301	79,914	—3.3
Express, freight, baggage, and mail	11,406	11,534	—1.1
Service cars	10,548	11,155	—5.4
Electric locomotives	404	357	13.2
Motor buses, number, one-man	370	[3]	.....
Persons employed by operating companies:			
Number	300,523	294,826	1.9
Salaries and wages	$445,680,135	$267,240,362	66.8
Salaried employees—			
Number[4]	30,239	27,151	11.4
Salaries	$57,489,091	$33,909,674	69.5
Wage earners—			
Number	270,284	267,675	1.0
Conductors, motormen, and one-man car and bus operators	130,628	136,184	—4.1
Other wage earners	139,656	131,491	6.2
Wages	$388,191,044	$233,330,688	66.4
Conductors, motormen, and one-man car and bus operators	$205,238,478	$127,222,144	61.3
Other wage earners	$182,952,566	$106,108,544	72.4
Traffic:			
Passengers carried	15,347,519,966	14,506,914,573	5.8
Car lines	15,331,399,851	14,506,914,573	5.7
Motor-bus lines	16,120,115	[3]	.....
Total revenue passengers	12,679,349,042	11,304,660,462	12.2
Car lines	12,666,557,734	11,304,660,462	12.0
Motor-bus lines	12,791,308	[3]	.....
Regular-fare passengers	12,217,523,995	11,304,660,462	8.1
Car lines	12,205,118,008	11,304,660,462	8.0
Motor-bus lines	12,405,987	[3]	.....
Pay-transfer passengers	461,825,047	[5]	.....
Car lines	461,439,726	[5]	.....
Motor-bus lines	385,321	[3]	.....
Free-transfer passengers	2,499,822,382	3,021,137,935	—17.3
Car lines	2,496,570,207	3,021,137,935	—17.4
Motor-bus lines	3,252,175	[3]	.....
Free passengers	168,348,542	181,116,176	—7.0
Car lines	168,271,910	181,116,176	—7.1
Motor-bus lines	76,632	[3]	.....
Car and bus mileage	2,145,398,078	.....	.....
Revenue-car mileage	2,124,523,362	2,139,801,530	—0.7
Passenger	2,068,293,833	2,087,818,534	—0.9
Express, freight and mail	56,229,529	51,982,996	8.2
Non-revenue car mileage	13,758,312	[3]	.....
Bus mileage	7,116,404	[3]	.....
Car and bus hours	203,785,888	.....	.....
Revenue car-hours[6]	201,838,263	203,056,931	—0.6
Passenger	197,146,335	199,052,633	—1.0
Express, freight and mail	4,691,928	4,004,298	17.2
Non revenue car-hours	1,325,573	[3]	.....
Bus-hours	622,052	[3]	.....

Condensed income accounts:	1922	1917	Per Cent of Increase[1]
Operating companies—			
Income from all sources	$1,049,048,321	$730,108,040	43.7
Operating income—			
Railway operating revenues	925,477,485	650,149,806	42.3
Railway operating expenses	678,563,107	421,250,838	61.1
Net revenue—Railway operations	246,914,378	228,898,968	7.9
Auxiliary operations—Revenues	91,241,607	59,675,286	52.9
Auxiliary operations—Expenses	49,232,061	31,343,816	57.1
Net revenue—Auxiliary operations	42,009,546	28,331,470	48.3
Net operating revenue	288,923,924	257,230,438	12.3
Taxes	64,788,315	45,756,695	41.6
Operating income	224,135,609	211,473,743	6.0
Non-operating income	32,329,229	20,282,948	59.4
Gross income	256,464,838	231,756,691	10.7
Deductions from gross income—			
Rent for leased roads (lines and terminals)	43,771,275	48,302,823	—9.4
Interest on funded and unfunded debt	139,126,390	119,113,018	16.8
Miscellaneous	16,379,561	7,889,920	107.6
Total deductions	199,277,226	175,305,761	13.7
Net income	57,187,612	56,450,930	1.3
Dividends	36,729,243	48,337,435	—24.0
Surplus	20,458,369	8,113,495	152.2
Lessor companies—			
Income from all sources	31,855,434	43,216,501	—26.3
Rentals from operating companies	31,103,067	42,759,850	—27.3
Miscellaneous income	752,367	456,651	64.8
Deductions from income	14,837,025	17,897,373	—17.1
Interest on funded debt	13,120,349	16,147,380	—18.7
Taxes and miscellaneous (maintenance and organization, etc.)	1,716,676	1,749,993	—1.9
Net income	17,018,409	25,319,128	—32.8
Dividends	16,933,751	24,925,706	—32.1
Surplus	84,658	393,422	—78.5
Capitalization:			
Total (gross)	5,446,794,547	5,532,223,818	—1.5
Operating companies	4,734,678,330	4,626,788,077	2.3
Lessor companies	712,116,217	905,435,741	—21.4
Capital stock	2,329,173,090	2,473,846,651	—5.8
Operating companies	1,972,832,506	2,006,151,013	—1.7
Lessor companies	356,340,584	467,695,638	—23.8
Funded debt[7]	3,117,621,457	3,058,377,167	1.9
Operating companies	2,761,845,824	2,620,637,064	5.4
Lessor companies	355,775,633	437,740,103	—18.7
Gross capitalization per mile of track owned[8]	126,075	126,021	.....
Net capitalization on account of electric railways (excluding investment securities and non-operating property	4,661,923,873	4,889,962,096	—4.7
Net capitalization per mile of track owned[8]	107,908	111,391	.....

[1] A minus sign (—) denotes decrease; percentage not computed where base is an average or is less than 100.
[2] Includes track laying outside the United States (1922 and 1917, 27.06 miles).
[3] No data.
[4] Numbers employed June 30, 1922, and Sept. 29, 1917.
[5] Not reported separately. Included in regular-fare passengers.
[6] Represents 770 companies for 1922 and 836 for 1917.
[7] Includes real estate mortgages amounting to $13,795,318 for 1922 and $7,197,895 for 1917.
[8] Exclusive of track not represented by capitalization, as follows: 1922, none; 1917, 5.30 miles.

TABLE II—INCOME AND EXPENSE PER REVENUE PASSENGER[1]: 1912 to 1922

	1922 Cents	1917 Cents	1912 Cents
Income from all sources	8.27	6.46	6.14
Railway operations	7.30	5.75	5.62
Auxiliary operations	0.72	0.53	0.33
Non-operating income	0.25	0.18	0.19
Operating expenses (railway and auxiliary)	5.74	4.00	3.49
Taxes	0.51	0.40	0.37
Interest	1.10	1.20	1.19
Other deductions from income	0.47	0.14	0.18
Net income	0.45	0.72	0.91
Dividends	0.29	0.65	0.74
Surplus	0.16	0.07	0.17

[1] Based on total regular-fare passengers and pay-transfer passengers, car lines and bus lines.

TABLE III—COMPANIES OPERATING OVER 500 MILES OF SINGLE TRACK IN 1922

Name of Company	Miles of Line Operated	Miles of Single Track Operated
Pacific Electric Company, California	631.23	1,114.86
Chicago Surface Lines, Illinois	510.76	1,070.33
The Connecticut Company, Connecticut	601.14	860.59
Public Service Railway Company, New Jersey	496.67	846.62
Eastern Massachusetts Street Railway Company, Massachusetts[1]	532.05	707.44
Philadelphia Rapid Transit Company, Pennsylvania	449.57	695.11
New York State Railways Company, New York	337.33	594.79
Pittsburgh Railways Company, Pennsylvania	329.42	592.26
Boston Elevated Railway, Massachusetts	237.46	509.51

[1] Reported as Bay State Street Railway for 1917.

TABLE IV—TRACK MILEAGE 1922 AND 1917 BY LOCATION AND CHARACTER OF SERVICE

	1922	1917	Per Cent increase
By location:			
Surface	43,004.61	44,119.29	—2.5
Public thoroughfares	25,856.95	26,284.53	—1.6
Private right of way	17,147.66	17,834.76	—3.9
Elevated	601.69	497.29	21.0
Subways and tunnels	325.56	218.79	48.8
By character of service:			
City and suburban	26,123.93	26,737.75	—2.3
Interurban	17,807.93	18,097.62	—1.6

TABLE V—TYPES OF CARS IN 1922, 1917 AND 1912

Kind	Number 1922	Number 1917	Number 1912	Per Cent Distribution 1922	Per Cent Distribution 1917	Per Cent Distribution 1912
Cars—Total	99,255	102,603	94,016	100.0	100.0	100.0
Revenue cars	88,707	91,448	83,956	89.4	89.1	89.3
Passenger	77,301	79,914	76,162	77.9	77.9	81.0
Closed	56,840	50,487	48,123	.....	.....	.....
Open	8,789	15,893	18,993	.....	.....	.....
Convertible or semi-convertible	10,224	12,601	[1]7,985	.....	.....	.....
Combination passenger and baggage, express, freight, or mail	1,448	933	1,061	.....	.....	.....
Special cars (included in passenger cars)—						
Parlor	51	73	149	.....	.....	.....
Sleeping	7	7				
Private	20	36				
Other special[2]	23	23				
Express, freight, and baggage	11,352	11,442	7,794	11.5	11.2	8.3
Mail	54	92				
Service cars:						
Snowplows	1,477	1,642	10,060	10.6	10.9	10.7
Sweepers	1,442	1,275				
Sprinklers	207	278				
Work and other service cars	7,422	7,960				
Cars equipped with electric motors	75,335	76,429	73,758	75.9	74.5	78.5
Cars equipped with gasoline engines	8	19	21	.....	.....	.....
Electric locomotives	404	357	277	.....	.....	.....

[1] Reported as "Combination—closed and open."
[2] 1922, one ambulance car, six dining cars, ten funeral cars, and six cars of a character not stated; 1917, eight funeral cars, six excursion cars, and nine cars of a character not stated.

TABLE VI—DENSITY OF TRAFFIC ON ELECTRIC RAILWAYS, NEW YORK CITY, CHICAGO, PHILADELPHIA, AND BOSTON IN 1922[1]

	Miles of Main Track	Number of Revenue Passengers[1]	Average number of Revenue Passengers Per Mile of Track	Per Car-Mile
New York City:				
Surface	194.41	351,018,849	1,805,560	12.83
Elevated and subway	352.20	1,102,953,327	3,131,611	5.83
Chicago:				
Surface	993.13	762,629,211	767,905	6.57
Elevated and subway[2]	151.52	181,280,754	1,196,415	3.51
Philadelphia[3]	634.68	691,177,642	1,089,018	8.46
Boston[3]	441.31	356,423,418	807,649	7.06

[1] Includes pay-transfer passengers for 1922 as follows: New York, 13,326,466; Chicago, none; Philadelphia, 55,206,600; Boston, none.
[2] Includes a small amount of surface trackage operated as part of elevated systems.
[3] Comprises both elevated and surface trackage.

TABLE VII—REVENUE PASSENGERS AND REVENUE-CAR MILEAGE—PER CENT DISTRIBUTION AND PER CENT OF INCREASE, BY GEOGRAPHIC DIVISIONS: 1922, 1917 AND 1912

Division	Per Cent Distribution 1922	Per Cent Distribution 1917	Per Cent Distribution 1912	Per Cent Increase[1] 1917–1922	Per Cent Increase[1] 1912–1917
Revenue Passengers[2] United States	100.0	100.0	100.0	12.0	18.4
New England	9.0	11.0	11.0	—8.7	18.2
Middle Atlantic	39.3	37.4	36.8	17.8	20.3
East North Central	23.5	24.0	22.6	9.8	25.6
West North Central	7.4	8.0	8.2	4.4	14.6
South Atlantic	6.6	6.6	6.5	11.1	21.2
East South Central	2.4	2.6	2.8	5.5	8.6
West South Central	3.0	2.8	2.8	21.5	15.7
Mountain	1.2	1.4	1.6	—8.3	5.2
Pacific	7.6	6.2	7.6	36.8	—2.2
Passenger Revenue-Car Mileage United States	100.0	100.0	100.0	—0.9	10.7
New England	8.2	9.8	10.0	—16.9	8.8
Middle Atlantic	34.1	33.5	34.9	0.8	6.3
East North Central	25.3	25.2	24.5	—0.3	13.9
West North Central	8.2	8.1	8.0	—0.1	12.8
South Atlantic	7.2	6.6	6.5	7.5	12.8
East South Central	2.8	3.1	3.0	—9.1	10.9
West South Central	3.8	3.7	3.2	2.7	25.2
Mountain	1.5	1.6	1.6	—7.6	9.2
Pacific	8.9	8.4	8.2	4.2	13.3

[1] A minus sign (—) denotes decrease.
[2] Includes pay-transfer passengers; does not include motor-bus passengers.

TABLE VIII—CAPITALIZATION AND FLOATING DEBT, OPERATING AND LESSOR COMPANIES, COMBINED: 1922 AND 1917

	1922	1917	Per Cent Increase[1]
Capital stock	$2,329,173,090	$2,473,846,651	—5.8
Common	1,842,639,433	2,012,189,294	—8.4
Preferred	[2]486,533,657	461,657,357	5.4
Funded debt	3,103,826,139	3,051,179,272	1.7
Real-estate mortgages	13,795,318	7,197,895	91.7
Floating debt	176,734,785	166,592,228	6.1
Total	$5,623,529,332	$5,698,816,046	—1.3
Stocks and bonds of other electric railway companies and treasury securities	446,435,768	390,489,091	14.3
Gross capitalization less stocks and bonds of other electric railway companies and treasury securities	$5,177,093,564	$5,308,326,955	—2.5
Investments in other securities and non-railway properties	338,434,906	251,772,631	34.4
Net capitalization:			
Including floating debt[3]	$4,838,658,658	$5,056,554,324	—4.3
Per mile of track	111,999	115,186	.....
Excluding floating debt[3]	4,661,923,873	4,889,962,096	—4.7
Per mile of track	107,908	111,391	.....

[1] A minus sign (—) denotes decrease.
[2] Includes debenture stock amounting to $3,830,551.
[3] Includes real-estate mortgages.

TABLE IX—FINANCIAL STATISTICS FOR VARIOUS GROUPS OF ROADS

	Surface Railways Without Commercial Lighting 1922	Surface Railways Without Commercial Lighting 1917	Elevated Railways and Subways 1922	Elevated Railways and Subways 1917
Number of companies	722	758	7	7
Ratio of operating expenses to operating revenues (per cent)	72.6	63.8	63.9	46.2
Per mile of track:				
Operating revenues	$22,589	$16,137	$123,392	$102,891
Railway operations	22,489	16,070	120,046	100,231
Auxiliary operations	100	67	3,345	2,660
Operating expenses	16,402	10,297	78,864	47,544

[1] A minus sign (—) means decrease.
[2] Less than one-tenth of 1 per cent.

and the statistics of electrified steam roads are not included in the general tables. The statistics of the Chicago Tunnel Company are also not included.

The census reports four surface railways still operated by cable, two in California and two in Washington. It also shows three roads still operated with animal traction, though only one, located in Arkansas, with 0.75 mile of track, was operated exclusively by this form of power. The others were one electric railway company in Pennsylvania and one in New York which reported small amounts (totaling 3.27 miles) operated by animal power for the purpose of holding franchises.

The final chapter in the report gives statistics of the sixteen municipally operated electric railways and the one state-operated railway.

For the first time, the Census Bureau collected data in regard to motor bus operation by electric railways, pay-transfer passengers and non-revenue car-mileage and car-hours. The information in regard to motor bus operation related only to those lines which form integral parts of electric railway companies, and did not cover independent bus lines or separate lines operated under stock ownership by railway companies.

For the first time since statistics of street and electric railways have been compiled by the Census Bureau, the mileage shows a decrease. The miles of single track operated in 1922 were 903.5 less than in 1917. This total included 294.14 miles of idle track. There was also a decrease in the number of passenger cars operated, in value of road and equipment and in number of companies. On the other hand, the number of employees increased 1.9 per cent, the number of revenue passengers (including pay-transfers) increased 12.2 per cent, and operating revenue increased 42.3 per cent.

The principal statistics of the electric railways, with the exception of statistics on power plants, are given in Table I. Table II gives the income and expenses in cents for revenue passengers from 1912 to 1922.

The average size of each operating company in 1922 was 51.20 miles of single track, 90 passenger cars and 350 employees, and the average company operated 2,416,231 passenger car-miles during the year and carried 14,797,381 revenue passengers. There were nine companies which operated more than 500 miles of track in 1922, as shown in Table III.

Data on Track and Rolling Stock

All kinds of railways decreased their total length during the half decade from 1917 to 1922 except "elevated railways," and "subways and tunnels." This is shown by Table IV.

Table V shows for the last three census years the different kinds of cars used in electric railway service. Of this number, 75,335 cars were equipped with electric motors, as follows: 298 were equipped with one motor each, 42,811 with two motors, 297 with three motors and 31,929 with four or more motors. Of the 98,042 cars equipped with brakes, 80,936 were equipped with air brakes, 1,190 with other kinds of power brakes, and 15,916 with hand brakes exclusively. Of the 88,432 revenue cars, 16,506 were mounted on single trucks and 17,926 on double trucks.

Power Equipment

The report shows an increase in the number of companies purchasing electrical energy instead of generating it. The proportion to the entire number reporting no power plant equipment was 73 per cent in 1922 as compared with 62.4 per cent in 1917. There was also a decrease in the output of stations operated entirely for electric railway purposes. The total power station capacity for electric railways, central stations and electrified sections and tunnels of steam railroads increased greatly, however, this total being, in rated horsepower 17,425,580 in 1917, and 24,800,732 in 1922.

Statistics on Traffic

In their statistics on electric railway traffic the compilers of the census report point out that some zone fare companies count passengers as the number of persons paying fares in each fare zone, whereas on other lines each passenger is counted but once regardless of the distance he rides. They also declare that some com-

[1] A minus sign (—) denotes decrease.
[2] For 1922 as of date June 30; for 1917, Sept. 29.
[3] Not reported separately.

panies, in compiling their revenue car-mileage, count a motor car and trailer as one car and others count them as two. This should be considered in connection with the accompanying tables, as should also the fact that while all companies reported car-miles, only 89.7 per cent of the companies reported car-hours, although these companies carried 95.2 per cent of the total revenue passengers (not including motor bus passengers). In the tables, also, pay-transfer passengers are included with the regular fare passengers as "revenue passengers," but motor bus passengers are not included in the general statistics.

Table VI shows some figures on density of traffic in four large cities in 1922. This table does not include all of the roads in the city mentioned in each case.

Table VII shows per cent distribution and per cent increase by geographical divisions of revenue passengers and car-miles for the last three census years.

The report gives extensive statistics on the finances of operating and lessor companies. The figures for both classes of companies, combined, for 1917 and 1922, are given in Table VIII, with the net capitalization, after securities owned are deducted, and the net capitalization per mile of track. Of the 1,154 operating and lessor companies, 315 operating companies and 180 lessor companies paid dividends. The average rate was 5.4 per cent for the operating companies and 7 per cent for the lessor companies, or an average of 5.8 per cent on the outstanding capital of those companies which declared dividends.

Table IX shows some interesting averages for 1922 and 1917. In the first group of two columns the railways are those surface railways where the company does not do any commercial lighting, so that the receipts and expenses for auxiliary operations are small. The final two columns related to elevated railways and subways. The census report gives similar figures for roads combining railway with lighting operations.

Table X shows the operating expenses by primary accounts for 1922, with percentage distribution and per cent increase over 1917. The report also brings out the fact that while the taxes paid by the industry as a whole have increased 41.6 per cent since 1917, the increase has been greater for the larger than for the smaller properties. On roads with receipts of more than $1,000,000 the per cent increase has been 44.4, for those between $250,000 and $1,000,000, 40.9, and for those with receipts of $250,000 and less, only 4 per cent.

Table XI is published to show the considerable variation in the income, operating expenses, etc., per revenue passenger for different states.

EMPLOYEES

Table XII shows the number of employees, salaries and wages by occupational classes for the last two census years. In this grouping "officials" comprise presidents, vice-presidents, secretaries, financial secretaries, treasurers, assistant treasurers, auditors, counsel and similar officials. Managers and superintendents include the general manager, assistant general manager, general superintendents and superintendents of departments. The third class is made up of clerks, stenographers and other salaried employees not included in the first and second class. Under the main heading "wage earners," "other wage earners" are made up of power plant employees, employees of maintenance of way, transportation and equipment departments, elevated and subway guards, and employees of electric light and power departments which did not make complete separate reports for such departments.

The striking feature of this table is a large reduction

TABLE XIII—STATISTICS OF EMPLOYEES FOR COMPANIES OF DIFFERENT CLASSES, 1922

	All Companies	Companies Divided According to Annual Income from Railway Operations: Over $1,000,000	Between $1,000,000 and $250,000	Less than $250,000	Companies: Without Commercial Lighting	With Commercial Lighting	Elevated Railways and Subways *a*	Surface Lines *a*

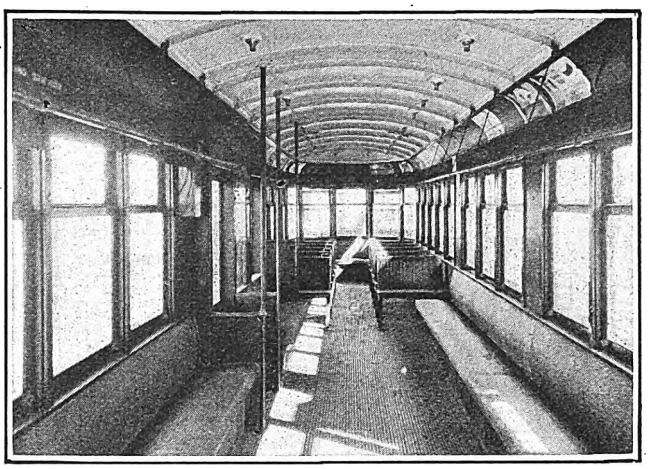
a—The group classification covers all tracks of the companies allocated according to the principal class of track, the "Elevated and Subway" group including a minor amount of surface trackage and the "Surface" group including some elevated and subway trackage.
b—Exclusive of guards on subway and elevated trains, who are classified under "all other wage earners."

Digitized by Google

in the number of conductors and motormen since 1917. Of course, this is due in very large part to the increased use of one-man cars, and it will be noted that the total number of motormen and one-man car operators reported for 1922 exceeds the number of motormen (including one-man car operators so far as reported) shown for 1917. The report says that there is also probably more efficient operation and a tendency on the part of some companies to operate fewer cars in order to reduce expenses.

Table XIII shows some interesting averages as regards employees of companies of different types. During 1922 the average number of revenue passengers per employee was 42,148 and per car operator 97,267. Car operator in this connection is understood to be a motorman, conductor or one-man car operator. Elevated railway and subway guards are not included in this designation.



An Interior View of the Dayton Car After Rebuilding
Cross-seats were put into the rear section to induce passengers to move back from the front entrance. All piping and control wiring are installed under the longitudinal seats.

Center-Entrance Trailers Converted to One-Man Motor Cars

People's Railway Company of Dayton Installed Front Entrance Door so That Passengers Board at the Front and Alight at the Center

BY THE conversion of three center-entrance trailers into front-entrance, center-exit, one-man cars the People's Railway of Dayton recently obtained needed additional motor car equipment at minimum cost, and at the same time succeeded in making the converted cars pleasing in appearance and efficient in operation. This work, which was done by the Cincinnati Car Company, involved the addition of four GE-264 motors with single-end K-35 control, rebuilding of former trail trucks for motor operation and installation of a front door, air compressors and safety car devices.

The original trailers, which are shown in an accompanying illustration, were equipped with two hand-operated sliding doors at the center, and with longitudinal seats throughout. These cars were originally built to handle war-time traffic, which consisted of very heavy peak loads from certain designated points, for which trailer equipment was considered particularly suited. In addition to this, motor cars in Dayton were at that time operated by two men, and the use of trailers meant the saving of one man for each two-car unit. After the war, and with the adoption of one-man operation, the conditions which originally favored the building of trailer equipment were eliminated, and consequently it became desirable to convert this equipment into one-man motor cars suitable for all-day service. The operation of several old and heavy motor cars to meet the traffic demands made it particularly desirable to provide additional light-weight one-man equipment which would allow the heavier and older cars to be reserved for rush-hour service.

The appearance and floor plan of the converted cars are also illustrated. It was considered desirable to substitute cross-seats for the longitudinal seats in the rear section of the car, so as to induce entering passengers to move back from the front entrance. Since only one of the center doors was needed as an exit, the other center door was blocked shut and additional seats installed in front of it as shown in the drawing. The large step well formerly in the center of the body was covered over except for a small space in front of the exit. This allows passengers to move readily from the front to the rear section, without stepping into the well.

In doing this work, the step-well structure was left in place, and a false floor was laid over it so as to make the whole body floor level. Additional framing was installed so that the side sill could be cut to form the well for the front door.

A CP-27 air compressor was installed under the car near one rear corner. Due to lack of room under the

Appearance of the Dayton Trailer Before and After It Was Rebuilt Into One-Man Motor Car

The rear door near the center was blocked shut and a new entrance door put in at the front end. Lamps installed in the small housings over the tops of the doors illuminate the steps and the ground at night, when the doors are open. The front end of the car, before reconstruction, is shown at the right.

car on account of the framing of the old center well the air tanks were installed inside the body under the longitudinal seat. All piping and control wiring were also put under the longitudinal seat, the wiring being installed in flexible conduit. The M-28 brake valve, which is part of the safety car equipment, controls the front-entrance door, while the center door, which is also operated with a National Pneumatic engine, is controlled from an auxiliary valve installed in a convenient position.

Inside the car a mirror is mounted in front of the operator so that he can see passengers at the center door. A similar exterior mirror on the vestibule corner post gives him a view of the center door from the outside so that he can see when passengers have alighted so that it is safe to close the door. This is interlocked so that he cannot start with the door open. Outside lamps mounted above the front and center doors illuminate the step and the ground near the car. These lamps are lighted by switches on the floor engines when the doors are opened.

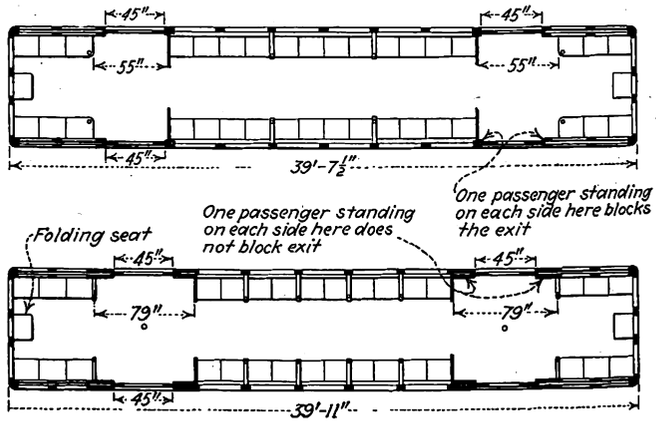
Conversion of the trucks for motors involved rebuilding with larger diameter axles and 26-in. wheels in place of 24-in. This work increased the weight of each truck from 3,600 lb. to 4,000 lb. without gears. The original light weight of the trailers was 21,368 lb. complete. The changes and additions for one-man motor operation increased this weight to 28,800 lb. complete. The cars have a seating capacity of 50 passengers. This is slightly less than that of the original trailers due to removal of the circular seats at the front end to provide space for the operator.

New Door Arrangement on the Berlin Elevated

To Prevent Door Blockades in the Cars Recently Installed, the Seating Arrangement Has Been Changed and Thus More Space for Passenger Movement Secured

IN THE new side-door cars now being put in service on the Berlin Elevated & Underground Railway, a different arrangement of doorway has been introduced to prevent the blockading of the side entrances by standing passengers. This same difficulty of blockading has been experienced on rapid transit lines in the United States as well as in Berlin. It is found that when cars are crowded, there is a tendency on the part of one or more passengers at an entrance to remain close to the opening and maintain a position there at stops by grasping any handhold that may be available. This requires other passengers to force a way past. The thought of those thus blocking the doorway is evidently that if they step out onto the platform to leave the passage clear, they will not recover their advantageous position near the door.

In the United States efforts to overcome this practice have included the removal of all handholds on the inside



The Old Type of Car on the Berlin Elevated Above. The Latest Type Below. The Latter Drawing Shows the Wider Spacing of Seats Opposite the Side Doors

of the car near the doors, and in one case, the Interborough Rapid Transit subway in New York City, a dividing barrier has been placed at the middle of the entrance so as to provide two passages, each wide enough for only one person.

On the new Berlin Elevated cars the attempt has been made to grapple with this problem by setting the seats back on each side of the entrances. In the old cars, the door was 45 in. wide and the spacing between the seats adjoining the door entrance was 55 in. This distance has now been increased to 79 in., so that one standing passenger on each side of the door leaves an opening at least equal to that of the door. To accommodate this change, the cars are made 3½ in. longer. The number of low partitions, or arm rests, between seats and the number of stanchions used for handholds has been increased in the new type of car. One of the stanchions in the new design of car is set opposite the entrance in the middle of the car.

As shown in the accompanying illustrations, there is a folding seat at each end of the car and no passageway between the cars of a train. More distinct coloring to distinguish the cars of the two classes operated has also been adopted in the new car.

The News of the Industry

Plans for Increased Travel

Georgia Company Announces New Car Purchases and Bus Extensions Following Ouster of Jitneys

With the signing of the new ordinance barring jitneys from competing with street cars in Atlanta, Ga., plans are being made by the Georgia Railway & Power Company to meet the increased travel which is expected on March 8 and thereafter when the jitneys will have ceased operation. The company announced on Feb. 9 that it had placed orders for the immediate delivery of 20 new, large and modern street cars, which will be put into operation as the jitneys cease to run. According to officials of the company, the elimination of the jitney is only the first step in solving the city's transportation problem, and it is ready to do its full share in putting the Beeler recommendations into effect. They stated that the company was willing to confer with city officials as to the best manner of handling the situation and would co-operate with the city in every possible way.

As one of the first steps in this direction it is indicated that at least two bus lines will be established in the near future by the company to supplement its railway system and serve sections of the city not as yet reached by any street car line. In fact, on Feb. 12 the company petitioned the City Council for the right to operate buses over two designated routes. One route is through the Peachtree-Morningside district of the city and the other through the Boulevard Park-Highland Avenue districts, both of which are at present inadequately supplied with street car service.

While it is not yet known what type of bus will be selected, or exactly how much money will be spent upon the auxiliary bus system, it is understood that at least 15 20-passenger buses will be ordered by the company and that several hundred thousand dollars will be invested by the company in buses, garages and shop facilities for carrying on this line of work.

The routes selected for the first two lines are, with a few minor changes, those pointed out by the Beeler report, and stopping places will be indicated by neat coach stop signs similar to the car stop signs now in use.

In asking for permission to operate the two coach lines, the company points out that a heavy initial investment will be required to start operation, that the lines will have to be operated at a loss for at least a year while patronage is being built up and that the investment will be justified only if the company is given the exclusive use of the two routes.

The fare on the new bus lines will be the same as that charged on the street cars, it is understood, and if the trade develops properly and the experiment is a success other buses will be added to the equipment of the company and other routes added to supplement the street car system.

Entrance of the Georgia Railway & Power Company into the bus field has been under consideration for some time and awaits now only the approval of the City Council. The company states that it is "deeply appreciative of the action of the City Council in voting for the elimination of unregulated jitney competition with the street railroad" and that it will work toward a definite solution of the city's transportation problem.

Maine Central to Study Electrification

Murray & Flood, consulting engineers, New York, have been retained by the Maine Central Railroad to investigate and report to President McDonald within six months upon the cost and feasibility of electrifying the main line of the company from Portland to Bangor, including various related yards.

Electrification Goes Ahead

Review of Work on Roads Out of New York City Under Jurisdiction of State Utilities Commission—Work on Long Island Road's Babylon Line to Be Finished on Time

RAPID progress is being made by the Long Island Railroad in electrifying that portion of its line now operated by steam from Valley Stream and Jamaica to Babylon, a distance of more than 25 miles. In fact the progress made so far indicates that the schedule will probably be met which called for the work to be finished by May 1, 1925.

It is planned to rehabilitate the old Central Extension branch from Bethpage Junction to Babylon, so that it may be placed in operation and thus relieve the electrified section of the heavy summer traffic to the Hamptons and the South Shore of the east end of the Island as well as furnish better service to daily patrons east of Babylon.

At present there remains only 15 per cent of the work planned to complete electric operation to Babylon; 36 miles out of 53.25 miles of third rail has been laid; 16.7 miles out of 18.6 miles of a new high-tension transmission line extending from Lynnbrook to Babylon has been completed; the rebuilding of an existing pole line from Rockaway Junction to Valley Stream to permit transmission at 33,000 volts instead of 11,000 is about 10 per cent completed. There remains to be undertaken pole line work between Valley Stream and Cedarhurst and the installation of an additional feeder between Dunton and Rockaway Junction. A new duct system from White Pot to Dunton, 16,495 ft. in length, has been completed. Substation buildings at Laurelton, Freeport, Wantagh and Babylon have been completed. Those at Amityville and Lynbrook are about 75 per cent completed. Equipment has been installed at Babylon and Wantagh.

This is only one of the pieces of electrification work going on under the jurisdiction of the Public Service Commission of New York. Hearings are in progress upon the petitions filed in connection with the electrification of the Yonkers branch, that portion of the Putnam division in the city of Yonkers, and the Port Morris branch of the New York Central Railroad. An order has been adopted approving the petition of the New York Connecting Railroad to complete the electrification of its railroad in the Borough of Queens. A determination was reached early in 1924 in the matter of the electrification of the Staten Island Rapid Transit Railway and the Staten Island Railroad.

Progress on Staten Island Work

This project is now well under way, approximately 70 per cent of the scheduled work having been completed. A contract has been made by the railroad with the Staten Island Edison Corporation under which the latter will furnish the energy to be used. This required extensive additions to plant by the Edison Corporation, about 40 per cent of which has been completed. It is now expected that electric operation upon Staten Island will be begun about Nov. 1, 1925.

About 90 per cent of all of the work required to relay the main running tracks with 100-lb. rail has been completed, 65 per cent of the necessary third rail ties has been installed, 35 per cent of the third rail has been distributed, bonding, preliminary signal installation work, platform changes and other work are progressing rapidly. Plans for all of the necessary substations are completed and all of the material with which to equip them has been ordered. Orders have been placed for 80 multiple-unit cars to be operated upon the railroad. The Staten Island Edison Corporation has made an effective start in necessary changes at its power plant.

The most important and extensive change from steam to electrical service contemplated under the so-called Kaufmann act is the change to be made by the New York Central Company in its operation on the west side of New York City. The railroad filed a petition to

Digitized by Google

substitute electricity for the present steam motive power. Hearings were promptly undertaken jointly by the Public Service Commission and the Transit Commission of the State of New York. It very early developed in these hearings, however, that the change from steam power to electric power could not be undertaken until arrangements were made not only for the necessary grade crossing changes but also for the essential relocation of a considerable portion of the railroad's line on the west side of New York. These matters are not under the jurisdiction of the Public Service Commission. It is the understanding of the Public Service Commission that they are under consideration by the authorities of the city of New York and the railroad and within the last month some three grade crossing changes were ordered by the State Transit Commission.

$100,000 Bus Plan for Suburban Rochester

The Rochester Co-ordinated Bus Lines, subsidiary of the New York State Railways, Rochester Lines, has announced plans for a network of bus lines through the towns of Greece, Parma, Hilton and places along Lake Ontario between Charlotte and Manitou Beach, provided the Rochester-Manitou Railway's petition to discontinue its line is granted by the Public Service Commission. The lines planned by the railway will entail an expenditure of at least $100,000.

The Manitou line, a 9-mile railway, operates only during the summer and serves lake shore colonies. The railway now plans year-round bus service. Plans are being discussed for turning the roadbed into a highway, but operation of the bus service by the railway is not contingent upon this.

The fight is still on between the railways and the Ridge Road bus line. The Council granted the Ridge line permission to operate its buses into the Broad Street terminal in Rochester, but barred their taking passengers within the city limits. The railways countered with an application to open a bus service over the Ridge Road. The town of Greece has granted this permission and the matter is before the Public Service Commission. The move will be fought by the New York State Auto Bus Association, of which James J. Dadd, Rochester, is secretary.

The New York State Railways, through its subsidiary, operates the East Avenue bus line, the Dewey Avenue feeder line and a crosstown trackless trolley line. The new plans indicate its intention to enter the bus business on a wide scale, based on the success of its experiments to date.

The petition to the commission asking permission to abandon the Rochester-Manitou line sets forth that in 1922 the net loss was $5,809; in 1923 it was $7,371 and in 1924 $12,815. The petition shows that the company has a deficit of $25,882, with cash on hand of only 50 cents, and miscellaneous accounts receivable of only $10, whereas it owed $12,607, besides its funded debt of $85,000 principal and $1,808 accrued interest.

Commission Blameless, But Needless

Governor Smith Runs with the Hares but Holds with the Hounds on New York Situation

Governor Smith of New York recommends the abolition of the present Transit Commission and the transfer of its duties and powers to the Board of Transportation of New York City. This he did in a message sent to the Legislature on Feb. 16 in which he reviews the investigation conducted by Supreme Court Justice John V. McAvoy into transit matters in the city of New York and quotes at length from his report.

Touching upon the bus situation, the Governor in his message said:

> Illegal operation of buses is against the law and nobody can defend it. A municipality should not be above the law any more than an individual. While this report makes no definite recommendations as to legislation, I call your attention to my annual messages of 1923, 1924 and 1925 and special messages dealing with this subject, in which I have repeatedly urged that all the cities of the State be given the right to own and operate bus lines.

Reference is also made by the Governor to that part of the report of Justice McAvoy in which the justice said:

> The proof presented with respect to the charges filed by the Board of Estimate and Apportionment against the Transit Commissioners shows that the charges are without foundation and that no cause exists for the removal from office of the Commissioners.

In his comment on this the Governor said:

> I approve this conclusion. There is, however, a sharp distinction between the removal from office of individual commissioners upon charges of misconduct and the abolition of a commission itself as an agency of government. After removal upon charges the obligation would still rest upon the Governor to appoint successors to the office. I have held continuously since 1923 that there is no need for such an agency of government as the Transit Commission. Its existence in the city of New York has given rise to a division of responsibility in the past with respect to transit matters.

In 1923 and 1924 the Governor recommended the abolition of the Transit Commission and stated that in his belief its powers could be lodged in the municipality. Since that time the power to construct new subways has been taken from the Transit Commission and placed in the Board of Transportation of New York City, but all other powers remain as before in the Transit Commission. He is still of the opinion that the Transit Commission should be abolished. He said:

> The deplorable transit conditions in New York are admitted by everybody. The immediate question, therefore, is relief, and relief at the earliest possible moment for the millions of people who live in the city of New York. I urge upon the Legislature to study the constructive recommendations of this report and by following the recommendations herein contained to make its contribution to the health, happiness and comfort of the people of the largest city in the country.

Meanwhile, Senator James A. Higgins has introduced a bill calling for a referendum on municipal operation of subways and a 5-cent fare. A second new bill, offered by Senator Thomas F. Burchill, demands that the Interborough, B.-M. T. and all other railroad companies in the metropolis replace wooden cars with steel ones within a year. This is direct repudiation of Justice McAvoy's findings, which declared wooden cars safe.

Four bills have been introduced in the New York Legislature which seek to afford legal aid to operation of motor buses. One of the measures would authorize street surface railroads to exercise all powers conferred by law upon a stage coach corporation. At the present time it is necessary for an electric railway wishing to operate a bus line to do so through a holding company. Another measure would amend the railroad law by authorizing the Public Service Commission to permit a street surface railway to substitute a stage route, bus or motor vehicle route in place of any part of its railroad. Still another bill would amend section 22 of the transportation corporation law by empowering stage coach corporations to own, maintain and operate automobiles and other vehicles for transporting persons for hire, including sightseeing trips. The fourth bill would add a new section to the transportation corporations law authorizing the Public Service Commission to grant a stage coach corporation a certificate for operating a through route, in lenth 100 miles or more in one general direction, without the consent of local authorities.

Service Cuts in Buffalo—Mayor's Baiting Tactics Harmful

Service on five local lines of the International Railway in Buffalo, N. Y., will be abandoned on Feb. 22 and schedules on various other lines will be materially curtailed as the result of increased operating deficits. Every possible economy will be made.

On Feb. 15 the company placed one-man cars in operation on the Seneca Street and South Park lines, two of the heaviest patronized lines in the city, and on Feb. 22 the use of one-man cars will be extended to three other local lines. One-man cars will soon be in service on practically all the local lines in Buffalo where near-side pay-enter cars are in operation. This economy in operation is expected to save the railway upward of $700,000 annually.

Mayor Frank X. Schwab announced he would declare an emergency existed and would issue permits for the operation of jitneys as soon as the railway abandoned service on its local lines.

Criticism of the attitude of the Mayor in his handling of the traction problem is voiced by Herbert G. Tulley, president of the International Railway, in the current issue of "Tulley Talks," distributed by the railway to car riders. Mr. Tulley said in part:

> Encouraging the strikers, who had under a previous management tied up every street car in Buffalo in order to enforce the immediate payment of increased wages, was certainly the wrong way to go about reducing the company's operating costs so as to help it to keep the 5-cent fare. Encouraging jitneys to rob the company of its most profitable short riding, as was done, and the delaying of bus consents to the International for so long a period, had also a very bad effect. The city should have granted the company the right to operate and then helped us to keep fares down, as well as costs, which must always be paid from fares.
>
> The Mayor's New Year greeting contained the words, "Small-town criticism has no place in the city of Buffalo, and a resolution that should be made by all of us might be, 'Here's where I live. I will boost Buffalo in 1925.'" I. R. C. men and managmeent would gladly give the goodby to "small-town criticism" and help the Mayor keep his 1925 resolution, so that car riders may benefit from city-company co-operation in a measure comparable with the possibilities already shown by co-operation of men and management.

Board Recommends Service Improvements in Trenton

The Board of Public Utility Commissioners of New Jersey recently submitted a report outlining the results of an investigation into the trolley service in Trenton. The suggestions for improving the service were applicable to the Trenton & Mercer County Traction Corporation and also to the regulation of traffic by the city authorities. The commission felt that one of the principal sources of complaint was irregular headway. It recommended the use of more men to supervise operation of cars. It also recommended that car platforms should be reconstructed to facilitate speedy loading and unloading. As another remedial measure the board recommended additional layovers at the various terminals to permit the absorption of delays in normal running schedules. It urged additional facilities for turning back cars where there had been unusual breaks in the headway.

So far as the City Commissioners were concerned the board recommended further regulation of traffic by the elimination of parking in the center of the city between certain streets, at least during the peak traffic hours, and the further diversion of motor vehicle traffic from the more congested thoroughfares upon which the trolleys were operated. In making its recommendations the board said that it was mindful of the difficulties of the situation because of the narrow streets and the tremendous growth in automobile traffic. It believed that service could be improved by co-operation between the City Commission and the company.

Bus Bill in Massachusetts Provokes Discussion

Representatives of the bus lines in Massachusetts resent the thought of being placed under control of the Massachusetts Department of Public Utilities. This they made plain in their fight against a bill to regulate them, filed by Clinton Q. Richmond, president of the Berkshire Street Railway, when the matter was discussed by the joint legislative committee on street railways. Mr. Richmond would require bus lines to secure a certificate of convenience and necessity from the Department of Public Utilities in addition to the permission of local authorities in communities in which they plan to run. The department would be permitted to refuse or recall the license and indicate the route.

Day Baker, who represents the bus owners, contends the only dispute between the railways and the bus owners is over the question of the proper board of regulation. He says that the Department of Public Works is best qualified to have jurisdiction. He has a bill that would make the Public Works Department the sole authority to license operations when the routes extend beyond any city or town. Mr. Baker said that at present one city or town may hold up the entire operation by refusing permission to pass through that particular locality.

James M. Swift, counsel for the Motor Coach Association of New England, is supporting the Baker bill. W. F. Smith of the Royal Blue Line, George E. Marsters of the Marsters Tours, B. L. Thomas of the Sightseeing Tours and Harry J. Dooley of the Gray Line Auto Tours also are in favor of the Baker bill.

2,000,000 Bus-Miles in Detroit

The Department of Street Railways in the City of Detroit is installing another bus line to have a length of 3.8 miles, making the eighth coach line for the motor coach division to operate. This line will extend from the terminal of the Fort Street car line at the West Jefferson carhouse to State and Fort Streets in the village of Lincoln Park. According to Ross Schram, general manager of the D. S. R., the city will operate over 2,000,000 coach-miles this year. Six coach lines were started in the month of January with a total of 23 miles and 250,000 fares were collected during that month. It is anticipated that within 30 days the D. S. R. will be collecting 350,000 bus fares monthly.

The line on West Fort Street will exhaust the last of the 50 single-deck buses rented from Dodge Brothers. More buses are to be requested from the Council and it is also planned to build two service garages, one for the east side and one for the west side of the city, to care for the buses.

Operators of the city buses are obtained largely from among the D. S. R. platform men. The D. S. R. motor coach division is expanding so fast that difficulty is found by the department in keeping up with the demand for revision of running schedule. Maps have been prepared by H. M. Gould, assistant general manager, and Frank Peppler, superintendent of the division, showing the location of all the coach lines. Patrons of the line are supplied with copies of these maps and also with time schedules. Criticisms or suggestions in regard to the service are solicited from the patrons.

Accidents Decreased 23 per Cent

One year of an intensive accident campaign on the Chicago Surface Lines has resulted in a reduction of 23 per cent in fatalities. All accidents, regardless of responsibility, are included in the figures, which will be published in advertisements in Chicago newspapers. The campaign was conducted by Victor T. Noonan, who addressed 100 group meetings in 1924. The statement "Saving Lives," follows:

There was a reduction of 23 per cent in the number of fatal accidents on the Chicago Surface Lines last year as compared with 1923.

This was achieved despite the fact that a hundred more cars were in operation and several hundred more men were employed on the system last year, and at least 50,000 more automobiles were on the streets.

It is a direct result of careful organization in the interest of public safety.

A general advisory council composed of company officials meets with the company's accident prevention engineer at regular intervals to determine safe policies.

Employees' councils study accident prevention and report unsafe practices and conditions to the accident prevention engineer and the general advisory council.

One hundred group meetings of employees were held last year for the purpose of discussing safety.

Thus every individual is brought to realize his personal responsibility for the comfort and safety of others.

Every week is safety week on the Surface Lines.

Ottawa Revenue Loss Charged to Bus Competition

The Ottawa Electric Railway, Ottawa, Ont., says that the operation of bus lines is largely responsible for the receipts of the company falling $109,484 below the estimate for last year as made in the Feustel report. This contention was made by the company in a letter to the special street railway committee, which met recently. The company claims that the bus lines are breaking the law by carrying passengers from one point to another within the city limits. The company asked the city to co-operate in securing legislation to prevent the bus lines operating within the city. The committee agreed to the company's plea for special legislation and also agreed to co-operate with the company in an application for increased borrowing powers.

The company now has power to borrow on bonds up to $1,000,000 for construction work. It wants to borrow up to 75 per cent of its assets if necessary. The committee agreed to recommend that the company be allowed to defer the construction of the extension from Queen Street along Lyon to Gladstone. This was to be done this year, but the company points out that the extension is not warranted by the receipts. Major F. D. Burpee, vice-president and manager, said that the company was prepared to carry out other extensions in the second year's program. There was no objection to the company's proposal that 40 double-truck or large cars should be built within the next 2 years instead of 27 large and 20 small cars in 5 years.

Suggests Relief for Tacoma Property

Recommendations have been made which favor the granting of certain concessions to the Tacoma Railway & Power Company, Tacoma, Wash., in the matter of paving requirements, the hauling of city employees and direct competition by buses, on the basis of a 2-year experiment, without abrogation of existing franchises. The suggestions were contained in the report of the committee on transportation of the Federation of Improvement Clubs recently submitted to the City Council. The committee suggested that the company be relieved of paving payments except to the extent to which the cost of paving is increased by reason of the presence of the street car tracks, but asserted that maintenance of paving between tracks should continue as an obligation of the company. It suggested the regulation of buses by requiring them to run on other streets than those with car tracks and requiring a tax from them. It also favored the abolition of free rides for city employees except policemen on duty, and expressed the belief that for such concessions the street car company should be willing to extend service to present unserved sections. Admitting that a gross earnings tax on a corporation shown to be losing money is probably unjust, the committee said that relief from this tax should be a last resort. The report finally urged greater co-operation between the city and the railway.

St. Louis & Kansas Line Seeks Certificate

Incorporators of the proposed short line electric railway between St. Louis and Kansas City, Mo., appeared before the Missouri Public Service Commission at Jefferson City on Feb. 11. They are seeking a certificate of convenience and necessity to operate the line, but announced they were not ready to make a detailed showing of the financial backing of the new venture unless the members of the commission absolutely insisted upon it. The commissioners did not press the point at this time and the hearing was adjourned until March 5.

Lee Dunlap, Kansas City, vice-president of the new road, which will be known as the St. Louis-Kansas City Short Line Railroad Company, and S. J. McWilliams, Kansas City, counsel for the road, appeared for the road, but did not go into its finances except to say that bonds probably would be sold to defray part of the cost. The other incorporators of the road, which was granted a charter on Nov. 28, 1924, are Frank E. Lott, Kansas City; Ernest H. Lawton, Erba D. Smith and William H. White, St. Joseph. When the charter was issued it was stated $240,000 in stock had been subscribed of the total capital stock of $2,400,000.

At the hearing on Feb. 11 Mr. Dunlap stated that virtually all the needed right-of-way across the State had been obtained. The proposed line extends from University City, Mo., to Kansas City, a distance of 238 miles. The principal towns that will be served are: St. Charles, Warrenton, Columbia, New Franklin, Marshall, Higginsville and Independence. The road will construct two bridges across the Missouri River, at Creve Cœur and Arrow Rock.

Charles G. Miller, Kansas City, attorney for the Chicago & Alton, the tracks of which will be paralleled half way across the State, was the chief inquisitor for the steam railroads. H. H. Larimore of the Missouri Pacific and H. J. Nelson of St. Joseph, representing the Burlington, protested that before the road was authorized to sell stocks or bonds it should be made to prove its financial responsibility.

It has been estimated the road will cost $26,000,000 for construction and equipment. The new road will parallel the Wabash from St. Charles to High Hill and the Chicago & Alton from Marshall to Kansas City. This project was referred to previously in the ELECTRIC RAILWAY JOURNAL.

P.R.T. Puts Into Operation First Loading Platform

The first trolley car loading platform for passengers to be operated in Philadelphia, Pa., was installed alongside the westbound trolley tracks on Market Street, at 12th, on Feb. 8, and immediately placed in use. The platform was built and installed by the Philadelphia Rapid Transit Company at the request of the Highway Bureau. The Council appropriated $15,000 to pay for the construction and installation of a number of the platforms as a measure to protect car riders from automobiles while waiting for cars, and the Highway Bureau of the Department of Public Works was authorized to proceed with the project. After consulting with the P.R.T., Highway Bureau officials found that the company could construct and place in position the platforms more economically than the city could do it and it was arranged for the company to do so.

The platforms are built in sections 21 ft. long, which may be joined, end to end, so that a platform of any length desired may be placed at a car stop. They are 5 ft. wide and 6 in. high. Iron uprights, along the tops of which a chain is strung, are placed at intervals of several feet along the side of the platform toward the curb, so that passengers waiting for cars are fully protected from automobile traffic.

If the operation of this platform is successful others will be placed throughout the city at points where traffic is heavy.

Seeks 8-Cent Fare in La Crosse

Confronted by an unsatisfactory operating condition which could only be eliminated by higher fares and lower operating costs if it is to continue its business along profitable lines, the Wisconsin Railway, Light & Power Company has filed with the Wisconsin Railroad Commission a petition asking for an increase in fares in La Crosse from 7 to 8 cents. The company also seeks to abolish three cut-rate privileges covering eight tickets for 50 cents, the monthly commutation tickets of 50 for $2.75, and books of 20 tickets for $1 to school children. For these it would substitute a book containing seven tickets for 50 cents. Permission is also sought to use one-man cars on the north side line.

R. M. Howard, vice-president and general manager of the company, explained that in 1924 and previous years the company was unable to earn the usual return allowed by law on its investment. Responsibility for this condition was attributed to paving expenses of $50,000 in 1923 and 1924 and increased use of the automobile.

Suggests Fellow Workers on Board in Detroit

Ross Schram, general manager of the Detroit Department of Street Railways, has made a proposal that its platform employees nominate a group to act in place of the trial board to discipline fellow employees. At present the board is composed of Department heads. The proposal was made to Neil McLellan, secretary of the street car men's union, in answer to a protest against what Mr. McLellan said was an encouragement by the department of complaints from the street car riders.

It was announced that criticism would be welcomed by the head of the department as in the past, but there was no objection to having the men select a group from among their own number to judge the fairness of the complaints. The management will assume the roll of prosecutor in the trials of employees accused. If such a plan is favored by the men or if another plan is advanced by them it will be given a month's trial to determine whether or not it fits in with the policy of the department for improving service to the public by giving the men added responsibilities.

Wisconsin Commission Sanctions Extensions

The Railroad Commission of Wisconsin has voted two to one to grant a certificate of public necessity and convenience to the Milwaukee Electric Railway & Light Company to build an electric railway 3.49 miles long for freight-hauling purposes from its Lakeside power plant west through the town of Lake to the freight lines of the Chicago & Northwestern Railroad, and another line 8 miles from Clement Avenue paralleling the Chicago, Milwaukee & St. Paul line to a point 1½ miles south of South Milwaukee, where it will join the Racine interurban line.

The company sought the right to build the first-mentioned line in order to insure an adequate and unfailing supply of coal for the power plant and a right-of-way for a transmission line.

The route from Clement Avenue is to be used as a cut-off for through passenger trains on the Racine interurban line.

Commissioners Gettle and MacDonald point out that the route recommended by the Public Land Commission is about a mile south of the one petitioned for by the company, but that under the law the company has a mile wide margin within which it can build its tracks, and the route proposed by the objectors is within the mile area. They also point out that about $175,000 has already been spent on the proposed route and that the plea on behalf of future zoning regulations could not be considered, as the commission cannot take into account what may happen later.

In dissenting on practically all points, Commissioner Kanneberg denied there would be any increased construction and operating costs and held that the law permitting change of route applies only to open country and not to a line in a town, village or city, although not incorporated. He also maintained that co-operation in zoning and other plans to aid in city planning activity must be considered by the commission.

Contract Legal if Approved

The city attorney of Milwaukee, Wis., has ruled that if the Common Council and the voters approved of the proposed service-at-cost agreement now being negotiated between the Milwaukee Electric Railway & Light Company and the city it would be legal, especially if the city and company entered into the arrangement voluntarily. He gave this opinion following the threatened plan of certain Milwaukee business men to invalidate the contract by legal action on the ground that the 1900 franchise was still effective. The city attorney explained that the company was now operating under the indeterminate permit law which superseded the franchise granted to the company in 1900.

Student Rates Unfair and Hard to Collect, Says P. R. T.

The Philadelphia Rapid Transit Company, Philadelphia, Pa., believes that a reduction in fare for high school students would be both discriminatory and uneconomical. This is the substance of its answer to the students' associations of the high schools of the city, who petitioned recently for special reduced rates for high school students. The company said that it was in sympathy with the large number of students who were doing part time work in order to defray the expenses of their education, but that it would not be fair to extend to them a privilege which it would be impossible to give to the many thousands of young women whose financial condition was such that even a part time working plan would not enable them to secure a high school education. To the argument of the association that many cities do provide a special fare for students, the company said that in practically all cities where the privilege existed it had been inherited from early days when original franchise grants included this and other provisions based on other considerations than the cost of service. Experience and observation of the Philadelphia management had indicated that the practice involved so great a cost in collection as to eclipse any added revenue brought by increased riding.

The company stated that fare reduction for such of the high school students as were short riders must await completion of the Broad Street subway, at which time the company would advocate a 5-cent fare for the full length of all high-speed lines and a 5-cent zone system on surface cars.

Buses Affect Revenue of Dallas-Denton Line

Bus competition is affecting the revenue of the new interurban electric line of the Texas Interurban Company between Dallas and Denton, but the company has taken no action looking to a curtailment of service. Earnings of the Texas Interurban Company, which operates both the Terrell and Denton lines, failed to meet interest charges on its investment during January, but the loss was all on the Denton line.

The Terrell and Denton lines were built by the company in fulfillment of a commitment made when the railway franchise was granted to C. W. Hobson and associates in 1917.

Stations Lengthened in Brooklyn to Increase Capacity

In order to provide for the better accommodation of passengers by longer trains, the New York Transit Commission has formally directed the lengthening of all of the stations on the main line of the Fourth Avenue subway in Brooklyn. The commission has initiated the project with a request that the Board of Transportation make the necessary plans and supervise construction after an appropriation is obtained from the Board of Estimate and Apportionment. Eight-car trains instead of the present seven-car trains will be made possible.

The additional station-lengthening program includes the local stations south of Pacific Street to the end of the existing line at 86th Street. An extension of the Fourth Avenue line is under construction from 86th to 95th Street, Fort Hamilton, but the lengthening of the terminal station at the latter point, the only station upon the extension, will be taken care of during construction.

All will be lengthened to a full 530 ft. At present they are principally 435 ft. long, those more recently constructed being 485 ft. long.

For the fiscal year ended June 30 last the Fourth Avenue line carried 57,838,316 passengers, as against 52,193,641 in the preceding similar annual period.

Railway Expands Bus Lines in St. Louis

The West Florissant-Jennings, Mo., line of the St. Louis Bus Company, auxiliary of the United Railways, St. Louis, Mo., has proved a financial success and the company has placed orders for several additional buses to be used on the line. The Natural Bridge Avenue line is also beginning to make a little money. Patronage is building up very nicely and more buses will be added soon. On the West Florissant and Jennings line a branch leaves West Florissant Avenue at Helen Avenue and runs to Melrose Avenue. Eight White buses will eventually be used on this installation. For a time temporary equipment obtained from other bus companies was used in this service. When the St. Louis-Jennings Electric Railway was abandoned a few years ago the residents of Jennings and West Walnut Manor were left without adequate transportation, and the new bus line with transfer privileges to all the city street car lines proved welcome.

The acquisition of the St. Louis Bus Company by the United Railways has presented no insurmountable shop problems for the latter company. Prior to the opening of the bus lines the United Railways had large and strictly modern garage and automobile repair shops for its fleet of automobile repair trucks, track department vehicles and automobiles used by officials of the company. The 12 buses now in operation on the Natural Bridge Avenue and the West Florissant Avenue-Jennings-Helen Avenue lines are being housed in the general garage on Thirty-ninth Street just north of Park Avenue, near the general offices of the railway. The automobile repair shops adjoin the garage. The shops are equipped with the very latest machinery and machine tools for rebuilding and repairing automobiles and gasoline engines. The mechanics are specialists in auto work and at all times 18 or 20 boys from the various shop departments are students at the David Rankin, Jr., School of Mechanical Trades. While they are attending the school the boys are paid a minimum of 25 cents an hour, with an increase of 3 cents an hour every six months. When the boys finish their course they are given positions in the shops organization at the full wage of journeymen mechanics.

Exemption Ordinances Not Considered

Ordinances which would exempt the East St. Louis & Suburban Railway, East St. Louis, Ill., from obligations incurred under a franchise which recently expired failed to come up for final vote before the City Council at its meeting on Feb. 9. The Council had previously accepted an agreement with the company and approved a resolution to submit the ordinances to the people.

Michael J. Whalen, City Commissioner, has led the fight against the three ordinances which would exempt the railway from paving between its tracks on North Seventh Street and permitting the abandonment of services on other streets. He objected to a section in one of the ordinances which provided that the company should pay an annual tax of $25 a car, the number of cars to be based on an 18-hour unit of operation a day. The former franchise provided for the payment of $25 a year on each car operated.

At a caucus of the Council on Feb. 10 W. H. Sawyer, president of the railway, presented a certified copy of a resolution passed by Council on Aug. 5, 1913, which stated that in the absence of a definite method of calculating the number of cars operated by the company the fee provided for should be based on the number of cars in an 18-hour operating unit a day.

Buses Supplement Topeka Street Cars

New buses to serve as street cars for the outlying districts will be put in service by the Topeka Railway in the near future. Several of the buses have already arrived and are going through the paint shop. They will resemble the street cars in color and interior arrangement, each car seating 25. Passengers will enter and leave by the front entrance, but a rear door has been added for emergency use. The routes have not yet been mapped out. They will not be stub lines, but will run all the way downtown. Transfers will be interchanged between the buses and the street cars.

Bus Extensions in Oakland Announced

The Key System Transit Company will shortly begin the operation of four more bus lines in Oakland, Cal. This will bring the number of bus lines operated by the company in the East Bay cities up to ten. These bus lines have been installed as the result of the recent traffic survey and routed in sections that have grown to a point where more transportation has become vital.

In making public announcement of the new lines, the company said that all 10 motor bus services now in operation or arranged for would be continued, if the loss was not too great. The company said: "We ask your regular patronage in order that these services may be maintained and extended. All are now operated at a loss, some at an unjustifiable loss." The new buses are expected to be ready for operation by March 1.

News Notes

Substitute Plan for Pittsburgh.—Car looping in Pittsburgh, Pa., was postponed recently pending trial of a new substitute plan agreed to by traction and downtown interests. Ordinances to bring the new plan to a focus were ordered drawn on Feb. 16 by the Council after a session with representatives of both sides of the controversy, which has been raging for several weeks. One ordinance to be drawn will be a new traffic measure which will add many downtown streets to the "AA" class of streets on which parking will not be permitted between 7.30 a.m. and 6 p.m. The other ordinance entails a franchise for the Pittsburgh Railways in Diamond Street, which would permit the company to create a loop. Mayor Magee indicated that the complete downtown parking regulations was an infringement on the work being done by R. W. Marsh, city traffic engineer. A traffic ordinance following his survey had been prepared, he said, but had been withheld from submission to the Council. He suggested that Mr. Marsh be included in the consultations of the interests and the traffic changes be worked out together.

Buses Succeed Cars. — The Union Traction Company, Santa Cruz, Cal., recently replaced two of its lines in that city with three 25-passenger Mack buses. Santa Cruz is a city of 11,000 population. The railway there has been operating 15 miles of line.

Board Intact. — W. W. Knight has been reappointed by Mayor Brough a member of the Board of Street Railway Control of Toledo, Ohio, for 6 years. The appointment is effective Feb. 1. Mr. Knight has already served a term of 4 years on the board and in the last 2 years has acted as chairman of the group. The reappointment of Mr. Knight will keep the membership intact. Other members are H. C. Truesdall, who has 4 years to serve, and David H. Goodwillie, who has 2 years yet to serve.

Refuses Higher Bus Fares.—The Public Service Commission has refused to grant the application of the International Railway, Buffalo, for an increase in bus fares on the Bailey Avenue line from 7 cents to 10 cents to make them uniform with the Delaware and Delavan Avenue bus lines. The company claimed it is losing $2,000 weekly on the Bailey Avenue bus route. This line is being operated at the same rate of fare as the street cars—7 cents or four tokens for 25 cents, with free transfers to connecting car lines. The company will abandon its Bailey Avenue car line between Broadway and East Seneca Streets on Feb. 22 along with four other local lines.

Bus Permit Granted.—The East St. Louis & Suburban Railway, East St. Louis, Ill., has been granted a permit to operate buses over the St. Louis Municipal Bridge and to loop around the downtown St. Louis business section. The permit was granted by the Board of Public Service of St. Louis on Feb. 13. The permit fixes the maximum fare at 10 cents. The East St. Louis & Suburban has also applied to the Illinois Commerce Commission for a certificate of convenience and necessity to operate motor express trucks in St. Louis and National City, Edwardsville, Collinsville, Shiloh, Fairmount City, Brooklyn, Madison, Alton, Venice, Hartford, Granite City, Maryville, Woodriver, East Alton, Lebanon, O'Fallon, Belleville and East St. Louis. W. H. Sawyer, president of the company, stated that the express trucks will supplement the present interurban freight and express service.

Experimental Bus Service in Ann Arbor.—Under the terms of the service-at-cost agreement with the city of Ann Arbor, Mich., the People's Motor Coach Company, which is affiliated with the Detroit United Railway, started bus service in Ann Arbor recently. The 5-cent trolley lines, which serve only a small part of the city of Ann Arbor, have been succeeded by a bus system of much greater route mileage and vehicle mileage at the following fare schedules: 10 cents cash, 8½-cent token, 50 rides for $3 on a punch card, and $1.25 weekly pass. The agreement permits the return to railway service after one year if the results with buses are not mutually satisfactory.

Commission Vacancies to Be Filled. —R. H. Musser, Plattsburg, Mo., one of the two Democratic members of the Missouri Public Service Commission, has announced his intention of resigning not later than March 1. His term expires April 15. The term of E. J. Bean, De Soto, the other Democrat, also expires April 15. Governor Baker will be urged to select engineers from St. Louis and Kansas City to succeed Messrs. Musser and Bean as the two major cities of the state at present are without representation on this important board despite the vast public utilities centered in those cities.

Joint Interurban and Bus Service.— An arrangement has been made between the Toledo & Indiana Railway and the Fort Wayne-Toledo Transportation Company to operate a joint service between Toledo and Fort Wayne, Ind., effective Feb. 15. Five trips each way daily will be scheduled. The running time is 4 hours and 10 minutes. The railway cars take passengers as far as Bryan, Ohio. From that point the run is made in buses by way of Hicksville and Harlan to Fort Wayne.

One-Man Car Service Started.—In accordance with authorization granted by the City Council of Macon, Ga., several months ago, the Macon Railway & Light Company recently started one-man street car service on the East Macon-Montpelier Avenue line. All of the old equipment of the company is being converted into one-man street cars. The service will be extended to all other lines as quickly as possible. The reconstruction of the cars was decided upon by the company in working out a plan whereby sufficient money might be saved and be applied to the paving of streets as provided for under the company's agreement with the city. To meet this requirement it became necessary to curtail operating expenses, L. A. Magraw, general manager, announced.

Will Hear Bus Petition for Niagara Falls.—Application has been made by the International Bus Corporation, a subsidiary of the International Railway, Buffalo, for a franchise to operate de luxe buses in the city of Niagara Falls as part of the proposed Buffalo-Niagara Falls interurban route to be established in the spring. The application of the bus company will be considered by the Niagara Falls City Council at a public hearing on Feb. 23. The company says it would charge a one-way fare of $1 between Buffalo and Niagara Falls. The fare between LaSalle and Niagara Falls would be 25 cents; Buffalo and Tonawanda or North Tonawanda, 50 cents, and the same fare between the latter two cities and Niagara Falls.

Power Issue to Higher Court.—The case of the Community Traction Company's rate for power against the Toledo Edison Company has been appealed to the Supreme Court of Ohio on error. Both Common Pleas and Appeals Court at Toledo have held against the city's contention that the case is one in which the Public Utilities Commission alone has jurisdiction. Present power rates represent a voluntary reduction from the original rates in effect for nearly 3 years under the Milner ordinance. The rate now is 0.9 cent per kilowatt-hour consumption plus a service charge of $23,000 a month. The original rate was 1.2 cents a kilowatt-hour. Through court action the city has sought to recover about $200,000 overcharges during the time the higher rate was in effect.

Railway Wins Cross-Town Bus Permit.—The Public Utilities Commission of the District of Columbia recently authorized the Washington Railway & Electric Company to operate a cross-town bus line between 37th and S Streets and 10th and E Streets, Northwest. The order stipulated that the rate of fare to be charged should be the same as the current rate of fare on street railway lines, except that transfers between cars and buses should be sold at the rate of 2 cents each and will be sold only upon the payment of 8 cents cash fare. The bus line was authorized to start on or before March 1, 1925. The railway company was also authorized to extend its present Potomac Park bus route. At the same time the application of the Washington Rapid Transit Company, which operates in the city of Washington and elsewhere in the District of Columbia independently of the railways, to supply cross-town bus service was rejected.

Insurance Policies Distributed.—For the third year, at Christmas, 1924, the Interstate Public Service Company, Indianapolis, Ind., distributed life insurance policies to employees who had been in the service a year or longer. The total amount of the policies distributed this past Christmas was $2,191,000 to 1,123 employees. Of this the company paid premiums on $1,134,600. The employees subscribed for an additional sum of $956,800, through a special advantageous arrangement made by the Interstate with the company writing the insurance.

Financial and Corporate

$16,500,000 Atlanta Valuation Figure Questioned

The Georgia Railway & Power Company, Atlanta, Ga., will not accept the Beeler survey figure of $16,500,000 as the valuation of its railway property for rate-making purposes. This was indicated on Feb. 13 when officials of the company appeared before the special traction committee of the Atlanta City Council to push their contention that the valuation should be $24,094,708, or approximately $7,500,000 above the Beeler report figures.

Various evidences of the value of the company's physical properties as listed in the Beeler report are as shown in the following:

1. Historial appraisal as of Jan. 1, 1924, $13,054,004.
2. Foregoing adjusted to Jan. 1 price levels, less observed depreciation, $16,337,206.
3. Market value of securities, $16,164,023.
4. Capitalized net earnings under proposed plan of operation, $15,078,244.
5. Reproduction cost new less accrued depreciation, $16,252,109.
6. Reproduction cost new less observed depreciation, $17,495,581.
7. Reproduction cost new less accumulated reserve, $17,517,544.
8. Reproduction cost new, $19,515,720 .
9. Reproduction cost new less non-essential construction, $18,905,102.

The final judgment of the Beeler report was that a valuation of $16,500,000 should be set upon the property for rate-making purposes.

Preston A. Arkwright, president of the Georgia Railway & Power Company, in asking for a higher valuation of property, said:

> The Beeler Organization survey was made before jitneys were barred from the city. It took into consideration all traffic conditions, including jitneys. We think the valuation figure too low and are presenting our side of the question to the City Council, believing the actual physical value of the property to be at least $24,000,000 instead of the $16,500,000 given in the Beeler report.

J. L. McLendon, chairman of the special committee considering the seven points of the relief petition of the Georgia Railway & Power Company, stated recently that the committee will meet soon to consider other phases of the petition.

In connection with the valuation matter the Beeler report said that consideration had been given to all evidence tending to determine the original cost of construction of the present plant, the amount and market value of the bonds and stock of the company, the present as compared with the original cost of construction, the probable trend of railway construction costs in the future, the estimated earning capacity of the property under particular rates, the sum required to meet operating expenses, the age and probable useful life of the various items of the property, the exhaustion, wear and tear, obsolescence and inadequacy, the manner in which it has been maintained, the amounts expended for maintenance, the present operating condition of the property and the amounts accumulated on the company's books in the reserve for renewals and replacements.

It will be recalled that the ordinance virtually eliminating jitney competition with the railway was passed by the City Council and has now been approved by Mayor Sims. In addition to asking elimination of jitneys, other matters suggested in the relief petition of the company are: Increase of cash fares to 10 cents, tickets to be sold at the rate of 6⅔ cents each; 2 cents charge for transfers; reasonable revision of its operating routes; elimination of unnecessary stops; relief to the extent necessary of all gross receipts tax and relief to the extent necessary of all street paving charges.

Allows Partial Abandonment in Yonkers

The New York Public Service Commission issued an order on Feb. 13 consenting to the abandonment by the Yonkers Railroad of certain of its routes in the city of Yonkers. The commission disapproved the abandonment by the company of the Nepera Park line on Nepperhan Avenue without prejudice to a renewal of that application on changed conditions or further proof. Concerning the claim of the city that sums paid to the Union Railway for use of its tracks for intercity business were excessive, Commissioner Semple said that he was not convinced that these charges were excessive. He thought the contract fair to the Yonkers company and that if it were deemed fair by the Union Railway its continuance was very much in the public interest in giving convenient access to the station of the Interborough company by the Yonkers people. On the subject of bus applications Commissioner Semple said that he thought the company was entitled to the approval of its declaration of abandonment without regard to any applications either by the company or by other persons for consent of the Yonkers city authorities to the operation of buses on routes which might serve localities now served by the railroad and desired to be abandoned.

Refinancing Plan at Columbus, Ohio, Approved

The $25,000,000 refinancing plan of the Columbus Railway, Power & Light Company, Columbus, Ohio, as proposed by former President Charles L. Kurtz and amended at a special stockholders' meeting on Jan. 28, was passed by the stockholders at another special meeting held at Columbus on Feb. 10.

The amended plan gives the stockholders 6½ per cent per annum on the series B preferred and in exchange for each share of series B the holder will receive one share of the new and 25 cents. The holder of the present series A preferred will receive for every 100 share 105 of the new series A, which will provide the shareholder an income of 6⅓ per cent. All preferred stock will lose its voting power and the series B will have a retirement value of 110. Common stock will be exchanged on the basis of two shares for one.

It is pointed out that with the amendments to the Kurtz readjustment plan an additional $500,000 will be gained by the company.

Following the adoption of the refinancing plan, the stockholders decided to issue 30,000 shares of non-par common stock at $57.50, subject to the approval of the State Utilities Commission. In putting the new common on the market at 57½ and in giving holders two of the new shares for one of the old, the price of the common stock is kept at 115, the price paid by Cyrus S. Eaton, Cleveland, who recently secured a controlling interest in the Columbus company.

It was estimated that approximately $9,000,000 will be needed to provide for the growth of the power and light company during the present year. Included in this estimate is the cost of the new power station which is being erected 8 miles south of Columbus at a cost of $6,000,000. It is expected the new plant will be completed by next fall.

Surplus Increases on New York State Railways

A comparative statement of the earnings and expenses of the New York State Railways, Rochester, for the years ended Dec. 31, 1924 and 1923, was recently submitted by President Hamilton to the stockholders. The report follows:

SUMMARY OF OPERATIONS OF THE NEW YORK STATE RAILWAYS

	1924		1923
Railway operating revenues	$10,358,198		$10,800,517
Railway operating expenses (including depreciation)	7,257,744		7,708,178
Net revenue railway operations	$3,100,453		$3,092,339
Net revenue auxiliary operations	665		2,482
Net operating revenue	$3,101,119		$3,094,821
Taxes assignable to railway operations	711,305		797,121
Operating income	$2,389,814		$2,297,699
Non-operating income	125,071		76,868
Gross income	$2,514,886		$2,374,568
Deductions from gross income	1,478,478		1,451,177
Net income	$1,036,407		$923,391
Sinking fund appropriations	34,636		34,129
Dividends preferred stock	(5%) 193,125	(5%)	193,125
Earned on common stock	(4.05%) $808,645	(3.49%)	696,136
Dividends common stock		(2½%)	448,762
Surplus	$808,645		$247,374

Steady Progress Reported from St. Louis

At the annual meeting of the United Railways, St. Louis, Mo., on Feb. 10 officers were re-elected. The reorganization committee reported the progress of its work to date and the adoption of the plan for the reorganization made public last November. The report of this committee was approved.

One of the next important steps to be taken by the reorganization committee is the securing of a new city franchise. This matter, however, will be permitted to remain dormant until after the municipal election in April. In that way the possibility will be avoided of injecting the franchise matter into the political battle.

A bill of complaint alleging that a number of prominent St. Louisans who have been or are connected with the United Railways as officers or stockholders mismanaged the company and its finances, with a resultant loss to other stockholders, was filed with the United States District Court at St. Louis on Feb. 9 by counsel for John B. Downing and Robert C. Delbridge, stockholders of the company. The bill asks that those complained against be held accountable for any losses the company may have sustained through the alleged mismanagement.

The traffic on the United Railways' lines aside from the Missouri Electric Railway fell off in January compared with the similar month in 1924. The gross receipts for the city lines in January approximated $1,571,000, against $1,683,000 in January, 1924. The Missouri Electric showed $11,000 against $14,000.

Interurban, Long in Receivership, Now Paying

An offer has been made to the preferred stockholders of the Buffalo & Erie Railway, Buffalo, N. Y., to exchange their preferred stock for the A and B stock of the International Utilities Corporation. The sponsors for the offer are Chandler & Company, New York City. As organizers of the International Utilities Corporation that firm recently took over the bonds of the Buffalo & Lake Erie, with all common stock, and issued 5 per cent preferred stock, amounting to 7,005 shares, in exchange. This preferred would now be exchanged for the shares of International Utilities on the following basis:

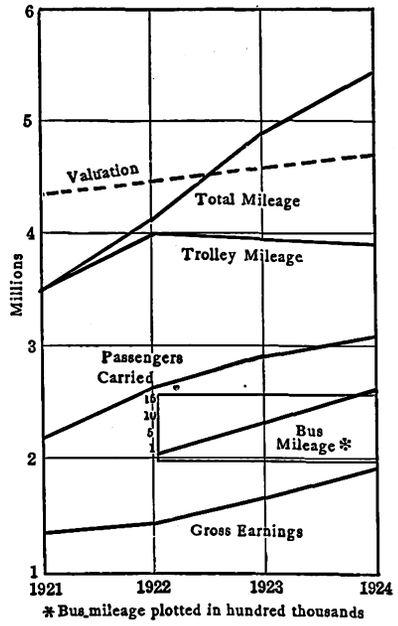
Each share of the preferred stock of the Buffalo & Erie Railway will receive one-half share of the Class A stock and one-half share of the Class B stock of International Utilities. The Class A shares are quoted in the market at around 47 and the Class B around 13.

The reorganization agreement that was submitted to the bondholders of the Buffalo & Lake Erie Traction Company, the predecessor of the Buffalo & Erie Railway, which has been in receivership since the bonds went into default in 1912, provided for the organization of two new companies, the Buffalo & Erie Railway and the Erie Railways.

Since taking charge last September, Chandler & Company have not only improved service on the traction lines, but through the adoption of one-man cars and the application of more intensive methods of selling have put the line on a paying basis. The Buffalo & Erie serve a population of 700,000. It operates 125 miles of track, with 41 miles over private right-of-way.

Youngstown Operates at Profit

For the first time since Jan. 16, 1919, when the service-at-cost franchise of the Youngstown Municipal Railway became effective, has the company shown a profit after paying all costs, and a 7 per cent return on the capital investment. This was in December, 1924. The actual profit was $187 for the 31-day period. Gross revenue for the month was $185,413. The operating cost was $185,413, divided as follows: $110,819, actual cost of operation;



*Bus mileage plotted in hundred thousands

Four-Year Record of Youngstown Operation

$45,435, cost of maintenance; $1,739, taxes; $27,418, return on investment.

While the actual surplus was only $187, the book surplus shows a profit of $2,575, placed in the stabilizing fund. This difference between the book profit and the actual surplus is the difference between $5,196 saved on the allowed operating expenses and the $7,585 expended for road improvements, a difference of $2,388. When this sum is subtracted from the book balance it gives the $187 surplus.

In the annual report, Dec. 24 has been marked as the biggest day of the year. This, Christmas eve, showed that 123,000 passengers were transported by the buses and trolleys. For the month of December 479,493 passengers were carried. Earnings per car-mile were 38.70 cents, while the operating costs were 38.66 cents.

For the year there was a deficit of $217,041 owing the Pennsylvania-Ohio Power & Light Company, the parent company. This is the difference between the amount allowed under the 7 per cent return ruling and the amount actually paid by the company. The return allowed under the franchise was $321,584, while the amount paid was $104,543. This deficit was added to the deficit which has accumulated during the last five years.

Gross revenue for 1924 was $1,909,908. The cost of operation was $1,262,388; cost of maintaining the lines, $447,612; taxes, $95,364; return on the investment, $321,584, leaving the deficit $217,041.

During the four-year period from 1921 to 1924 there has been a steady increase in the gross revenue, mileage traveled and passengers hauled.

Bus service was started in 1922. The valuation of the road has been increased from $4,406,071 on Dec. 31, 1921, to $4,760,327 on Dec. 31, 1924.

Sale of Portland Properties to Be Consummated

More than 29,000 shares of stock of the Cumberland County Power & Light Company, Portland, Me., have been deposited in acceptance of the purchase offer of Albert Emanuel Company, New York. Settlement will be made Feb. 16. The purchase price is $136.50 a share. Of the total of 30,000 shares, 16,000 were owned by E. W. Clark & Company, Philadelphia, and J. & W. Seligman & Company, New York. In accordance with the agreement for sale of these shares a similar offer was made to minority holders. According to the offer the purchasers reserved the right not to consummate the sale unless they secured 25,000 shares.

Reference to the offer of purchase was made in the ELECTRIC RAILWAY JOURNAL for Jan. 31, page 201. Included in the properties is the Portland Railroad, which operates 105 miles of city and suburban railway.

Pensacola Property Taken by Alabama Power Interests

Interests closely affiliated with the Alabama Power Company, Birmingham, Ala., have acquired the Pensacola Electric Company, Pensacola, Fla. Plans are under way for the extension of hydro-electric service from the Alabama company's system in South Alabama to Pensacola and other cities of North Florida.

The effect of the sale of the Pensacola Electric Company, it is believed, will be to make it an operating subsidiary of the Alabama Power Company. The Pensacola company is controlled by Stone & Webster. It operates 25 miles of electric railway. For some time the property has been under the direction of J. G. Holtzclaw as receiver.

TRAFFIC AND MILEAGE STATISTICS OF YOUNGSTOWN MUNICIPAL RAILWAY

Year	Earnings	Passengers	Car-Miles	Bus-Miles	Total Miles
1921	$1,463,352	21,703,998	3,579,532	.....	3,579,532
1922	1,491,095	26,337,168	4,010,067	112,901	4,122,968
1923	1,707,530	28,807,622	3,979,806	919,557	4,899,364
1924	1,909,908	30,526,353	3,885,882	1,511,091	5,396,973

Auction Sales in New York.—At the public auction rooms of A. H. Muller & Sons there were sold this week 465 shares of collateral trust certificates of the Chicago Elevated Railway, Chicago, Ill., prior preferred participation shares, $37 lot.

Abandonment Application Turned Down.—The California Railroad Commission has denied the application of the Pacific Electric Railway for permission to suspend operation and remove the tracks of its Brockton Avenue line in Riverside, but has granted permission to the applicant to abandon service on the Seventh Street and Fairmont Park-Victoria Avenue lines. The railway alleged that the traffic did not warrant the expense of maintenance of the service and that the company was faced in the immediate future by the necessity of assuming heavy expense on account of paving. The commission found that the Brockton Avenue line was paying a small return and its abandonment would not be warranted.

Ottawa Electric Pays $279,075.—The directors of the Ottawa Traction Company, Ottawa, Ont., recently submitted their report for the year ended Dec. 31, 1924. This company owns the Ottawa Electric Railway, which operates the railway system in Ottawa. The amount received from the Ottawa Electric Railway during the year was $279,075, with which was paid the usual quarterly dividend of 1 per cent and a bonus of 1 per cent. The report states that 20 new pay-as-you-leave cars have been purchased and are now in operation. A great deal of track construction work was completed during the year. A large modern carhouse and repair shop, now under construction in the west end of the city, is expected to be ready for use early this spring.

$17,650,000 Debentures to Be Retired.—It is announced from Montreal, Que., that the Montreal Tramways will retire $17,650,000 of its debentures by exchanging them for 30-year general mortgage bonds. The first mortgage bonds, of which $21,351,000 are outstanding, will be closed at $25,000,000. Both steps are in connection with the plans to round out the company's financial structure.

Interurban Sold at Auction. — The Columbus, Newark & Zanesville Electric Railway, with headquarters and terminal at Columbus, Ohio, was sold at public auction at Newark, Ohio, on Feb. 3. The property consists of two divisions. The Columbus and Buckeye Lake division brought $400,000 and the Newark and Zanesville division $350,000, both figures being the minimum price fixed by the court. Howard C. Johnson bought the first parcel, and John C. Jones the second. Both buyers represent the bondholders. James R. Fitzgibbons, attorney for the company, said that after the reorganization has been effected, plans already made for improving the property would be carried out.

Office and Carhouse Sold.—The terminal and carhouse of the Trenton & Princeton Traction Company at West Hanover and Warren Streets and Chancery Lane, Trenton, N. J., has been sold to William A. Weinmann. Trolley cars will continue to use the terminal under a lease but the railway will erect an office and carhouse some distance from the center of the city.

Preferred Stock Offered.—A syndicate including Hambleton & Company, Baltimore, Md., is offering at $96 a share and accrued dividend yielding about 7.30 per cent 15,000 shares of the Southern Power & Light Company's cumulative participating preferred stock, no par value. The Southern Power & Light Company controls by ownership of all of the common stock the Louisiana Power Company, the Louisiana Power & Light Company, the Mississippi Power & Light Company and indirectly, through the Arkansas Light & Power Company, the Pine Bluff Company. The properties of the subsidiaries include 37 miles of electric railway.

Sale of Power Plant Arranged—The price at which the North Avenue power house in Youngstown, Ohio, is to be returned by the Youngstown Municipal Railway to the Pennsylvania-Ohio Electric Company has been agreed on at $600,000, the price paid by the city to the P-O when the city took over the plant. The power rate which the Municipal would have to pay the P-O after the station is returned has not been established because the two parties were unable to agree on the efficiency of the Pennsylvania-Ohio company's equipment which must be used in converting the city's power from alternating to direct current. It has been agreed to leave final decision in the matter of conversion equipment in the hands of chief engineers of the Westinghouse Company and the General Electric Company. They will be asked to submit figures on the new equipment such as would be necessary to convert to direct current the amount of alternating current required by the city.

New Directors Elected.—H. B. Voorhees, general manager of the Cincinnati division of the Baltimore & Ohio Railroad and Joseph B. Verkamp, clothing manufacturer, were elected directors of the Ohio Traction Company at the recent annual meeting of the stockholders. They succeed Bayard Kilgour and A. J. Becht, president and secretary respectively of the Cincinnati Street Railway. The Ohio Traction Company is the parent company of the Cincinnati Traction Company, which operates the street railway system in Cincinnati under lease from the Cincinnati Street Railway.

Bonds Being Offered.—The issue of $2,116,000 of first and refunding mortgage gold bonds of the Worcester Consolidated Street Railway, Worcester, Mass., referred to in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 14, is being offered by Harris, Forbes & Company, Inc., Blodget & Company, Paine, Webber & Company and the Old Colony Trust Company of Boston. The bonds are selling at 97¾ and interest to yield 7 per cent. The coupon rate is 6½ per cent. The bonds are dated Aug. 1, 1910, and are due Aug. 1, 1930. The proceeds will be used to refund $1,771,000 of debt and to provide additional working capital.

Equipment Trust Plan Approved.—Authority has been granted the New York, New Haven & Hartford Railroad by the Interstate Commerce Commission to assume liability for $3,645,999 of equipment trust certificates to be issued by the First National Bank, Boston, covering the advance rental necessary to procure equipment, which will include: Thirteen electric motor cars, five alternating-current electric locomotives, two alternating-current electric switching locomotives, two direct-current electric switching locomotives and one gasoline-electric plough.

Stock Sale Sanctioned.—Approval of the sale of 250,000 shares of no par value capital stock, at $10 per share, by the Public Service Transportation Company, the bus service affiliated with the Public Service Railway, has been granted by the New Jersey Board of Public Utility Commissioners. The company will use the proceeds for the purchase of new buses and repay advances made to the corporation for purchases of buses.

May Make Offer for Company in Receivers' Hands.—Samuel H. Barker, representing interests which have not been named, may make an offer of $250,000 for the Frankford, Tacony & Holmesburg Street Railway, Philadelphia, Pa. The company was placed in the hands of receivers following such request in Common Pleas Court on Jan. 20 this year. At that time it was pointed out by petitioners for the receiver that unless prompt action were taken operation would cease. The company operates 17.29 miles of track, 1.11 miles of which are leased from the Philadelphia Rapid Transit Company. It owns 42 passenger cars.

Receiver Named.—Judge Sanderson of the Massachusetts Supreme Court recently appointed Franklin T. Miller, president of the Boston & Worcester Street Railway, Framingham, Mass., as receiver for the company. Plans for the reorganization of the company are under way, as noted in recent issues of the ELECTRIC RAILWAY JOURNAL.

One Mile Abandonment Allowed.—Approval of the Public Service Commission to the abandonment by the Westchester Electric Railroad of about 1 mile of its route in the villages of Bronxville and Tuckahoe, N. Y., was granted on Feb. 13. The order requires the company to remove at its own expense its track and overhead structure and restore the streets to good condition.

Interurban Operation Successful.—Profit from interurban operations offset a $24,500 loss for the Stark Electric Railroad, Alliance, Ohio, during 1924. During the year the city service showed a loss of $20,053 while the freight service showed a loss of $3,494. Receipts from interurban fares more than offset these deficits and placed a small fund in the treasury at the close of the year. During the 12 months 976,329 city passengers were carried and 2,076,812 interurban. Passenger cars covered 933,616 miles and freight cars 39,038. The Stark Electric Railroad operates from Salem to Canton, Ohio, a distance of 32 miles with city car service in Alliance only.

Personal Items

Messrs. Thornton, Blair and Lindsay Advanced at Montreal

Kenneth B. Thornton has been appointed assistant general manager of the Montreal Tramways, Montreal, Que. This is a new office in the company, rendered necessary by increased pressure of work. Mr. Thornton will act as assistant to Lieut.-Col. J. E. Hutcheson, vice-president and general manager of the company. Mr. Thornton was formerly general manager of the Canadian Light & Power Company and the Quebec & New England Hydro-Electric Corporation and consulting engineer for the Montreal Tramways.

D. E. Blair, formerly superintendent of rolling stock, has been appointed general superintendent of the tramway.

A. M. Lindsay, formerly connected with the rolling stock department of the tramway, will replace Mr. Blair as superintendent of rolling stock.

Mr. Blair has been with the tramways for the past 21 years. He is now president of the Canadian Electric Railway Association. He has worked his way up with the company from a comparatively minor position. He started his career with the Quebec Street Railway. A portrait and a biography of Mr. Blair were published in the ELECTRIC RAILWAY JOURNAL for June 21, 1924.

No Successor Selected to Mr. Kurtz

No successor has been chosen to Charles L. Kurtz, who refused to let his name go on the nomination list for president of the Columbus Railway, Power & Light Company, Columbus, Ohio, at the directors' meeting on Jan. 27. Clarence C. Slater was named vice-president and general manager and has been acting in official capacity since the meeting.

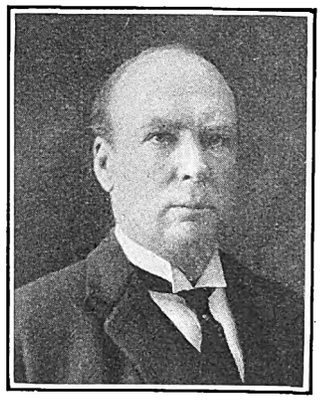
Frank T. Hulswit, president of the United Light & Railways Company, which through the United Light & Power Company secured control last August of the Continental Gas & Electric Corporation, which in turn has come into control of the Columbus Railway, Power & Light Company, declared on Feb. 10 that no one was being considered at the present for the presidency, although he said some one would be considered in the near future for this office.

Norman McD. Crawford, who resigned as vice-president of the company before the directors' meeting, effective on March 1, will stay until March 15.

A. L. C. Fell, until recently general manager of the London County Council Tramways, London, England, has accepted an invitation from the council of the Tramways and Light Railways Association to become a vice-president of that body. The invitation was extended to Mr. Fell as "a mark of sincere appreciation of his valuable services so long and so wholeheartedly placed at the disposal of the association." It will be recalled that Mr. Fell a few months ago retired from the managership of the London tramways on account of ill health. No permanent successor to him has yet been appointed, but the County Council recently constituted a sub-committee to consider the subject. Meantime J. K. Bruce continues as acting manager.

George William Allan New President at Winnipeg

George William Allan was recently elected president of the Winnipeg Electric Company, Winnipeg, Man. He is the senior partner in the law firm of Munson, Allan, Laird, Davis, Haffner & Hobkirk, Winnipeg. The firm of Munson & Allan was formed in 1882, and Mr. Allan has been an active member since that time. His firm was formerly general solicitor for the Winnipeg Electric Company.



G. W. Allan

Mr. Allan, who succeeds as president Sir Augustus Nanton, was educated at Upper Canada College, Galt Collegiate Institute, Trinity College School, and Trinity College University, and is a graduate of the latter. He was a member of the House of Commons for South Winnipeg from 1917 to 1921. For some years he has been actively associated with a number of companies doing business in western Canada, and he occupies the following among other positions: Director Canadian Bank of Commerce; member Canadian Committee of the Hudson's Bay Company; director Canada Permanent Mortgage Corporation; National Trust Company, Ltd.; Great West Life Assurance Company; the Northern Trust Company; the Northern Mortgage Company of Canada; the Canada Cement Company, Ltd.; Manitoba Bridge & Iron Works, Ltd.; Beaver Lumber Company; Home Investment & Savings Association; Guarantee Company of North America, and Beaver Fire Insurance Company. Mr. Allan was born at Moss Park, Toronto. He is a son of the late Senator G. W. Allan, P. C.

George W. Wells has been appointed vice-president and general manager of the Interstate Consolidated Street Railway and the Attleboro Branch Railroad, Attleboro, Mass., which have been taken over by Hemphill & Wells, New York City. Mr. Wells has long been connected with the street railway industry. For a number of years he was manager for one of the properties of Stone & Webster and before that was connected with the General Electric Company. He is a brother of Gardner F. Wells, one of the members of the firm that has taken over the roads.

P. C. Rideout has succeeded George M. Todd as superintendent of transportation of the Cumberland County Power & Light Company, Portland, Me.

H. B. McCune of Cleveland has succeeded Winchell G. Yates as superintendent of track and railway of the Wheeling Traction Company, Wheeling, W. Va. He was connected with Charles Clark, railway superintendent, previous to going to Wheeling.

F. H. Patterson has succeeded C. C. Bullock as superintendent of transportation of the Shreveport Railways, Shreveport, La.

F. S. Hunnewell, who has been superintendent of both the Interstate Consolidated Street Railway and the Attleboro Branch Railroad, Attleboro, Mass., has returned to the employ of the New England Investment & Security Company, Springfield, Mass., officers of which were also officers of the Attleboro properties. The two roads first mentioned were recently taken over by Hemphill & Wells, New York City.

C. F. Crockett has replaced V. M. Ake as secretary-treasurer of the Municipal Street Railway, Alexandria, La.

R. L. Clifford, formerly with the Toronto & York District, Ontario Hydro-Electric Railways, engineering department, has been appointed superintendent of the Peterborough Radial Railway, at Peterborough, Ont., which is operated as the Peterborough District, Ontario Hydro-Electric Railways, at Peterborough. He reports to W. R. Robertson, general superintendent of the Hydro-Electric Power Commission of Ontario's railways department, Toronto.

W. E. Bainhart has been appointed secretary of the Kansas City, Kaw Valley & Western Railway, Bonner Springs, Kan. O. S. Lamb is superintendent in charge of operation.

J. L. Puckett has replaced R. O. Bethea as electrical engineer and engineer of overhead construction of the Hattiesburg Traction Company, Hattiesburg, Miss.

J. W. Corbett has succeeded L. Va Voie as purchasing agent of the Canadian National Railways with offices at Toronto, Canada.

George R. Lunn, Schenectady, N. Y., former Lieutenant-Governor, has been nominated a member of the New York State Public Service Commission to succeed Oliver C. Semple, New York, whose term of office expired Feb. 1. The appointment is for a term of 10 years at a salary of $15,000 a year. Governor Smith has transmitted the nomination to the Senate for approval.

$700,000 for Interurban Extension

The New York, Westchester & Boston Railway, New York City, plans immediate construction of a line to Larchmont Gardens and Mamaroneck at a cost of $700,000.

Contracts have been awarded to Dwight P. Robinson & Company for the construction and the two municipalities probably will be linked with the metro-urban early next fall. The New York, Westchester & Boston will finance the project without any assistance from the New York, New Haven & Hartford Railroad.

Upon completion of the enterprise the company will have upward of 80 miles of track in operation between its metropolitan terminals and 25 suburban communities. The next step in the New York, Westchester & Boston expansion program will be an extension to Harrison, Rye and Portchester.

The new construction will be double track, with freight and terminal sidings, steel and concrete construction and overhead grade crossings.

When the road ran its first trains the aggregate population of the seven largest municipalities it tapped was 137,000. Today the population approaches 230,000. The combined assessed valuations were $16,000,000. Today they are approximately $429,030,000. In a statement which he made L. S. Miller, president of the railway, said:

> The purposes of the builders of this road are looming toward fulfillment. Month by month the territory we serve is becoming more prosperous and more productive of traffic revenue.
>
> In our first full year of operation we carried 2,874,000 passengers. Last year we carried 10,000,000. In our first year we operated under a deficit, before taxes, of $1,000,000. Our 1924 report will show that we operated upon a credit, before taxes, of more than $530,000.
>
> Our facilities for increased service with the addition of more rolling stock to the present equipment are immeasurable. We could transport 100,000,000 persons this year without difficulty.
>
> The metro-urban is fast reaching the point where it will cease to be a liability to the New Haven and will become an important asset.

Brill Profits Smaller

For the year 1924 the combined output of the four plants of the J. G. Brill Company, Philadelphia, Pa., amounted in sales value to $8,721,726. The combined output for each of the past 7 years was as follows:

1918	$16,761,154
1919	14,210,622
1920	17,537,293
1921	7,647,898
1922	10,177,582
1923	18,167,486
1924	8,721,726

After deducting from earnings all cost of operations, including maintenance and repairs for the year amounting to $410,658, and after setting aside out of earnings reserves for depreciation of plant and equipment of $252,795 and for Federal and State income taxes, not yet due, of $92,310, the result of the operation of all the plants shows a net profit for the year of $577,761.

It is explained that development work undertaken in connection with gasoline-propelled cars for use on steam railroads progressed satisfactorily during the past year and that the management believes, from present indications, that this branch will show very satisfactory growth the present year.

CONSOLIDATED PROFIT AND LOSS ACCOUNT OF THE J. G. BRILL COMPANY AND SUBSIDIARIES FOR THE YEAR 1923 AND 1924

	1923		1924
Total net sales billed	$18,167,486		$8,721,726
Cost of sales, including operating, selling, administration and general expenses and depreciation for the year	15,525,021		8,212,337
	$2,642,465		$509,389
Miscellaneous income	101,937		160,681
Operating profit	$2,744,402		$670,071
Less reserves:			
For federal and state income taxes	$347,896	$92,310	
For special depreciation	150,000		
For development of gasoline-propelled vehicles	100,000		
	597,896		92,310
Net profit to surplus	$2,146,506		$577,761
Earned surplus at Dec. 31	$3,582,971		$4,985,196
Less:			
Adjustments of patents and good will	$199,670		
Miscellaneous adjustments—credit	16,499		
	183,171		*96,538
Add profit as above	$3,399,800		$4,888,657
	2,146,506		577,761
	$5,546,306		$5,466,418
Less dividends paid:			
Preferred	$320,600	320,600	
Common	240,510	240,510	
	$561,110		561,110
Earned surplus at Dec. 31	$4,985,196		$4,905,308

*Debit.

The amount of work on hand on Dec. 31, 1924, was approximately $4,250,000, compared with $3,500,000 on Dec. 31, 1923.

$10,000,000 Shop Development for Brooklyn

Plans for the construction of one of the most complete repair shops and yards ever devised for passenger train service have been completed by the Board of Transportation of New York City for the Brooklyn-Manhattan System. In connection with this development bids have been invited and received for the construction of the foundation for the main repair shop and the inclosure of the electrical repair shop at Shell Road and Avenue X, Coney Island. The several buildings when completed will embrace an area of 65 acres with floor space of 475,000 sq.ft., affording storage capacity for 1,000 cars and inspection pits for 64 cars, as well as wharfage facilities on Coney Island Creek. The plant when finished will cost approximately $10,000,000.

Seventeen contractors bid on the foundation work for the main repair shop and twelve contractors bid on the electrical repair shop inclosure. The total number of items in both jobs is 136.

The main repair shop building will be sufficient in its capacity and equipment to maintain in service and in a state of repair 3,000 steel cars of the type now in use on the Brooklyn-Manhattan Transit Corporation system. The main building of the proposed new group will contain machine shops, service shops, track assembly, motor and track shops, foundry and blacksmith shops, wheel and axle shops, carpenter shops, lumber storage, paint shops, cotton waste and oil storage and car washing stands.

The electrical repair shop soon to be inclosed will be for all motors and motor parts and for every electrical phase of motor and trail car used in rapid transit service.

The proposed improvement of the bulkhead and wharfage facilities on the shore of Coney Island Creek will provide for docking of scows, floats and barges from which to unload coal, rails, ties, timber and general freight for the maintenance and supply of the entire plant.

Mack's Bus Business Expanding

The Mack management is said to be devoting its entire energies and financial resources to the further expansion and development of its business, particularly in the bus division. Whereas in 1923 Mack was almost entirely a manufacturer of commercial trucks, its volume of bus business last year approached 20 per cent of the total, and at the rate of current expansion it is not unlikely that by the end of this year Mack's bus production will be close to the level of its truck operations.

Shipments of all classes of products for 1924 exceeded any previous years, and orders for December and January were in excess of any previous December and January in the company's history.

Metal, Coal and Material Prices

Metals—New York	Feb. 17, 1925
Copper, electrolytic, cents per lb	14.50
Copper wire base, cents per lb	17.00
Lead, cents per lb	9.25
Zinc, cents per lb	7.77
Tin, Straits, cents per lb	57.00
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.45
Somerset mine run, Boston, net tons	2.125
Pittsburgh mine run, Pittsburgh, net tons	1.95
Franklin, Ill., screenings, Chicago, net tons	1.875
Central, Ill., screenings, Chicago, net tons	1.75
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$7.25
Weatherproof wire base, N.Y., cents per lb.	20.00
Cement, Chicago net prices, without bags	2.20
Linseed oil (5-lb. lots), N. Y., per gal	$1.15
White lead in oil (100-lb. keg), N. Y., cents per lb., carloadlots	0.1297
Turpentine (bbl. lots), N. Y., per gal	0.935

Rolling Stock

Coral Gables Utilities Company, Miami, Fla., has received three of the new cars to be operated between Miami and Coral Gables. The cars were built by the J. G. Brill Company and are of the same type as those used on the Miami municipal lines, but of slightly larger model.

Wisconsin Power & Light Company, Fond du Lac, Wis., has purchased four new buses of the parlor car type for use in Fond du Lac, Oshkosh, Waupun, Beaver Dam, Columbus and Madison.

Cleveland Railway, Cleveland, Ohio, has announced specifications of the 100 cars ordered last October. The plans for these cars were only recently approved by the City Council. The details of the cars follow:

Builder of car body	Cleveland Railway
Type of car	Front entrance, center exit, motor
Seating capacity	56
Total weight	41,140 lb.
Bolster centers, length	25 ft. 1 in.
Length over all	51 ft. 2 in.
Truck wheelbase	6 ft. 0 in.
Width over all	8 ft. 4¾ in.
Height, rail to trolley base	11 ft. 0 7/16 in.
Body	Semi-steel
Interior trim	Cherry
Headlining	¼-in. Agasote
Roof	Plain arch
Air brakes	Westinghouse DH-20
Armature bearings	Babbitt
Axles	4½-in. carbon steel
Bumpers	10-in. formed channel front, 6-in. rear
Car signal system	N-L indicating
Car trimmings	Brass
Center and side bearings	Cleveland Railway standard
Conduits and junction boxes	Cleveland Railway asbestos-lined sheet steel
Control	Westinghouse K35-G
Couplers	Tomlinson Form 8, Type A
Destination signs	Hunter front and side
Door operating mechanism	Cleveland Railway manual control
Fare boxes	Cleveland
Fenders	Eclipse Type C
Gears and pinions	Tool Steel, spur
Hand brakes	Independent equalizing
Heater equipment	Peter Smith
Headlights	Dayton pressed steel No. 1583-A
Journal bearings	Babbitt
Journal boxes	Symington, 1-F-9
Lightning arresters	Westinghouse MP.
Motors	Four Westinghouse 340, inside and outside hung
Paint	Cleveland Railway standard
Sanders	N-L No. 4 vacuum trap
Sash fixtures	Cleveland Railway new type
Seats	Longitudinal front, Brill & H-K rear
Seating material	Rattan
Slack adjuster	Anderson
Step treads	Kass
Trolley catchers	Eclipse Railway Supply
Trolley base	Nuttall No. 15
Trolley wheels	Cleveland Railway standard
Trucks	Brill 51-E-1 and 68-E-1
Ventilators	N-L type
Wheels	26-in. steel

Springfield Street Railway, Springfield, Mass., has ordered three Garford buses, each seating 21 passengers, for use on Union Street.

Georgia Railway & Power Company, Atlanta, Ga., has placed orders for the immediate delivery of 20 new, large and modern cars. These will be put into operation as the jitneys cease to run. It is also reported that the company will order 15 20-passenger buses.

Missouri & Kansas Railway, Kansas City, Mo., suffered the loss by fire recently of four motor cars and three trailers at the Strang line carhouse in Overland Park. The damage was estimated at $100,000. It is said that arrangements are being made to rent additional cars.

Citizens' Traction Company, Oil City, Pa., ordered during January from the Fageol Motors Company, Oakland, Cal., two six-cylinder buses of street-car type.

Track and Line

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., plans to double-track its 35th Street line from Clybourn Street to Wells Street, now a single-track line. As soon as this work is completed the 35th street line will be double-tracked along its entire length.

Worcester Consolidated Street Railway, Worcester, Mass., is considering the feasibility of including in its 1925 budget of expenses an appropriation for re-laying the car tracks on Park Avenue, Worcester. The cost will be about $100,000.

Lehigh Valley Transit Company, Allentown, Pa., plans to relocate its roadbed through Center Valley and Coopersburg, Lehigh County, and to Zion Hill in Springfield Township. The idea of the relocation was broached by the State Highway Department last summer when the latter made announcement of the building this year of a concrete highway from Allentown by way of Quakertown to Spring House. If the company had remained on the highway it would have been compelled to rebuild its lines and place them in the center of the road. By the time the new private right-of-way is built it will mean an outlay of nearly $500,000. The line will be a little more than 5 miles long, running from 300 to 1,500 ft. west of the present line. There will be ten crossings, eight at grade over lanes and two will be overhead.

Shops and Buildings

Puget Sound Power & Light Company, Seattle, Wash., has announced plans for a modern interurban train and bus station, to be located on Seventh Avenue and Olive Street to cost several hundred thousand dollars. The new terminal will be constructed around the west and south sides of the company's electric building. It will take the place of the present Everett interurban terminal on Sixth Avenue and Olive Street. The garage, storage yards and shops now occupying that portion of the Olive Street property between the electric building and the Everett station will be moved to a modern building to be erected on a site owned by the company on Lake Union.

Trade Notes

Pure Carbon Company, Wellsville, N. Y., has appointed the Simpson Power Equipment Company as its Cleveland representative with offices at 7016 Euclid Avenue. The Pure Carbon Company has also announced the opening of a Detroit office in the General Motors Building.

Key System Transit Company has ordered full automatic Tomlinson couplers for 130 cars. These will be used to equip 12 new cars and to replace the present couplers on 118 old cars.

Hale-Kilburn Company, Philadelphia, Pa., has recently appointed H. Barney Gengenbach, with the title of Western sales manager, to its office in Chicago. Mr. Gengenbach has been acting Western sales manager for a year or more, since the death of Harry R. Rochester.

Hyatt Roller Bearing Company, Harrison, N. J., announces that H. A. Brown, Jr., general manager of sales, has appointed P. C. Gunion, for 6 years advertising manager of the Hyatt company, to a place on the sales board. Mr. Gunion will also head up the market research activities in addition to his advertising work. The Hyatt sales board is composed of the general manager of sales and his assistant, the advertising and research manager and the three sales managers in charge of the automotive, farm machinery and industrial divisions.

New Advertising Literature

Ditzler Color Company, Detroit, Mich., has issued an attractively arranged and cleverly prepared booklet entitled "Motor Bus and Taxi-Cab Colors." The folder in its illustrations offers some new and distinctive color combinations particularly adapted to the bus field. In its reading matter it proves that color is a sales argument recognized in many lines of business.

Uehling Instrument Company, Paterson, N. J., has issued bulletin 118-A, describing the principle of operation of the Apex pneumatic CO_2. The indicator of this meter is actuated by changes in pneumatic pressure developed by dry absorption of the CO_2.

Sawbrook Steel Castings Company, Lockland, Ohio, in an illustrated pamphlet, has announced the full operation of its foundry in the production of "high grade electric steel castings."

General Electric Company, Schenectady, N. Y., has issued bulletin 44103.1, describing the 60-ton oil-electric locomotive which it developed along with the American Locomotive and Ingersoll-Rand Companies. Illustrations showing the locomotive in service, views of the interior and tables of operating data and specifications, as well as a general description, are included in the booklet.

Accurate Maintenance Costs Are Worth While

FROM a study of maintenance methods and practices in various shops, one is impressed by the lack of adequate cost figures. Questions regarding most of the technical phases of the work are readily answered, but accurate cost records are seldom available. This condition seems to be quite common except in some few shops where the master mechanic, apparently in sheer desperation, has set up a rough cost system of his own which enables him to judge to some extent in what direction he is headed.

Maintenance costs are collected in one form or another to compile the various accounts of the standard classification. The manner and degree to which they are utilized for the preparation of statements for the information of the maintenance departments determines whether or not this information becomes simply dead records or active guides and signals to direct the work of the maintenance forces.

The need for more detailed maintenance figures has been generally recognized. Last year a joint committee of the Engineering and Accountants' Associations prepared a tentative subdivision of the standard classification for the way and structures department. At the convention, however, this classification was questioned because it contained certain subdivisions to which it would be very difficult to make accurate charges. It was pointed out during the discussion of the report that it is difficult to get maintenance men to differentiate accurately between a large number of accounting subdivisions. This defeats the very purpose of the subdivision. It requires constant vigilance and supervision even to get charges made properly to the various accounts of the standard classification. An interesting pictorial guide made up by the Department of Street Railways of Detroit and described in the Aug. 16, 1924, issue of this paper, was devised to guide foremen and workmen in making such charges correctly.

There must be a definite purpose for an account subdivision to justify its use. Both in the shop and field it is important to avoid burdening maintenance forces with a top-heavy system of red tape. Mechanics should spend their time in productive work and not in keeping books or making out endless time tickets.

The need for detailed maintenance cost figures led to a decision to continue the work of the joint committee on engineering accounting, which is preparing a subdivision of the equipment group of accounts. This work might be carried still further to include a study of report forms designed to give the maintenance departments necessary cost information for their guidance in the most concise and intelligible form.

The extent to which subdivision is carried, and the form in which reports are prepared, should be determined by the concrete purpose for which the information is compiled. In the shop, for instance, the cost statements, to be of maximum value, would show on the one hand the relative maintenance cost for the various types of each major part of the car equipment. Thus if this cost for any particular class of equipment or important part becomes excessive due to obsolescence or imperfect design, the fact will at once be apparent. In the same way, the master mechanic who is manufacturing replacement parts in the shop should know from time to time the cost of the parts so manufactured in comparison with their market price. With changing conditions, such statements will show whether it is cheaper to manufacture the parts or buy them outside.

When new equipment is to be purchased, accurate records of past performances are invaluable as a guide in the selection of the equipment best suited to the needs of a particular property and a particular service. The cost of a few additional clerks is small compared with the savings that can be made.

All of this requires the supervision of men versed in the principles of cost accounting, and who at the same time are in touch with the maintenance forces and are familiar with their needs and their problems. In practically every railway organization of considerable size there seems to be a place for the engineer-accountant. He becomes the connecting link between the accountant and the maintenance forces so that their work may be co-ordinated to the end that the necessary cost information will be available in a form best adapted to guide the administration of maintenance work.

Modernizing the Shopman's Point of View

ONE subject that always arouses interest when equipment men get together is the improvement in machines and processes for lowering maintenance cost and making equipment more reliable. The men who make these economies possible have not received much attention. But the efficiency of a machine is no greater than that of the man who operates it, as was pointed out at the recent Dallas meeting of the Electric Railway Association of Equipment Men, Southern Properties. This was the keynote of a commendable discussion on the question: How can the shopmen best be educated so as to increase the efficiency of their work? Vocational training courses, the reading of technical books and publications, conferences and discussions on timely topics were suggested as some of the means to this end.

It is of little avail to re-equip a railway shop with modern labor-saving machinery if the point of view of the shop employees remains the same as it was

This is the issue in February that is devoted essentially to maintenance subjects

Digitized by Google

20 or 30 years ago. Their thinking must be made as up to date as the tools they are using. There has been in the past too much of the "We've always done it this way" attitude. In most cases methods that were adopted in 1895 are as out of date in 1925 as a car built at that time would be today.

This need of modernizing the point of view of the men in the shops is now receiving considerable attention from railway managements. Opinions differ somewhat as to how it may best be accomplished. To a certain extent the method must depend upon the conditions in the particular shop where it is to be applied.

It is of primary importance, however, that the educational idea be properly "sold" to the shopman. A definite relation between the teaching and its results must be demonstrated. These men are not likely to be interested in ways to improve their minds simply for the sake of mental improvement. But they are intelligent men, and if they can be convinced that the educational program will make their work easier and better they will grasp the opportunity eagerly. The increasing attention being paid to this subject indicates that the electric railway industry will soon see a development in modernizing the shopmen's point of view similar to that which has already been made in modernizing the equipment in the shops of the more progressive companies.

Better Maintenance Will Reduce Noise in Car Operation

INCREASED attention is being given by electric railway officials to the problem of reducing noise in car operation. This can be considered as one of the details of modernization and will have a far-reaching effect in promoting better relations with the public.

Much of the noise in car operation is caused by parts which have been allowed to become loose or excessively worn. Loose truck parts, brake rigging, brakeshoes, and journal boxes, or worn motor suspensions, trolley wheels, springs, bearings, gears and pinions are parts that cause noise in operation. A second cause is the noise produced by impact between the car wheels and the rail. Such noises result from worn and corrugated rails, loose or broken joints, grit and dirt on the rails, flat wheels and wheels out of round. Moreover, jarring and vibrations from impact loosen car parts and eventually cause creaking at the body joints. Still a third major cause of noise is that originating in vibration of the operating and braking equipment itself.

Other factors contribute to car noises. Although they do not actually make the noise, they accelerate and transmit it instead of damping it. The susceptibility of parts to take up and transmit sound waves and vibrations introduces a problem in design that hitherto has not received great attention. Construction of track and roadway as well as of the cars themselves should be included. Surrounding buildings and equipment outside the track area sometimes add to the noise, on the principle of a sounding board.

The best way to reduce noise in the car equipment itself and in the track and roadway is by means of a higher grade of maintenance. Instead of keeping gears and pinions in service until they are worn so sharp that there is danger of breaking before they are removed, noise reduction requires that they be scrapped as soon as they wear to a point where excessive vibration occurs. The same principle applies to all wearing parts of car equipment. Bearings should be replaced more frequently than is the present practice. If any considerable reduction in noise is to be accomplished extreme wear must be prevented and definite limits of wear for the various wearing parts of car equipment should be established and should be enforced.

A special study of noises that come from car operation is being made by the equipment committee of the American Electric Railway Engineering Association. After the various causes for noises are classified and tabulated, it will probably be found that many of them can be relieved considerably by simple remedies. If, in addition to this, improved types of equipment be adopted and construction designed with the thought of reducing noise, much improvement will be accomplished.

$12,000,000 Saving Vindicates Milwaukee Electrification

AT LAST figures are available to prove the wisdom of the directors of the Chicago, Milwaukee & St. Paul Railway in adopting electric motive power for 650 of the 880 track-miles between Harlowton, Mont., and Tacoma, Wash. They have been criticised for their judgment in this matter because traffic and other conditions on these long-drawn out stretches of single track seemed not as favorable for large savings as those which existed in other parts of the country. It is all the more encouraging, therefore, to the proponents of judicious electrification of steam railroads that the financial showing is so good. This good showing results from a number of causes, among which the following stand out prominently: Abundant water power, as compared with the scarcity of good coal; heavy grades, on which the motors of the electric locomotives act as generators and thus save energy and brakeshoes; greatly lessened maintenance cost of equipment and reduced yard expenses.

All of these advantages have been reduced to a cash basis, for which figures are presented in a statement just made public. An abstract is published on another page. While the figures may not prove the wisdom of the construction of the line itself and the expansion of the Milwaukee into a transcontinental line, they show that in the circumstances, even on items that can be measured in dollars and cents, the conversion of the line to electric power was justified. In addition, of course, electrification has made riding more enjoyable, a good merchandising point for passenger traffic, and greatly reduced the danger that the railway might cause forest fires, a very important argument, especially in the State of Washington, where there is a great deal of valuable standing timber.

These and other incidental advantages are not enumerated in the article already referred to, but even without them the saving effected by electricity during the 9 years since the first division was put in service amounts to more than $12,000,000, after full allowance had been made for depreciation and interest charges on investment. As a whole, the figures are the most nearly complete of any made public giving the results from electrical operation on an electrically equipped steam railroad. May the example of the directors of the Chicago, Milwaukee & St. Paul Railway in giving out these detailed data encourage those of other electrified steam railroads to do likewise.

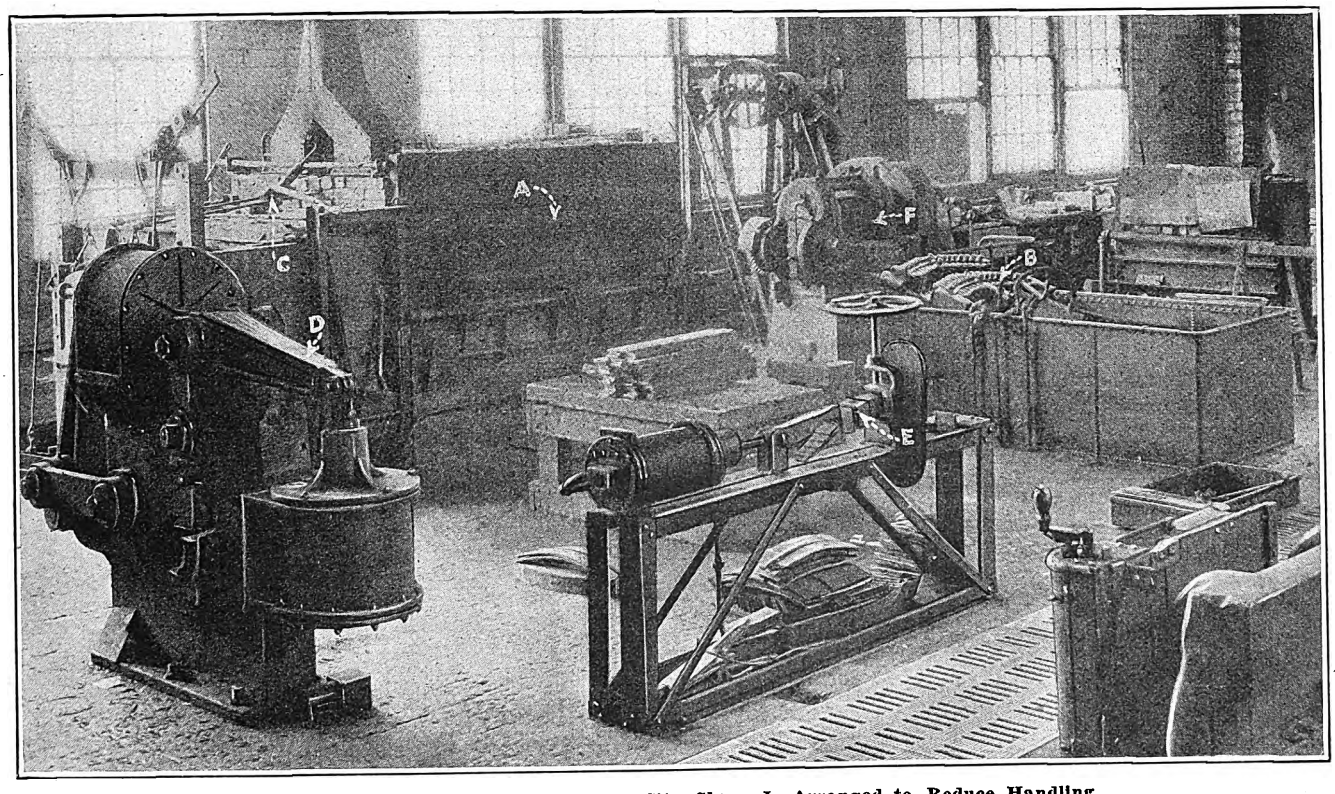
Maintaining Car Springs in Twin Cities

Proper Maintenance of Springs Is Considered to Be an Important Item in Improving the Riding Quality of Cars, Keeping Down Step Heights and Reducing Noise and General Wear and Tear on Equipment—Special Machine Equipment Results in Better Springs and Lower Cost



The Spring Department in the Twin City Shops Is Arranged to Reduce Handling

The leaves are first heated in the oil furnace, *A*, and after forming and quenching in the adjustable forming machine, *B*, they are tempered in the end of the furnace at *C*. Spring bands are made in the machine at *D* and are put on in the machine shown at *E*. In the background at *F* is the rolling machine for tapering the ends of the spring leaves.

THE maintenance of car springs is considered of so much importance by the Twin City Rapid Transit Company, Minneapolis, Minn., that special equipment and machines have been developed in the company's Snelling Avenue shops for the work. In this way the costs have been held down to a point which makes it possible to replace springs on cars at the first indication of weakness. This renders it unnecessary to keep in service springs that have sagged, as is done sometimes by the expedient of inserting wooden blocks to maintain clearance between the car body and the apparatus underneath. Provision of proper facilities for the economical repair of defective springs eliminates the necessity of economizing in this particular way and thereby results in steps being maintained at the correct height, while the noise and general wear and tear on the equipment resulting from imperfect springs are reduced.

One Man Handles Each Operation

Much of the machine equipment used for spring work in the Twin City shop has been developed to meet the specific requirements of an operating company's maintenance shop, and the methods in use enable comparatively small lots of springs to be put through at reasonable cost. All of this equipment is located in one section of the forge shop and is arranged with a view toward efficient use of a minimum number of men. One of the features of this arrangement is that practically every step in the work is carried out as a one-man operation.

Spring steel is purchased in bars of the proper dimensions for making the leaves of elliptic springs. Physical and chemical specifications assure a high grade of material. The first step in the shop process is to shear this material to the correct length. The cut pieces are next taken to a power-driven rolling machine, shown in an accompanying illustration, where the ends are tapered. They are then trimmed to exact length.

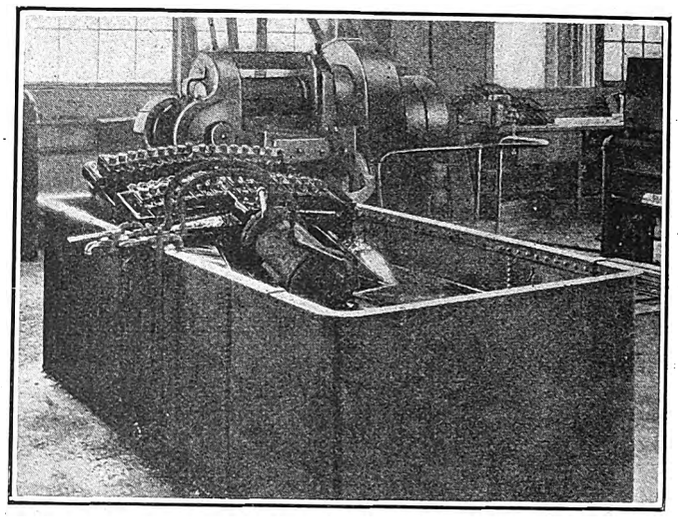
After being trimmed the leaves are ready to be formed to the proper shape for the finished springs. They are heated to 1,550 deg. F. in an oil furnace, described later, and are formed and quenched automatically in a machine shown in an accompanying illustration. This combined forming and quenching machine, which was developed in the company's shop, is designed so that it can be adjusted to form any shape of spring used on the various cars in service. The die is made up of a series of slotted dogs, each of

Digitized by Google

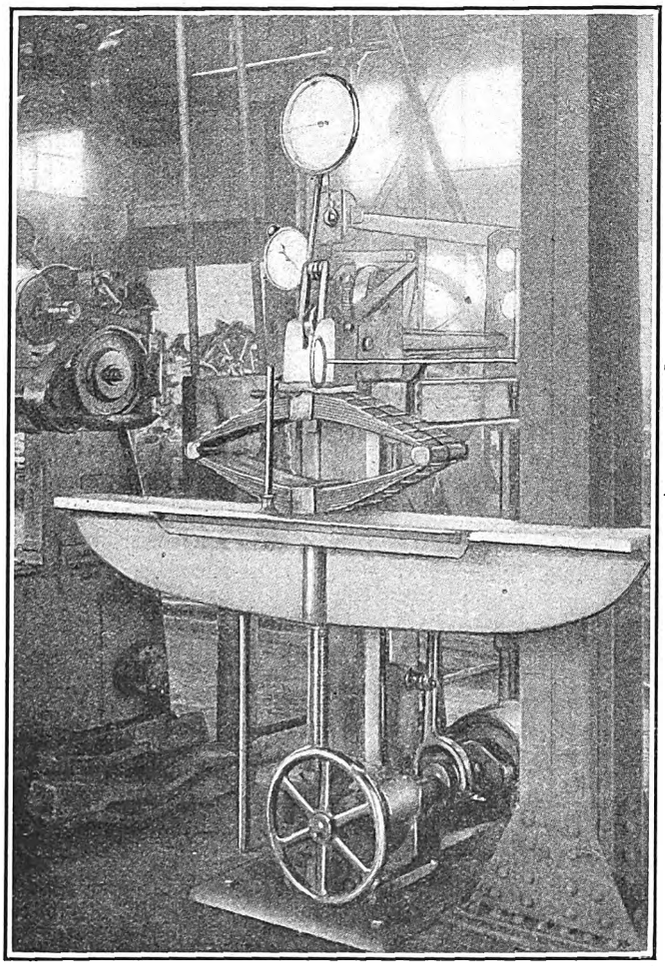
which is held in place by bolts. To form a leaf of any given shape, it is only necessary to set the dogs against a standard template made for the purpose, which is shaped for that particular leaf. Then the various bolts are tightened and the die is ready for use.

A die of this type is mounted on each end of a tilting table, which is supported in the oil tank shown in the illustration. An air cylinder in the center has a piston at each end, so that manipulation of the air valve causes the movable part of the die to be pushed out, first on one end of the table and then on the other end. The whole apparatus is so balanced on a central pivot that the change in the distribution of weight, caused by change in the position of the piston and dies as one is pushed out and the other pulled back, causes the table to tilt first to one side and then to the other. Tilting of the table submerges the die with the hot spring leaf at one end and raises the one at the other end.

In practice, two different leaves are put through simultaneously, one man handling the entire operation, including the heating. The die at one end of the table is set to form one of the leaves of a spring and that at the other end is set to form another. The proper material for these two leaves is prepared and a number of each type are put in the oil furnace. The two dies are then used alternately to run through the two lots of spring leaves. The capacity of the machine is fixed only by the time required for the steel to cool in the oil. While this is taking place, after each leaf is immersed, the single operator has time to attend to the pieces of material heating in the furnace. As the piston is moved out, first toward one end and then toward the other end of the table, the leaf in the end that is raised out of the oil is released. It is readily removed from the die and set on a dripping screen to drain, preparatory to the next operation.



A Close-Up View of the Forming and Quenching Machine
This shows the adjustable dies for forming the leaves to proper shape. The tilting table carries a similar die at the opposite end, which is immersed in the oil; as the operating piston moves first to one side and then the other, the two dies are alternately dipped in the oil. Two different spring leaves are run through alternately by a single workman.



All Springs Are Tested to Uniform Specifications in This Standard Spring Testing Machine

Leaves Heated and Tempered in One Furnace

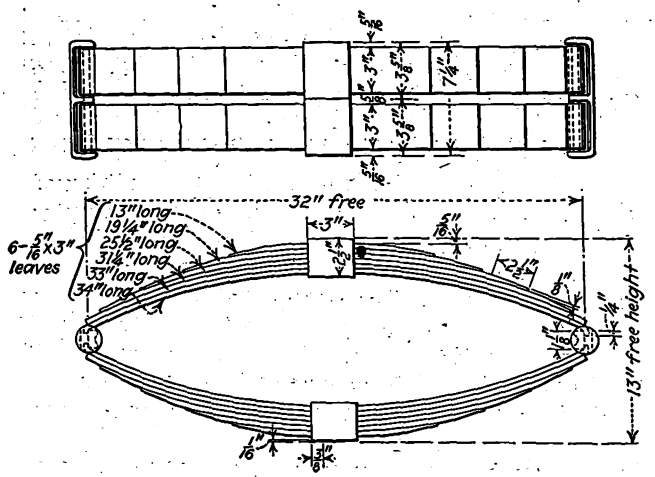
After forming, the leaves are ready for tempering. This is done in another compartment of the same furnace in which they are originally heated for forming. The furnace is shown in an accompanying illustration. It is rectangular in shape and is so arranged that the doors at the front open into a compartment which is heated to about 1,550 deg. F. for the forming and hardening operation. These doors are convenient to the forming machine just described. The general arrangement is shown in the illustration. In the end of the same furnace another pair of doors open into a tempering compartment, to which the heat from the one burner is deflected, the temperature being adjusted by means of a regulating damper. In this way a saving in fuel is made, as the one burner serves two heating operations at widely different temperatures.

The tempering end of the furnace is divided into two sections, each fitted with individual doors. Thus the material in one compartment may be allowed to soak at the proper temperature while spring leaves are being withdrawn from the other. The tempering compartments are loaded in two layers, on gratings provided to increase the capacity. This furnace was furnished by the Mahr Manufacturing Company of Minneapolis and was specially designed to meet the requirements of this spring work. A suitable stack outlet for the tempering compartment draws off any gases that form and keeps them out of the shop.

When the formed spring leaves have been reheated to the proper temperature they are withdrawn by a workman who handles this end of the furnace and are individually fitted together while hot. They are then allowed to air cool.

Spring bands are forged in a commercial type of machine which is on the market for the purpose and

Digitized by Google



Complete Detailed Drawings for Each Type of Spring in Use Are Furnished to Shop Foremen for Their Guidance

WORKING LOADS

Deflection	Loaded Height	Load in Lb.	Car Load
2⅜ in.	10⅜ in.	4,000	Empty
3 in.	10 in.	5,000	Seated
4 in.	9 in.	7,200	Standing

which is shown in one of the accompanying illustrations. These bands are then placed on the springs, in a special machine designed and built in the shop. This is also shown in an illustration. It is designed so that the spring leaves are held together in a clamp mounted near one end of a light structural frame which forms the bed of the machine. At the other end is an air cylinder carrying a clevis that slides in a slot between two horizontal angle members. A pivoted shoe on the clevis is arranged to force the band into place over the spring leaves when air is admitted to the cylinder.

In practice, new material is added to elliptic springs only as required. Any of the old leaves that are not too badly corroded are retempered and used again. Thus the amount of new steel required is held to a minimum consistent with putting the springs in proper condition for service.

Testing the Springs

All guesswork has been eliminated in this work by the installation of a modern spring testing machine. From the standpoint of securing satisfactory and uniform results, this testing work is considered second in importance only to the tempering of the material. It is considered to be impossible to determine just what results are being accomplished unless proper facilities for testing are available.

Shop foremen are furnished with detailed drawings showing the exact dimensions of each type of spring in use. In addition, specific test data showing the working loads and allowable deflections for the different springs on various cars have been worked up and are furnished in convenient data sheet form to those in charge of the repair and testing of springs.

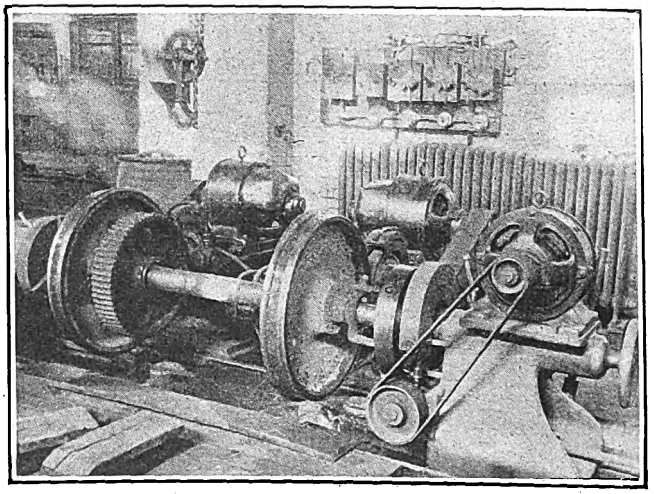
All springs going through the shop are tested for deflection under working load. A loaded height of ⅜ in. more than that specified is permitted, but a variation below the specified height is not allowed. Free height is determined after the maximum working load has been once applied and fully released. After this the permanent set is determined by again applying maximum working load and then completely releasing the spring a second time. The difference between the height after this second load is released and the original free height indicates the permanent set. This is not allowed to exceed 1/32 in. If, however, there is any permanent set (not exceeding 1/32 in.) the spring is again fully loaded and released twice, and must thereupon show no increase in the amount of permanent set.

Wheel Maintenance Practice in Denver

Pit Grinders Used for Truing Up Rolled Steel Wheels When Any Evidence of Wear Develops—Automatic Welder Builds Up Sharp Flanges

THE Denver Tramway has had considerable success in the use of automatic welding and grinding equipment in the maintenance of rolled steel wheels. The objective has been to minimize the amount of turning required so that as much as possible of the available metal of tread and flange will be actually useful in service, with resulting increased mileage for these wheels.

When this property adopted rolled steel wheels, the carhouses were equipped with pit-type wheel grinders installed for the maintenance of cast-iron wheels. Very favorable results have been obtained from these same grinders in maintaining rolled steel wheels. The practice is to true up wheels showing any evidence of worn flanges by running the car over the grinder and taking care of the situation before the wheels reach such a condition that they must be brought into the shop for turning. As a result, comparatively few wheels are turned, and this usually occurs only when it is necessary to match sizes of second-hand wheels for mounting them on a new axle. Besides the increased wheel mileage obtained by a reduction in the amount of turning, there is a substantial labor saving as a result of not having to take the wheels out from under the cars several times during their life.



When It Becomes Necessary to Send Wheels to the Shop, the Flanges and Treads Are Trued Up on the Grinder

Most of the carhouse grinding work is done when the cars are in the house during the non-rush hours. The average time per pair of wheels is about three-quarters of an hour. This figure is taken from the average for a month on four divisions, and includes the time of shifting cars, jacking and preparation for grinding, as

Digitized by Google

well as the actual time involved in truing up the wheel. The object of the pit grinding being to catch the wheel as soon as it shows any evidence of wearing a sharp flange and to true up the flange and tread before the condition becomes so serious as to require the wheel to be taken out, the wheels are largely worn out in service and the average mileage obtained has been materially increased. At the present time, the average mileage for 31-in. nominal diameter wheels with 3-in. treads is approximately 125,000 miles per wheel.

The practice of grinding wheels at the carhouses has reduced considerably the amount of work done at the shop. At present one man in the shop, working only part time, performs all the wheel work which is done, and which formerly required two men working long hours in shifts. No wheel-turning lathe is considered necessary, and what little wheel turning is required is done on a large engine lathe that has been fitted up for this purpose.

A small proportion of the wheels develop sharp flanges when allowed to go too long without grinding at the carhouses. When this occurs these wheels are brought into the shop for welding and grinding. A General Electric automatic welding outfit, with single head, is used. The welding equipment and control panels were purchased from the manufacturer and the driving lathe was built in the company's shop. The lathe is equipped with individual motor drive and external gear speed control gears so as to rotate the wheels at proper speed for welding. The welding head is carried on a specially designed carriage which may be moved laterally on the bed of the machine and also has a screw adjustment for setting the head at the correct height.

This welding work is done in a compartment partitioned off from the remainder of the shop with corrugated sheet steel. An opening in the partition back of the welder allows the wheels to be moved readily in and out of the machine. This is closed by a large canvas curtain mounted on an overhead roller so that it may be raised and lowered readily. The general arrangement is shown in an accompanying illustration.

Welding Time Varies with Condition of Wheel

The time of welding varies with the condition of the wheel. Usually it has been found necessary to weld only one flange of a pair of wheels. An average thin flange on a 31-in. wheel is welded with the single head machine in about 2½ hours. The welding material is laid on with a current of about 225 amp. and with the wheel rotating at a peripheral speed of about 7 in. per minute. The wheels are cleaned in advance with a steel brush. No material is turned off the wheel and the welding material is applied with the flange just as it comes in to the shop. No difficulty from chipping of flanges has been experienced after welding. Before the installation of this outfit the welding was done by hand. In that case some difficulty from chipping occurred. No attempt is made to weld the tread.

After welding, the wheels are set up in the shop grinder shown in an accompanying illustration. This is a number 0 machine made by the Springfield Manufacturing Company, Bridgeport, Conn., and has been found entirely satisfactory for this work. The time of grinding varies with the condition of the flange and tread. Usually, only one flange of a pair of wheels is welded, and then both flanges are ground and the tread trued up if necessary. The time of grinding in the shop varies from one-half hour to one hour per pair of wheels, and the work is done by one man, working only part time. An accompanying illustration shows the condition of a welded flange just after metal is applied and before grinding.

At Right, the Single Head Wheel-Welding Machine

This is made up from an old lathe bed with the automatic welding head mounted on an adjustable carrier. A canvas curtain mounted on an overhead roller covers the openings in the partition back of the welder, which permits wheels to be moved readily in and out of the machine.

Specialized Inspection Reduces Pull-Ins on Kansas City Railways

Designation of Certain Trained Men to Do Inspection Work Exclusively Has Resulted in Eliminating Many Street Failures—Cars Are Inspected Both Before and After the Work Is Done and Each Man Is Held Responsible for the Group of Cars Assigned to Him—Graphic Records Help to Check Performance

ADOPTION of what might be called specialized inspection methods by the Kansas City Railways has had a material effect in producing a simultaneous reduction in both maintenance costs and pull-ins chargeable to mechanical defects. This specialized inspection consists in so subdividing and standardizing the work that it can be carried out by specially trained men who have become highly expert inspectors and go over each car in accordance with carefully planned routine methods. This practice, together with that of working toward standard maintenance methods in the various carhouses and in the shops, the use of high-grade materials and a spirit of frank co-operation between the shop and the inspection carhouses have all contributed materially toward the favorable results accomplished.

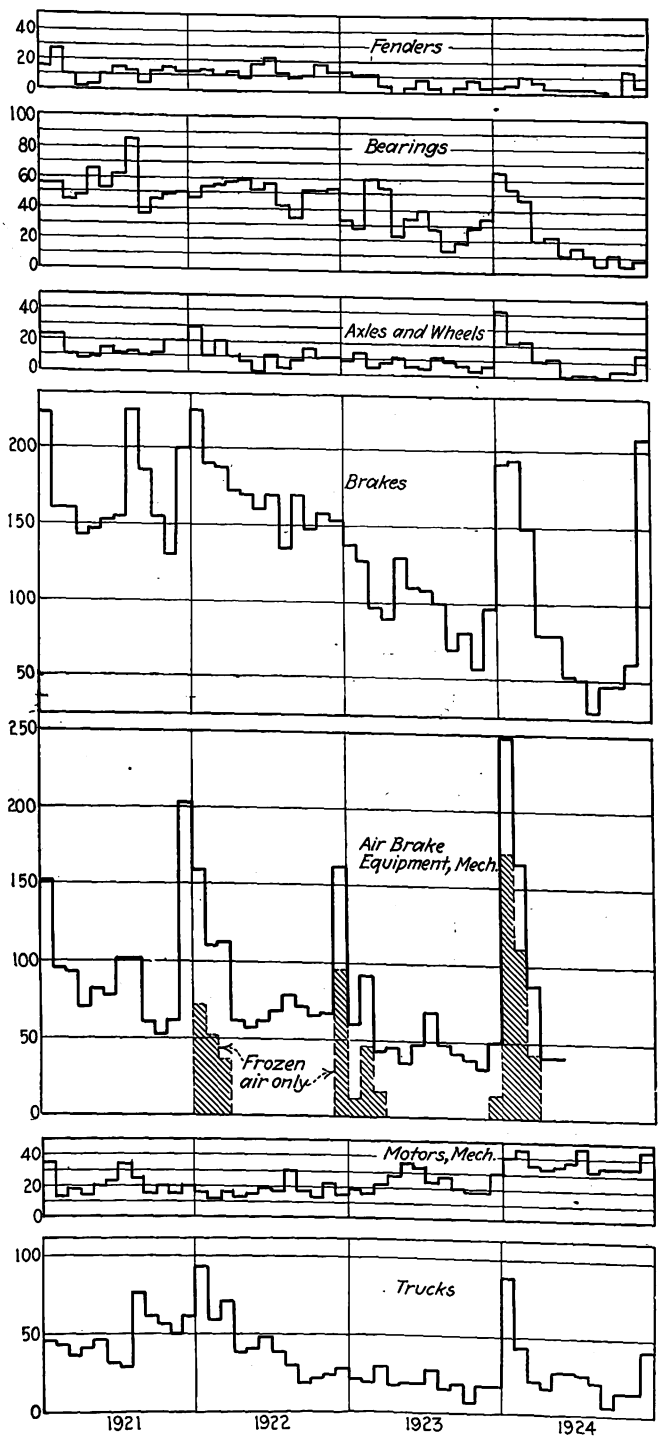
Foremen Have Regular Meetings

Foremen's meetings held on a regular schedule, in which a spirit of democracy is carefully cultivated, are considered to be no small part of the general scheme. Care is taken to avoid giving them the atmosphere of a series of lectures from the superintendent of the department. The men are encouraged to take part actively in frank discussion of any maintenance or operating difficulty that develops in the various carhouses and a particular effort is made to encourage the discussion of methods of improving the practices of the department.

Along with these meetings, a general open-door policy is maintained in the superintendent's office. Each foreman is encouraged to take a general interest in department activities. New policies and practices are freely discussed both in individual conferences and in the foremen's meetings. Full records of maintenance costs are made available to the foremen so that each may not only check up his own performance in comparison with the other men but may also be familiar with the results accomplished by the department as a whole. New ideas are checked up in advance by being discussed in the foremen's meetings. In this way the benefit of the experience of the men in actual contact with the maintenance work is obtained. If the new method is to be adopted, the co-operation of all the men is assured by making them entirely familiar with all of the factors connected with the adoption of the change in practice and the procedure to be followed.

Complete Motors Changed at Carhouses

At one time cars were brought to the shop for making wheel and armature changes. Subsequently it was found that this work could be carried out more economically by changing the wheels at the carhouses and by making replacements of complete motors when any

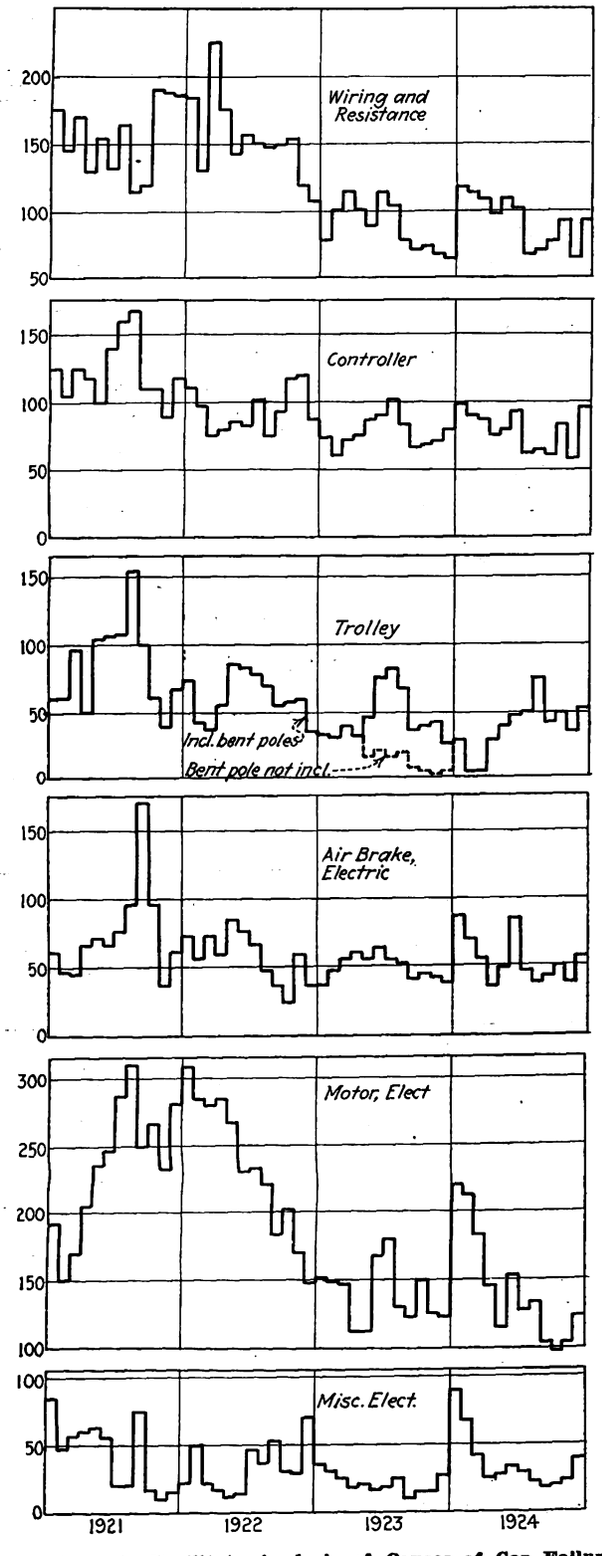


Defects Found on Air Brake Apparatus and Motors Are Divided Into Both Electrical and Mechanical Groups. Some of the Other Principal Subdivisions of Mechanical Defects Are Shown by These Curves. Unusually Severe Weather Encountered in January, 1924, Is Reflected in the Sudden Rise for that Month

Digitized by Google

parts such as armatures, fields, bearings or pinions required repair or replacement. It was decided that the practice of changing armatures at the carhouses does not properly safeguard the condition of the fields and the fit of the end housing in the frame. It also creates a hazard through rough handling of armatures or bearings when they are shipped back and forth between carhouse and armature room.

It was found perfectly feasible and economical to ship the complete motors back and forth between shop and carhouses. Thus all motor work is concentrated in a group of specialists in the shop. A proper condition of fields is assured each time an armature is changed. Then, too, the practice gives a shop check of the axle bearing wear, and in a number of other ways helps to maintain the motor in the best possible condition. As each motor is brought into the shop the leads, fields and brush holders are inspected by shop experts. The fit of the end housing in the motor frame is carefully checked from time to time. Another result which has accompanied the practice of bringing all motors into the shop has been the elimination of shims of one kind and another, toward the use of which there is always a tendency when part of the motor maintenance is carried out in the carhouses, where insufficient tool equipment is available to enable worn surfaces to be properly built up and remachined.



Graphic Records Facilitate Analysis of Causes of Car Failures. Class A Pull-Ins Include Only Those for Which Mechanical Department Is Responsible. Subdivision of Electrical Defects Is Shown in the Above Curves

Less Work by Changing Complete Motors

After the adoption of the practice of sending complete motors to the shop, it was found that there is really less carhouse work involved in changing complete motors than in removing and replacing armatures, pinions and bearings at the carhouses. When the change in procedure was made the general overhaul period for cars was reduced to 50,000 miles in order to put the cars into the best possible condition by eliminating considerable deferred maintenance. As the cars were put in better condition the general overhaul period was gradually extended until it is now on an 80,000-mile basis. At these general overhauls the trucks as well as the car bodies are also completely gone over and put in first-class condition.

An important part of the general scheme for reducing pull-ins is the carefully worked out system of records which are compiled graphically in such form as to enable an analysis of the causes of pull-ins to be made. These records enable the head of the department to make comparisons of the results obtained by various divisions, and also of the troubles experienced with different types and classes of equipment. Examples of the method of subdividing pull-ins are shown in the accompanying illustrations.

A careful check is made through both the transporation and mechanical departments to make sure that car defects are properly reported. These reports are the basis for the pull-in records. In each operating carhouse is a division log book in which each trainman going off duty is expected to record any defects that come to his attention while operating the car for which he signs off. The trainmen also report these defects to the carhouse hostler or car shifter when the cars are brought in from service. The hostler makes out a ticket report in duplicate, one copy of which goes to the carhouse repair foreman and the other to the transportation department division superintendent.

Transportation Department Reports Failures

Transportation irregularities from any cause, including equipment failures, are reported over the transportation dispatching system telephones. These are summarized each day by the chief dispatcher in a daily transportation department statement. Each carhouse repair foreman also compiles a daily pull-in report from the hostler's tickets, indicating the cause reported for the pull-in and the exact condition found by the inspectors. The carhouse foremen also indicate on their reports the classification under which each pull-in should be grouped.

Above—Front Side of Car Record Card Shows Complete History of the Main Items of Equipment on Each Car. At Bottom—Back of Record Card Provides Space for Log Record of Pull-Ins and Shows Up Recurring Defects on Individual Cars

Copies of both the carhouse repair foreman's report and the transportation dispatcher's report are forwarded daily to the mechanical department office, where any discrepancies that may have occurred can be checked by a comparison.

As these pull-in records are received from day to day, the mechanical department office makes up a daily summary, classifying them into three main groups. The first, comprising what are known as Class A pull-ins, includes those attributable directly to failure of some part of the apparatus or equipment on the car. The second group, known as Class B pull-ins, includes cars pulled in for the same causes as those in Class A, but which are found O.K. when inspected. Cars pulled in for any other causes, in which the mechanical department is not directly responsible, such as damage from collisions, derailments, etc., are grouped into Class C. Any car which is taken out of service, because of defects of any kind, before completing its regularly scheduled service is classed in one or the other groups of pull-ins.

Each carhouse repair foreman carefully analyzes each case of pull-in and posts a record on the carhouse bulletin board indicating not only the results found by the inspection but also the man who was responsible for work on the defective car.

Most of the inspection work is done during the day. The inspectors report the conditions found, but do not actually make repairs themselves. This practice is followed in order to make the men more critical than would be the case if they made the repairs themselves. As a result of this specialization of the inspection work, the number of men required properly to supervise the condition of the cars has been reduced approximately 10 per cent. Each man thoroughly inspects approximately seven cars per day.

Two general inspectors report to the supervisor of the division mechanical forces in addition to the in-

Digitized by Google

dividual carhouse foremen. These general inspectors have direct supervision of the inspectors in the various carhouses. This arrangement gives the individual foremen full charge of the labor forces in the carhouses, as well as the work which is carried on, but the inspectors do not report to these foremen for orders. The inspection forces are kept separate from the maintenance forces, but the work of both is co-ordinated through the supervisor of the division mechanical forces.

CARD RECORDS MADE FROM PULL-IN SUMMARY

A copy of the summary of pull-ins, made up in the equipment department office, goes to each chief inspector. He checks over the cases which involve equipment in his charge, and thereby supervises the work of the individual inspectors. Another copy of this report goes to the record room of the mechanical department for tabulation on the individual car card record, shown in an accompanying illustration. The records thus indicate any recurring defects on individual cars and give a ready check of the performance of individual inspectors assigned to those cars. Outstanding cases of repeated trouble, either on individual cars or on certain classes of equipment, are handled by memoranda sent out from the office to the carhouses, or are taken up for discussion in the carhouse foremen's meetings.

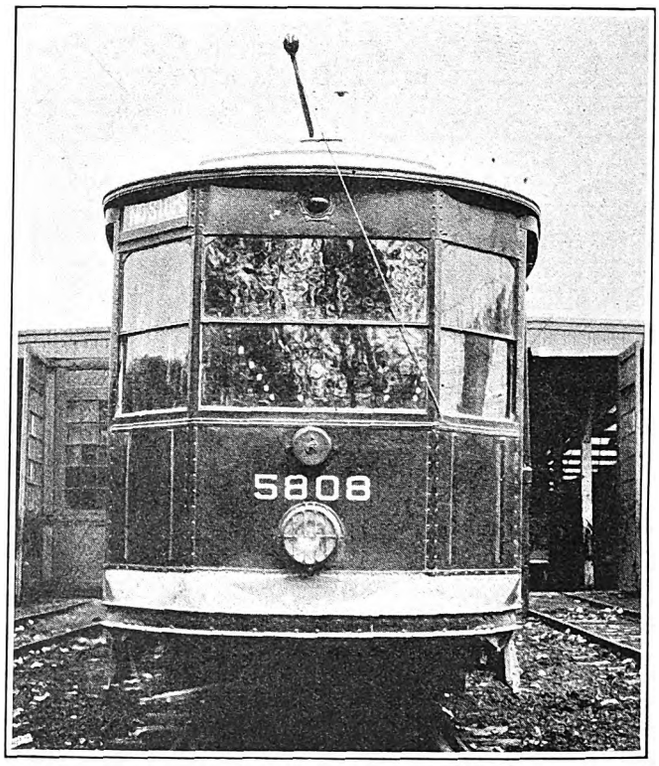
Steel Vestibule Window Posts Allow Broader Outlook

IN THE design of the latest light-weight one-man, two-man surface cars bought by the Boston Elevated Railway an innovation suggested by the legal department of the company has been incorporated. In order to give the least possible interference to the outlook of the motorman the vestibule window posts are narrow sections of pressed steel. All vestibule window sash is of metal, so that between the belt rail and the roof the end of the car is nearly all glass. This modification is expected to reduce materially the number of accidents. The appearance of the end of the car is shown in the accompanying illustration. In other respects these cars are the same as the light-weight one-man, two-man cars which have been in service on the Boston Elevated for several years past.



Narrow Window Posts and Metal Sash Have Increased the Vestibule Window Area on This Car

Emergency Equipment in Street Boxes

WRECKING and emergency equipment for use in the event of a car derailment or minor accident is provided by the City Railway in a number of substantial locked boxes located at various points in the business district of Dayton, Ohio. This equipment includes rerailing shoes, a heavy chain and a heavy-duty jack. A similar practice in New Bedford was described in this paper Jan. 17.

The boxes are kept locked to prevent tampering or theft but in addition to providing keys for authorized railway employees, keys to these boxes are also furnished to traffic officers on duty near the points where the emergency boxes are located. Consequently in the event of a disabled wagon, derailment or other accident that would cause delay in car schedules, emergency equipment is made available at the earliest possible moment, and bad delays are frequently avoided.

Old Rail Used for Ties in Bangor

Rigid Reinforced Concrete Track and Paving Construction Is Employed—Wood Ties Are Alternated with Steel Ties, Which Are Welded to the Base of the Running Rail—Joints Are Thermit Welded

By E. W. Jennison
Engineer Maintenance of Way Bangor Railway & Electric Company

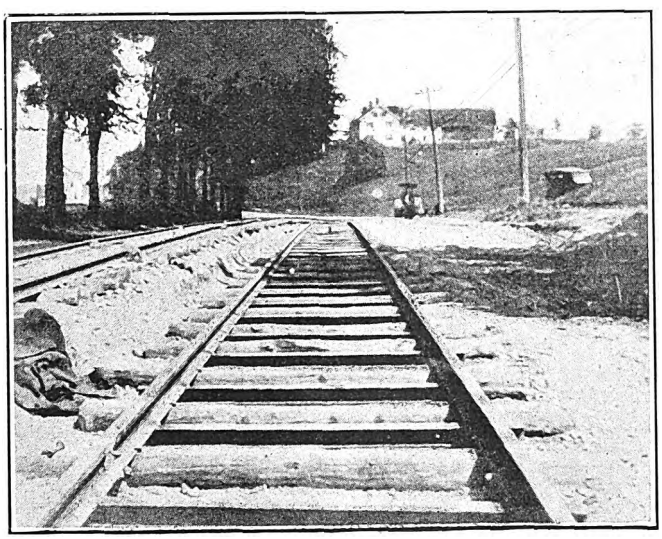
A TYPE of track construction in which old 60-lb. T-rail was used for ties has been quite extensively employed by the Bangor Railway and Electric Company. Placement of concrete in a single course between the ties and up to the head of the rail produced a rigidly reinforced structure.

Removal of Old Track

The old structure consisted of light T-rail, ranging in weight from 58 to 70 lb. per yard, laid on cedar or hemlock ties, spaced 20 in. center to center. Little or no ballast was used under the ties. The space between the ties and up to the top of the rails was filled with bank-run gravel or crushed-stone macadam without any binding material on the wearing surface. The rail was fastened to the ties with 5½-in.x⅝-in. drive spikes and the joints were of the four-bolt Weber type.

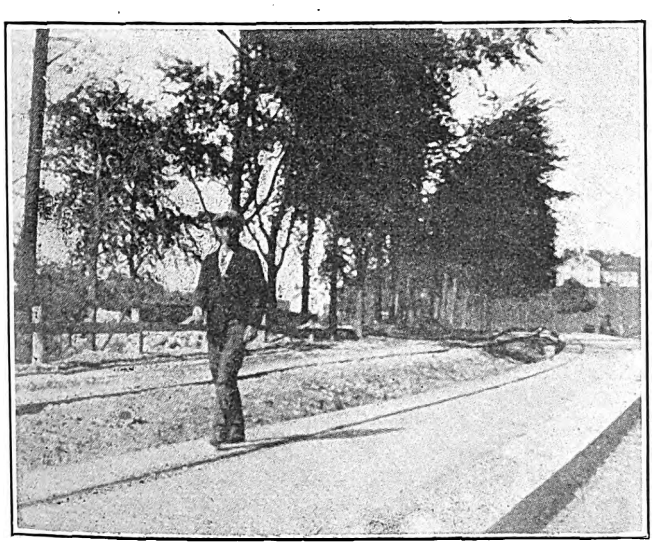
No traffic was maintained on the track under construction, even while the excavating was going on. In the case of double track, traffic was routed to the second track with Lorain Steel Company's portable crossovers built of 60-lb. stringer type of rail. In the case of single track, provided the rail itself was not to be changed, a temporary track was built alongside. If new rail was to be installed the old track was pulled to one side by a 5-ton Holt tractor and used as a temporary track.

A Russell special scarifier drawn by the 5-ton Holt tractor was first run over the track two or three times, with the teeth of the scarifier set low enough just to clear the tie tops. When a rail was straddled one tooth was removed from the scarifier. This loosened all material above the ties. Next, pockets were dug under the rails and the track jacked up, after which it was either pulled one side for temporary track or taken apart. This left the ground clear for completing the excavation under the most favorable conditions, which was done by loosening the material with a construction plow, tractor drawn, after which it was shoveled by hand onto flat cars and distributed on the shoulders of suburban lines. Excavating was to a depth of 15 in. below grade.

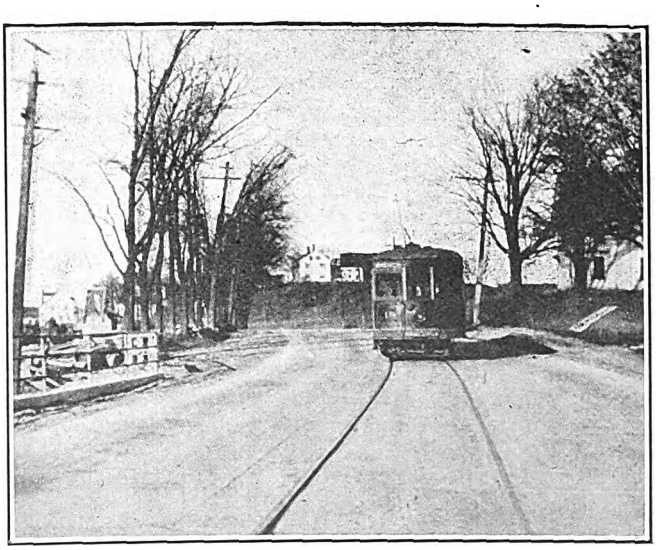


Joints Welded and Track Ready for Concrete

In nearly all cases there was no preparation of the subgrade except to level it off, the track slab resting on the natural soil, except that bank-run gravel to the depth of 4 in. was placed under the ties for use in tamping. Where seepage conditions appeared in the subgrade, trenches were dug below the frost line. The trenches were filled with rocks and tile pipe was then installed to drain to the sewer. The sub-



Track Slab Finished—Note Temporary Track

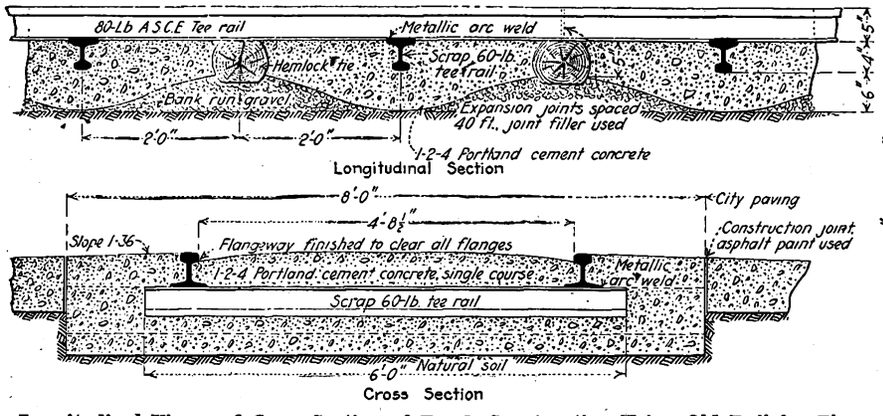


Appearance of Finished Concrete Pavement

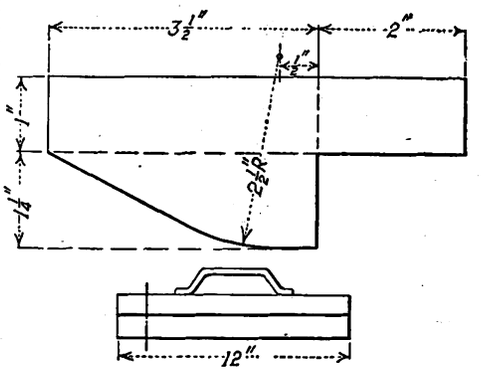
Digitized by Google

grade was not rolled, as the natural soil was already very thoroughly compacted.

Native hewn hemlock ties were laid out on the subgrade on 4-ft. centers. Between these were placed 6-ft. lengths of 60-lb. scrap T-rail to serve as cross-reinforcing members for the paving, the running rails serving as longitudinal reinforcing. The running rails were next laid and fastened with 5½-in.x⅝-in. drive spikes to the ties. Joints were made up temporarily with angle splice bars, using only one bolt. At this time the steel inserts used in thermit welding were placed between rail heads. Then the track was surfaced in the usual manner by hand tamping with shovels, using the gravel placed under the ties, and lined, after which thermit welds were made.



Longitudinal View and Cross-Section of Track Construction Using Old Rail for Ties

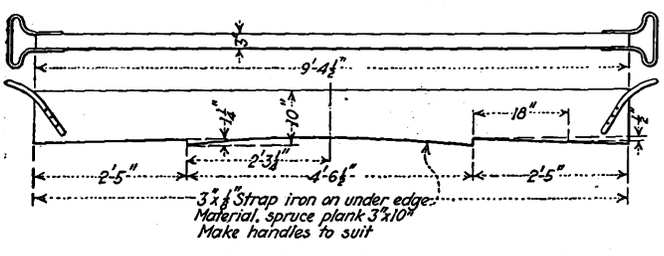


Flangeway Template for Concrete Paving

Cross-reinforcing members were lifted into place under the rail by means of small tongs and a chain on one end of a long lever. One man held the member in place while the welder spot welded it to the rail. The entire stretch of track under construction was covered in this manner and later the welder returned alone and finished the welding. This was done by the metallic arc process, using a Rail Welding & Bonding Company type B B dynamotor with ⅝-in. grade 30 steel rod. It required ½ lb. of steel rod per cross-reinforcing member. These cross-members take care of cross-bonding in a very thorough manner. After welding and just previous to pouring the paving the track was given a final surfacing and lining.

Concrete Is Poured in a Single Course and Hand Tamped

Actual paving was done by a city crew and mixer, although the railway paid the cost. This consisted of actual labor and material charges plus a rental of $20 a day for the mixer. Concrete was mixed 1-2-4 and was laid in a single course. Particular care was taken to have the mix dry enough and to have it thoroughly tamped under the rails and cross-members. Tamping under the rail was done by hand, using ordinary rail-way tamping bars, while the paving surface was tamped with a plank of the shape shown in the accompanying sketch. Final finishing of the surface was done by hand floats and the template shown was used as a guide in finishing the flangeway. Care was exercised that neither new nor worn flanges could hit the concrete. If this happens the finished surface of the paving is damaged and rapid disintegration caused by vehicular traffic will take place in the flangeway. After its initial set calcium chloride was spread on the pavement surface to hasten the final set of the concrete. After 10 days the track was opened to electric car traffic.



Concrete Tamper Used by Bangor Railway & Electric Company

Welds Ground Without Lifting Wheel

Grinding the welds is one of the most important steps in track construction where the thermit process is used, because if it is not properly done a cup may develop. The joints when welded were given a slight crown. When the paving had been poured 2 days the grinding of the welds was started. The running surface was ground with a Universal rotary track grinder and the gage side with a type M-8 flexible shaft grinder, both made by the Railway Track Work Company. The guides of the Universal were not warped. This, together with the joint crowning, allowed a perfectly flat cut, running off to nothing, to be made without lifting the grinding wheel. Particular care was taken on the first cut to hit only the high spot at the insert and at no time to force the grinding in the least. It was found that forced grinding left a high spot on the finished surface at the insert, which in a very few months showed bright and later caused a slight cup beyond.

A little more than 2,000 ft. of single track area 8 ft. wide, as shown in the accompanying drawing, was constructed during the 1924 season, in three separate locations, at a total net cost of from $5.97 to $6.68 per foot of single track. In the case of the low figure the rail was not renewed, the battered ends being cut off with an oxyacetylene torch. It is interesting to note that in this case the thermit welds consumed 12 per cent of the total net cost, whereas in the case of new rail the percentage was 6 and 7. The cost of the thermit welds was $9.95 each with old rail as against $6.70 with new rail. The largest of these three jobs contained only 51 welds, and it is reasonable to suppose that on larger jobs the cost per joint could be lowered. The paving cost ranged from $2.18 to $2.83 per square yard, which is approximately equivalent to a figure of $7 to $9 per cubic yard. Total labor charges were from $1.64 to $2.21 per foot of single track. Common labor was obtained at a cost of $3.50 per 9-hour day.

Jigs Expedite Multiple Drilling

Variety of Operations Performed on Three-Spindle Drill in Columbus Railway Shop by Use of Proper Jigs

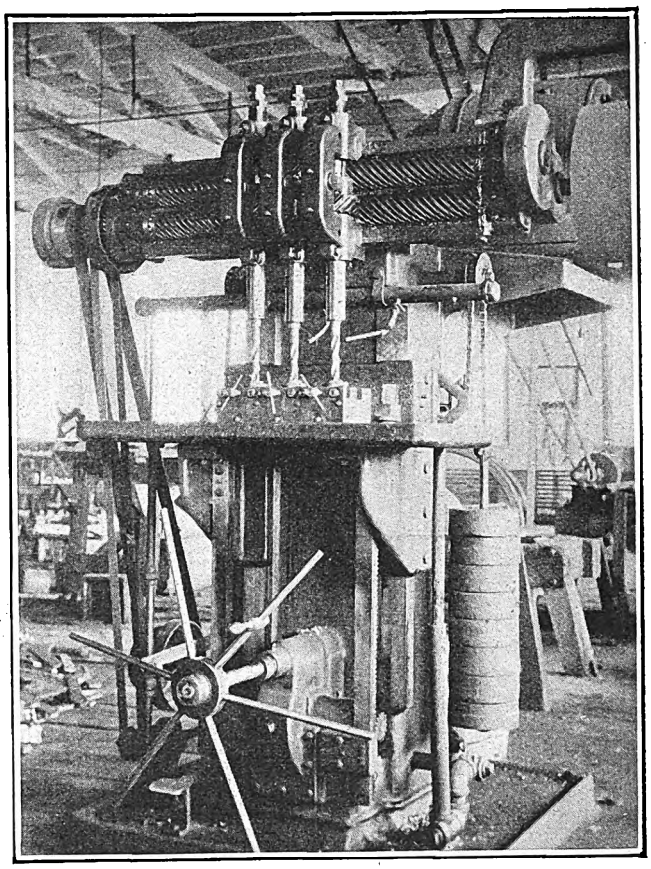
HOLES in brake levers, adjusting nuts and other similar parts are drilled three at a time in the repair shop of the Columbus Railway, Power & Light Company. The machine used, a Moline "Hole Hog," has proved particularly useful due to the jigs that have been designed and made in the shop for it.

The machine has three spindles mounted on a stationary crosshead. The table may be raised or lowered approximately 30 in. by hand or by power to feed the work to the drills. The spindle heads may be moved laterally the width of the table, which is approximately 30 in. Due to the width of the spindle head, the minimum center-to-center distance between adjacent drills is 5 in. The machine has a separate motor drive and a capacity of three 1¼-in. drills in 0.050 carbon steel.

The three holes in brake cylinder levers and in truck brake levers are drilled at one operation. As used on this property, air-brake cylinder live levers are approximately 18 in. long and are made of 1-in. x 3½-in. steel. Two end holes in these levers are 1 7/64 in. diameter, while the center hole is 1 15/64 in diameter. The jig made for use on this job has a base of 1-in. x 3½-in. steel, mounted on three legs, one at each end and the third at the center of the base. The jig guide plate is mounted approximately 1 in. above the base, this being sufficient to allow the insertion of a brake cylinder lever blank. Two stops at the back and a pair of clamps at the front hold the lever in the proper position. These front clamps swing down out of position to allow the blank to be inserted and removed.

A different type of jig is used when drilling the three holes in a brake lever for a Brill No. 22 truck, in which two of the holes are located less than 5 in. apart. Consequently, it was necessary to make a special jig for drilling simultaneously two holes in one lever and the third in another lever, in order to work the machine at full capacity. This resulted in a jig of right-angle construction. The main portion, containing the bushed guides for two holes in the lever, is identical in construction with the jig used for drilling the air brake cylinder lever. However, at one end is a right-angle extension, which holds a second lever in a box-like holder. Two removable pins fit into the two holes drilled in the blank in the first position, thereby aligning it for the third hole. Thus after two holes have been drilled in the first blank of a given lot, it is possible to drill three holes at a time, one being drilled in the first lever while two holes are being drilled in another piece.

This jig is made up of a 1-in. steel base supported on four legs. The top guide plate, stops and clamps are similar in design and construction to those on the jig for air-brake cylinder levers. The main part of the jig is provided with an adjusting set screw for aligning the blank for the first two holes. This is shown in an



Various Drilling Operations Are Performed on This Moline "Hole Hog," for Which Numerous Jigs and Fixtures Have Been Made. It Is a Three-Spindle Drilling Machine with Individual Motor Drive

accompanying illustration, which gives an idea of the jig and also of the finished product.

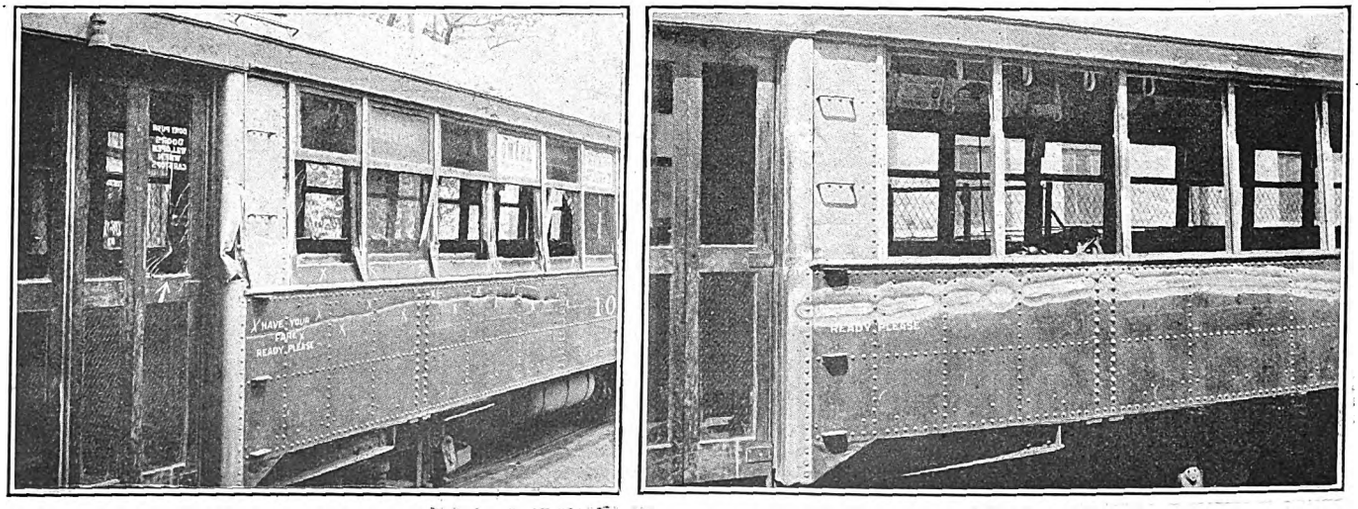
Another handy jig used in conjunction with the same machine is one for drilling grate links for the power house of the company. Although not a railway maintenance or replacement part, reference is made to it because this jig increased the scope of work that can be done with the drilling machine. The base of the jig is of such dimensions as to accommodate one side of the drag link. The top is similar and is mounted so as to allow room for the U-shaped link. On the back of the jig two uprights permanently fastened to the top and bottom members serve as stops for the blank. In front, two similar uprights are fastened so they can be swung out of the way when a link is inserted. Hardened bushings guide the drills which pass through the top member of the jig and also through two angle brackets fastened to the rear supports just above the lower leg of the link. Two long $\frac{15}{16}$-in. drills are used to drill the two holes through both the upper and lower sides of the link.

In addition to such jigs as those described, a variety of fixtures are also used in conjunction with the Moline machine. One of these, which may be taken as representative, is a fixture clamp which holds three brake-rod adjusting nuts for simultaneous drilling. This fixture has its bottom and sides made of 1-in. steel. The back and front of the fixture are held together by $\frac{1}{2}$ in. bolts, which serve as guides for the clamp portions of the fixture, which are moved back and forth by means of small hand screws in the front plate. The clamp jaws are cut out to engage the square shanks of the adjusting nuts. Three $\frac{15}{16}$-in. drills are used simultaneously with this particular fixture and the time of drilling the nuts is about one-half what it was when each nut was drilled separately.

Oxyacetylene Torch Used to Good Advantage in Omaha

IN THE shops of the Omaha & Council Bluffs Street Railway T. E. Wood, master mechanic, has found that careful study of the various types of repair jobs to which the oxyacetylene torch can be applied yields rich returns in reduced maintenance and repair costs.

An example of the large savings that can be made



An Oxyacetylene Torch, in the Hands of a Skilled Operator, Made Possible a Substantial Saving in Cost of Repairing This Damage
At left, the car as it came in after an accident. At right, use of the welder eliminated the necessity of removing the damaged side plate

Digitized by Google

through the use of the torch in the hands of a properly skilled workman is brought out in the accompanying illustrations. In this case a glancing blow received by a car from a vehicle on the street cut a deep gash in the side girder sheet, tore a piece out of the steel corner post and also damaged the side posts.

Ordinarily, this damage would have called for a major repair job. To replace the side girder sheet it would have been necessary to tear out the interior trim of the car to get at the rivets. Drilling and fitting a new plate would have been far from a simple or inexpensive job. To have attempted to replace the corner post or the damaged side posts would have added increased work, delay and expense.

Skillful welding work accomplished the results shown in the second illustration. Extreme care was required to avoid buckling the thin side sheets under the heat action of the welding torch, but the success with which the job was carried out is clearly shown by the final condition of the plate as shown in the illustration. A similar welding operation on the damaged steel corner post and splices in the damaged side posts transformed what would ordinarily have been a costly job into a comparatively simple and inexpensive repair.

New Cyanide Hardening Process in Chicago Shops

Improved Process Provides for Heating the Cyanide Solution from the Top and Thereby Effects Substantial Economies in Cost and Eliminates All Danger to the Operator

A MATERIAL improvement in the cyanide hardening process in general use has been perfected in the forge shops at the West Shops of the Chicago Surface Lines by Charles Ringstrom, foreman of that department. This improved process not only assures uniformly good results but also effects material economies in cost and amply protects workmen against the dangers of inhaling cyanide fumes.

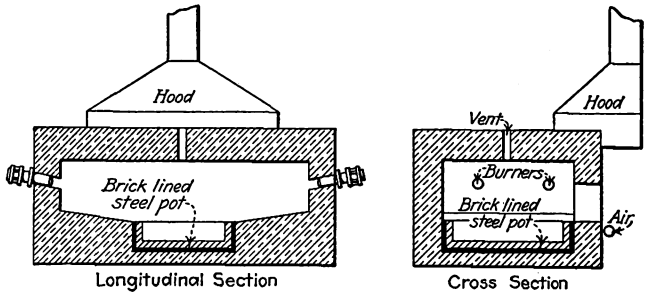
In the steel pot bath method of cyanide hardening, which is used by most steel treaters of the present day, the parts are preheated in a forge or furnace and then submerged in a pot containing the red-hot melted cyanide solution. They are then taken out and quenched in water. Although this method gives a uniform treatment to the part, it does not produce that glass-hard surfacing that cyanide is capable of imparting to steel where the entire process is carried through in one atmosphere and one temperature. Carbon steels case harden best at their critical temperatures, 1,500 deg. to 1,700 deg. F., due to the high affinity of iron for carbon in its second allotropic state. It is not possible to attain safely more than 1,450 deg. F. in a cyanide solution in a bottom-heated steel pot. In the newly developed furnace the cyanide pot is heated from above, and it is this idea that permits a combination of all the ideal conditions for the practical, safe and economical hardening of steel with cyanide base carbonizers.

The new furnace is of the oven type. The brick-lined steel pot is located in the center of the floor, which is laid with a 10-deg. rise from the pot to the side of the oven, as shown in the accompanying illustration. Uniform temperatures in the 1,500 to 1,800 deg. F. range are maintained by the four No. 3 Hyperbo gas burners. It was found, after many changes and tests, that this burner steadily delivered a finely controlled flame which maintains an even, uniformly circulated heat. Particular attention was given to the circulation current to confine their direct flow to a location above the cyanide solution in the pot, thereby maintaining a high temperature in the solution without agitation and consequent high volatilization.

All operations are performed inside the heat chamber. Large parts, weighing up to 12 lb., and small parts, down to ½-in. washers, are uniformly treated with equal facility in quantities up to 40 lb. per hour. The procedure is to place the parts to be treated on one of the inclined planes, where they are heated to 1,600 deg. F., then to submerge them in the cyanide pot for the required length of time, after which they are pulled out on the opposite incline plane, drained free of the solution and finally heated for penetration. They are then ready for quenching.

It will be noted that all operations are performed under a constantly maintained temperature, thereby insuring a very effective penetrative action; that the fumes from the cyanide mingling with the gas flames exclude all other air from the furnace, thus eliminating oxidation, and finally, that the liquid cyanide drains from the work into the pot after submerging, thus actually saving 50 per cent of the cyanide required for the same amount of work by the ordinary cyanide process.

The service life of the ordinary bottom-fired, pressed-steel cyanide pot is limited to a month or less. The corrosive effect of the cyanide solution, combined with heat, causes a rapid deterioration of the pot. The heating of the pot from the top, as is done in the new furnace, greatly diminishes the corrosive action of the solution on the container. After six months of operation the pot in this furnace, costing $4, was found to be as serviceable as when first installed.



This Sectional Diagram of the New Cyanide Hardening Furnace Developed in the West Shops of the Chicago Surface Lines Illustrates the Arrangement for Heating the Solution from the Top, Using Gas as Fuel

A record of production under the old and under the new processes shows the following results: For a period of 11 months, using the ordinary type process, 21,988 truck wear plates, each weighing 7 lb., were treated at a total cost of $6,629.26. This is an average cost of $0.0402 per lb. In the new process, under the same manufacturing conditions, miscellaneous parts weighing from one ounce to 12 lb. were treated during a 5-month period. In this case 69,500 lb. were treated at a total cost of $1,490.78, giving an average cost of $0.0214 per lb. of metal treated.

A material saving in the cost of steel pots is made with the new process, and it is conservatively estimated that 30 per cent of the carbonizing agent required in the common process is saved. There is a 50 per cent gain in the wearing quality of the metal treated. In addition to this, an operator produces 50 per cent more work during the 8-hour day with absolutely no danger of breathing cyanide fumes.

Electrical Equipment Causes Big Saving

Comparative Data from the Chicago, Milwaukee & St. Paul Railway Show Definite Economy from Electrical Operation on Both Electrified Divisions, Though Traffic Conditions Differ Greatly

THIS week the Chicago, Milwaukee & St. Paul Railway made public for the first time detailed figures of the relative costs of operating its Rocky Mountain divisions by electricity and by steam locomotives. The report was prepared by C. E. Oliphant, assistant to the comptroller in charge of statistics, under the direction of W. W. K. Sparrow, vice-president, and in consultation with R. Beeuwkes, electrical engineer in charge of the electrical installation. The figures include both operating expenses and carrying charges (the latter including depreciation) and have been brought to the same basis. This was done for the operating expenses as follows:

The electrical operating costs are the actual costs for the year ended Dec. 31, 1923. The steam operating costs are based on the costs of the last year of steam operation, corrected where known to be incomplete as for some of the minor items, and then recalculated to cover the differences which have occurred in labor and material costs. In other words, the figures are restated so as properly to represent the price levels of 1923, or what the cost would have been if the divisions had been operated by steam. With regard to the savings with the electrical system through the use of regenerative electric braking, it was found that no existing data were available which would enable the brakeshoe wear to be determined with any accuracy for the condition of continuous and long application which, under steam operation, occurs on mountain grades. Therefore, a wear figure, believed at least to be conservative of 1 lb. of wear per 100,000,000 ft.-lb. of energy dissipated, was used. There is also a saving in draft rigging brake apparatus and wheel wear, all of which, for evident reasons, are indeterminable where cars move over many divisions. The amount of savings on account of these items was assumed to be the same as that resulting from the reduction in brakeshoe wear. This estimate is believed by the officers of the railway company to be conservative.

The comparisons of costs for the two motive powers are published in the accompanying tables and charts, the figures for which include only those accounts for both steam and electric operation which are affected by the type of motive power. Operating costs common to both steam and electric operation and carrying charges on investment in property commonly necessary to both forms of operation were omitted from these tables for the sake of simplicity.

The selection of accounts used was made after a careful study of the expenditures under each of the primary accounts of the operating classifications. Some of the accounts excluded as not being affected by change in power are without doubt affected to some extent by such a change, but the effect is so slight as to be negligible in comparison with the effects produced by other causes. Thus, "Maintenance of Track" is admitted by the company to be an expense unquestionably affected to some extent by the class or kind of power. It was felt, however, that the effect from other causes, such as weather, availability of money, cycles of renewal of parts, maintenance program, labor conditions, etc., are so much greater and so impossible of exact ascertainment for elimination, that this expense

*Electrical operating property at actual cost 1917-18-19: Steam operating property priced as of the costs obtaining during the same period (1918).

should be classified as not being affected by change in power, though other items in the primary account of maintenance of way and structures were included. Work train expenses have been separated and included as expenses directly affected by change in power for several reasons, one of which is that certain standby losses under steam operation are eliminated by the use of electric motors in work train service. The costs of the two periods have been adjusted to the same amount of work train service.

Costs of electric power for the electric division are based upon a minimum total payment corresponding to the respective amounts of energy for which the railway company had exercised options during 1923 for the different sections. Where these amounts were not sufficient to handle the increased traffic, the power cost was increased on the basis of the additional power required.

Cost as Affected by Volume of Business

Of course the total tonnage moved in the year selected was not the same for steam and for electric operation. Therefore, to make the comparison exact, the cost items affected by a change from steam to electrical operation were separated between those which within reasonable limits remain constant for different volumes of traffic and those which vary directly with the volume of traffic. The latter items were further separated between the passenger and freight services. With these separations, it was easy to make a comparative statement of figures on investment and depreciation based on the same tonnage. In determining the figures on investment, only the power equipment facilities and appurtenances directly related to each system of motive power were considered.

In tabulating the investment in the property involved,

*"Variable"—Expenses considered to vary practically directly with volume of traffic: "Constant"—Expenses considered to remain practically constant for all volumes of traffic within a reasonable range.
**Constant up to a total of 906,007,000 Gross Ton Miles for Freight and Passenger Services; thence increased in freight service as estimated necessary for greater volumes of traffic: (The amount to be added at 1,014,511,000 G. T. M. is $38,307.00.)
***The actual for the period, 186,232, adjusted to the tonnage of electrical operation as the difference rests solely in the number of cars per train due to difference in train routing: Expenses adjusted to conform.

Digitized by Google

the same practice was followed as with the operating expenses, namely, to include only the equipment facilities and appurtenances directly related to each type of equipment. For example, in steam operation, the steam locomotives and the fuel and the water stations were included, and in electrical operation the locomotives, the transmission and distribution systems, substations, etc. The signal systems were also included, as it was necessary to change the d.c. system formerly used with steam for the a.c. system when the road was electrified.

The figure taken as the investment for the property peculiar to electrical operation was the actual cost of installation—i.e., on the Coast division the prices obtaining in 1918 (1917 to 1919), and on the Rocky Mountain and Missoula divisions the prices obtaining in 1915 (1914-1916). The investment in the property peculiar to steam operation was based upon the actual cost, modified and adjusted to the price levels as of the electrical installations—i.e., on the Coast division as of 1918 and on the Rocky Mountain and Missoula divisions, which extend from Harlowton to Avery, as of 1915.

The carrying charges computed interest and depreciation. The interest rate has been taken as the rate paid by the railway during the different periods of installation—for the Coast division 6 per cent and the Rocky Mountain and Missoula divisions 5 per cent. Depreciation has been computed upon the sinking fund basis, using an interest rate of 6 per cent.

THE SYSTEM INVOLVED

The miles of track involved in electrification are as follows:

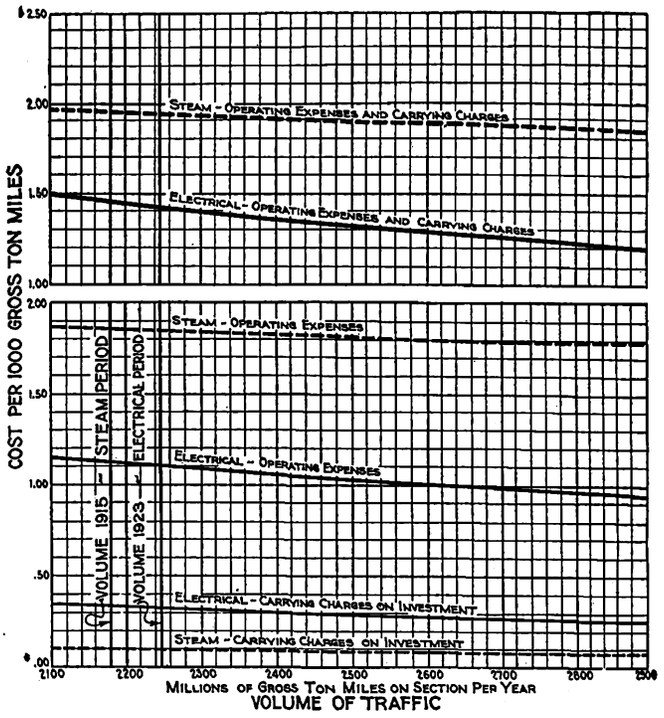
MILES OF ELECTRIFIED TRACK CONSIDERED, CHICAGO, MILWAUKEE & ST. PAUL RAILWAY.

	Miles of Track—First Main	Miles of Track—Other	Operation Dates
Harlowton to Deer Lodge	226	66	April, 1916
Deer Lodge to Avery	212	62	November, 1916
Othello to Tacoma (helper service)	...	...	August, 1919
Othello to Tacoma (through service)	208	72	March, 1920
Tacoma Junction to Tacoma (passenger)	2	...	April, 1920
	648	200	

The direct-current overhead trolley system of electrification is used. This current is not generated by the railway, but is purchased from hydro-electric stations along the line. It is received at taps in the company's high-tension lines, transmitted to substations where it is stepped down from three-phase a.c. at 100,000 volts to a working voltage of 2,300 and then converted to motor-generators to d.c. at 3,000 volts for distribution on the trolley. The motors of the locomotives are so constructed as to act as generators when descending grades, thus returning current to the line and controlling the speed of trains without mechanical braking. Full technical details of the electrification have been published in this paper.

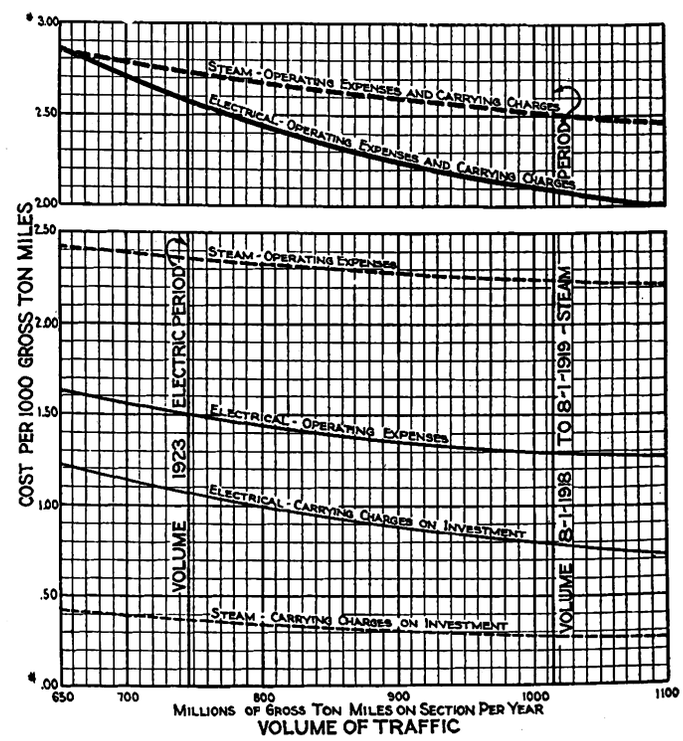
STATISTICS

The first of the accompanying tables shows for the years since the beginning of electrical operation the net saving from electrical operation, using for steam operation the actual cost of the last 12 months of such operation—adjusted to the cost obtaining in 1923; and for electrical operation, the actual cost as determined for the year 1923. The net savings shown are obtained by deducting from the savings in operating expenses the carrying charges of interest depreciation on the additional investment required by the electrification, which, as shown in two of the subsequent tables, amounted to $15,625,739.



Comparative Costs per 1,000 Gross Ton-Miles—Passenger and Freight—Of Operating Expenses and Carrying Charges as Investment in Property Directly Affected by Change in Power—Harlowton to Avery

From this table it will be seen that for the year 1923, with its comparatively low tonnage, the net saving from electrical operation of the two sections amounted to $1,271,793. For the minimum tonnage so far experienced, which was in the year, 1921, the savings amounted to $671,014. The maximum tonnage so far experienced was in 1919. Had the section from Othello to Tacoma been under electrical operation during that year, the savings for the two sections would have amounted to $2,355,199. Detailed figures of cost



Comparative Costs per 1,000 Gross Ton-Miles—Passenger and Freight—of Operating Expenses and Carrying Charges on Investment in Property Directly Affected by Change in Power—Othello to Tacoma

Digitized by Google

on the bases described are given in the other tables shown.

The two charts present the savings per 1,000 gross ton-miles, freight and passenger, resulting from electrical operation in place of steam. In these charts it will be seen that the volume of traffic in the steam and electrical operating years were nearly the same for the Rocky Mountain and Missoula divisions, but in the case of the Coast division the steam operating year included a considerably greater volume of traffic than did the electrical operating year—a situation favoring steam operation to some extent in the comparative figures.

No Indirect Savings Credited

No savings were credited to electric operation which were not directly ascertainable, as for example the possible increased revenue due to the release of equipment used in the transportation of coal under steam operation. Similarly, no credit was given electric operation for the better utilization of freight equipment due to faster movement, less wear and tear on road and equipment, reduced station expenses and similar expenses affected by the number of trains required to handle a given tonnage. In the case of all of these items it was impossible to determine an exact monetary value for these incidental advantages. In the same way, no credit is given for the increase in passenger revenue resulting from the attractiveness and greater comfort of travel under electrified operation.

German Comment on Foreign Practice Report

A Supplement of the Report of the Foreign Practice Committee at Atlantic City Convention of the American Electric Railway Association, Prepared by a German Writer

THE report of the committee on foreign practice of the American Electric Railway Association, presented at Atlantic City last October, has attracted considerable attention on the continent of Europe as well as in England and the United States. The German comment is instanced by an extended abstract of the report, extended through three issues of *Verkehrstechnik*. It was written, with comments, by General Manager Stein of the Hamburg Elevated Railway, who was recently in the United States on a tour of inspection of American electric railways. Mr. Stein says many complimentary things about the report of the committee on foreign practice, among them that the members were careful observers and that while they may have seen many things through American spectacles, they accumulated a vast amount of valuable data. The omission of Germany from the itinerary, however, Mr. Stein says, is hard to understand, in view of the fact that so many American railway men have visited Germany during the last three or four years. Evidently he did not realize the limited time at the disposal of the committee.

The author then mentions a number of developments of electric railway interest which the committee might have seen in Germany, and this summary is published here somewhat condensed, as it may serve as a possible unofficial supplement, by a prominent German engineer and railway manager, to the report of the committee. Mr. Stein says:

They could not only have seen interesting historical objects, like the first electric car in the world, made by Siemens, but also developments which constitute today a decided advance in electric railway engineering and operating developments. Some equipment of chiefly German character was seen by the visitors in Switzerland, such as single-phase, main-road electrification and the bow type of trolley for surface cars. Notable developments in overhead line construction and locomotives for single-phase main-line operation, however, could have been studied to better advantage in Germany, particularly unusually large single-phase motors. It would have been possible on the urban and suburban lines in Berlin to have observed the latest types of direct-current equipment. Mercury-arc rectifier sets, much larger than those in France and Switzerland, could also have been inspected in Germany. The American visitors would have had an opportunity of observing the excellent results obtained on surface lines with brakes of the short-circuit, disk or solenoid types, which have given in this service better general results than air brakes or magnetic rail brakes. Of the latter kind of brakes, some notable models could have been seen in use on track with heavy grades, so arranged as to permit regeneration.

The visitors could also have learned how Germany has succeeded in economizing in the use of material and electrical energy. They would have found very interesting improvements in armature bearings and axle bearings, particularly in the use of roller and ball bearings and new types of inexpensive anti-friction bearing metal such as Lurgi metal. Oil-electric cars and storage-battery cars could have been seen in operation. Data could have been obtained in regard to progress in the development of rail sections. It should be remembered that the first rolled girder rail was produced in Germany (in 1873) and that the thermit-welding process was a German invention. The committee could have seen, in Dortmund, a four-wheeled car with a 4-m. (13-ft. 2-in.) wheelbase, equipped with a high-speed motor and automobile type of gear transmission. If they had visited Hamburg, they would have seen a new six-wheel auto bus. They would also have had an opportunity to observe important developments in signaling systems, such as the trouble signals in Hamburg, new methods of fare collection and accounting.

But most important of all, the committee would have found how common the practice is in Germany to plan the extension of city railway systems so as to fit in with future building operations. In many countries this is considered a practically unattainable ideal, but in Germany laws have been passed in this respect and good results are being obtained. Finally, they would have been able to see how engineer and architect, when working together, can design such attractive structures for use with subways and elevated railroads that these structures harmonize with the general architecture of the city.

Aurora-Elgin Time-Table Carries Much Local Information

INSTEAD of carrying advertisements, the back of the new time-table folder of the Aurora, Elgin & Fox River Electric Company contains useful information for commercial men as well as regular patrons. The interurban service time-table is printed on one side of an eight-page folder which measures 6¾ in. x 3½ in. On the other side of the sheet is information relative to Aurora, Elgin and the small towns through which the interurban line passes. Lists of clubs, theaters, hotels, hospitals, parks, banks and manufacturers are given. In the tabulation of manufacturers in Aurora and Elgin opposite each manufacturer's name is the name of the local street car line which passes near it. This information gives the commercial traveler an alphabetical list of manufacturers, their addresses and how to reach them.

In addition to this information, schedules of city car operation in Aurora and Elgin appear in the time-table. These schedules give the time of departure at the center of town and at the terminals for cars on all lines.

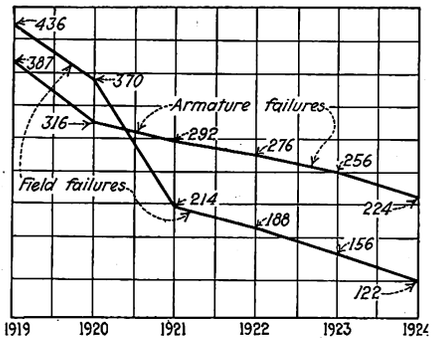
Equipment Maintenance Notes

Dipping and Baking Motor Frames Reduces Field Failures

A REDUCTION to about one-quarter of the former number of field failures has been made by the Washington Railway & Electric Company, Washington, D. C., during the past 5 years. Dipping and baking of armatures and fields was begun on an extensive scale in 1920 and dipping and baking of frames with fields in place was started in 1922. Although many factors have contributed to this result, it is felt by the company that the practice of dipping and baking motor frames with the fields in place has been an important reason for the improved performance record.

For this purpose an electric baking oven and dipping apparatus, as shown in the accompanying illustration, was built by the railway and installed in its P Street shops in 1922. Just before the motor frames are to be returned to service and after the new fields have been installed they are baked and dipped. The frame is preheated at 200 deg. F. for 7 hours in the electric oven.



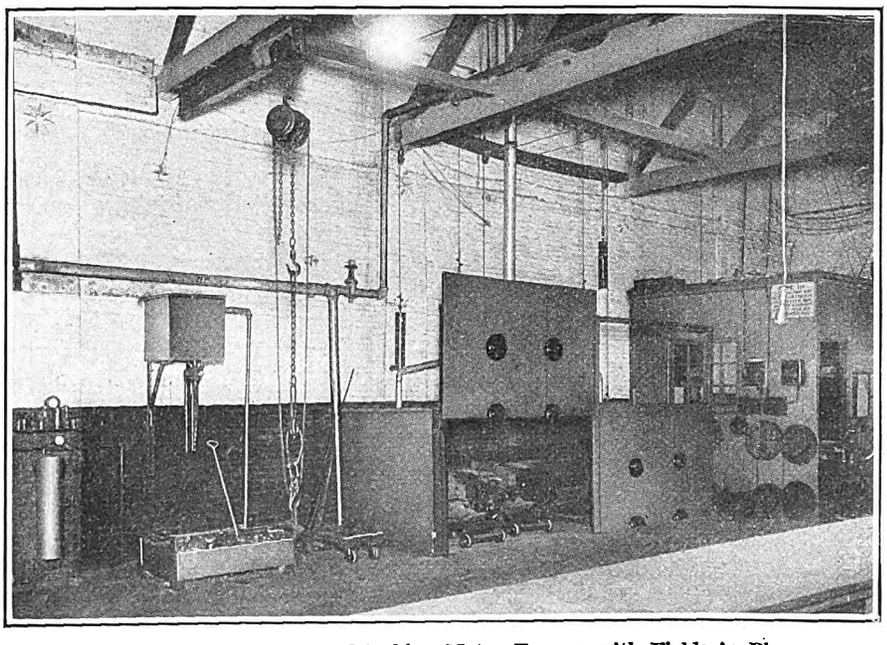
Total Armature and Field Failures

The effect of dipping and baking on the number of field and armature failures is clearly shown by the marked reduction since 1920.

Small trucks used to move motors around the shops are run right into the baking oven.

After the frame has been preheated all holes are plugged and it is suspended by the chain hoist above a shallow varnish pan. Wooden disks cover the openings usually occupied by the bearing housings. The frame is then filled with varnish from a tank above the pan. This is allowed to remain for 10 or 15 minutes until all bubbling ceases, when the varnish is allowed to run out into the pan. From the pan it flows through a pipe to an underground tank. After the pan is empty, a valve closes the pipe opening. A storage air tank located near by on the wall is connected to the underground varnish tank, so that the liquid can be raised by compressed air to the tank shown in the accompanying illustration.

After the frames have been thus impregnated with varnish they are allowed to cool. It is not thought necessary to return them to the ovens for further baking. The heat which the iron has accumulated during the 7 hours previous baking is retained for a sufficiently long time to dry out the varnish properly. All motor frames are treated in this way when they are returned to the shop for their regular 60,000-mile overhauling.

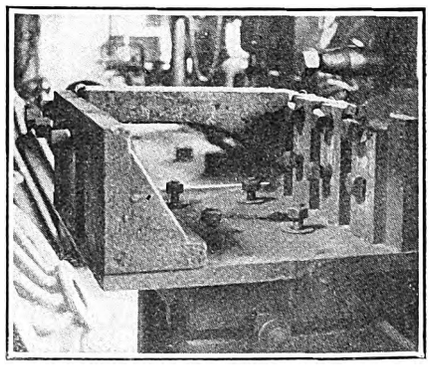


Apparatus for Dipping and Baking Motor Frames with Fields in Place

On the right are the plugs which are used to stop up openings in the frames. In the center is the electric baking oven, containing two motor frames. To the left is the varnish tank and the pan into which the varnish is emptied after the frames have been treated. Air control equipment is shown at the extreme left.

Pedestal Jaws Finished in Shaper

IN THE shops of the Gary Street Railway, Gary, Ind., cast-steel, bolted-type pedestal jaws, when badly worn, are replaced with new castings. These replacement castings are finished four at a time in a fixture attached to the bed of a shaper. These are held at one end by means of square-headed bolts and at the other end by setscrews. The fixture consists of a heavy steel base with uprights at two edges. The base is a piece of 1-in. rolled steel approximately 24 in. square. One upright is of 1¼-in. steel, grooved out to receive the shoulders on the top of the pedestal casting. Two ¾-in. square-headed bolts are used to fasten each casting to this upright.



Four Pedestal Jaw Castings Are Machined at One Time in This Fixture

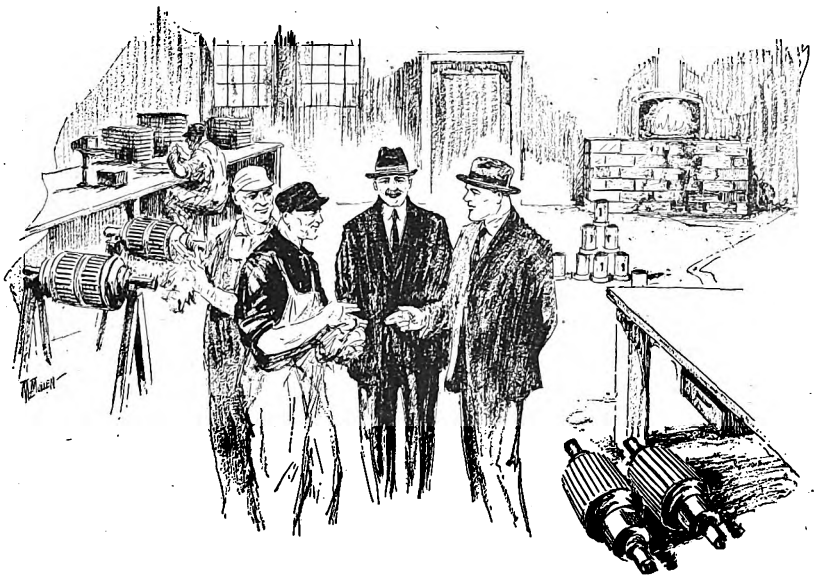
Dick Visits the Centerville Shop

And Makes a Suggestion



DICK PRESCOTT and Steve White of the Consolidated Railway & Light Company finally reached the Centerville railway shop. The master mechanic proved to be a very pleasant fellow. After Dick and Steve had explained to him that their inspection trip was for the purpose of gathering new ideas and information on current methods, the three started out through the shop. As they went over the work of various departments, many questions of maintenance practice were freely discussed between the two visitors and the master mechanic.

After several hours they found themselves in the armature room with the foreman of that department. While awaiting the return of the master mechanic, who had been called to the telephone, the subject of bearing maintenance came up.

"How do you decide when bearings should come out?" asked Dick. "Do you have definitely established limits of wear?"

"Why, let's see; I don't know how the stations are handlin' that now; wait'll I see. Oh, John, come 'ere a minute, will yuh?"

A husky, grimy workman approached the group in response to the foreman's call, wiping his hands on a piece of waste as he came.

"Say, John, how do those fellahs out at the station tell when bearin's have to come out?"

John hesitated a moment. Then he replied, "Why, they put a bar up under th' pinion and feel when she's gettin' pretty loose."

"Well, do they have a definite limit of wear allowance?" asked Dick.

"Sure, they take 'em out before th' armature tears up on th' poles. They feel when she's pretty loose with the bar. Sometimes they look at the armature to see if she's rubbin'."

"How about axle bearings?" questioned Dick.

"Oh, you can tell when they're gettin' pretty thin by heavin' up on th' motor with a bar."

"Well, then, you don't set a certain limit of wear and then take them out when they've reached that point?"

"Huh?—Oh, they jus' take 'em out when they look pretty loose."

As the master mechanic rejoined the group, the armature room foreman nodded to John, who returned to his bench, still wiping his hands on the piece of waste.

"What mileage do you get from gears and pinions?" asked Dick, addressing the master mechanic.

"Why, we don't have a record of the mileage of each one. I think we're gettin' pretty good mileage from the gears we've got, but I'm afraid they're a little too hard. We do have lots of trouble from broken teeth. Sometimes, when one piece breaks out it gets jammed in the teeth and bungs up the whole gear, and we've had some shafts break when they jammed. It sure makes a mess of the armature when a pinion breaks."

"We've just been talking about axle bearings," replied Dick. "Don't you think letting the bearings go too long might cause some of that breakage?"

"I don't know," replied the master mechanic. "There may be somethin' in that, though—we do get a ridge worn in the pinion face sometimes, out near the end of the tooth."

"I'm beginning to believe," said Dick, "that we've all been too economical on this matter of bearings, and that establishment of definite limits of wear would not only keep our gears fitting better but would reduce a lot of noise and vibration."

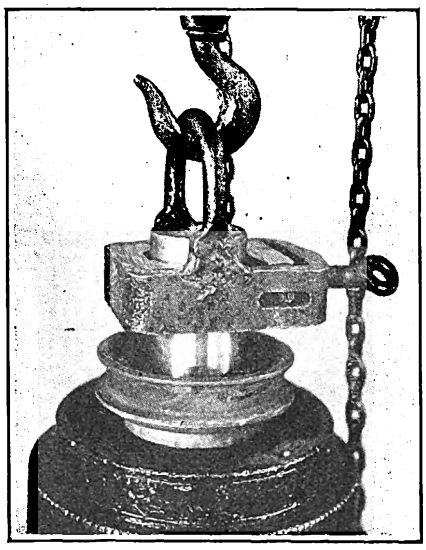
"I don't know but what there's some truth in what you say. If you get any more dope on that, I'd like to get hold of it."

"Fine!" said Dick. "I'll be glad to drop you a line when we get back."

The other upright contains four setscrews of ¾ in. diameter for steadying the small ends of the pedestal jaws. This upright may be removed from the base so that the castings may be easily mounted in the permanent upright. The jaws are first fastened to the permanent upright, after which the movable upright is placed in position. The setscrews are then run in to hold the castings. This set-up requires less than 10 minutes to make and allows four jaws to be machined at one time. The entire fixture was constructed in the shop from materials on hand and has proved handy in expediting this particular machining job.

Clamp for Holding Armatures Vertically

ARMATURES are dipped with the commutator end up in the shops of the Department of Street Railways, City of Detroit. For holding the armatures while supported by the hoist and also during handling, a clamp has been designed to fit the upper end of the armature shaft. This method of support keeps the clamp free from the compound during dipping and also facilitates rapid handling.



Clamp Applied to Armature Shaft to Support It in Vertical Position

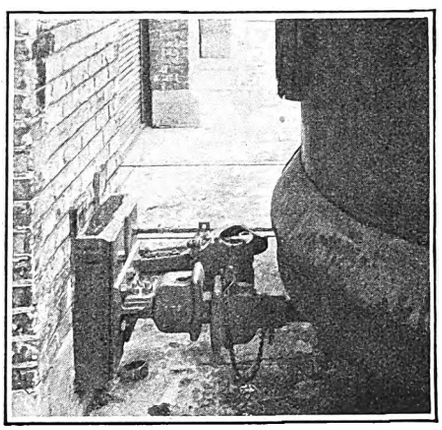
The clamp consists of a casting with hook top. Two copper jaws are arranged to slide inside the casting, one being of V-shape, which is stationary, the other having ends which fit in slots of the casting to act as guides. After placing the clamp over the end of the shaft, it is tightened by means of an eyescrew. The copper pieces which bear against the shaft prevent injury and at the same

Digitized by Google

time insure a tight clamping action, so that there is no danger of the clamp slipping.

Testing Drawbars on Cars

DRAWBARS on the cars of the Milwaukee Electric Railway & Light Company are tested by coupling and uncoupling with stationary drawbars mounted on pillars between tracks at both ends of the transfer table bay. The tests are made at the Cold Spring shops. A rack on each side of the bay is equipped



A Rack Mounted on a Carhouse Pillar Between Tracks Contains Two Types of Drawbars to Which a Car on the Transfer Table May Be Coupled for Testing the Coupler and Draft Rigging

with one city type and one interurban type drawbar head. Both of these are identical in every detail with the types of couplers used on the cars. The rack is so mounted that the height of the drawbar heads on the rack is the same as the height of the drawbars on the cars.

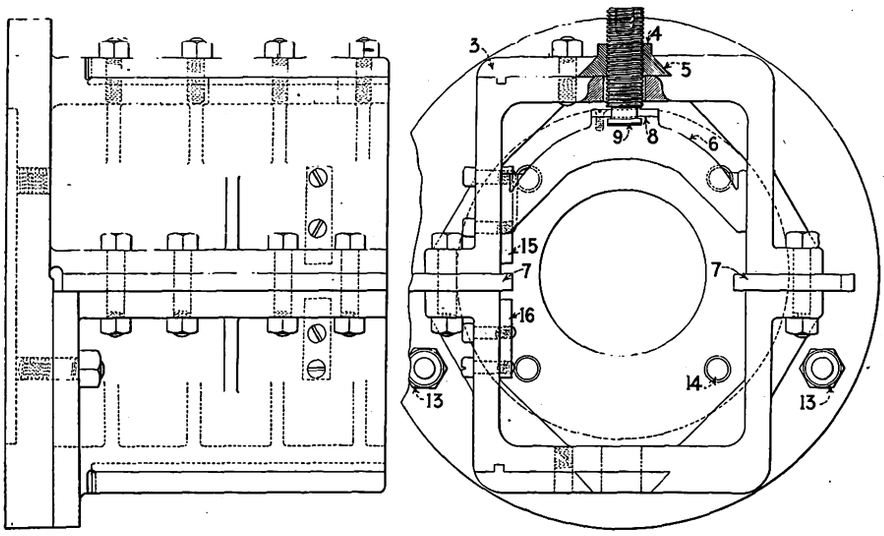
Inasmuch as all cars entering and leaving the repair shop floor are handled by the transfer table, they must necessarily pass by the racks. In this method of testing it is only necessary to stop the table at the proper place to line up the drawbars. Coupling and uncoupling are accomplished in the usual manner, the car being moved back and forth on the transfer table under its own power.

It has been found that visual inspection, or inspection with especially designed gages will not always disclose defects in the draft rigging, so that a more reliable system was needed. This practical method of testing by actually coupling with stationary drawbars has proved very reliable and actually discloses irregularities in the coupling devices which would be difficult of detection by any other system.

Lathe Chuck for Axle Bearings

THE difficulty frequently experienced in chucking axle bearings for boring is overcome in the Hillcrest shops of the Toronto Transportation Commission by use of a special chuck, shown in the accompanying illustration, which holds the bearing securely for reboring. The self-centering arrangement makes adjustment easy and saves much time and labor.

The chuck is bolted to the face plate of the lathe by stud bolts through the holes, No. 14 in the accompanying drawing. When in position the locating pads, which are No. 7 in the sketch, have one surface on the center line of the face plate. The axle bearing when placed in position has its split surface resting on the locating pads. The clamping screw at the top is then screwed down, which forces the clamping body down so as to hold the bearing firmly in position. After this has been done, the clamping screw is held firmly by the nut No. 5 and also by a nut clamp No. 3, which prevents any loosening.

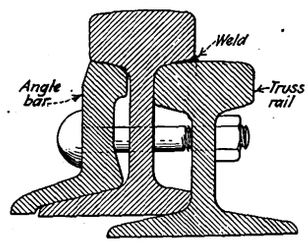


Axle-Bearing Chuck Used for Machining Bearings by the Toronto Transportation Commission

(3) Cast-iron nut clamp, (4) clamping screw, (5) bronze nuts, (6) cast-iron bearing clamp, (7) locating pads, made of tool steel, (8) retaining plates of machine steel, (9) tool steel wearing plates, (13) chuck studs, (14) face-plate studs to hold chuck in position, (15) top key, (16) bottom key.

Truss Rail for Repairing Rail Joints

ABOUT 200 rail joints with angle bars worn so badly that they did not give proper support were reconstructed by the Lincoln Traction Company, Lincoln, Neb. They were repaired by using a 6-ft. length of scrap T-rail of the same section as the rail to be repaired. The section of rail was drilled with the same spacing of holes as the angle bars, and was then driven under the outside at the joint as is shown in the accompanying illustration. One angle bar was used on the inside of the joint which was bolted through the running rail tightly to the truss rail. In addition, the two rail heads were welded along the seam. This made a very firm joint almost equal to continuous rail. The length of the truss section was sufficient to rest on four ties.



Truss Rail Construction Used for Repairing Worn Joints

Precautions in Replacing Field Coils

THE following points are well worth following while overhauling or repairing the field windings of railway motors:

1. The field coils and motor frames should be cleaned and painted.
2. Care should be used to make certain that field coils are placed properly in the frames, so as to give the proper polarity.
3. The use of a winding diagram will aid the man who is connecting the field coils, and assist in preventing wrong connections.
4. The polarity of each pole should be checked after coil is installed.

Digitized by Google

5. Where coils are connected by means of cable leads, connections between coils should be made by butting the ends together and then covering the joint with a copper sleeve, which is soldered in place.

6. When coils have terminals, the end of the cable which fits into the terminal should have a metal sleeve soldered over the wire. This will prevent damage to the ends of the wire and insure a tight connection when the terminal screws are in proper position.

7. The ends of cables which connect to brush-holders should also be provided with metal sleeves or terminals that can be securely clamped and locked to the brush-holder casting.

8. All wiring around the frame should be securely anchored to the frame to prevent vibration and keep the insulation from being rubbed or cut by rotating parts.

9. Motor leads coming out of the frame should be protected by insulated bushings.

10. Coils should be spring-supported, and where necessary they should be backed up by washers of either metal or fiber, well painted.

11. Springs and washers should be taped temporarily to the coils while they are being replaced in order to keep the parts from working out of place and getting in between the pole and pole seat during assembly.

12. The surface of the pole and pole seat should be cleaned carefully in order to insure a good close fit when the bolts are drawn up tight.

13. A lock washer should be placed under each nut, and white lead added over the nut after tightening to prevent the entrance of water.

14. Poles should never be pounded into place with a sledge. The use of a wooden block or piece of soft metal will prevent damage.

15. After assembling, the poles should be sounded with a small hammer to insure that they are drawn up tight.

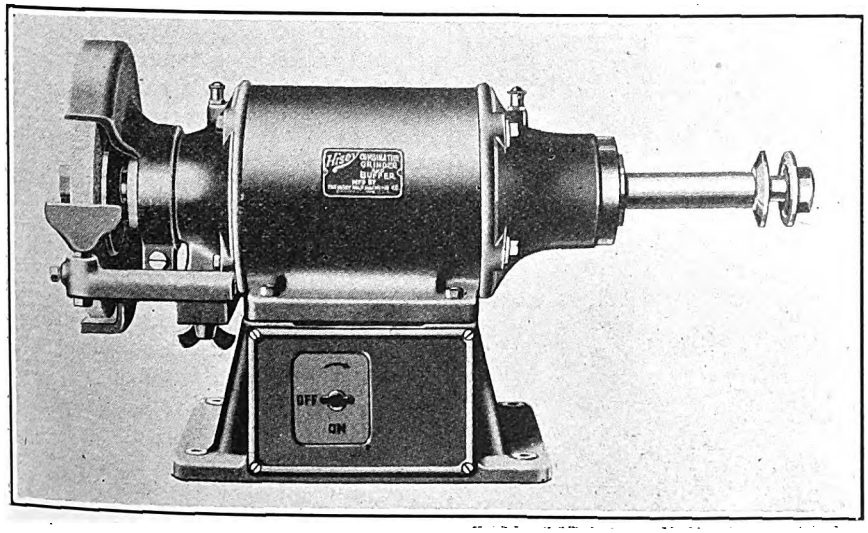
16. Where dipping and baking are carried out, best results are obtained from dipping and baking the entire frame after the coils are in place.

New Equipment Available

Grinding and Buffing Machines

A COMBINATION grinder and buffer of bench type and with floor-stand combination is being placed on the market by the Hisey-Wolff Machine Company, Cincinnati, Ohio. The bench machine is made in ½-hp. and 1-hp. sizes and is designed with an open type of spindle extension. The floor type machine is also made in ½-hp. and 1-hp. sizes, but is regularly furnished with encased spindles. These machines can be used for a large variety of shop work requiring the use of a grinding wheel, buffing wheel, wire brush or rotary wire rasp wheel. The machines with encased spindle are fitted with four ball bearings, while the open-spindle machines require only two. All bearings are completely inclosed, and are provided with heavy felt washers on each side of the bearing housing to keep out dust and grit.

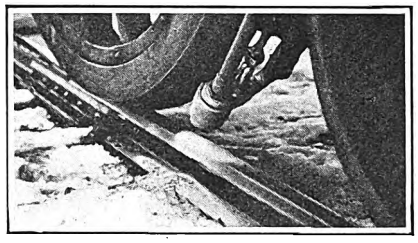
The spindles are unusually heavy and are made of high-grade steel, accurately ground. Flange washers are machined all over to provide accurate balancing. All inner flanges are firmly keyed to the spindle, but can be removed easily by hand. The machines are furnished with either direct or alternating current motors.



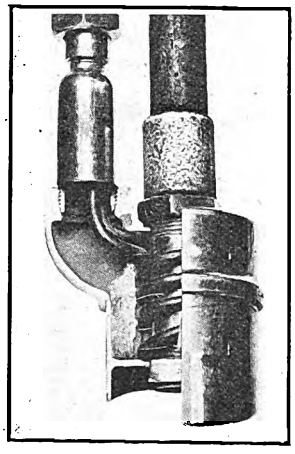
This Bench Type Combination Grinder and Buffer Has an Open Spindle Extension

Electric Sandpipe Heater

A TYPE of electric sandpipe heater for use on electric cars and locomotives to keep the lower end of the sandpipe dry and prevent clogging is being marketed by the Universal Electric Sandpipe Heater Company, Philadelphia, Pa. This heater is



Electric Sandpipe Heater as Installed on Locomotive



Section of Sandpipe Heater Showing Interior Construction

arranged to screw into the end of the sandpipe and a separate connection is provided for the conduit which carries the electrical connections. Standard armored cable can also be used. The function of the device is to keep the end of the sandpipe dry, as in stormy weather wet sand will not flow freely from the lower end of the sandpipe and the particles which stick to the sides of the pipe will eventually close the outlet.

The method of mounting and the construction of the device are shown in the accompanying illustrations. Inside the shell of the main heater

Digitized by Google

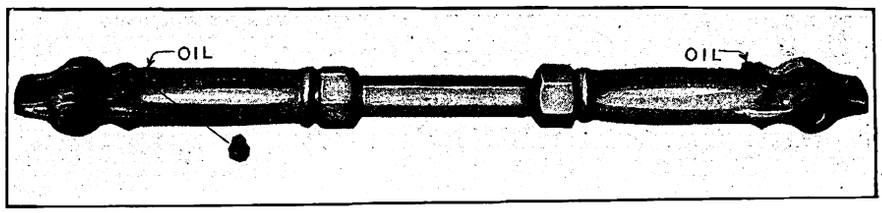
casting and around the lower end of the sandpipe is fitted the heating element. This consists of a length of Nichrome wire inclosed in but insulated from a metallic tube. This heating element is bent to a spiral form so as to surround the sandpipe, and the two leads for electrical connections are brought out through a separate opening in the casting. The heating element is made by the General Electric Company, Schenectady, N. Y.

When installed on electric cars or electric locomotives, the heating element is connected in series with one of the lighting circuits. The voltage and amount of current which passes through the element are thus reduced without the necessity of providing an additional external resistance.

A dependable flow of sand is essential to safe operation of electric cars and this sandpipe heater overcomes the difficulty of stoppage due to moisture and freezing conditions.

Lubricated Brake-Rod Casting

A FORM of brake-rod casting used by the J. G. Brill Company, Philadelphia, Pa., for the past two years on its type 79-E truck is now being applied to pivotal trucks wherever possible. In the design of this casting the lever end is closed so as to provide an oil chamber, access to which is through an opening tapped in the top of the casting. With the lever end closed the threaded brake rod is protected from dirt, water and snow. Being lubricated, it is safeguarded against rust. These advantages will be readily appreciated by the railway operating men as difficulties due to brake rods rusting tight are prevented and brake adjustments can be made more easily.



Closed Brake-Rod Casting with Provision for Lubrication

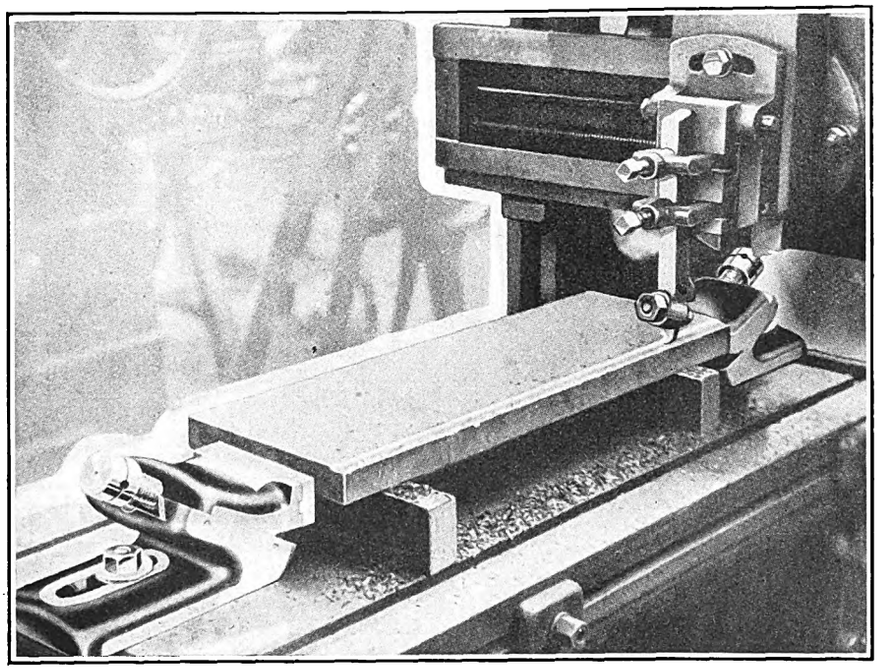
Divided Machine Vise

IN ORDER to overcome difficulties from clamping irregular shaped pieces for work on various machine tools, the Coats Machine Tool Company, New York, N. Y., has developed a divided machine vise. It is designed to hold tapered or irregular work in a parallel position and combines adjustability in height with an unlimited span. Through use of a compound parallel and downward movement of the jaws, the work is bedded on its support and eliminates the use of a hammer. The downward thrust of the jaws also permits the clamping of comparatively thin plates, so as to keep them lined up accurately on their packing pieces.

The body and jaws of the vise are made of close grained cast iron and the jaws are faced with hard steel serrated surfaces to insure a good grip. Screws are of steel and have right and left-hand threads, the left-hand thread running in a solid nut on the moving jaw, and the right-hand thread in the nut which is secured to the body. Each revolution of the screw produces a movement of the jaws equal to twice the pitch of the screw.

The jaws can be used either singly, in pairs, or in threes or fours, where necessary to clamp irregular shapes firmly. They may be placed in an offset position, as is frequently required by the shape of the work. Their main field of usefulness in electric railway shops is on the tables of planing, milling, drilling, shaping and slotting machines.

The vises are made in three sizes, with the width of jaw ranging from 2½ in. up to 10 in. and the diameter of the screw from ½ in. to 1½ in. The approximate weights per pair are 6 lb., 40 lb. and 220 lb. respectively, which takes care of all sizes of irregular work.



Divided Vise Clamping Work on Planer for Machining

Controllers for Shop Motors

AMONG the recent developments in control equipment for shop motors are three new types of starters being marketed by the General Electric Company, Schenectady, N. Y. These include an inclosed magnetic switch for starting two and three-phase alternating-current motors and two types of automatic starters for synchronous motors, one for full-voltage starting and the other for reduced-voltage starting.

With the inclosed magnetic switch, overload protection is provided by means of a relay which follows the heating curves of the motor. This switch can be operated by push button, pressure governor, float switch or similar device, and when used as a primary switch the only accessory needed is a drum switch.

Special features of the automatic starter include a temperature overload relay for close protection of the motor from overload, and a definite time relay which determines the accelerating period.

Southern Equipment Men Meet in Dallas

Ways to Reduce the Number of Pull-Ins, Car Painting, Education of Mechanical Employees, and Motor Maintenance Were Among the Subjects Discussed

A VARIETY of practical questions was discussed at the seventh semi-annual meeting of the Electric Railway Association of Equipment Men, Southern Properties, held in Dallas Jan. 21, 22 and 23. On the second day a joint meeting was held with the mechanical division of the Southwestern Public Service Association, and on the third day a trip was made to Fort Worth on the invitation of the Northern Texas Traction Company to inspect the shops.

A new system of overhauling cars on a 40,000-mile basis at New Orleans was described by R. M. O'Brien. This plan was outlined in ELECTRIC RAILWAY JOURNAL for June 21, 1924. Mr. O'Brien said that it is costing the New Orleans Public Service, Inc., $75,000 to start the system. In this is included the cost of extra parts, such as extra trucks, extra motors and extra line breakers. These will be changed every 40,000 miles. When cars are brought into the shops for overhauling, other trucks will be ready and other motors, line breakers, etc. The old equipment will be sent to be repaired by the practical railway shopmen and then to be tested by an engineer. The motor going out of the shop will be in as good condition as when first it came from the factory, Mr. O'Brien said. This new system is expected to result in a saving of about $450,000 per year.

After considerable discussion as to what really constitutes a "pull-in" the following definition was adopted: "A car which has to be removed from service prior to the completion of its regular prescribed run for any mechanical, electrical or man failure or accident will be termed a pull-in."

CAR PAINTING METHODS

Speaking on the subject of car painting, A. Taurman said that the painting of a car being repaired or rebuilt should begin when the parts are being assembled. In the painting of new steel cars, the inspector should pay special attention to the steel before it is assembled to see that it is carefully sandblasted and cleaned free of all dirt and grease, and that the primer is placed on this steel immediately after it has been sandblasted before rust has an opportunity to begin. He should also see that all concealed parts are painted before the steel is assembled.

Similar care should be exercised, Mr. Taurman said, in the assembling of wooden parts. All joints should be carefully white-leaded and all surfaces that are covered up or lapped should be given a coat of paint. As a strictly preservative precaution, the painting of the concealed parts adds more to the life of the car than any other detail of painting. Most painters, however, are prone to pay more attention to the finished and exposed surfaces than to the hidden parts. After all surfaces have been thoroughly primed and all crevices, cracks, nail and screw holes puttied up, the appearance of the finished job will be much better if all uneven parts are sanded off smoothly.

While it is very essential to have the best material possible, too much thought cannot be given to the manner in which the painting is done. The surroundings and temperature of the paint shop are very important items, Mr. Taurman said. The paint shop should be kept warm and as dry as possible at all times. In fact, it is much better to have the cars thoroughly dried out before the painting is begun. Good results can be obtained from a number of the standard painting systems, and enamel has good features, too, Mr. Taurman thought, especially because it saves time. Flat color and varnish, however, are preferred by him because it is possible to use more varnish than with the enamel system.

EDUCATING SHOPMEN

Effective methods of educating the employees in the mechanical department were considered at length. Mr. Taurman said that the best way was to arouse the interest of the men, and to inform them of what the company is trying to do. This makes their work easier and more pleasant. The practice of the Shreveport Railways, according to C. D. Rushing, is to explain to every man his mistakes. This company also urges its employees to read ELECTRIC RAILWAY JOURNAL and other publications. If any employee has a good suggestion, the company is glad to try it. Putting a new man with an old man who is familiar with mechanical work is recommended by I. E. Kinser. Ideas along somewhat the same lines were outlined by W. Silvus, C. B. Lane and J. J. Vaughn.

In Fort Worth, the Northern Texas Traction Company has night classes for mechanical men. The I. C. S. course is taught to the employees at classes held two nights a week. If a man finishes his course, he is reimbursed for the cost, according to J. T. Porter, but if he does not finish it, he must stand the expense himself. Advantages of the I. C. S. courses and other vocational training courses were described by H. C. Pressler and W. W. Holden.

Mr. O'Brien stated that he holds a meeting of the foremen once a month. At this meeting they select some one subject and discuss it. Mr. O'Brien displayed a textbook which is furnished to every man in the mechanical department of the New Orleans Public Service, Inc. The men are allowed to take these books home to study. Good results have been obtained by this means, he said.

Having few pull-ins is a good indication that the equipment is well maintained, in the opinion of Richard Merriweather, vice-president and general manager Dallas Railway, who addressed the meeting. The Dallas Railway has profited by belonging to the Electric Railway Association of Equipment Men, Southern Properties, he said. Records of pull-ins during the past 3 years indicate that this company is progressing, and it is due to the fact of belonging to the association, he believes, because attention was thereby directed to the matter of pull-ins.

Mr. Meriwether also emphasized the importance of educating the shop men. It makes very little difference how good a mechanic the man at the head of the equipment department may be; if he is not an executive and cannot organize his forces and inspire them in a way to get the best work from them, he is a failure. Although he may be the best mechanic in the world, he is worth nothing to his company unless he has ability as an organizer. Work in the mechanical department is likely to get stale unless the interest of the men is maintained. A man working at a bench gets into a rut easily, but education will go far to develop him and push him along, Mr. Meriwether said.

MOTOR VENTILATION STUDIED

Methods of installing exterior ventilators on non-ventilated railway motors were described by Mr. Rushing. His company has installed a ventilator furnished by the Westinghouse Electric & Manufacturing Company on the commutator end of Westinghouse No. 306 motors. Two cars were equipped in this way 5 months ago and a recent inspection showed that the motors were in much better condition than the motors without ventilation. A new shaft is furnished with the commutator end tapered to fit the new housing necessitated by the ventilator. As far as ventilation is concerned Mr. Rushing said that it is entirely satisfactory and the motor is much cleaner inside.

Considerable variation in the period of inspection among the different companies was indicated by the discussion on this subject. The frequency when based on mileage varied from 500 to 2,000 miles. Companies making inspection on a time basis generally do so every 7 days, but a few use 8 or 10 days as the inspection period.

A brush-holder designed by the Westinghouse Electric & Manufacturing

Digitized by Google

Company to prevent dirt getting in between the brush and the holder in ventilated motors was exhibited by W. C. Looney. He said that by using this brush-holder the Houston Electric Company had increased the mileage from 1,500 to more than 8,000.

The comparative life of armatures as a result of dipping and baking was discussed. Mr. Taurman said that his company got three times as much life out of armatures that had been dipped and baked. F. Wampler said that the Cincinnati, Newport & Covington Railway had been obtaining an average life of 76,000 miles per armature before dipping and baking and that this had been increased to 342,000 miles. M. B. Osborne estimated that this process doubles the life of armatures. Mr. Pressler agreed with this view and W. K. Curtis estimated the increase in efficiency at 20 per cent.

The frequency with which it is necessary to renew motor leads developed considerable divergence of opinion. Estimates of their useful life varied between 4 and 10 years.

At the end of the Thursday afternoon meeting officers were elected for the coming year. The present officials —A. D. McWhorter, president, and A. Taurman, vice-president and secretary-treasurer—were unanimously elected. On the invitation of J. M. Kington it was decided to hold the next meeting of the association in Knoxville, Tenn., on July 22, 23 and 24.

Members present at the meeting were: A. D. McWhorter, A. Taurman, G. D. Rushing, E. D. Wright, Frank Wampler, E. W. Jenkins, F. T. Dawkins, W. Silvus, I. E. Kinser, W. H. Curtis, J. J. Vaughn, R. M. O'Brien, J. M. Kington and J. L. Brown.

L. B. Stillwell to Head Engineering Foundation

AT THE 10th annual meeting of the Engineering Foundation board, held in New York recently, L. B. Stillwell was elected chairman of the Foundation. He succeeds C. F. Rand, who declined re-election after serving for 5 years. E. D. Adams, who has been first vice-chairman since 1915, was re-elected to that office. E. A. Sperry was chosen second vice-president. Other officers named were: Treasurer, J. S. Langthorn; assistant treasurer, H. A. Lardner; director and secretary, A. D. Flinn.

Mr. Stillwell is a past-president of the American Institute of Electrical Engineers and the American Institute of Consulting Engineers. He is a member of the American Society of Civil Engineers, the American Engineering Council, the National Academy of Sciences, the Institution of Electrical Engineers of Great Britain, the Royal Society of Arts of Great Britain, the American Philosophical Society and the Franklin Institute. He is also a trustee of Princeton University and a director of the United States Chamber of Commerce. For several years he was connected with the Westinghouse Electric & Manufacturing Company. Later he was identified with the electrification of the Manhattan Elevated Railway and the rapid transit systems in New York city and elsewhere.

Announcement was made at the same meeting that the four founder societies of civil, mining, mechanical and electrical engineers had begun the study of plans to increase the endowment of the Foundation, established by Ambrose Swasey with a gift of $500,000, and recently supplemented by a bequest of $50,000 under the will of Henry R. Towne.

Hoover Sees Progress in Highway Safety Program

REAL progress toward better control of traffic to prevent accidents has been made since the recent conference on highway safety, according to Herbert Hoover, Secretary of Commerce. On this subject Mr. Hoover said:

"Legislation to improve safety on the highways has been introduced into 38 state legislatures since Jan. 1. The various classes of legislation and the number of states in which each class has been introduced can be summed up as follows: Licensing of drivers, 11 states; driving while intoxicated, 17; failure to stop after accident, 6; speed, 12; impounding or confiscation of the car as a penalty for violations of the motor vehicle law, 2, and for transporting liquor or other illegal use, 7; compulsory stopping at railroad crossing, 12 (one legislature is considering a bill to repeal an existing railroad crossing stop law); certification of title, 10; compulsory automobile insurance or bond, 20.

"Recently a law has been introduced in one state legislature amending a law of 1858 with regard to 'the passage of each other by vehicles on the highway,' thus showing that the traffic problem is by no means a new one.

"This legislation, if adopted, will increase to 23 the number of states which require that all drivers of motor vehicles shall be licensed. Fourteen more states will require licenses for drivers of vehicles for hire, while there would remain 11 states without operators' license laws of any kind. Twenty-two states will require some sort of examination before the issuance of license to the applicant.

"In addition to state activities, movements are being started in a large number of cities for carrying out the recommendations of the conference for the co-operative organization of communities for public safety. While many of these cities have had safety programs in the past, these are being revised and an effort is being made to have them conform to the national program as far as local conditions will permit.

"At the present time 12 states have laws requiring the certification and registration of automobile titles, while similar laws are being introduced in the present sessions of the legislatures of four others. The conference designated this class of legislation as 'one of the most important and effective means for reducing thefts, and, by virtue of this result, owing to the relation between the theft and accident hazards, also a measure for improving the present public accident situation."

Pacific Claim Agents' Association

THE next meeting of the Pacific Claim Agents' Association will be held at the Hotel Biltmore, Los Angeles, Cal., July 22 to July 25, inclusive. This date was set at a meeting of the executive committee of the association, held at the offices of the claims department of the Market Street Railway, San Francisco, on Feb. 14. A tentative list of subjects follows:

"Will Periodical Physical and Mental Examinations of Trainmen Reduce Accidents? How Often Should These Examinations Take Place and What Should Be the Scope of Such Examinations?"

"Methods of Facilitating Vehicular Traffic in Cities."

"The Advantages and Disadvantages of Presenting Claims Against Automobile Owners and Others Responsible for Damage to Company Property."

"Perfecting Plans for Reference so that the Claims Department in an Emergency Can Be Readily Enlarged to Meet Any Catastrophe that May Arise on Company Property."

"Training of Men for Positions as Investigators and Adjusters."

American Association News

A. E. R. A. in New Quarters

NEW OFFICES are now being occupied by the American Electric Railway Association. They are in the Johns-Manville Building, 292 Madison Avenue, New York, at the southwest corner of East 41st Street. The move from the former quarters at 8 West 40th Street was made over the holiday which included Feb. 23. The change was made with great celerity.

The space now occupied comprises the whole 14th floor. The quarters are plainly but comfortably and efficiently furnished and arranged. Partitions, the upper half of which are glass, separate the various offices. The lighting system is semi-direct. As for the building itself, it is about 5 minutes walk from the Grand Central Terminal, 3 minutes from the subway system and surface lines, and close to the Engineers' Club and the Transportation Club.

More than 2 years ago the former office space became overcrowded, and the association took over two additional rooms on the same floor. The volume of work continued to increase, and a year ago additional space was taken on the fifth floor of the building. This arrangement was not satisfactory since it separated the Bureau of Information and Service from the rest of the headquarters, but it was the best that could be done at the time.

L. S. Storrs, the new managing director of the association, will have his headquarters in the Johns-Manville Building, but their location has not been definitely determined. His suite, however, will probably be on the 12th floor of the building, the one immediately below the floor now occupied by the other officers of the association. There is no 13th floor.

Home Rule for Buses Up Again in Ohio

The hearing before the Public Utilities Commission of Ohio on the applications of the People's Motor Bus Company and the Cleveland Railway for operating rights in Cleveland, scheduled for Feb. 11, was postponed indefinitely to give the State Legislature, now in session, a chance to consider amendments that have been proposed to the existing law under which the operation of buses is regulated. One of these amendments will take control of motor bus transportation in cities and in municipalities contiguous thereto from the State Public Utilities Commission and place it in the hands of the local governments. A bill to do this has already passed the State Senate, and lacked but one vote of passing the House on Feb. 19. On reconsideration the measure was to come up again during the week ended Feb. 28.

Unlawful for City to Pass Ordinance Against One-Man Cars

Judge Isaac Wolf in the Superior Court at New Haven, Conn., recently granted a permanent injunction restraining the city of New Haven from interfering with the operation of the one-man double-truck trolley cars used by the Connecticut Company in that city.

In handing down his decision Judge Wolf made it plain that the issue did not involve whether the ordinance in question should be adopted and enforced upon the ground of public convenience and safety, but merely whether the city by provisions of its charter is vested with power to pass such an ordinance. The city protested the operation of the one-man double-truck trolleys with "An ordinance to prevent accidents, facilitate traffic and preserve good order in the streets of the city and highway districts and to secure the safety of persons using said streets."

No Abandonment on Five Lines in Buffalo

The Public Service Commission issued an order directing the International Railway not to abandon service on Feb. 22 on five of its local lines in Buffalo as had been threatened.

In a conference with members of the Public Service Commission in New York city 48 hours prior to the time the abandonment order was to go into effect Coleman Joyce, chief counsel for Mitten Management, Inc., although consenting to withdraw the order, said that no court or commission could force the company to undertake the operation of a non-paying enterprise and that the International Railway has been operating its system at an annual loss of $660,000. The commission, however, issued a mandatory order directing continued operation of the five lines which were scheduled for abandonment.

One-man cars were placed in operation on Feb. 22 on three additional lines in Buffalo—Niagara Street, Broadway and Elmwood Avenue. These are three of the heaviest patronized lines in the city. The economy program was announced by the company in a brief statement to car riders.

There is now pending before the Public Service Commission an application of the company for a higher rate of fare and a similar action is pending whereby the city seeks to have the fare reduced to 5 cents. The present fare is 7 cents or four tokens for 25 cents. A rate of 8 cents cash with two tickets for 15 cents has been suggested.

The International Railway is considering the abandonment of the Main Street car line in the city of Niagara Falls and has asked for a 7-cent fare or four tokens for 25 cents in that city. The company now charges a 5-cent fare in Niagara Falls.

Bus Report Presented in New York

Transportation Board Makes Suggestions for Guidance of City—Routes for Private Operation Recommended—Many Railway Companies Seek Operating Rights

THE Board of Transportation of New York City filed with the Board of Estimate and Apportionment on Feb. 20 its second report on the pending petitions for omnibus franchises in the city of New York. The report deals with 80 applications by 52 corporations or individuals, many of them local railway companies, for franchises to operate 113 routes.

The report was made in response to a resolution of the Board of Estimate on Nov. 3, 1924, requesting the Board of Transportation to conduct a further examination and investigation of all applications for omnibus lines in the five boroughs and to embrace in the report information which the Board of Transportation deemed should be in possession of the Board of Estimate for its guidance in considering omnibus franchise applications.

If the right of the city to own and operate omnibus lines is upheld a series of routes and lines that may properly be established in all the boroughs is laid out and recommended in the report. If the right of the city to engage in municipal operation of omnibus lines is denied, it is recommended that a grant, either in the form of a permit or a franchise, be made to petitioners desirous of providing such operation. In this event, the board believes a definite plan of routes and franchise conditions should be considered so that all those seeking franchises may have a standard form of application and the Board of Estimate have for its consideration proposals that are comparative and competitive.

The report points out that if the city cannot undertake municipal omnibus operation the Board of Estimate could tentatively, at least, approve the routes and the form of proposed franchise and invite applications which would be uniform.

As a basis for standard proposals for franchise grants the board recommends that the following factors be adhered to:

(a) Duration of franchise.
(b) Fare to be charged and transfer conditions.
(c) Compensation to be paid to the city for the franchise.
(d) Service or headway to be offered at the beginning of operation.
(e) Type of vehicle to be employed.

In its treatment of the question of fares the report states:

Most of the petitioners for omnibus franchises express willingness to operate and maintain service for a 5-cent fare. Some offer to grant transfers for that fare without extra charge for transfer, and others stipulate that a charge shall be permitted for transfers. Others of the petitioners, including some of the surface railroad corporations and the corporation that now operates a comprehensive omnibus system in Manhattan under perpetual franchise and temporary permits for a 10-cent fare, demand a 10-cent fare for longitudinal or trunk line service, with a 5-cent fare for crosstown or short route service. Those corporations that offer service for 5 cents are for the most part newly created, and some of them are not at present in the transportation field. There is no present reason, however, to question their financial ability to carry out the proposals submitted.

Records of omnibus operation in this city and elsewhere show that such operation is being maintained over certain routes for a 5-cent fare. On some routes the return for a 5-cent fare may be inadequate because of light patronage or length of haul, but for a system embracing both short and long haul traffic several of the petitioners state that they are prepared to operate for a 5-cent fare.

The report indicates that the estimated initial cost of equipping and housing 1,259 buses will be approximately $11,000,000, of which $3,000,000 will be for garages. The estimates for bus equipment are:

	Buses	Cost
Manhattan	439	$3,130,900
Bronx	73	497,100
Brooklyn	422	2,743,000
Queens	325	2,112,500
	1,259	$8,483,500

In dealing with the cost of operation the report says:

From most carefully compiled statistics it would thus appear that in order to meet all necessary expenses on the basis of a 5-cent fare eight or more passengers per mile must be carried, or "picked up," for double-deck service and six or more passengers per mile for single-deck service.

Digitized by Google

Forty of the 52 corporations or individuals that have petitioned for bus franchises seek to obtain grants for single routes or for from two to six routes. These applications are classified as miscellaneous largely for the reason that in many cases the routes are disconnected or that generally no comprehensive system of bus transportation is indicated by the applications.

Among the applicants for bus routes to be operated in conjunction with existing rapid transit lines are the Brooklyn-Manhattan Transit Corporation, the New York Railways and the Staten Island Rapid Transit Railway.

The application of the New York Railways discloses that the company proposes to abandon 20 miles of trolley lines and substitute 40 miles of bus routes. The railway officials suggest payment of $5,857,577 out of omnibus earnings in return for discontinuance of surface railway property that cost originally $7,857,405. Part of the surface railroad track proposed to be paid for under this amortization scheme has been unused and practically abandoned for some time past. It is estimated by the company that the salvage that will accrue to it from sale of this scrapped surface railroad property will be 5 per cent of original cost. Franchise rights are asked for practically 100 per cent more mileage for omnibus service than it is proposed to discontinue as surface railroads.

While a 5-cent fare can only be charged for railroad operation, a 10-cent fare is proposed for longitudinal or trunk lines of omnibuses. The only free transfer proposed in connection with omnibus service is from 10 cent lines to 5 cent lines.

The Interborough Rapid Transit has not filed formal application for a bus franchise, but the company has expressed a desire to operate crosstown or other feeder lines as may be agreed upon for a 3-cent fare. The Third Avenue Railway, operating in Manhattan and the Bronx, has also signified its willingness to run buses.

Express Bus Service Between Fairmont and Morgantown

De luxe express bus service between Fairmont and Morgantown, W. Va., is being planned by the Monongahela-West Penn Public Service Company as an added feature to its Morgantown-Rivesville service. If the State Road Commission concurs in the arrangement, the service will be started in about 6 weeks.

A modern Fageol bus of 25-passenger capacity has been purchased and the contemplated schedule provides for four or more round trips each day with running time between the two cities 1 hour and 15 minutes.

Bus Lines Will Supplement Railway in Minneapolis

Although it has been ruled that a proposed ordinance granting the Minneapolis Street Railway, Minneapolis, Minn., an exclusive franchise to supplement its trolley system with bus lines will require a special enabling act from the Minnesota Legislature the city attorney holds that by agreement Council may require the company to establish certain bus lines. The company now is operating buses between the Twin Cities and between St. Paul and Stillwater, Minn., a suburb.

The railway expects to spend $500,000 for bus equipment after the ordinance is passed, in addition to buses already planned to fit ordinances already effective and those now in service in north Minneapolis. A garage will cost $100,000 additional. Universal transfers will be given, but the bus fare will be higher than the car fare, which is 6 cents.

Chicago Mayor Wins

Prospects for $600,000,000 Traction Program Believed to Be Enhanced by Election on Feb. 24

Mayor Dever and Samuel Insull have agreed on $85,000,000 as the price to be paid by the city for the Chicago elevated lines. The conclusion of the deal was announced on Feb. 25, after 8 months of dickering. The compromise was reached the day after the forces aligned behind Mayor Dever had succeeded in electing an outright majority of the City Council to back up his $600,000,000 traction ordinance. This measure called for the construction of elevated lines by the city in the event that a deal with Mr. Insull could not be arranged. The city yielded several points in the ordinance and the redraft was at once submitted to the Council for passage.

The outstanding feature of the election on Feb. 24 was the decisive approval of the policies of Mayor Dever as reflected in the results at the polls. Mr. Insull's attitude is that so urgent is the necessity for an adequate transportation plan that he cares not what the scheme may be that is proposed, provided it embodies a co-ordination of the local transportation facilities and the development of rapid transit in the largest sense of the word.

Hostility of the old ring of Chicago politicians who ran on a "5-cent fare" platform in the days of William Hale Thompson has taken a new turn in relation to the $600,000,000 Chicago traction ordinance. Governor Small has entered the arena with an order to the Illinois Commerce Commission to make a thorough investigation of the ordinance before it comes to referendum. He is also having a traction bill drafted for the Legislature.

Small acted at the behest of Fred Lundin, who "made" Thompson and had to retire from politics when the notorious Chicago graft trials broke Thompson's grip on the machine. Thompson and Lundin split. The latter now seeks to take away the foundation for Thompson's 1927 mayoralty candidacy by stealing the transportation issue.

The bill which Small is having drawn is likely to provide for the creation of a "transportation district," a tax-assessing government functioning similarly to school governments. Thompson once sponsored such a plan, but Lundin now says he was the author of it. The price of political preference is again being expressed in terms of patronage.

Rockford Mayor Awards Franchise to New Company

The city traction problem in Rockford, Ill., became acute recently when Mayor J. Herman Hallstrom cast the deciding vote awarding the railway franchise to the Rockford Public Service Company, headed by T. M. Ellis, Jr., in opposition to the Rockford City Traction Company, now operating in the city. The Council was divided eight and eight on the two franchises submitted. Final action is dependent upon a referendum at the city election on April 7.

Prior to the Council's action the Rockford City Traction Company ran a series of advertisements addressed to the public and Council in which it set forth its side of the case.

The City Traction Company for 2 years has been operating under a temporary franchise, but has been negotiating for a franchise ordinance embodying railway and bus services, and had apparently come to an agreement on terms when Mr. Ellis came forward with his offer. The Rockford City Traction Company does not consider the problem settled. W. C. Sparks, manager; F. W. Walker, representative of the bondholders, and Judge R. K. Welch, attorney for the company, issued a statement expressing surprise at the hasty action of the Council "without giving all parties interested a chance to be heard and which, if it prevails, works a gross injustice on those who now have their money invested in this property." The various steps in the Rockford controversy have been followed in the ELECTRIC RAILWAY JOURNAL.

Insurance Measure Dead in New York

Compulsory insurance for all motor vehicle owners is dead at Albany for this year at least, in the opinion of Lewis G. Stapley, chairman of the motor vehicle committee of the Assembly and chairman of the joint legislative committee on motor vehicle legislation, who presided at the hearing at Albany on Feb. 24 on the various motor vehicle bills before the Legislature.

The New York State Auto Bus Association, however, through James J. Dadd of Rochester, its secretary-treasurer, has recommended the amendment of section 282-b of the highway law, so that all motor bus concerns carrying passengers for hire would be subject to the provisions. At the present time the law excepts corporations. While the Public Service Commission is requiring liability insurance as a stipulation to the certificate of convenience and necessity this ruling is not retroactive as to old corporations. The Bus Association feels that what is fair for one is fair for another and that it is unfair to except a bus owner because he is a corporation. An amendment to the law covering this feature is expected to be introduced at an early date.

Passage of Moorhead Bus Bill Awaited

The Moorhead bus regulation bill was advanced another step toward passage in the Indiana Senate on Feb. 9. The bill would place commercial motor vehicles under the regulation of the Public Service Commission. Bus interests want their vehicles under the direction of the State Highway Commission.

The Moorhead bill was amended so as to exclude private truck owners. Another amendment made provision for continuance of city bus lines under the control of city boards where already so established. The third amendment was to the clause taking care of existing bus companies in the matter of issuing certificates of convenience and necessity. It made that clause refer to bus lines that were in existence ninety days prior to the taking effect of the act instead of ninety days prior to Jan. 1, this year. The fourth amendment struck out the emergency clause. This will delay the enforcement of the act, if it is passed, until the proceedings of this Legislature are published, which will be some time in May. With the emergency clause attached, the bill would be in effect immediately after the Governor appended his signature.

Goldsboro to Have Buses

The Board of Aldermen of Goldsboro, N. C., recently granted an exclusive franchise to H. G. Bales, for the operation of buses beginning March 1, 1925, for a period of 10 years. Mr. Bales is president of the Highway Motor Transit Company, a concern operating buses between Goldsboro and Warsaw. Transportation will now be available to the residents of Goldsboro, who have been denied service since the Goldsboro Electric Street Railway abandoned service a few years ago.

A recent statement from the city said that the Goldsboro Electric Street Railway was no longer in existence since the city took over its holdings; that the property was now in charge of C. W. Grantham as city manager, and that the greater portion of the trackage and equipment had been dismantled. Further, it was the purpose of the city to dispose of all the equipment. The new proposed operation will consist of not less than three buses of the street car type with a passenger carrying capacity of between 20 and 27 passengers. Mr. Bales said he could loop the city with five buses run on regular schedule. The rate of fare will be 10 cents, but books of 20 tickets will be sold to school children for $1. It is said that the original investment requires $50,000.

Albany Company Seeks 10-Cent Fare

The United Traction Company, operating in the cities of Albany, Troy, Cohoes, Watervliet and Rensselaer, N. Y., filed a petition with the Public Service Commission on Feb. 21 asking for an increase in its fares from 7 to 10 cents, effective on short notice. The 7-cent fare was fixed by order of the commission on July 5, 1922.

The petition of the company declares that the fair value of the railway now exceeds the sum of $15,000,000 and that the revenues have not been sufficient to meet the costs. A table submitted shows for 1922, from June 30, a total railway operating revenue of $1,524,814 and operating expenses and taxes of $1,461,939, leaving net operating revenue of $52,875; 1923, operating revenue, $3,234,149, operating expense, $3,084,437, with net revenue of $149,711; 1924, operating revenue, $3,205,856; operating expense, $3,076,247, with net revenue of $129,608, all before the payment of fixed charges and taxes.

More Bus Rights Sought in Rochester

Independent bus owners of Rochester, represented by James J. Dadd, secretary of the New York State Auto Bus Association, have petitioned the City Council for permission to operate a belt bus line over 30 streets in the city of Rochester. The proposed line will cross thirteen of the local lines of the New York State Railways, but only in a few minor instances will it parallel the railway routes. It is planned to operate with six sedan type buses.

Rochester now has virtually no cross-town lines and the proposed route circling the city would connect with all parks, golf links, etc. Its backers profess themselves willing to furnish transfer privileges with the railway.

As has been explained previously, the New York State Railways has petitioned to run buses over the Ridge Road, a route now served by Buckley & Buckley, operating under the name of the Ridge Road Bus Lines. Officials of the state bus men's association opposed this plea at public hearings. Following announcement that the Manitou railway line would suspend operation, the New York State Railways proposed to establish a network of bus lines along the lake shore serving towns along the railway. The independent owners, headed by Mr. Dadd, now propose to operate buses from Nine Mile Point to Manitou, serving virtually the same route. They have petitioned the town boards along the line for operating rights.

The Council has referred the belt line petition of the independents to a committee. Council members, it is said, are loath to authorize any competition with the New York State Railways, which operates in Rochester under the service-at-cost contract and for 4 years straight has failed to make its guaranteed return.

Expansion of the bus system of the railways is looked for as the outcome of the rivalry. Purchase of the Buckley line by the traction interests is regarded as another possibility.

Canadian Government Suggests Electrification.—Electrification of railroad lines in Quebec Province is forecast by Premier Taschereau, who recently suggested such a plan and promised that if railway companies adopted the proposal the province would do all in its power to assist. Abitibi Southern, which is now obtaining its charter, is the first road to indicate it would take advantage of government suggestion.

Question of Paving Responsibility Considered

The New York Transit Commission reserved decision on Feb. 24 on the question whether the New York Railways in its reorganization should be permitted to abandon lines on which service has been discontinued and thus probably escape responsibility for its share of the cost of repaving and resurfacing the streets when the tracks are torn up. The cost to the company, if it is held responsible, is estimated at about $500,000.

The matter came before the Transit Commission at a hearing on the form of deed of sale of the company's properties, which were sold in foreclosure proceedings last summer. In this deed from the New York Railways to the New York Railways Corporation, as the reorganized company will be known, there has been omitted the Delancey and Spring Streets lines and parts of the Avenue C, Madison Street and Sixth Avenue lines, service on which was discontinued soon after the late Job E. Hedges was appointed receiver. Under the law, a receiver can discontinue service on an unprofitable line but cannot surrender the franchise, as such action can only be taken by the directors of a solvent company.

Assistant Corporation Counsel Edgar J. Kohler objected to approval of the deed without the inclusion of the discontinued lines. Mr. Kohler said that the Manhattan Surface Coach Company, which he said was a subsidiary of the New York Railways, had applied for bus franchises on the streets occupied by the discontinued lines and contended that the company wanted the city to stand the entire expense of resurfacing the streets and then permit its subsidiary to operate buses upon them.

George H. Stover, assistant counsel of the commission, also opposed the approval of the deed without inclusion of the discontinued lines. Joseph P. Cotton, counsel for the company's reorganization committee, advocated approval of the deed, as did Hugh J. Sheeran, the present receiver.

Madison Company Adopts Bus as Auxiliary

The Madison Railways, Madison, Wis., will begin on March 1 the operation of a bus line from the Capitol square to the residential district of Nakoma. This will be its first experience in the operation of buses as an auxiliary. Dudley Montgomery, vice-president of the railway, announced that three street car type buses, seating 29 passengers, would be purchased from the Yellow Coach Manufacturing Company, Chicago. The proposed schedule provides for 25 trips each way daily. It is believed that as traffic warrants bus lines will be established in other parts of the city.

Some time ago the Wingra Bus Company, Madison, applied to the Common Council for an exclusive franchise to operate buses in the city. With the proposed activity in the bus field by the railway it is generally thought that this application will not be favorably acted upon.

News Notes

Fare Increase Deferred.—The Cleveland Railway, Cleveland, Ohio, has postponed the raising of car fares from 5 to 6 cents in Lakewood, a suburb, in accordance with a recent agreement with that city. This action was taken by the railway in view of the attitude of the City Council of Cleveland in refusing to approve the change, even for a year.

Considers Improved Service in Remote Sections.—The City Council of Portland, Ore., in a public hearing, recently discussed the problem of improving railway service in remote sections of the city, especially in the St. Johns district. F. I. Fuller, vice-president of the Portland Electric Power Company, stated that his company was willing to co-operate in any way that would give the patrons of the district the best service. He called attention to the fact that last year 4,500,000 passengers were carried on the line, with receipts of more than $250,000. The report of Commissioner Mann on proposed improvements was heard. Mr. Fuller stated that the improvements suggested in the report would cost more than $250,000, but believed the service should be given.

Must Explain Platform Extension Neglect.—The Chicago Rapid Transit Company, operating the elevated lines in Chicago, has been cited by the Illinois Commerce Commission to explain the failure to lengthen the elevated platforms in the loop district as authorized by the commission. The company has an application pending with the city for permission to extend the platforms, but action has been delayed for the last 6 months pending negotiations between Samuel Insull and Mayor Dever over the purchase of the elevated lines. The city has final jurisdiction.

Bus Operator Protests Grant to Railway.—The Columbus & Marysville Bus Company, Columbus, Ohio, has filed a protest with the State Utilities Commission against granting the Columbus, Urbana & Western Electric Railway a certificate to operate a bus line over Riverside Drive from Fishinger's Bridge, 8 miles north of Columbus, to the center of the city. The protestant claims that residents in the community north of Columbus have easy access to the city on its buses, also on city street cars and on Columbus, Urbana and Western interurban cars. There is not enough business for two bus lines, the complaint says.

Traction Solves Puzzle.—There will be no more unmerciful chewing of innocent lead pencils over a lost word on the de luxe trains of the Illinois Traction System. Cross-word puzzle dictionaries have been installed in the parlor car coaches of the Capitol Limited, the de luxe train running between St. Louis and Peoria. The sleeping car Illini, from St. Louis, Decatur and Champaign, which has reading tables, will also be equipped. The old faithful game of "rummie" is becoming a lost art among railway passengers. Every one is working cross-word puzzles, so the company is supplying dictionaries to solve its patrons' puzzles.

Bus Service Grows.—Another Pierce-Arrow de luxe passenger coach has been placed in service on the Niagara Falls - Lewiston - Queenstown route of the Gray Bus Line of Niagara Falls. This is the second of these buses placed in service over the Niagara Scenic Highway since the Niagara Falls Power Company took over the Niagara Gorge Railway, which controlled the Gray Bus Line. The company's buses are painted a very light shade of gray with vermilion trim.

Use the Trolley and Save Money.—The fact that the price of gasoline has increased in Detroit more than 44 per cent since the first of the year is pointed out by officials of the Detroit Department of Street Railways in placards on all municipal cars which carry the sign "Gas up 44 per cent; save by trolley." With the price increases put into effect by the gasoline producers and the 2-cent gasoline tax, which recently went into effect in the state when the bill was signed by Governor Groesbeck, D. S. R. officials have used the placard to advise motorists to save by using the trolley cars for city riding and leaving their automobiles at home.

Substitution of Municipal Buses for Private Ones Approved.—Plans for the operation of buses by the Seattle Municipal Railway on Tenth Avenue Northeast and branch lines in the University district have been approved by D. W. Henderson, superintendent of railways, who expresses the belief that the buses in time would yield a profit. The buses will replace those now being operated by a private concern. Under the present private operation patrons of the buses pay 10 cents cash fare with transfer, the city receiving 2½ cents of this amount. If the city takes over the buses the fare will be reduced to 8⅓ cents, with transfer privilege to the street cars.

Three-Cents-a-Mile Tickets Valid.—The Public Service Commission has approved a new regulation of the Buffalo & Erie Railway, Buffalo, N. Y., providing for the sale at all ticket offices of the company of books, each containing two one-way tickets, valid for transportation of persons presenting ticket between points named on ticket, at 3 cents per mile per trip. No ticket will be sold for a distance of less than 5 miles. This ruling became effective Feb. 20.

Contract Approved.—An application filed with the Public Service Commission by the Philadelphia Rapid Transit Company, Philadelphia, Pa., for approval of a contract with the Township of Upper Providence was considered recently. A representative of the transit company, lessee of the Darby, Medina & Chester Street Railway, explained that by payment of $13,000 the transit company was relieved of all liability with respect to the paving and maintenance of the streets in the township occupied by railway tracks. There was no protest and the matter was referred to the entire commission.

Course in Public Utilities Offered.—A new course in public utilities will be offered in the Indiana University in Indianapolis in the spring semester. The course, under the supervision of Marvyn Crobaugh, will include the history, development and present status of the industry. Besides the regular course of study there will be a series of lectures by public men familiar with public utility problems. The speakers include Martin J. Insull, Middle West Utilities Company, Chicago; Arthur W. Brady, Union Traction Company of Anderson; Dean Heilman of Northwestern University, and prominent engineers and public service commissioners.

Motorman Absolved in Accident Case.—Although held responsible by the Interstate Commerce Commission for the rear-end collision between two trains on the Buffalo-Niagara Falls high-speed division of the International Railway on Oct. 19, when many excursionists were injured, Howard Foreman, motorman of the second section, was absolved from all blame by Coroner J. E. Helwig of Tonawanda. Failure of the equipment of the car to function properly was given as the cause of the accident by the coroner.

Resolution Praises Retired President.—Charles L. Kurtz, whose resignation as president of the Columbus Railway, Power & Light Company, Columbus, Ohio, was recently referred to in the ELECTRIC RAILWAY JOURNAL, will be presented with an engrossed copy of a resolution passed by stockholders and directors of the company which expresses their appreciation of the manner in which he conducted the business of the company during his presidency. The resolution regretted the loss of his advice and interest and assured Mr. Kurtz of the well wishes of his former associates in the years to come.

Accident on Pennsylvania at Newark.—Three persons were killed and thirty-two others were injured, several seriously, when a Philadelphia local train on the Pennsylvania Railroad rammed into the rear of an Atlantic Coast Line express standing at the platform of Manhattan Transfer early on Feb. 24 on the New Jersey Meadows. The accident occurred on the electric division of the road.

Use of Tokens Extended.—The North Carolina Public Service Company is now using tokens on all of its cars in Salisbury instead of cardboard tickets. They are being sold at the same price that has prevailed for tickets, 7 cents each or four for 25 cents. Tokens have been used by the company in Greensboro for some time.

All-Night Service Unprofitable.—Operation of all-night service over the Stark Electric Railroad between Alliance and Canton, Ohio, is a losing venture, according to company officials. The service was started several months ago to accommodate railroaders who live in Alliance and report for work at the company shops near Canton. A contract between the Stark Electric Railroad and the Pennsylvania Railroad which resulted in establishing the all-night service expired Jan. 1. Railroad officials have made no move to renew the agreement.

Buses Replace Cars.—Word has been received from Leavenworth, Kan., that all local trolley service has been suspended and five Mack 25-passenger buses are now providing the local transportation facilities. Last December the Kansas City, Leavenworth & Western Railway applied for and was granted permission to abandon street car service in Leavenworth and substitute bus service in its stead, to operate over the two routes formerly covered by the trolleys. The traction company formed a separate bus operating company known as the Leavenworth Transportation Company, which placed buses in service recently. The two routes, which are between 3 and 4 miles in length, are now being covered by the buses, operating on an 8-cent fare.

Action Prohibiting Bus Operation Restrained.—A writ restraining the county courts from taking action in the case of the Union Traction Company, Anderson, Ind., against Donald Lake and others, involving their right to operate buses in Muncie, Ind., has been issued by the Indiana Supreme Court. The case has been pending in the courts for some time.

Widow Wins Case.—A verdict of $10,000 was recently awarded to Mrs. Eva Chrampanis for the killing of her husband by a trackless trolley operated by the city of New York on Staten Island in March, 1923. The corporation counsel interposed the defense that as the city was operating illegally it was not answerable in damages. When Justice Strong had sustained the city's defense the attorney for Mrs. Chrampanis countered this move by amending the complaint so as to join Mayor Hylan and the members of the Board of Estimate and Apportionment individually as defendants. A jury before Supreme Court Justice May in Staten Island on Feb. 18 decided that the city was answerable to the widow and children.

Fare Boxes in Little Rock.—The Arkansas Central Power Company recently adopted the system of fare boxes on its cars in Little Rock, Ark. To help passengers have the exact fare ready a 6-cent token or metal ticket has been provided.

Wants Enforcement of Paving Ordinance Restrained.—Suit has been filed in the Federal court in Indianapolis, Ind., by the Terre Haute, Indianapolis & Eastern Traction Company against the city of Newcastle, John H. Morris, Mayor, and Robert S. Hunter, city attorney, asking an injunction restraining the enforcement of a city ordinance which would require the company to lay new tracks and pave a part of a street in Newcastle. The complaint alleged that the ordinance is in violation of the Federal constitution in that it deprives the plaintiff of its property without due process of law and is contrary to a contract held by the company with the State of Indiana.

Both Companies Secure Permits.—The Board of Public Service of St. Louis, Mo., following a public hearing, decided to issue permits for a bus line on West Florissant Avenue to both the People's Motor Bus Company and the St. Louis Bus Company, an auxiliary of the United Railways.

Foreign News

Auckland Uncertain About Buses

The City Council of Auckland, New Zealand, is adding to its bus equipment, but believes that "tramways remain supreme for mass transportation of dense communities of the cities." The tramway system in Auckland was taken over by the city in 1919 and serves a population of 170,000. To carry this traffic 186 cars are used and these operate over 30.35 miles of route. Though a municipal enterprise jitney buses were allowed to run, and these, with the great increase in private automobiles, have caused a strain on the finances of the tramway system.

The Council decided to put the matter before the public, and late last year published a statement giving an official review of its tramway policy. In this review the Council expresses its belief that no other vehicle can adequately or satisfactorily replace the tramway cars, so far as regards the transportation needs of 90 per cent of the community. The question, it says, is whether it is proper to allow the tramway service to be impaired by senseless competition because of the habits of the remaining 10 per cent of the population. Buses alone are inadequate to serve the situation.

The city has decided to expand its bus service. Last fall it had 10 on order and it has decided to order 20 more to take the place of any further track extensions, for the present, though 10 additional cars are to be added for the 1925 season.

Traffic Congestion a Problem in Glasgow

A traffic survey for the relief of street congestion was suggested to the members of the Glasgow Town Council, Scotland, at the annual inspection of the tramways undertakings. Referring to the suggestion to eliminate all tramways from the central area of Glasgow, ex-Bailie Laing said that instead of more than 1,000 tramcars, it would take between 2,000 and 3,000 buses to transport the people into the center of the city, and if the tramways were barred congestion would be increased. He urged the adoption of one-way streets and utilization of certain roads for fast traffic. He also suggested that the railway companies provide an electric shuttle service between the city and suburban areas.

Fares Cut on London Buses

A drastic reduction in fares was put into effect on Dec. 3 by the Association of London Omnibus Proprietors, under which so-called pirates are run. The cuts amount to approximately one-third of the previous fares.

The object of these cuts, according to A. Kemp-Gee, managing director of the Cambrian Company, is to meet the competition of the London General Omnibus Company, following its introduction of combined bus, tram and tube tickets, and combined season tickets. This competition has been further accentuated by the opening of the new section of the City & South London Railway. Mr. Kemp-Gee said in an interview that while his company could not offer similar facilities to its patrons, it could reduce fares to a point even below the monthly or quarterly season ticket rate.

It is understood that the London General Omnibus Company does not intend to take any action at present, but will proceed with its plans to offer the public a co-ordinated traffic service along the lines already outlined.

Operations Show £63,598 Balance.—The accounts of the Cape Electric Tramways, South Africa, for the year to June 30, 1924, show a profit of £81,535, and after providing for debenture interest, redemption of debentures and taking into account balance brought forward a net credit of £63,598 remains. The reserve fund has been credited with £20,000, leaving £43,598. The directors recommend a final dividend of 3 per cent, making 6 per cent, free of tax, for the year, carrying forward £14,125. During the year the tramways carried 31,794,150 passengers, with gross receipts of £398,896, as against 32,094,580 passengers, with gross receipts of £408,753, in 1922-23. Although a falling off of slightly under 2½ per cent has been experienced in traffic receipts, there is a corresponding reduction under various headings of expenditure; the net result, therefore, comes out practically the same as last year.

Franchise of Paris Transports en Commun to Be Revised.—The question of the revision of the Transports en Commun franchise was discussed at a recent meeting of the Council General of the Seine. An agreement that will be acceptable to both parties is being sought. The final proposition is that the Transports en Commun shall renounce its remuneration of one-fourth of 1 per cent on receipts exceeding 250,000,000 francs, the bonus on economies exceeding 0.85 of 1 per cent of the receipts, a quarter of the bonus running from 0.85 to 0.95 of 1 per cent, half of the bonus between 0.90 and 0.95 and three-fourths of the bonus exceeding 0.95 of 1 per cent of the receipts. The economies resulting for the Department of the Seine by this new agreement are expected to amount to approximately 500,000 francs during 1925. The franchise now in effect was outlined previously in these columns.

Japanese Electric Railway Plans Changed.—The franchise right for construction of underground railways in Tokyo, Japan, has been canceled by the Tokyo government. The franchise was formerly held by the Musashi Electric Railway. This company has been reorganized as the Tokyo-Yokohama Electric Railway and proposes to build a suburban railway from Tokyo to Yokohama.

Financial and Corporate

$3,000,000 Philadelphia Stock Issue

Passenger Partnership Campaign Started by Mitten Management to Secure Additional Funds

Users of the service of the Philadelphia Rapid Transit Company, Philadelphia, Pa., are being afforded an opportunity to become stockholders of that company under a new plan which makes investment easy. It is explained that the issue which the car riders are to be permitted to buy is to consist of $3,000,000 of preferred stock paying a 7 per cent cumulative dividend. It is to be split up into 60,000 shares with a par value of $50 each. Passengers are to be permitted to apply for from one to ten shares. The proceeds from the sale of the stock will be used to finance extensions and additions to property and to retire or acquire prior obligations. It is explained that the earnings applicable to the preferred dividends for 1925 appear to be more than 15 times the sum necessary to pay them. In this connection the company says that "conservative bankers consider a preferred stock a good investment where the dividend is earned only three times."

After the stock has been allotted purchasers will be permitted to pay for it in full in cash or at the rate of $1 per share per month. The partial payment plan is intended to make it easy for men and women who desire to save as they go to become part owners in the property. P. R. T. employees asked the right to buy the preferred stock, but they have agreed to wait until the car riders have had the first opportunity to buy.

Men and management at Philadelphia together now own more than one-third of the common stock of the company, through which ownership they may subscribe to more than one-third of the preferred stock. They have waived this right so that more than $1,000,000 of the new preferred stock will be available for sale to the car riders as soon as it has been authorized and issued. All other stockholders will be asked to give up their rights of subscription so that all of the $3,000,000 issue may be sold to the car riders.

As to the partial payment plan, the payments will be due each Saturday, but it is explained that they can be made on any week day or for as many weeks in advance as desired. Should any payment become 5 days overdue all money paid in up to that time will be returned and the stock will be sold to another purchaser. Receipts will be issued for each payment and when $50 per share has been paid the stock certificates will become the property of the purchaser or subscriber.

It is intended to pay dividends of $1.75 per share every six months. The stock will be redeemable at $55 per share. Application will be made to list the stock on the New York and Philadelphia exchanges so that a ready market will be available for the issue at all times.

Another Property Passes to Mr. Insull

Samuel Insull, Chicago, and interests represented by him have arranged to purchase the entire system of the Indiana Service Corporation, including both the local city lines in Fort Wayne, Ind., and the three interurban systems operated by the local company. Formal transfer of the company has not yet been completed, but according to an announcement made on Feb. 20, all the details of the transaction were completed some time ago. Robert M. Feustel, president of the company at Fort Wayne, has made this plain.

It was reported in Fort Wayne that the Insull interests paid practically par for the entire preferred and common stock holdings of the local company, but confirmation of the terms of the sale has not been made. Mr. Feustel says the company will continue to function as a local organization, with much the same staff for the present at least.

In addition to the city lines in Fort Wayne, the Indiana Service Corporation operates the city lines in Wabash, Peru and Logansport and the interurban lines to Lafayette, Bluffton, Waterloo and Kendallville. Its properties also include the light and power plants which supply Fort Wayne.

San Francisco Municipal Loss $295,230

For the Year Ended June 30, 1924, the Excess of Income Over Operating Expenses and Reserves Was $8,374, but Taxes and Similar Items Amounted to $303,604

TOTAL revenue of the Municipal Railway, San Francisco, Cal., for the year ended June 30, 1924, was $3,189,533, and interest on securities owned increase this by $46,519 to $3,236,052. Deducting operating expenses of $2,460,282 left a net of $775,770. Against this $196,223 was charged interest on funded debt and $571,173 for depreciation and accidents, leaving a balance of $8,374, compared with $13,830 for the previous year.

For the purpose of securing a comparison between the results of operation of the municipally owned utility and those operated by private capital, the charter of the city and county of San Francisco provides that the operating reports shall include certain comparison charges consisting of items which constitute part of the actual cost of operating private-owned companies, but which the municipally owned utility is not required to pay. For the year these charges amount to $303,604, leaving a net deficit of $295,230. This compares with a similar deficit for the preceding year of $272,045.

There has been a continuing deficit, as shown by the cumulative income account for the period from Dec. 28, 1912, to June 30, 1923, amounting to $1,024,-

COMPARATIVE INCOME ACCOUNT, SAN FRANCISCO MUNICIPAL RAILWAY

	Years Ended June 30 1923	Years Ended June 30 1924	Dec. 28, 1912 to June 30, 1924
Passenger revenue	$2,993,829	$3,173,181	$25,415,189
Miscellaneous revenue	11,372	16,352	110,356
Total revenue	$3,005,201	$3,189,533	$25,525,545
Interest on securities owned	55,297	46,519	316,674
Total income	$3,060,498	$3,236,052	$25,842,219
Operating expenses:			
Way and structures	$109,572	$115,468	$799,920
Equipment	216,605	187,636	1,495,486
Power	424,695	465,889	3,369,704

Number of passengers carried per car-mile	8.96

* The sum of $200,000 expended from depreciation reserve for bond retirement. † Includes mileage of buses. ‡Includes car-hours of buses. Italics indicate loss or deficiency.

386, when the comparison charges are included. Neglecting these, there has been an excess of income over operating charges, interest and reserves of $1,251,798 for the same period.

Particular attention is given in the report to the explanation of the items in the balance sheet, which is reproduced in condensed form herewith. The capital assets consist of cash in bond funds, $17,428, which represents unexpended balance of the bond fund cash now in possession of the treasurer; road and equipment, $7,570,225, and general expenditures, $324,873. These latter accounts represent the total cost of the road and equipment.

The current assets consist of $943,635 cash in various funds, $979,325 for the book value of the securities bought for the account of the depreciation fund; accounts receivable, $14,148; materials and supplies, $237,815.

Deferred assets have not changed during the year.

On the liabilities side, the funded debt item represents the par value of the bonds outstanding in the hands of the public on June 30, 1924. Current liabilities include accounts and vouchers payable, $221,946, and interest due on funded debt, $47,773. The reserves include a reserve for depreciation of $1,467,977 and a reserve for compensation insurance of $100,492.

The municipal railway has no capital stock and the excess of its assets over its liabilities represents surplus. In the preparation of the balance sheet, it is stated, this surplus has been divided into two classes, first, that which was created by donations or contributions, and, second, that which was accumulated from the earnings resulting from the operation of the road. The contributed surplus includes premiums realized from the sale of bonds, $26,000, and contributions from general taxes, $306,552. In surplus from income is included $1,489,000 representing bonds retired from income; $101,000 reserve for bond redemption. These amounts, totaling $1,590,000, represent the income which has been set aside in cash for the redemption of bonds.

An item of considerable interest to railway operators is the charter reserve of $903,802 for insurance and taxes. As explained previously, there are set aside certain sums for comparison with private operation, of which this item is a part. The municipal system not having to pay any of these charges, the receipts from operation were deposited in the operating cash fund without any restrictions as to how they were to be used. As a matter of fact, however, most of the cash in the operating fund represented by such comparison charges actually was expended in new construction and addition and betterment work, so that these reserves, representing obligatory charter comparison charges, have in reality been used as reserves for betterments.

For the purpose of making the balance sheet reflect the actual results of operations, it is stated, the amount expended in addition and betterment work has been reflected in an account entitled "additions and betterments from income," and the charter reserves for insurance and taxes carry a balance equal only to the unused portion of the original income. The amount in the additions and betterments account is $2,199,388.

Operating surplus is made up as follows:

Surplus, June 30, 1923, as per last report	.....	*$484,477*
Add:		
Reduction of compensation insurance reserve corresponding to dividends declared by the state compensation insurance fund applicable to year ended June 30, 1924	$14 946	
Transfers from depreciation fund to operating fund as follows:		
Deficits in operating fund	60 639	
Insurance refund credited to accident insurance reserve but deposited in operating fund	1 679	77 264
		$407 213
Deduct:		
Amount transferrable from income account	$295 230	
Interest on bonds credited to income but deposited in depreciation fund	46 519	
Adjustment reconstruction of lower Market Street tracks	19 518	361 267
		$768 481

Italics indicate loss or deficiency.

STATEMENT OF BUS LINE OPERATIONS, SAN FRANCISCO MUNICIPAL RAILWAY, YEAR ENDED JUNE 30, 1924

Revenues:		
Passenger revenue	$33,323	
Quartermaster tickets	5	
School tickets	639	
Local transfers	11,356	
Total revenues		$45,323

Garage expense	13,317	
Conductors and chauffeurs	21,936	
Depreciation (18 per cent of gross passenger revenue)	5,998	
Compensation insurance	1,138	
Total operating expenses		65,184
Net loss for year		$19,861
Average net loss per day		54.26

COMPARATIVE CONDENSED GENERAL BALANCE SHEET, SAN FRANCISCO MUNICIPAL RAILWAY, AS OF JUNE 30, 1924

Assets	1924	1923	Increase or *Decrease*
Capital assets	$7,912,526	$7,610,138	$302,387
Current assets	$2,174,925	$2,241,396	*$66,470*
Deferred assets	$132,124	$132,122	.....
Total assets	$10,219,575	$9,983,659	$235,916
Liabilities, Reserves and Surplus			
Funded debt	$3,992,000	$4,192,000	*$200,000*
Current liabilities	$269,720	$343,126	*$73,406*
Reserves	$1,568,469	$1,615,740	*$47,270*
Contributed surplus	$332,552	$332,552	
Surplus from income	$4,056,832	$3,500,238	$556,594
Total surplus	$4,389,385	$3,832,791	$556,594
Total liabilities, reserves and surplus	$10,219,575	$9,983,659	$235,916

Italics indicate loss or deficiency.

The statement of bus line operations for the year shows total revenues of $45,323, compared with $39,875 last year, and expenses of $65,184, compared with $61,302 the previous year, giving a net loss for the year of $19,861, compared with $21,427. In 1922 the net loss was $29,086 on a total gross of $38,863. These figures, however, do not include any supervision or other overhead or comparison charges.

Customer Ownership Campaign on in St. Joseph

The St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., started its second customer-ownership campaign on Feb. 16 to be in effect until Feb. 28. The security is preferred stock of the Cities Service Company, which controls the St. Joseph property. The employees are all interested in making the campaign more successful than last year's and are anxious to exceed their sales by a substantial number. The New York office has set the St. Joseph quota at 2,500 shares. An offer of $7,000 in prizes and commissions has been made to employees who sell the greatest number of shares.

Twelve important steps in selling the Cities Service preferred stock were outlined in the February number of "Rylite Employees' News," the company's official publication. The employees were advised to tell the prospect that his purchase would make him part owner of the company's substantial properties and that he would share in the company's earnings.

January a Record Month for Boston "L"

The Boston Elevated Railway, Boston, Mass., reports the largest surplus for any January since the road was turned over to public trustees.

In submitting his report for the month Edward Dana, general manager, says that the savings were accomplished by the most rigid economy and without curtailment or impairment of service. The company carried 33,305,311 passengers, received from all sources $3,130,996 and paid out $2,861,347, which leaves an excess of receipts over cost of service of $269,649. The natural increase in wages from the arbitration award would have been $40,000, but the actual increase was only $1,400 because 400 employees were laid off and the repair shops were put on a 5-day basis.

	1925	1924
Revenue passengers:		
10-cent passengers	26,813,722	25,079,496
5-cent passengers	1,138,715	9,337,482
6-cent passengers	5,352,874	.....
Total revenue passengers	36,305,311	34,416,978
Total receipts per revenue passenger	9.401c.	8.855c.
Receipts from fares per revenue passenger	9.186c.	8.643c.
Cost of service per revenue passenger	8.591c.	8.490c.
Total payroll included in operating expenses	$1,453,173.97	$1,451,724.35
Payroll cost per revenue passenger	4.363c.	4.218c.

By increasing the safety factor, operating more safely, reducing accidents and incidentally accident insurance, the company cut its expenses for the law department, injuries and damages and insurance from $141,310 in January, 1924, to only $77,431 last month. Coal was bought at an average figure of $5.37 per ton as against $6.30 per ton a year ago, and the consumption was reduced by the higher efficiency engines, from 27,326 tons in January a year ago to 25,445 tons in January of this year.

Purchases Interurban Tracks

The City Commission of Dallas, Tex., recently gave the Dallas Railway permission to requisition $123,675 to purchase the Forney Avenue line from the Texas Interurban Railway. The company will give a note for the purchase price and pay the interest out of the company's authorized 7 per cent return on property values.

This line was built by the interurban company for the Terrell-Dallas line, but the Dallas Railway rented the trackage for local service. Under the new arrangement the Dallas Railway will have title to the lines and the Texas Interurban Railway will pay an annual rental of $3,000 for the interurban service.

Valuation of New York State Railways Reduced

The city of Rochester has reached an agreement with the New York State Railways in its long-pending suit for a reduction of the base valuation of the Rochester lines of the company, whereby the value under the service-at-cost contract will be cut from $19,216,000 to $18,076,000, a reduction of $1,140,000.

The figure agreed upon represents a compromise on the part of both parties, as the railway some time ago offered to reduce the value by $1,005,000. This proffer was rejected. The matter now is before the Common Council and acceptance is said to be assured.

The amount of the reduction, Corporation Counsel C. M. Platt said, is too small to allow any immediate reduction in the present 7-cent fare. Under the service-at-cost contract the railways must show a surplus of $200,000 in its balancing accounts before a fare cut is possible. The railways for the 4 years of operation under the contract have failed to show such return.

Dividends and Directors in Brooklyn.—The Brooklyn City Railroad, Brooklyn, N. Y., declared a quarterly dividend of 20 cents, payable March 2 to stock of record Feb. 14. Three months ago the company declared a quarterly dividend of 20 cents and 5 cents extra. Thomas I. Parkinson, vice-president of the Equitable Life Assurance Society, and Clinton E. Morgan, vice-president and general manager of the road, were elected directors.

Contract Agreement Reached.—Agreement over the question of valuation has finally been reached between the officials of the Milwaukee Electric Railway & Light Company and the public utilities acquisition committee, which are negotiating the proposed service-at-cost contract. It places a valuation of the company's properties at $56,456,506 as of July, 1925, the date when the contract is to become effective, providing the vote is in favor of the plan. This figure will be replaced by the exact amount determined when the audit of the company's books is completed up to that time. The audit is now completed up to Jan. 1, 1922, which establishes a valuation at that time of $42,382,000.

Receipts Higher in January This Year.—Total passenger revenues of the Indianapolis Street Railway, Indianapolis, Ind., for January were $449,657. This is a decrease of $17,091 compared with the previous month, but contrasted with total receipts for January of last year revealed an increase of $21,683.

Railway Included in Merger.—The Maine Public Utilities Commission recently rendered a decision authorizing the Bangor Railway & Electric Company, Bar Harbor & Union River Power Company, the Bangor Power Company and the Lincoln Light & Power Company to consolidate with the Bangor Hydro Electric Company.

No Intervention for Protection Necessary.—When the time arrives for a settlement under the reorganization of the United Railways of St. Louis all judgment creditors of the company prior to the receivership will have an opportunity to protect their interests. Federal Judge Faris so informed John V. Lee, counsel for judgment creditors holding claims for $129,000 against the company. Judge Faris overruled Counsel Lee's request to intervene in the receivership suit. The court told Mr. Lee there was no necessity for him to intervene as all those interested in the reorganization would receive proper consideration. In overruling a similar motion many weeks ago Judge Faris stated he had been assured the judgment creditors would be paid off in full when the reorganization was accomplished.

Railway at Public Sale.—The Phoenixville Trust Company as trustee for the bondholders will offer at public sale on March 11, 1925, at the Phoenix Hotel, Phoenixville, Pa., all the property of the Phoenixville, Valley Forge & Strafford Electric Railway, a 4½-mile trolley. Included in the sale will

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population.

Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials.

Wages index is relative average maximum hourly wage of motormen, conductors and operators on 100 of the largest street and interurban railways in the United States, weighted according to the number of such men employed.

be Pleasure Park, near Valley Forge, and about 12 acres of land. The road runs from Main and Church Streets, Phoenixville, Pa., to the village of Valley Forge and the Pennsylvania State Park, embracing the encampment grounds of Washington's army. Early last year it was stated that no buyer for the road could be found and the creditors' committee had decided that it would be best for the bondholders to purchase it and sell it for scrap.

Changes in Effect to Improve Business.—Receiver Henshaw of the Oklahoma Railway, Oklahoma City, Okla., has purchased the Katy railway passenger station at Guthrie with four and one-half blocks of yards and 7,000 ft. of railroad track by the Oklahoma Railway for $10,000. The purchase is to enable the electric railway to increase freight business. The receivers have outlined a reorganization plan calling for the expenditure of $50,000 on the Guthrie division, which is expected to reduce annual operating cost of that division by more than $40,000.

January Shows Profit. — January operations of the Community Traction Company, Toledo, Ohio, resulted in a profit of $14,952 for the stabilizing fund. Gross earnings were $334,874 and operating expenses $257,433, leaving a net profit of $77,441. Non-operating income added $3,035. Bond interest was $36,390 and the sinking fund requirement $22,512. This left $21,400 applicable to preferred dividends and stabilizing fund. Dividends on the preferred stock outstanding were $7,153.

Seeks Abandonment Permission.—The Pennsylvania-Ohio Electric Company, Youngstown, Ohio, has asked the Public Service Commission to permit it to abandon its railway between Hubbard, Ohio, and New Castle, Pa.

Dividend Suit Dismissed. — Suit to force distribution of nearly $2,000,000 as dividends to stockholders of the Chicago City Railways, Chicago, Ill., has been thrown out of court by the federal appellate judges who upheld a lower court ruling which involved the validity of the 1907 traction ordinances of Chicago.

City May Retire from Interests Outside City.—The city of Winnipeg, Man., will confine its traction activities to Winnipeg proper and retire from adjacent municipalities under a plan which has been submitted to the City Council and shareholders of the Winnipeg Electric Company, according to a recent report. If the plan is accepted by the city and the shareholders competition between the city and the company in the street railway business will be eliminated. The city would also buy the company's surplus current. Early in the present year it was said that a special committee might be appointed by the new City Council to consider the advisability of taking over the railway from the Winnipeg Electric Company.

Electric Branch Line Under Consideration.—The Philadelphia & Reading Railway is negotiating for the purchase of the Princeton branch of the New Jersey & Pennsylvania Traction Corporation, Trenton, N. J., for a freight line between Trenton and Princeton.

Personal Items

C. A. Brooks Leaves Poughkeepsie

Manager There Joins Fitkin & Company, Bankers and Utility Operators, in Charge of Railway Properties

Charles A. Brooks, general manager of the Poughkeepsie & Wappingers Falls Electric Railway, Poughkeepsie, N. Y., for the J. G. White Management Corporation, will on March 1 become associated with the general engineering and management corporation of A. E. Fitkin & Company, New York City, in charge of its electric railway properties. The Fitkin holdings include both city and interurban lines.

Mr. Brooks went to Poughkeepsie in April, 1913, after having served as a member of the J. G. White staff in New York. He had been identified with the traction business since 1902, when he entered the employ of the Brooklyn Rapid Transit Company. Later he was with Sanderson & Porter, New York, but left their employ to enter the service of the Third Avenue Railroad, New York City. Then followed a period in which he directed the construction of the South Shore traction lines in Long Island, and in 1912 he joined the staff of the White Corporation as a special engineer.

C. A. Brooks

Since he went to Poughkeepsie Mr. Brooks has been in charge of the railroad there except during the period from May, 1922, to November, 1923, when he was associated with Ward S. Lent in the Lenbrook Motor Corporation. Upon the death of R. J. Morrison, who had succeeded him as manager at Poughkeepsie, Mr. Brooks returned to his old position.

Under his direction the company at Poughkeepsie has purchased and put into operation an entire new equipment of rolling stock and has virtually rebuilt its lines. Ninety-five per cent of its trackage and pavement within the city has been replaced since 1913, under his personal direction.

Mr. Brooks has been president of the local Chamber of Commerce for nearly two years. In addition he is president of the Poughkeepsie Automobile Club, and is affiliated with many other local organizations. He is a member of the Amrita, Poughkeepsie Rotary, and Dutchess Golf and Country Clubs, and of the Transportation Club of New York City. He is a Knight Templar.

The Poughkeepsie *Eagle-News* said:

> Mr. Brooks has demonstrated that he is a man of high capabilities and of outstanding public spirit. As manager of the railway he has filled one of the most difficult positions in the community. He has had to contend with the same conditions which in other cities have made the operation of traction lines an exacting business in the last decade. Mr. Brooks succeeded in increasing the efficiency of service, despite formidable handicaps, and under his supervision the physical property of the company has been almost entirely rebuilt. Any fair review of his management must concede that he has done an extraordinarily fine piece of work. Mr. Brooks's services to the city through the Chamber of Commerce have been likewise notable.
>
> Mr. Brooks takes up his new duties with a background of experience which will serve him in good stead. Poughkeepsians will be glad that he has obtained at least a part of that experience in this city, and will wish for him the success which they are sure will be his.

Chicago Officials Advanced

At the annual meeting of the Chicago Rapid Transit Company, Chicago, Ill., operating the Elevated lines there, the title of B. J. Fallon was changed to vice-president in charge of operations. H. A. Johnson was given the title of general manager.

Mr. Fallon has been general manager since the summer of 1921. His promotion at that time had been the second within a period of a little longer than a year, his other positions being those of assistant general manager and engineer maintenance of way. His record of efficiency and achievement was reviewed in the ELECTRIC RAILWAY JOURNAL, issue of July 9, 1921.

H. A. Johnson, who now assumes the rôle of general manager, has also had a notable career in the railway field. He was formerly assistant to the general manager of the Chicago Rapid Transit and superintendent of shops and equipment of the Chicago, North Shore & Milwaukee Railroad. He was a member of the committee from the American Electric Railway Association sent abroad last year to study foreign practice. Recently, he was appointed director of research of the American Railway Association to take full charge of an extensive investigation of power brakes for both passenger and freight trains. The details of his career were published in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 20, 1924.

S. B. Way, vice-president and general manager of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has been elected president of the Peninsular Power Company, the properties of which were recently acquired by the North American Com-

Digitized by Google

pany. A. K. Ellis, general superintendent of the Wisconsin Traction, Light, Heat & Power Company, has been named vice-president, and F. J. Boehm, secretary and treasurer.

Wallace Shaw has succeeded Joseph P. Hines as general manager of the Nahant & Lynn Street Railway, Nahant, Mass. Thomas Fee is roadmaster, replacing Arthur Hollis.

J. Sandie has succeeded Alexander McCready, deceased, as master mechanic of the Sault Ste. Marie Traction Company, Sault Ste. Marie, Mich. J. H. Stewart has succeeded J. N. Franz as superintendent.

L. H. McCray, formerly assistant general manager of the East Penn Electric Company of Pottsville, Pa., has been elected vice-president of the New Hampshire Electric Railways. He will be in charge of the operation of the Massachusetts Northeastern Street Railway and the Dover, Somersworth & Rochester Street Railway in addition to light and power properties. Ralph Hood will continue as manager of the Massachusetts Northeastern Street Railway and the Dover, Somersworth & Rochester Street Railway.

J. P. Hudson, auditor of the Niagara, St. Catherines & Toronto Railway, St. Catherines, Ont., has had his jurisdiction extended to include the accounts of the Toronto Suburban Railway. Mr. Hudson will report direct to T. H. Cooper, general auditor, Montreal. H. J. Harris has been appointed assistant auditor with office at Lambton, Toronto, Ont.

Carl C. Jones has been promoted to division ticket and freight agent of the Terre Haute, Indianapolis & Eastern Traction Company, Terre Haute, Ind. This is a newly created office, to supervise all freight, express and baggage business which heretofore has been connected with the railway baggage department. The new arrangement separates the freight service entirely from the transportation department, which will allow M. M. Nash, superintendent of transportation, and his workers an opportunity to devote their entire time to traffic and transportation problems.

O. S. Hanson was elected treasurer of the Grand Forks Street Railway, Grand Forks, N. D., at the recent annual meeting. In this capacity he succeeds A. I. Hunter.

C. F. Crane, assistant to the president of the Harrisburg Railways, Harrisburg, Pa., was recently elected treasurer of the Pennsylvania Street Railway Association. At the same meeting Harold A. Buch was elected secretary. Mr. Buch was an assistant to the late Henry M. Stine, secretary and treasurer of the association.

Capt. W. V. Morland, manager of the Nottinghamshire & Derbyshire Tramways and the Midland General Omnibus Company, Nottinghamshire, England, has been appointed manager of the St. Helens Corporation Tramways.

Clarence Kline, purchasing agent, claim agent and superintendent of the Enid City Railway, Enid, Okla., is now vice-president of the Tulsa Street Railway, Tulsa, Okla. Mr. McGrath succeeded Mr. Kline at Enid.

E. W. Dickinson is retiring from the post of power station engineer of the London County Council Tramways, London, England, and will receive a retiring allowance. He has been on the permanent staff since 1906.

Obituary

F. P. Maize

F. P. Maize, master mechanic of the Portland Electric Power Company, Portland, Ore., since 1911, died recently. Mr. Maize was in the railway field for many years, his first connection being in the shops of the Carlisle Manufacturing Company, locomotive builders, which he served from 1885 to 1893. He then became foreman of the machine shop of the Atlantic Avenue Railroad in Brooklyn and a year later accepted a position with the Scranton traction company.

It was at the time he was connected with the Scranton property that Mr. Maize took up the study of the subject of mechanical and electrical engineering. This equipment enabled him to perform with even greater zeal the duties of foreman of repair shops of the second division of the Union Traction Company, Philadelphia. Each position seemed to fit him for something higher and a year later he became master mechanic of the New York & Queens County Railway, Long Island City, later being promoted to superintendent of power houses and equipment.

From 1903 until the summer of 1908 Mr. Maize was master mechanic of the Rochester Railway, in the latter year resigning to become a mechanical instructor of the Public Service Corporation of New Jersey and in general charge of the repair shops of the company throughout New Jersey. He next moved to Portland, Ore., where he has been employed for the past 14 years.

Job E. Hedges

Job E. Hedges, humorous speaker, political philosopher, lawyer and former receiver of the New York Railways, New York City, died at his rooms in the Chalfonte Hotel at Atlantic City, N. J., on Feb. 22. The death, which was sudden, was caused by heart disease, of which Mr. Hedges has suffered several previous attacks. He was 62 years old.

In 1914 Mr. Hedges was defeated for Governor of New York by William Sulzer, the Democratic candidate. After Mr. Sulzer's impeachment and the succession of the late Martin H. Glynn to the Governorship, Mr. Hedges became a candidate for the nomination again in 1914.

The New York *Times* said that in the opinion of many of his friends, Mr. Hedges' reputation as a humorist was a decided handicap to him politically, and that it was certain his reputation as a wit prevented many epigrams of political philosophy of his being taken with the seriousness that they deserved.

Mr. Hedges always took an active part in Republican State and national conventions. He placed Charles E. Hughes in nomination for Governor in 1906 and supported Mr. Hughes in the campaign.

In a speech at a dinner of the University of Vermont alumni, he said:

> The only difference between the Governor of Vermont and the Mayor of this city is that the Governor says nothing and does a whole lot while the Mayor says a whole lot and does nothing. When the Mayor has more to say than usual he seeks redress in the City Record.

Mr. Hedges' wit continued undimmed by failing health. When criticised by Mayor Hylan for action as a surface railway receiver, Mr. Hedges retorted by referring to the Board of Estimate and Apportionment as "a board that neither estimates nor apportions."

C. M. Murdock

Charles M. Murdock, Lafayette, Ind., vice-president of the Chicago, South Bend & Northern Indiana Railway, South Bend, Ind., died of heart disease Feb. 8 at his home in that city. He had been ill several years. The day prior to his death he visited the First Merchants National Bank, Lafayette, of which he was chairman of the board of directors, but that night appeared restless and at 7 o'clock, when the nurse tried to awaken him, she found he was dead. He was 60 years old.

With his father and brother Mr. Murdock organized the first gas company in Lafayette and later the Lafayette Lighting Company. These utilities are now combined as the Northern Indiana Gas & Electric Company. He and his brother also were pioneers in interurban development. They became interested years ago in the Terre Haute, Indianapolis & Eastern Traction Company, the Fort Wayne & Wabash Valley Traction Company, the Evansville & Southern Traction Company and the Chicago, South Bend & Northern Indiana Railway and the Southern Michigan Railway. Mr. Murdock also was interested in several banks.

William M. Lawyer, connected with the E-Z Car Control Corporation, Turnstile Car Corporation and Haller-Powers Printing Company, Syracuse, N. Y., is dead. Mr. Lawyer was born in Oswego County, New York, on June 19, 1874. After being educated in public schools of his native district he worked for the Buffalo, Rochester & Pittsburgh Railroad and later entered the employ of the New York Central Railroad, continuing with the latter until he had completed 10 years of service. He then went to Cleveland, Ohio, where he was associated with the Whitmore Manufacturing Company, manufacturers of lubricants, as salesman and Eastern representative for 16 years. Next he engaged in manufacture and distribution of railroad supplies in Syracuse and in March, 1922, he helped to organize the Turnstile Car Corporation.

Edward W. Gross, treasurer and general manager of the Berlin Street Railway, Berlin, N. H., died recently in Auburn, Me. In the early '80s in Lewiston and Auburn Mr. Gross organized the American Light & Power Company, becoming treasurer and manager. Twenty-two years ago he secured control of the Berlin Street Railway and as treasurer and general manager devoted all his energy to putting the company on a sound financial basis. Mr. Gross was 87 years old.

A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Jacksonville Coal Agreement Stimulates Non-Union Mining

The Jacksonville agreement between bituminous coal operators and the United Mine Workers is not working out in an entirely satisfactory manner, according to the opinion in well-informed quarters in Washington. It is stimulating greatly the production from non-union mines. One effect is the keeping in operation of inefficient mines in non-union territory and closing efficient mines in the union area. Nevertheless, the alternative to the Jacksonville agreement was a strike, and the present situation is preferable to one which would have followed such a course.

The union probably is not ready to concede it, but the trend among the men is to make wage concessions. It is regarded as entirely preferable that this suggestion should come from the men rather than from their employers. The coal industry, however, still is reaping the harvest, it is declared, of war distortions, of transportation inefficiencies and of the mismanagement which characterized the decade preceding the Jacksonville agreement.

Buses to Be Exhibited at Boston Show

Buses will constitute a substantial and special feature of the annual Boston Automobile Show in Mechanics Building on March 7 to 17. Many different sizes and types will be displayed. Some exceptionally fine buses are being built for service in New England this spring, and some of them will be on display at the Boston show before they are placed in service.

Gould Coupler Taken by Symington Interests

The Gould Coupler Company, New York, has been purchased from Charles J. Graham of the Graham Bolt & Nut Company by a banking group acting in behalf of interests connected with one of the largest railway supply companies. Announcement to this effect was made on Feb. 6. On Feb. 10 it was made public that the purchase of the Gould Coupler Company and the Gould Storage Battery Company was for the Symington interests.

Confirmation of these changes and of other details of the proposed new financing was obtained through Blair & Company, New York, on Feb. 26. At that time public offering was made of 175,000 shares of participating Class A shares of the Gould Coupler Company of Maryland. This company has acquired the plants, equipment, patents, trade names, etc., of Gould Coupler Company, a New York corporation, as a going concern. The business of the company was started 43 years ago under the title of Gould & Stimson. In 1890, the Gould Coupler Company was incorporated in West Virginia, and was succeeded in 1903 by a corporation of the same name chartered in the State of New York.

Simultaneously with this move, Charles A. Gould, who has been president of the company since its inception, is retiring from business at the age of 76 years and has been succeeded as president by his son, William S. Gould, who has been identified with the business for many years as vice-president. The executive and operating personnel will continue as heretofore with no other material change.

The Symington Company is acquiring a majority of the common shares of the new Gould company.

Electric Locomotive Shipments $3,500,000

Shipments of electric locomotives for the quarter ended Dec. 31, 1924, totaled 167, valued at $901,342, against 148, with a value of $738,540, for the quarter ended Sept. 30. Shipments for the year 1924 were 655, valued at $3,483,150, against 1,334, worth $6,221,170, in 1923. These figures are in accordance with the findings of the Department of Commerce.

Upward Trend of Gasoline Prices Quite Natural

A table of tank-wagon prices compiled by Dow, Jones & Company, New York, for 30 principal cities of the United States, shows an average price for gasoline was 15.6 cents a gallon on July 29, 15.21 cents on Aug. 29, 14.44 cents on Sept. 17, 14.64 cents on Sept. 20 and 13.59 cents a gallon on Oct. 3. It is explained that this steady decline was brought about by cheapness of crude, which, in turn, was attributable to overproduction that during the year added 19,843,000 bbl. to the 333,053,000 already held in storage at the end of

With the recent falling off in production and the improvement in crude oil prices gasoline has advanced 3.67 cents a gallon from the average low point of early October, the present average price being 17.26. Since Jan. 1, 1925, crude has advanced from $1.10 to $1.80 a barrel, net of 70 cents.

The yield of gasoline per barrel of crude varies with refining methods and the grade of crude oil, but averages about 30 per cent. In other words, a 42-gal. barrel of crude yields about 13 gal. of gasoline on the average, and other products and refining losses account for the remainder.

In commenting on these facts the *Wall Street Journal* admonishes its readers to remember that refiners were selling gasoline throughout the summer of 1924 at prices that would hardly yield a fair return on the investment, and that in all fairness present prices should allow them to recoup such losses as they sustained.

Oil men themselves explain that the recent upward change in prices is merely a manifestation of a natural economic sequence.

ELECTRIC RAILWAY MATERIAL PRICES—FEB. 26, 1925

Metals—New York

Copper, electrolytic, cents per lb.	14.687
Lead, cents per lb.	9.175
Nickel, cents per lb.	31.00
Zinc, cents per lb.	7.87
Tin, Straits, cents per lb.	57.00
Aluminum, 98 to 99 per cent, cents per lb.	27.00
Babbitt metal, warehouse, cents per lb.:	
Fair grade	60.00
Commercial	28.00

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.45
Somerset mine run, Boston	2.125
Pittsburgh mine run, Pittsburgh	1.95
Franklin, Ill., screenings, Chicago	1.875
Central, Ill., screenings, Chicago	1.875
Kansas screenings, Kansas City	2.50

Track Materials—Pittsburgh

Standard Bessemer steel rails, gross ton	$43.00
Standard open hearth rails, gross ton	43.00
Railroad spikes, drive, Pittsburgh base, cents per lb.	3.05
Tie plates (flat type), cents per lb.	2.425
Angle bars cents per lb.	2.75
Rail bolts and nuts, Pittsburgh base, cents, lb.	4.075
Steel bars, cents per lb.	2.10
Ties, white oak, Chicago, 6 in.x8 in.x8½ ft.	$1.60

Hardware—Pittsburgh

Wire nails, base per keg	2.85
Sheet iron (28 gage), cents per lb.	3.50
Sheet iron, galvanized (28 gage), cents per lb.	4.75
Galvanized barbed wire, cents per lb.	3.55
Galvanized wire, ordinary, cents per lb.	2.60

Waste—New York

Waste, wool, cents per lb.	16
Waste, cotton (100 lb. bale), cents per lb.:	
White	13–19
Colored	10–15

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), per gal.	$1.20
White lead (100 lb. keg), cents per lb.	0.1625
Turpentine (bbl. lots), per gal.	0.94
Car window glass, (single strength), first three brackets, A quality, discount*	84.0%
Car window glass, (single strength), first three brackets, B quality, discount*	86.0%
Car window glass, (double strength) all sizes, A quality, discount*	85.0%
Putty, 100 lb. tins, cents per lb.	4–6

* Prices f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb.	17.00
Rubber-covered wire, No. 14, per 1,000 ft.	$7.00
Weatherproof wire base, cents per lb.	19.50

Paving Materials

Paving stone, granite, 4x8x4, f.o.b. Chicago, dressed, per sq.yd.	....
Common, per sq.yd.	....
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.82
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3½x8½x3 N.Y., per 1000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.85
Cement, Chicago consumers' net prices, without bags	2.20
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., N. Y.	1.25

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.75
Light copper, cents per lb.	10.00
Heavy brass, cents per lb.	7.50
Zinc, old scrap, cents per lb.	4.25
Lead, cents per lb. (heavy)	7.50
Steel car axles, Chicago, net ton	$19.25
Cast iron car wheels, Chicago, gross ton	19.25
Rails (short), Chicago, gross ton	20.25
Rails, (relaying), Chicago, gross ton	25.50
Machine turnings, Chicago, gross ton	12.25

Extensive Improvements Planned in New Orleans

Improvements planned by the New Orleans Public Service, Inc., New Orleans, La., during 1925 will cost approximately $6,641,203. With the completion of the program planned for this year, the Public Service will have spent $21,022,253 in 3 years. Among other things the improvements will include new machinery for the power houses and substations, changes in overhead and underground systems of distribution and machinery to increase the capacity of the gas department to 21,250,009 cu.ft.

Changes in American Car & Foundry Personnel

H. W. Wolff, vice-president of the American Car & Foundry Company, and G. R. Scanland, formerly auditor, have been elected to the board of directors of the company. Mr. Scanland has also been elected vice-president in charge of finance and accounts. Others elected were S. A. Maleppe, assistant treasurer, in place of S. S. De Lano, deceased; E. S. Block, assistant auditor, and A. E. Jackson, assistant treasurer.

Rolling Stock

Madison Railways, Madison, Wis., expects to purchase from the Yellow Coach Manufacturing Company, Chicago, three buses of the street-car type seating 29 passengers.

Municipal Railway of San Francisco, San Francisco, Cal., will purchase 10 all steel cars at a cost of $16,000 each.

Minneapolis Street Railway, Minneapolis, Minn., expects to spend $500,000 for some 50 buses and $100,000 additional for a garage as soon as the bus ordinance is passed.

Track and Line

Grand Rapids Railway, Grand Rapids, Mich., expects to spend $746,714 on relaying and building new track, making a total of $2,081,737 spent for construction since 1919.

Denver Tramway, Denver, Col., plans to construct a new car line, a cross-town branch extending from Broadway to University Avenue and possibly beyond Colorado Boulevard when plans for reorganization and removal of receivership are completed. The line will be from 23 to 40 blocks long. This construction is part of the South Denver improvement program, providing for construction of a consolidated freight and passenger railroad station.

Key System Transit Company, Oakland, Cal., has been granted an extension of time by the Railroad Commission in which to construct double tracks across 41st Street and Piedmont Avenue in the city of Oakland, double tracks across Arroyo Avenue between York Drive and Ricardo Avenue at grade and a single track across Cambridge Way between York Drive and Ricardo Avenue at grade in the city of Piedmont.

Shops and Buildings

Public Service Railway, Newark, N. J., plans to erect a combination car-house and garage at New Brunswick, N. J., to be about 400 ft. long on Sanford and Delevan Streets and 200 ft. on Commercial Avenue. Six tracks would lead into the building. The garage would be 120 by 190 ft., with a 115-ft. pit. In addition there would be a bus repair shop, oil house and store room.

Wisconsin Power & Light Company, Fond du Lac, Wis., plans to build a modern interurban-bus terminal at Fond du Lac. Administrative and sales departments will also be located in this building. A train shed will be added to the building of sufficient size to provide ample space for the increasing number of buses in operation.

Trade Notes

Combustion Engineering Corporation, New York, N. Y., has announced the appointment of W. R. Quinn, former manager of the fuel oil department, as Pacific Coast agent, with headquarters in San Francisco. Mr. Quinn's territory will include the states of Washington, Oregon and California.

Economy Electric Devices Company, Chicago, Ill., announces the installation of 10 additional meters with inspection dials on the Denver Tramway's equipment. This installation completely equips all of the rolling stock on this property.

Allen D. Turner, formerly in charge of convention publicity for the Westinghouse Electric & Manufacturing Company, with headquarters at Pittsburgh, and more recently in charge of automotive equipment advertising at the Springfield, Mass., office, has been appointed publicity manager of the New England district office of the company with headquarters at 10 High Street, Boston.

Charles Piez, chairman of the board of the Link-Belt Company, Chicago, tells in the January number of *System* what he means by the "Exception Plan." "The man who has continually to work overtime is a poor executive," is the opinion of Mr. Piez. He says the executive cannot immerse himself in routine matters, but must hold himself free to take care of the exceptions. He is in effect an emergency man, and added that it would mean death to his usefulness if he made himself the slave of a time-table.

Okonite Company, Passaic, N. J., opened an office at 310 South Michigan Avenue, Chicago, on Feb. 1 and took over the sale of Okonite products in the Western territory. Charles E. Brown, formerly vice-president of the Central Electric Company, was appointed vice-president in charge of the territory west of Pittsburgh and east of the Rocky Mountains of the Okonite Company, with headquarters in Chicago. A. L. McNeill, formerly manager of the railroad department of the Central Electric Company, has been appointed manager of the railroad department. E. H. McNeill, formerly railroad sales representative of the Central Electric Company, has been appointed sales engineer. Ray N. Baker, formerly railroad sales representative of the Central Electric Company, has been appointed sales engineer. L. R. Mann, formerly sales representative of the Central Electric Company, with headquarters at St. Louis, has been appointed manager of the St. Louis office. Joseph O'Brien, formerly railroad sales representative of the Central Electric Company, has been appointed sales representative, with headquarters in Chicago. C. E. Brown, Jr., formerly country sales manager of the Central Electric Company, has been appointed manager of the light and power department.

Lynn W. Nones has been appointed Eastern sales manager for the Diamond Power Specialty Corporation, in charge of the Atlantic Coast offices from Boston to Charlotte inclusive. His office is at 90 West Street, New York.

New Advertising Literature

Texas Company, New York, N. Y., in the January issue of *Lubrication* has given much information regarding lubrication practice for electric railways. Articles on methods of reclaiming, handling and storing lubricants are given, together with specific recommendations to eliminate waste and increase efficiency.

Portland Cement Association, Chicao, Ill., has issued a publication entitled "Design and Control of Concrete Mixtures." This booklet describes a method to produce concrete of predetermined strength.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has reprinted the paper "The Development of the Electric Locomotive," originally presented before the meeting of the American Railway Association in Atlantic City in June, 1924. The paper points out the salient facts incident to electric locomotive progress.

General Electric Company, Schenectady, N. Y., has issued bulletin No. 47640.2, devoted to induction, time, over-current relays, types IA-201, IA-202 and IA-206. It describes the four forms of over-current relays, together with the applications of each. Details of construction, lists of available ratings and principles of operation are covered, together with other general information. The bulletin is illustrated by photographs, charts and diagrams.

Crouse-Hinds Company, Syracuse, N. Y., has issued folder No. 21, on junction box condulets with removable hub plates.

Federal Porcelain Company, Carey, Ohio, has issued its condensed catalog of standard electrical porcelain in response to a demand from some of its jobber customers for a small catalog, but one that would at the same time contain complete information on all the types most in demand. The condensed catalog contains list prices, weights, barrel quantities, dimensions and wire carrying capacities on all the items of standard porcelain which are most commonly in demand. The folder is properly punched to fit standard E. S. J. A. salesmen's binders.

Municipal Ownership— or Public Ownership

CHICAGO is about to vote on a new transportation ordinance, as outlined elsewhere in this issue. The City Council has passed it by a vote of 40 to 5, which indicates at least a fair chance of approval by the voters at the coming referendum on April 7.

After 30 years of strife over local transportation the solution now offered is essentially an expedient. A previous attempt to give the city a unified comprehensive system to provide for future growth was defeated in 1918. The present proposal introduces several new features. It eliminates the necessity of granting a long-term franchise to permit financing, by issuing municipal certificates for this purpose. It avoids the use of general tax funds for the benefit of the car rider by insuring a flexible rate of fare that is automatically changed without action by the city council. Capital account will be amortized through the establishment of a sinking fund that must be paid out of the car fare. Freedom from political control is sought through vesting broad powers in a railway board representing the city and security holders. A universal city-wide fare with free transfers between surface, elevated and subway cars is established for the purpose of encouraging maximum use of rapid transit facilities for the longer rides.

Mayor Dever says the ordinance provides for municipal ownership. He was elected as an advocate of that program. But in an interview with a representative of ELECTRIC RAILWAY JOURNAL, he said: "That does not mean political control. Quite the contrary. It means taking traction out of politics; providing a plan which will enable a comprehensive system to be developed to meet the present and future needs of the city. The board of operation is designed with a view toward providing an incentive to efficient and economical operation at least equal to that given by regulated private management under a service-at-cost franchise."

Samuel Insull, speaking to stockholders of the Commonwealth Edison Company, said that he had not much faith in a scheme of shifting responsibility from individual management to municipal management. But, according to Mr. Insull, so urgent is the necessity that, speaking as a representative of the capital represented, he did not care what the scheme might be, provided it contemplated a co-ordination of the local transportation facilities in Chicago and a development of rapid transit in the largest sense of the word. He feels that the Mayor's plan is entitled to a friendly hearing and an impartial judgment.

Frank O. Wetmore, president of the First National Bank of Chicago, a representative of the bondholders of the surface car properties, said in a recent interview to the press that the municipal certificates which would be issued in exchange for existing securities and for raising new money would be sound securities. He added that the plan proposed is neither private ownership and operation nor municipal ownership and operation.

On its face the ordinance to be submitted to the voters of Chicago will be called municipal ownership. Title to the properties will be vested in the city. Actually, however, the lines will be owned by the holders of the "municipal railway certificate." Control will be vested in the board of nine members representing both the city and the security holders and designed to be free of political meddling. When 51 per cent of the outstanding certificates are retired, the city will acquire a controlling membership on the board. Then the danger of political plundering may become imminent. In that the present ordinance postpones this opportunity for the patronage dispenser 40 years lies one of its greatest virtues. Consequently, though it bears the label of "Municipal Ownership," which may cause the ever-present zealots who espouse that cause in other communities to point to Chicago as the largest new recruit, it has for the present at least taken only a step in that direction.

Transit Matters Move Fast in New York

DEVELOPMENTS in the New York transit situation since the presentation to the Governor of the McAvoy report early last month have been rapid. The Transit Commission has indorsed it in its entirety. The Interborough Rapid Transit Company has taken exception to one suggestion, that of lengthening the short local station platforms, not from a transportation standpoint but because it declares the cost of making this change to be beyond its credit capacity. It therefore urges a higher fare in a "memorial" to the Governor and legislature. In this memorial the company asks for itself only enough of the added fare "to enable it to render adequate service and make such additions and betterments as may be found necessary or advisable by the public authorities having jurisdiction in the matter." The Merchants' Association of New York through its committee on rapid transit has condemned the Mayor's plan of an isolated subway system instead of extensions unified and co-ordinated with the existing lines. Finally, the Governor, to whom the McAvoy report was addressed, has accepted and approved its findings. By a curious kind of logic, however, he uses the statements in the report of a deadlock between the Transit Commission and the city as an argument for complete home rule in New York on transit affairs.

The Governor therefore recommended the abolition of the commission and the transfer of its present powers to the city. He also urged an expansion of the present borrowing powers of the city by a constitutional change so that it may build and operate new subway lines. Incidentally, although the Governor does not say so, such

Digitized by Google

additional credit, unless specifically limited to the construction of new subway lines, would enable the city to take over a considerable part of the existing lines under the "recapture" clauses of the dual contracts, thus providing for a city-wide municipally owned and operated transit system. In many respects the differences of opinion are not very great at present in the rapid transit policies of the Mayor and the Governor except as to whether the projected tunnel between Brooklyn and Staten Island will carry passengers and freight or only passengers. On this point the Governor explains that the nature of the proposed tunnel was specified by law and recommends this law be repealed.

Nothing Is Gained by Withholding Information

STREET railway service is subject to frequent interruptions from causes which are beyond the power of the management to control. No reasonable person will criticise the companies harshly for unavoidable delays of this kind. The attitude taken by the railway men toward the public after the delay has occurred, however, has an important influence on the way the latter feels about it.

That no effort will be spared to remove the cause of delays and to get the cars moving again as quickly as possible may be assumed. Meanwhile passengers are waiting impatiently in cars that remain motionless while other people are standing at terminals and street corners wondering why no cars come. "What is the matter? When will a car come?" Every one wants to know. Too often no effort is made to furnish information of this kind.

Nearly every line has some terminal point. Sometimes it is in an imposing terminal building and sometimes it is only an outdoor loop or switchback. But in any case there is likely to be a uniformed inspector or starter at hand. He usually has telephone communication with other points on the line and with the carhouse. The chances are that he knows the reason for any serious interruption to service and how soon the cars will be running again.

For some reason difficult to fathom, however, such men are often reluctant to give this information to the impatiently waiting people. Nothing is gained by this policy. In fact, a slight annoyance becomes a serious grievance when the passenger is so treated. The more progressive among the steam railroads long ago gave it up and adopted the plan of posting on a bulletin board the expected time of arrival of delayed trains and, where possible, the cause of delay. Why should not the street railway give all available information to its waiting patrons in case of interruption to service?

Besides being a satisfaction to the prospective passenger to know how soon he is likely to get a car, it would in many cases be a real convenience. If he knew that no car would come for 15 minutes he might be able to do an errand which he was planning to postpone to another day. Or again, if he were on his way to keep an appointment, this quarter of an hour might give him time to get in touch with his friend by telephone and explain the reason for his tardiness. Examples of how this policy would benefit the passenger might be multiplied indefinitely. In the long run any policy in matters of this kind that benefits the passenger benefits also the railway.

Adverse Weather Conditions and Bus Service

A FEW years ago many persons thought that the bus was only a fair weather means of transportation and that it could not render dependable service during the winter with snow and ice on the ground. In the light of greater experience, however, this opinion must be revised somewhat. Although the electric railway is inherently far better able than the bus to cope with a severe snowstorm, other factors have handicapped its actual effectiveness in operating under adverse weather conditions.

For example, the benefit of the better traction secured by steel wheels on steel rails as compared with rubber tires on a snow-covered asphalt pavement is entirely lost if some such rubber-tired vehicle as a 5-ton truck becomes stalled on the car tracks. Then again, as soon as the railway with its powerful plows and sweepers clears a path through the snowdrifts in the streets, all other vehicles hasten to take advantage of it and the speed of cars is reduced to a mere crawl, or perhaps they are halted altogether. Such conditions usually continue to hamper railway operation for days or weeks after a heavy snowfall. Theoretically this is unnecessary and unfair, but it is the actual situation in most cities and no altogether satisfactory remedy for it has yet been found. A similar condition exists with buses where the entire street area is not cleared and vehicles are required to travel in single file.

Where buses are used they encounter their most serious difficulties soon after the beginning of a storm. They slip and slide and often get stalled in deep snow. By the second or third day, however, some sort of a path has been made, and with the help of chains more or less dependable operation is possible. From that time on until the snow finally disappears there is little to choose between the bus and the trolley so far as regularity of service is concerned.

Dire predictions often heard, that the bus would be utterly useless as soon as the first snow fell, have not been fulfilled. Bus operation is hampered by unfavorable weather conditions, but in general it must be admitted that these vehicles have been able to open up their routes and render fairly acceptable service in spite of the elements.

Fuel Costs Go Up for the Principal Competitor

ELECTRIC railway officials and stockholders will regard with more equanimity than most persons the increases in the price of gasoline which have taken place during the last few weeks. While many railway companies operate buses and other automotive equipment, the disadvantage of a larger outlay for fuel for this equipment is more than counterbalanced by the fact that the principal competitor of the electric railway, the private automobile, is entirely dependent upon gasoline for its propulsion. It may be said that the cost of gasoline is one of the comparatively minor expenses in automobile operation, being usually exceeded by both tires and garage storage, and often by both depreciation and maintenance as well. Nevertheless an increase of 30 per cent or more in the cost of gasoline, such as has taken place within the last two months, is likely to make an impression on the average automobilist.

Two-Car Trains of This Type Are Used During Rush Hours with a Crew of Two Men. The Motor Car Is the Usual Front-Entrance-and-Exit Type, While the Trail Car Has Center Doors

Public Service Railway Has 92 per Cent One-Man Operation

This Company Now Operates More than 1,200 One-Man Cars on 70 Lines—Schedule Speed Has Been Slightly Increased and the Number of Boarding and Alighting Accidents Reduced Nearly 20 per Cent — Pneumatic Doors and Electric Fare Boxes Have Been Installed on Converted Cars—No Platform Employees Laid Off

IN FEBRUARY of this year the Public Service Railway of New Jersey was operating slightly more than 1,200 one-man cars on 70 lines. This constitutes about 92 per cent of the total service operated by the company. The present situation is the result of a steady growth of the one-man idea on this property during the past 2 years, particularly during the last 12 months. Outstanding results are an increase in the schedule speed, a reduction in the number of boarding and alighting accidents and important savings in operating expenses.

One-man operation on city lines was first undertaken by the Public Service Railway with the inauguration of safety car service in Paterson on Sept. 5, 1920. Prior to that time one or two shuttle lines in outlying districts had been operated in this way, but all the city and interurban cars were operated by two men. The Birney cars installed in the fall of 1920 were the first of 200 which the company had ordered a short time before. Eventually these were all put in service in various towns where the railway operates.

Double-truck one-man cars were first tried by this company on Nov. 28, 1921, on a crosstown line in Newark. These were standard 40-ft., double-end, side-seated cars, converted for one-man operation. Riding on this experimental line was fairly heavy, but it had the advantage of operating throughout almost its entire length over a route where no other cars ran. Following a successful trial on this route, one-man operation was gradually extended to other lines where the operating conditions were more or less similar.

In January, 1923, of the total number of cars operated by the Public Service Railway, 15.7 per cent were of the one-man type, either Birney or converted. During the first 7 months of the year this percentage was increased to 19.5. Then in August and September occurred a serious strike of platform men and all service was suspended for 59 days. When operation was resumed in October the one-man cars constituted 19.4 per cent of the total.

Soon after the resumption of service a 5-cent zone fare system was put into effect, as described in ELECTRIC RAILWAY JOURNAL for Oct. 6, 1923. A combination of circumstances, including an increase in wages granted to the men, a loss of traffic due to the strike and the fact that even under the previous 7½-cent fare the company had been losing money steadily, made it imperative that every possible operating economy be practiced. With this end in view it was decided to extend the use of one-man cars. How this has increased month by month is shown by the accompanying curve. Almost without exception each month has seen an increase in the number of one-man cars in operation, until at the end of January there were 1,199 such cars. Today the total is slightly more than 1,200. Two-man operation is still in effect, however, on a few of the interurban lines.

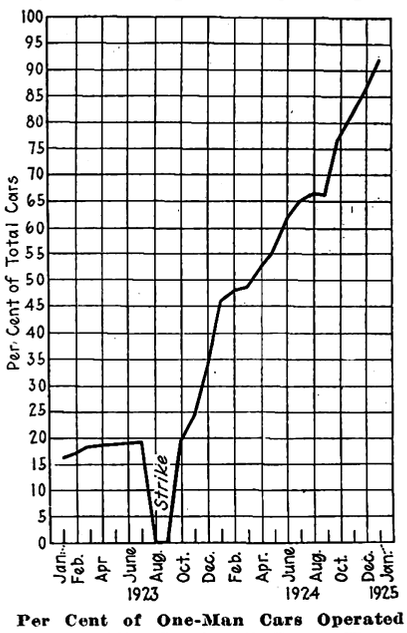
Heavy riding on certain city lines has not prevented the use of one-man cars. These are now operating on routes where the rush-hour headway is one minute or less. Two-car trains have been used to advantage on some lines during the past winter. They were particu-

Digitized by Google

larly valuable in the emergencies caused by the severe snowstorms in January, when occasional irregularities in headway were unavoidable. A standard center-entrance trailer is permanently coupled behind a car of the ordinary front-entrance type. One man is stationed on each car. Signals are transmitted by a single-stroke electric bell system which has been installed in addition to the ordinary buzzers.

Changes Made in Converting Cars for One-Man Operation

After a careful study of the question of one-man operation, the company decided that it was of primary importance to have plenty of room on the platform of such a car, in order to separate boarding passengers from those alighting, and thus increase the speed of interchange. Conversion of double-end, longitudinal-seat cars, equipped with double folding doors on both sides of both platforms, was comparatively simple. Except where it was thought absolutely necessary to retain the double-end character of the car, they have been changed to single-end cars by permanently closing the doors on the blind side and removing the steps. On the near side one of the rear doors has been permanently closed, while the other has been equipped with a pneumatic door engine controlled from the front platform. Removal of control and other apparatus from the rear platform and the permanent closing of the doors have made it possible to install a number of additional seats on the back platform.



Per Cent of One-Man Cars Operated by Public Service Railway Has Increased Steadily During the Past Two Years

All one-man cars operated by the Public Service Railway are equipped with pneumatic door engines, this being thought essential to good service under these conditions. A motorman has three door-operating handles. One is for each of the front doors and the third to control the rear door. An emergency control for the use of passengers in case of accident has been arranged and placed in a glass-covered case on the back platform.

A more difficult problem arose concerning the conversion of single-end cars for one-man operation. Most of these cars had small front platforms and large rear platforms. In the case of those with longitudinal seats the ends of the car were reversed and double folding doors were installed on what previously had been the blind side of the rear platform. An emergency exit door was installed on what had been the blind side of the front platform, while the doors formerly used were boarded up.

This method of conversion, however, was not feasible in the case of cars equipped with cross seats. It was necessary in such cases to extend the front platform about 2½ ft. and to remove the bulkhead which formerly separated the motorman from the passengers. An unusual outcome of the rebuilding program is that the changes have tended to give the rolling stock a more uniform appearance. Whereas on account of the different platform lengths the single-end cars used to present a sharp contrast to the double-end cars, all cars now have nearly the same exterior appearance.

On the near side of the dasher of every one-man car a red sign has been painted to indicate that it is a front-entrance car. In the vestibule window immediately above this is displayed a smaller reversible sign to indicate whether the car is operating pay-as-you-enter or pay-as-you-leave. Red and blue colors are used respectively to distinguish the two fare collection methods. In general, single-fare lines are operated pay-enter inbound and pay-leave outbound. On two-fare lines cars are operated pay-enter in the first zone and pay-leave in the second, irrespective of the direction in which they are going. Where there are more than two zones identification checks are used. For example, on a three-fare line in all zones passengers pay on entering. In the first area no identification check is issued and no fare collected when the passenger alights. Those boarding in the second zone receive an identification check, and in the third zone a different kind of identification check. The fare collected when the passenger gets off depends on the color of the identification check which he has. The number of checks averages only about 870,000 per month, and this is not an important item of expense. More than 6,500,000 transfers were used per month when the 7½-cent fare was in force.

Fare Collection Speeded Up

On the converted cars of the Mount Prospect line, in Newark, electric fare boxes have been installed. This is a fairly heavy crosstown route serving residential districts at its two ends and passing through the center of the city. Checks were made before and after the installation of automatic fare boxes to determine their effect on the speed of operation. More than 1,200 observations showed an average time of 2.16 seconds per boarding passenger with the old style fare box and approximately the same number of observations gave an average of 1.92 seconds after the change. This indicated a time saving of about 12 per cent and the company is now considering the installation of automatic fare boxes on other lines.

Another means to reduce the time taken boarding and alighting is the use of street collectors. During rush hours they are stationed at fixed points in the congested districts, usually on safety aisles, and collect fares so that in the afternoon passengers may board cars by the rear door, or in the morning leave cars by the rear doors on pay-leave lines. Actual door operation is controlled by the motorman. By means of a single-stroke electric bell the collector signals him when to open and close the rear door. A push button for this signal is inconspicuously located alongside the door.

In the Public Service terminal building automatic turnstiles have been installed at the stairs leading down to the subway loading tracks and up to the elevated platforms. Passengers board cars on these upper and lower levels, using doors at both ends. Loading time is thus saved at small cost. The only attendants neces-

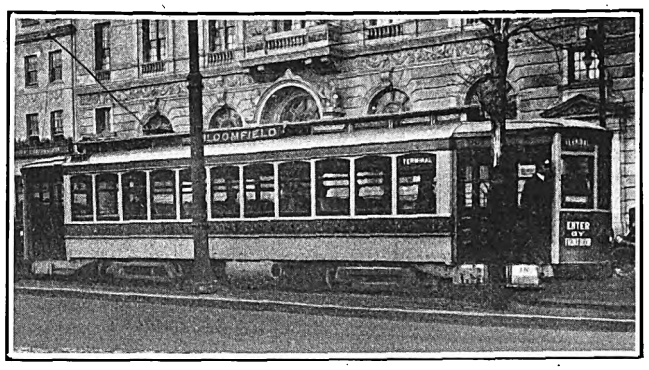
Digitized by Google

sary for the operation of the turnstiles are in the change-making booths in the center of the terminal concourse. As the fare is 5 cents and no transfers are issued, the use of automatic turnstiles is a practicable arrangement.

To train several hundred conductors to be motormen and vice versa was a big problem connected with the extension of one-man operation. This involved the instruction of a larger number of men in a shorter length of time than would ever have been the case under normal circumstances. The method followed was to send these men to the instruction school, where they took the regular courses, old motormen taking that for conductors and old conductors taking the motormen's course. They then returned to their own carhouses and were immediately put back on the cars. The force of traveling instructors was not sufficient to detail one to each of the new men, so it was arranged that they should break in at their new jobs in pairs. That is to say, an old motorman and an old conductor took out a car precisely as before except that they were both on the front platform and the motorman collected fares while the conductor operated the car. Either was therefore available to act as instructor to the other, being thoroughly familiar with that work. Moreover, if a car became slightly late or otherwise involved in difficulty, the trainmen could revert to their old jobs until the emergency had passed.

This plan of breaking in in pairs was followed for about 10 days. By the end of that time it was thought that a man should be able to do the work unassisted and he was sent out alone. In most cases this worked very well, but where a man had failed completely to master the new work an inspector or instructor was assigned to stay with him a while longer.

A few of the older men have appeared to be temperamentally unfitted to be one-man car operators. They have therefore been assigned to lines which continue to operate two-man cars or have been given other work. During the entire period of change from two-man to one-man operation no trainmen have been discharged on account of the reduction in number of men required to operate the cars. For this reason, and because a one-man operator is paid 5 cents an hour more than a man who works a two-man car, there has been practically no opposition on the part of the employees.



Single and Cross Seat Cars Have Been Converted for One-Man Operation by Extending the Front Platform and Installing Double Doors

In addition to the reduction in operating expenses which has been made possible by using fewer men on the cars, the company has made other savings on account of increased schedule speed and a reduction in the number of accidents of certain kinds. In December, 1921, after safety cars had been in service for slightly more than a year, their schedule speed was 7.82 m.p.h. and the entire system averaged 9.42 m.p.h. The schedule speed for the system has been increased 0.05 m.p.h., to an average of 9.47 m.p.h., at the present time.

The reason for the increase in the general average speed of the system is thought by the management to be that a one-man car is able to take advantage of traffic openings more quickly than is a two-man car. Where traffic signals are used a one-man car operator is able to start instantly if all his passengers are aboard, when the traffic signal allows him to proceed. The motorman on a two-man car, on the other hand, must wait until he receives a signal from the conductor, and thereby an appreciable amount of time is lost.

Statistics compiled by the claim department of the railway show that there has been no increase in the number of accidents due to the operation of cars by one man. On the contrary, in 1924 there were 585 fewer boarding and alighting accidents than in 1922. The year 1923 is not considered because of the long suspension of service. This is a decrease of 19.7 per cent and is attributed by the company to the fact that passengers get on and off under the eye of the motorman.

Time Is Saved Because the Operator of a One-Man Car Is Able to Take Instant Advantage of the Traffic Signal to Proceed

Popularizing Street Car Service in Pittsburgh

Increased Traffic Has Resulted from Extension of Transfer Privileges and Sale of Sunday and Holiday Passes—Attractive Colored Posters Help to Sell the Service

LIKE many other traction companies, the Pittsburgh Railways were faced last year with the problem of traffic decreasing seriously on account of competition from the private automobile. The falling off on Sundays and holidays was particularly noticeable. At the time this matter was under consideration, the present 10-cent cash fare and 8⅓-cent token rate was in effect, and it was felt by the management that a large volume of non-necessity riding could hardly be secured at this rate.

As a means to encourage riding special Sunday transfer privileges were arranged as described in previous articles in this paper. Following the successful trial of this plan it was decided to experiment with a 25-cent pass good all day on Sunday and holidays on any line in the city fare zone.

The reasons which actuated the management to make this experiment were twofold. In the first place it is felt that novelties from time to time are desirable to stir up interest in a utility that has few technical changes to attract attention. In the second place, people who are induced to ride the trolley because of some special sales proposition are better prospects for travel at other times. From the very beginning the results of this experiment have been extremely satisfactory.

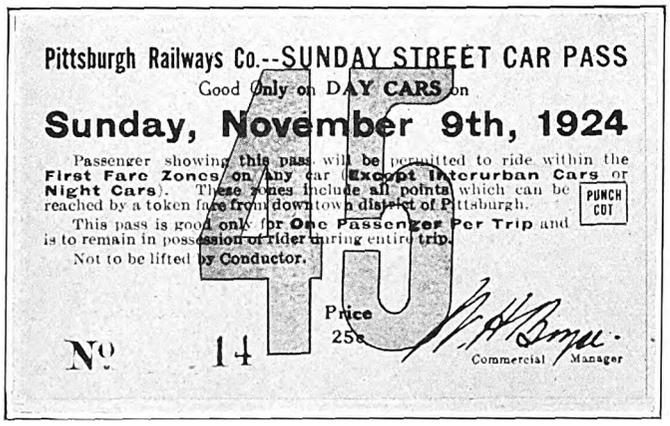
For the first Sunday, Oct. 26, 1924, the demand exceeded all expectations. Although 17,500 passes had been printed, many carhouses were sold out before noon. On the following Sunday 33,148 passes were sold. By Jan. 4, 1925, the use of Sunday passes had increased to 40,867. On the average the passes have produced about 21 per cent of the Sunday revenue. A calculation made by the management comparing like periods, a year apart, shows that in the 11 weeks preceding the installation of the pass Sunday revenue was about 10 per cent below what it had been the previous year, but in the 11 weeks following the sale of passes the revenue was less than 2 per cent below the corresponding period in 1923.

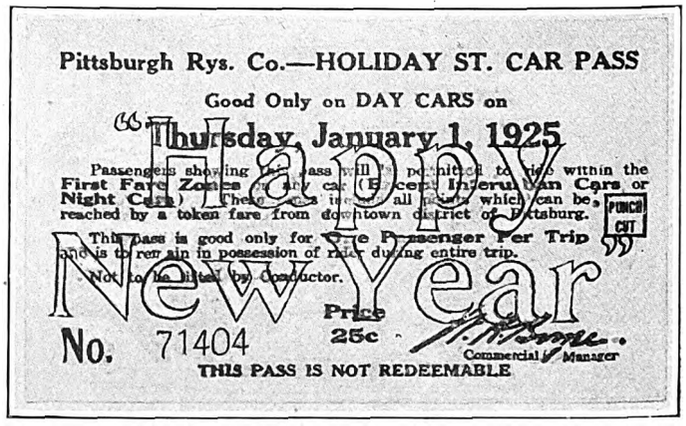
To secure an estimate of the use made of the pass, checks were made Nov. 9 and Nov. 23. These showed that approximately 6.8 rides were taken per pass during the day. While this figure is nearly double the usual Sunday riding on a pass in communities where the weekly pass is used, it is explained in part by the amount of transferring in Pittsburgh and in part by the number of short rides induced by the hilly nature of the territory.

In the table which appears on page 367 are shown the earnings by week before and after the sale of passes, together with the number of passes that were sold.

Following the Display of Attractive Posters of This Type Riding on Several Lines of the Pittsburgh Railways Showed a Marked Increase

During the first seven weeks of the Sunday pass the revenue averaged $40,697, as against $39,627 for seven pre-pass Sundays, or an increase of $1,070. Although on many Sundays in 1923 the revenue was higher than in 1924, the riding in the earlier year fluctuated more violently from week to week. It is thought that Sunday passes have tended to stabilize the revenue, because the man who buys a pass in the morning of a clear day will yield not less than 25 cents, no matter what the afternoon or evening weather may be.





Type of Sunday and Holiday Passes Used in Pittsburgh—The Number Indicates the Date

Nov. 30	39,229	34,880	Feb. 22	44,417	43,498

It has been possible to handle the Sunday pass traffic with practically no addition to service. Due to the large number of routes in Pittsburgh, service had already been reduced to the limit on many lines and there was still so much excess mileage operated on Sundays that the railway has been able to handle this increased traffic with the addition of practically no mileage.

Another move to popularize the street railway service made during the summer of 1924 by the commercial department of the Pittsburgh Railways was the use of elaborate colored posters. That these have been of real value is shown by the fact that on several Sundays after the display of posters urging people to "visit the Zoo," the Highland Park and Negley lines increased their traffic nearly 20 per cent over what it had been on the preceding Sundays. Similarly a bathing poster brought an increase of riding amounting to about 13 per cent of the Oakmont line.

Posters are 19 in. x 27 in., and are displayed on the front bulkhead inside the car. They are mounted in frames of three-ply wood fitted with triangular brass corners, under which they are inserted like pieces of blotting paper into a pad. The mountings were made in the railway shop at a cost of approximately $3 each.

Economical production of the posters is accomplished by using wood blocks costing about $55 each, instead of the more expensive metal blocks ordinarily used for such purposes. Five posters, each printed in three or four colors, issued in editions of 1,200 each, making a total of 6,000, cost only $978. All the posters are the work of the railway's own artists.

Among those which have been used up to date is one of a lioness, the *Megatherium Americanum*. Another was a Christmas shopping poster which was paid for by the Retail Merchants' Association. The Pittsburgh Iron and Steel Exposition was the subject of a third. In some cases the posters have been so arranged that by a slight change in the wording the same picture can be used again for other purposes.

Woman Is Assistant Instructor at Denver

RECENTLY the Denver Tramway has added a woman to the instruction room forces. This woman was given special training in various departments of the company to fit her for the position. First she was placed at one of the divisions as a clerk and there came in contact with the trainmen. After six months or so in this position she went into safety work and it was found that she had a faculty for arousing enthusiasm and interest, so much so that the division to which she was assigned won five safety contests out of eight.

Then she was placed in the general superintendent's office at the complaint desk. Although the Denver Tramway does not advertise the existence of a complaint department, there is one desk to which all complaints are referred. In this position she came in contact with the public and learned the common causes of complaint. After six months adjusting complaints she was transferred to the instruction room as assistant to the chief instructor. In this latter position she brings home to the trainmen the principal causes for complaints about service, particularly those with which women and children are concerned. She is able to give the trainmen the woman's point of view and in general has filled an important rôle in developing the desired attitude toward the public.

Statistics Showing the Extent of the Industry

In Addition to the Customary Figures, a Supplemental Table Gives a Division of Types of Cars Which Are in Use

A FEATURE of the statistical work undertaken by this paper for many years has been the publication annually of a table showing the miles of track and cars operated by the electric railway companies of the country. These statistics are obtained each year from the data received for the McGraw Electric Railway Directory. The table of this kind published in the issue of this paper for Jan. 5, 1924, was compiled from the August, 1923, copy of the Directory, but advantage has been taken this year of the early publication of the 1925 edition of this directory to use the information sent in for that edition. These reports have been supplemented as regards motor passenger cars by information received in reply to a questionnaire on types of cars owned, sent out by this paper in December, 1924. The two tables accompanying this article may then be considered to represent very nearly the condition of the industry during December, 1924.

Following the practice of previous years the mileage and cars of an interstate road have been placed in the state containing the greatest mileage of that company, and operated mileage only is included.

The figures presented include the mileage and cars used on electrified sections of steam railroads as well as in city and interurban roads. Cable railway cars, of which there are 156 left in this country, all in the Pacific States, were included under "passenger trail cars," and storage battery cars and gas electric cars, not more than 20 altogether, were put in the table under "motor cars." Straight gasoline motor cars, such as used on branch lines of steam railroads, when owned by an electric railway company are included in the table under "other cars."

On roads operating by both steam and electricity, the effort was made to include in the table only that equipment used in electric railway service. In consequence, the 2,405 trail, freight and express cars reported by the Fort Dodge, Des Moines & Southern Railroad and the 1,419 trail freight cars reported by the Northwestern Pacific Railroad are not included. For much the same reason the 319 coal cars reported by the East St. Louis & Suburban Railway and 495 coal cars reported by the St. Louis & Belleville Electric Railway have also been omitted, though the 3,129 trail freight cars of the Pacific Electric Railway and the

992 trail freight cars of the Illinois Traction Company are included. The 3,129 trail freight cars of the Pacific Electric Railway mentioned above are 1,272 in excess of those reported last year. If it was not for this increase the total number of cars for 1924 would be less than last year.

Estimates had to be made in some cases, where lessor and lessee companies were concerned, in regard to track and to some extent to rolling stock, so as to avoid duplication, where the figures as reported for the Directory or the questionnaire were not very clear in this regard. In some cases, also, the returns for the Directory and questionnaire did not agree. For these reasons the figures in the two tables can be considered approximate only, but they are believed to be as close to the facts as can be reasonably obtained under private direction, as distinguished from figures compiled by the Census Department.

A noticeable feature of Table I is the reduction in the number of companies. This occurs in each group of states and is due primarily to consolidation.

Reports to the questionnaire, upon which the second table is based, were received from about 80 per cent of the companies, representing more than 90 per cent of the cars. In this table the great growth in the number of one-man two-man cars recently is most notable. This type of car was hardly known two years ago. There are now more than 4,000 of them. The two-man car classification includes all cars used in city rapid transit service, though in some cases trains made up with this kind of car are being operated with fewer than one man per car. They were put in the two-man classification because if run singly these cars would require two men.

Chicago Plans $720,902,000 Unified Transportation System

Purchase Ordinance Under Which City Hopes to Take Over All Existing Transportation Facilities Passed by City Council — Service to Be at Cost with Universal Transfers—Control to Be Vested in Board of Nine Members

SHOULD an ordinance which has just been passed by the City Council of Chicago by a vote of 40 to 5 be approved at a referendum on April 7 all of the local transportation facilities may be taken over by the city. This is the result of agreements recently reached between Mayor Dever, bankers representing the bondholders of the surface street railways and Samuel Insull, representing the elevated lines. If upheld by the courts this will mean the adoption of a complete and co-ordinated plan for unification of all existing transportation facilities in Chicago, together with new construction and extensions amounting to approximately 465 single-track miles of surface and elevated railway, together with 68 miles of subway lines. The general physical plan contemplated is shown in the accompanying maps made up by Major R. F. Kelker, Jr., consulting engineer for the committee on local transportation of the City Council.

The entire program involves the ultimate expenditure of approximately $720,902,000. Of this amount, $162,843,584 represents the purchase price to be paid for the existing Chicago Surface Lines. The Chicago Rapid Transit Company will be purchased for $85,000,000, and $247,500 will be paid for that portion of the Chicago & Joliet Electric Railway within the city limits. Immediate surface line extensions, with equipment, including 500 passenger cars and necessary additions to shops and carhouses, will be made at an estimated cost of $25,432,000. This work is to be completed within 5 years. An immediate start is contemplated for the subways, including necessary equipment with 240 passenger cars. These are estimated to cost $62,162,000. Surface line extensions to be built in the second 5-year period, together with 100 additional cars, will cost $12,210,000 more. Extensions of rapid transit facilities and other miscellaneous items are provided for, which will bring the cost of the entire system to the approximate total of $720,902,000, as shown in the accompanying tabulation.

All this will be done under a plan which represents a new type of transportation agreement. The city will acquire and take title to all its existing local transportation facilities and to all extensions of the system. This will be financed through issue by the city of what are termed "Municipal Railway Certificates." These are not general city bonds, but are secured as to principal and interest solely by the property and earnings of the system taken over, together with such extensions as may be constructed under the ordinance. To make the certificates marketable under this limitation, the ordinance provides that a rate of fare must always be maintained which will yield sufficient income to pay the interest on the certificates and provide a sinking fund to retire them as they mature at the end of periods of

SCHEDULES OF EXPENDITURES FOR PURCHASE AND EXTENSION OF CHICAGO TRANSPORTATION FACILITIES

Purchase of Present Properties

Chicago City Railway Calumet & South Chicago Railway Southern Street Railway	$63,163,876	
Chicago Railways	84,963,201	
Cash in depreciation and renewal funds of Chicago City Railway, Calumet & South Chicago Railway and Southern Street Railway	5,838,939	
Cash in depreciation and renewal fund, Chicago Railways	8 877,568	
		$162,843,584
All existing elevated railway properties		85,000,000
Purchase of portion of Chicago & Joliet Electric Railway within city limits		247,500
		$248,091,084

Surface Lines—Immediate Extensions

Extensions to south side surface lines and 300 additional passenger cars together with additions to shop and carhouses, first 5 years	$14,641,000	
Extensions to north and west side surface lines and 200 additional cars with shop and carhouse facilities, first 5 years	10,791,000	
		$25,432,000

Subway Construction—Immediate

Construction of State Street, Madison and Po'k-Clark-Chicago Avenue subway—immediate construction	$47,554,000	
Equipment, including track, signals, etc., together with 240 subway passenger cars, necessary service equipment, shop facilities, etc	14,608,000	
		$62,162,000

Surface Line Construction—Second 5 Years

Extensions to south side surface lines and 50 additional cars with shop and carhouse facilities, second 5 years	$5,995,000	
Extensions to north and west side surface lines and 50 additional cars with shop and carhouse facilities, second 5 years	6,215,000	
		$12,210,000

Subway Construction—Second Period

Cottage Grove-Broadway subway and Madison subway, second period	$104,742,000	
Equipment of subway, track, signals, etc., together with 330 subway passenger cars, shop facilities, etc.	21,087,000	
		$125,829,000

Rapid Transit Construction—First and Second Period

New rapid transit extensions to be completed in first 10 years, including 2,760 new cars and necessary additions to shops, etc	$174,427,000	
New rapid transit extensions, second construction, including 780 new cars, etc	56,232,000	
		$230,659,000

Miscellaneous

Power houses, auxiliary buildings, etc	$49,500,000	
Cash to be paid into emergency fund	5,500,000	
Cash to constitute additions to depreciation and renewal fund for elevated railways acquired	8,000,000	
		$63,000,000

Summary

Purchase of existing properties	$248,091,084
Surface line construction, first 5 years	25,432,000
Immediate subway construction	62,162,000
Surface line construction, second 5 years	12,210,000
Subway construction, second period	125,829,000
Rapid transit construction, first and second periods	230,659,000
Miscellaneous	63,000,000
	$767,383,084

NOTE: All figures except purchase of existing properties include 10 per cent maximum allowance for sale of securities.

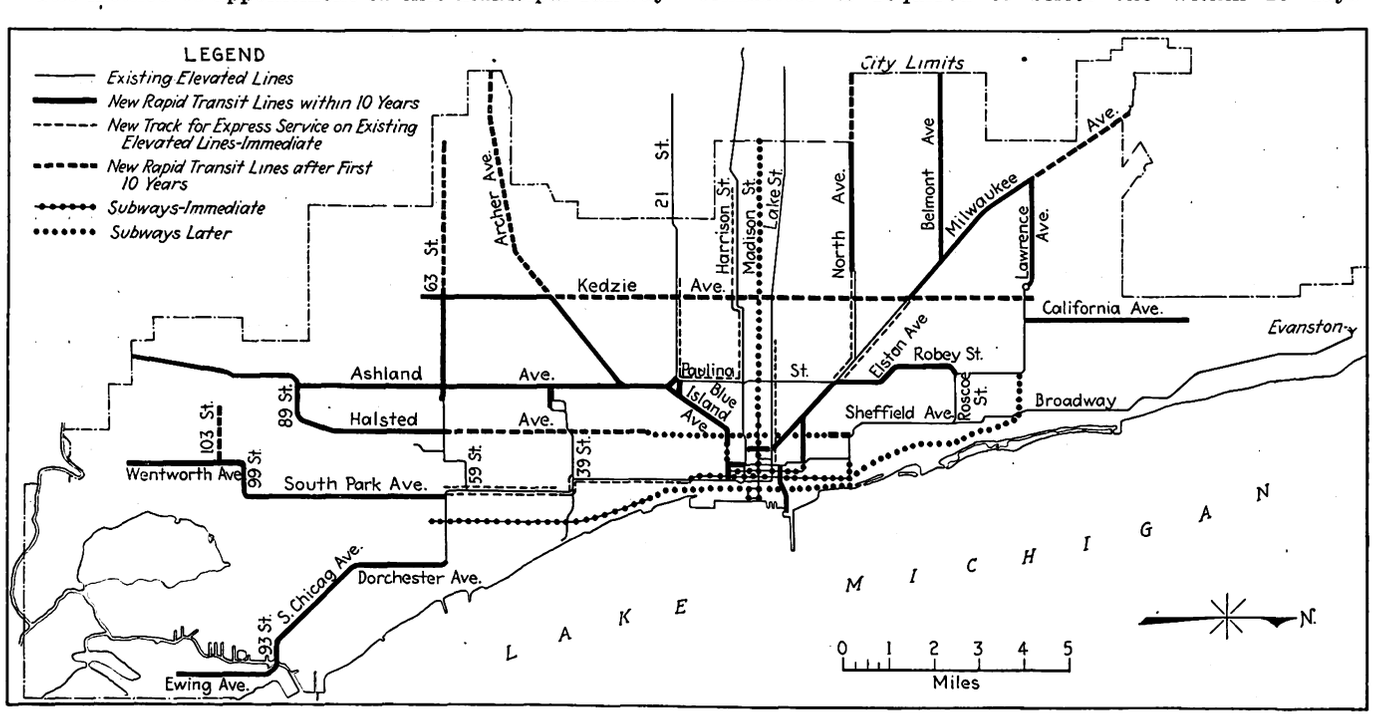
Map Showing Existing Surface Lines System and Extensions to Be Made Within 10-Year Period

30, 35 and 40 years. The certificates will bear interest at the rate of 5 per cent.

Although title to the properties is taken by the city, the control and operation is to be vested in a board of nine members. Three of these board members, designated as Group A, are to be selected by the Mayor with the approval of the City Council; three, designated as Group B, by a committee representing the holders of the certificates, and three, designated as Group C, by agreement between the Mayor and the committee. This is designed to insure a competent neutral board upon which the city and the security holders will have equal representation. Whenever the city shall have retired 51 per cent of the certificates issued under the ordinance, the composition of the board will be changed to include four representatives of the city and three members representing the security holders.

The method of appointment of this municipal railway board and the duration of the terms of its members, together with provisions for filling vacancies caused by resignation or death, are covered in detail in the ordinance. The Group C members must be selected from men of recognized high character and standing and experience. The three groups of the first board are to be divided so that one member of each group holds office for 3 years, one for 6 years, and one for 9 years. Their respective successors are to be chosen for terms of 9 years.

At the end of every 3 years the Mayor is to fill a vacancy in Group A and the certificate holders a vacancy in Group B. The two by agreement are to fill the vacancy in Group C. In the event of failure of the Mayor and the committee to agree on a member for Group C within 30 days, the Mayor is to tender to the committee the names of three persons, from which the committee is required to select one within 15 days



The Physical Plans Include the Construction of Elevated Extensions and 68 Single-Track Miles of Subways

Digitized by Google

after the list of names is submitted. If the list does not include persons with the qualifications set forth in the ordinance, the committee may request the Mayor to submit additional names to meet the qualifications. Failure on the part of the Mayor to submit names which in the opinion of the committee include persons qualified to act as board members under the terms of the ordinance gives the committee the right to apply to the three sitting judges of the first division of the Appellate Court for the First District of Illinois for a decision as to the qualifications of the men whose names are submitted.

The members of the board cannot be removed or dismissed by the Mayor, but are subject to removal for palpable omission of duty, misconduct or malfeasance in the discharge of their duties. Members will receive a salary of $10,000 per year, changeable by agreement between the board itself, the certificate holders' committee and the City Council.

The certificate holders' committee is to consist of five members selected by the First National Bank of Chicago, the Illinois Merchants Trust Company and the Harris Trust and Savings Bank.

Executives, managers, engineers and other employees to operate the properties are to be appointed or employed by the municipal railway board. Salaries to be paid are to be commensurate with salaries usually paid for like services in enterprises of similar magnitude. The board must furnish the City Council with monthly statements of its operations and with such additional information as may be required from time to time.

Flexible Rate of Fare Specified

A flexible rate of fare to provide service at cost is specified in the ordinance. This is secured through the operation of a $5,000,000 emergency fund that is set up to act as a barometer of fares. Should the revenues of the properties be more than enough to pay the cost of operation and maintenance and interest and sinking fund requirements the fare would be reduced 1 cent when the fund reached $7,000,000 for a continuous period of 30 days. Should the fund drop to $3,000,000 or less for a period of 30 days, the fare would be increased 1 cent.

This flexible fare provision of the ordinance does not become operative until after the first year. For that period the fare is fixed at 7 cents for all surface, elevated and subway lines to be acquired or built. It is proposed to issue universal transfers between elevated, subway and surface lines, so that a single fare will be payment for a continuous ride in the same general direction between any two parts of the city, using such combination of the various forms of transportation facilities as may be necessary to effect this journey by the most direct and speediest route.

In the event that the city constructs subways or other local transportation properties, or buys buses with money not derived from the sale of municipal railway certificates, compensation is to be paid into the city treasury for the use of these properties by the municipal railway board. For the use of subways so constructed this amount is fixed in the ordinance at 0.80 per cent. The amount to be paid for the use of any other properties than subways is to be fixed by agreement between the Mayor and the board. This arrangement is designed to allow the city, if it desires, to use its existing traction fund (amounting to approximately $40,000,000) for the construction of transportation facilities, or to build such facilities by special assessment against the benefited property, instead of by the issue of certificates.

The city mortgages all the property which it acquires with municipal railway certificates to a responsible trust company to secure the payment of the interest and principal of these certificates. This mortgage, together with the provision for adequate rate of fare to pay all charges, is the only security given by the city to insure such payments. Failure to pay principal or interest allows foreclosure, but no franchise to operate is granted in the event that this happens.

All accounts of the transportation system are to be kept distinct from other city accounts. These are to be prepared as nearly as possible in accordance with the standard classification of accounts adopted by the American Electric Railway Association. Sinking funds are to be established for the several series of certificates to be issued. The annual charges to this fund are to vary in accordance with the term for which the various certificates are issued; 0.80 per cent per year for certificates maturing in 40 years, 1.09 per cent for certificates maturing in 35 years, and 1.48 per cent for those maturing in 30 years.

In addition to meeting all sinking fund and interest requirements, the rate of fare must be sufficient to maintain the property in a high state of repair and efficiency, and in addition must permit a sum equal to 8 per cent of the gross receipts monthly to be set aside in a separate fund for depreciation and renewals. The municipal railway board is required to pave the streets between its right-of-way and to maintain this paving in accordance with specifications included in the ordinance.

Gasoline Raise a Trolley Sales Argument

THE Department of Street Railways, Detroit, is using the recent increase in the price of gasoline as a sales argument for travel by trolley. The accompanying illustration shows the car card carried in the center of the car and reading as follows:

In Detroit the Increase in Gasoline Price Is Used as a Sales Argument for Travel by Trolley

Gasoline soars 44 per cent. Since Jan. 1, gasoline has jumped from 15.8 to 20.8 cents per gallon. In addition, a tax of 2 cents per gallon is effective. This is a 7-cent increase. Save by trolley. Board of Street Railway Commissioners.

In addition to this card inside the car, a number of the cars carry dash signs calling attention to the fact

Digitized by Google

that the price of gasoline has gone up 44 per cent and the way to save money in local travel is to use the trolley.

New York Merchants Urge Co-ordinate Transit

Special Committee Report Condemns City's Transit Proposals as Uneconomical and Ineffective—Buses Useful Principally as Auxiliaries to Surface Lines

TWO important reports of the committee on city transit of the Merchants' Association of New York were made public this week. The Merchants' Association is the leading commercial organization of the kind in the city and has a membership of leading merchants numbering more than 7,000. Its committee on city transit has spent several months in studying the complicated transportation situation in New York as regards rapid transit and motor bus franchises in an endeavor to reach a businesslike conclusion. The two reports just presented to the board of directors of the association are the result. The committee consists of Theodore Beran, chairman; Jules R. Breuchaud, William C. Demorest, Ernest P. Goodrich, Edmond Earl Lincoln, Harry P. Nichols, Walter Stabler.

Rapid Transit Report Recommends 30 Miles of Immediate Construction

Taking up first the route of the proposed municipal Eighth Avenue-Washington Heights line, the committee in its rapid transit report recommends the connection of this line at points with the B.-M.T. system to utilize to the greatest extent all capital available for subway construction. Other lines recommended for immediate construction are a Brooklyn crosstown line and the completion of the Nassau Street line and the 14th Street-Eastern line. The total comprises 30.65 route-miles, aggregating considerably lower first cost and mileage than the route projected by the Board of Transportation.

In its discussion of the general transit policy which should be pursued by the city, the following are emphasized: A policy of unified operation to produce a maximum of service at a minimum of cost, by the most effective utilization of old and new facilities and the avoidance of construction costs of unnecessary new lines, the lowest possible rate of fare consistent with satisfactory service. The report declares in favor of the lines being self-supporting, however, and points out that this is not now the case as part of the cost is defrayed by taxes.

Motor Buses Cannot Fill the Need for Rapid Transit Subways

In its motor-bus report the committee says that all important rapid transit and surface street railway systems in the city have filed petitions or proposals providing for bus service in their respective territories. In addition, there are similar petitions from new corporations, making more than 50 filed with the Board of Transportation. Some of the routes proposed are overlapping or distinctly competitive with existing facilities.

The committee says that all thought that these additional bus lines can be so operated as to relieve the present rapid transit lines of any substantial part of their long-haul traffic may be dismissed. Hence, they cannot fill the constantly increasing need for additional subway facilities.

Investigations of the surface railway situation showed that the facilities of the present lines are not being used to capacity, yet a large proportion of the population is and must long continue to be dependent upon them for transportation. A division of traffic between existing car lines and one or more competing bus lines would normally so impair the earning power of all as to make it necessary ultimately to reduce service or to charge higher fares in order to pay expenses. If higher fares are not permitted, service will necessarily deteriorate. Since the fares charged by local transportation companies are closely regulated by law, it is contrary to the public interest to encourage unnecessary competition, which inevitably leads to duplication of investment, on which a return must be earned.

From all points of view, it seems desirable that whenever new bus routes are established, it should ordinarily be done by the existing transportation companies rather than by untried or competitive companies. Although the investment required for bus facilities of equal service is ordinarily much lower than that for surface cars, the operating cost of motor buses under reasonably comparable conditions and their rate of depreciation are generally much higher. The addition of buses to the present street car traffic would increase the congestion to such a point that traffic would be slowed down, with a resultant economic loss which would be hard to measure.

The use of the motor bus, while under certain circumstances clearly advantageous, is still in a distinctly experimental stage on the basis of a low rate of fare, so far as the United States is concerned. The conclusions of the committee as to policy follow:

Conclusions as to Policy

1. It is of doubtful legality for the city itself to engage in bus operation, nor in view of transportation facilities now existing and operating under franchise is it legal to authorize independent omnibus companies or individuals to compete with present transportation agencies unless a clear necessity therefor is established. Even if there were no legal difficulties, such a policy would be inequitable and economically unsound.
2. None of the proposed routes, either individually or collectively, can have much if any effect in reducing subway congestion.
3. Many of the recent proposals are unworthy of consideration, either because of the lack of experience of the petitioning companies, or because there is no economic justification for the additional investment.
4. Existing surface and subway lines should be encouraged and required to rehabilitate so far as necessary and to make the utmost use of their present equipment. They should also be granted the right to supplement or extend their present facilities through the development of bus routes when it is found that such service will be less expensive than a further development or continuance of the present means of transportation.
5. All important existing transportation companies have applied for motor bus franchises or have expressed their willingness to do so. Until more extensive experience has been gained in the operation of buses by these companies, either as an auxiliary service, an extension of present service, or as a substitute for trolley service when existing equipment becomes inadequate, it seems distinctly unwise for the municipal government to commit itself to any independent comprehensive plan of bus operation as a possible solution of our transportation difficulties.

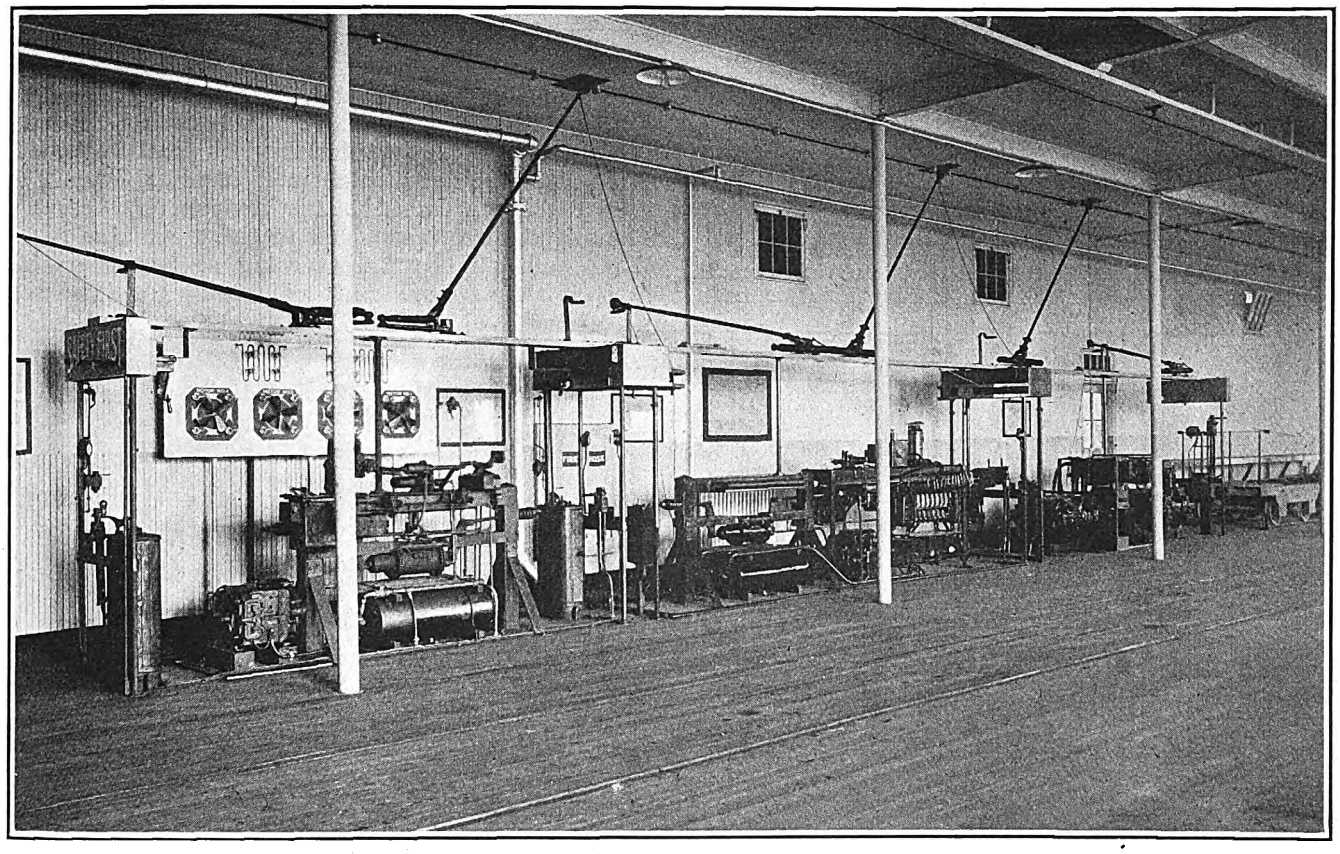
Boston "L" Has New Training School

Surface Car Operators and Rapid Transit Trainmen Are Taught Their Duties in a Completely Equipped Modern School — All of the Many Types of Equipment Used on This Railway Have Been Installed for Instruction Purposes



One Entire Side of the New Sullivan Square School Is Occupied by Surface Car Equipment. Note the Standard Track in the Center of the Room

INCREASING traffic in recent years has imposed different conditions upon surface car operators, and the necessity of familiarity with various types of cars has added other complications to the training of men for such service. The training of men for rapid transit service has become more technical on account of changes and improvements in car equipment. To meet these conditions the Boston Elevated Railway has moved its instruction school to new quarters at the Sullivan Square terminal. Under the direction of Frank S. Morgan, supervisor of instruction, new equipment has been installed and plans perfected for training men for the transportation division.

Previous to the year 1912, the system of instruction required only that each applicant undergo a course in platform training. He was given individual instruction in car operation, after which he was examined orally by the chief inspector. Then he was required to take a second examination given by the employment department, and if both examinations proved satisfactory he was certified and assigned to duty.

A separate instruction department was established in 1912, with a supervisor in charge. On the staff were also two assistant instructors detailed for class and shop training and four traveling instructors. The equipment of the school comprised types of control then in use, with motors and demonstration boards to show the applicant the flow of current under different conditions. A car arranged on a special track served to familiarize each applicant with actual operation. This predecessor school occupied about 3,000 sq.ft. of floor space.

The new school occupies about 6,500 sq.ft. of floor space, divided into rooms in which are installed every type of equipment that is in operation on cars of the Boston Elevated Railway. In addition there is provided a track connecting with a yard near by, on which a standard rapid transit train or a surface car can be run into the instruction room. There are two classrooms or examination rooms where men are gathered for examinations and instruction talks; a classroom for conductors where there are fare boxes, desks, and "clockboards"; a reception room and general office, and a private office for the supervisor.

The staff includes the supervisor, two assistants and twelve instructors. One of the latter is assigned to the rapid transit lines, and the remainder to the surface lines. Of these, five are traveling instructors, four are coasting instructors, and three are bus instructors.

An entire control and brake system for each standard type of car operated by the company has been set up exactly as on a car. Every pipe in the brake system,

Digitized by Google

every valve, and every working part of prime importance has been labeled so that no student will have difficulty in ascertaining the position, name, and function of any part of the equipment. Each control operates a set of railway motors, or, through a system of relays and resistances, a set of fan motors.

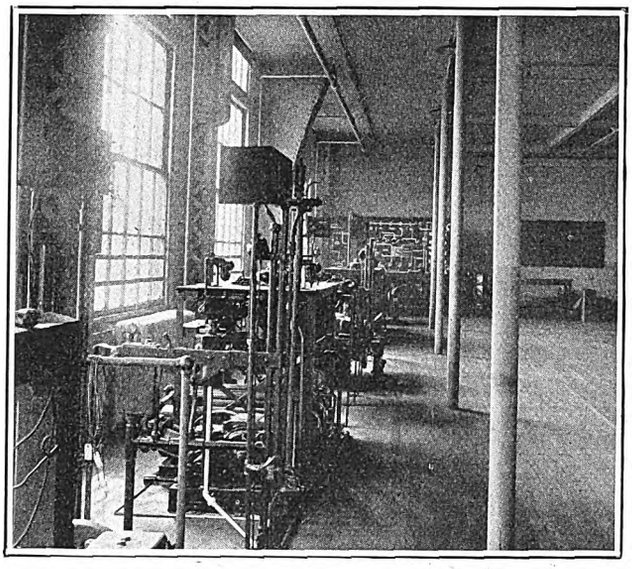
The equipment for demonstration includes:

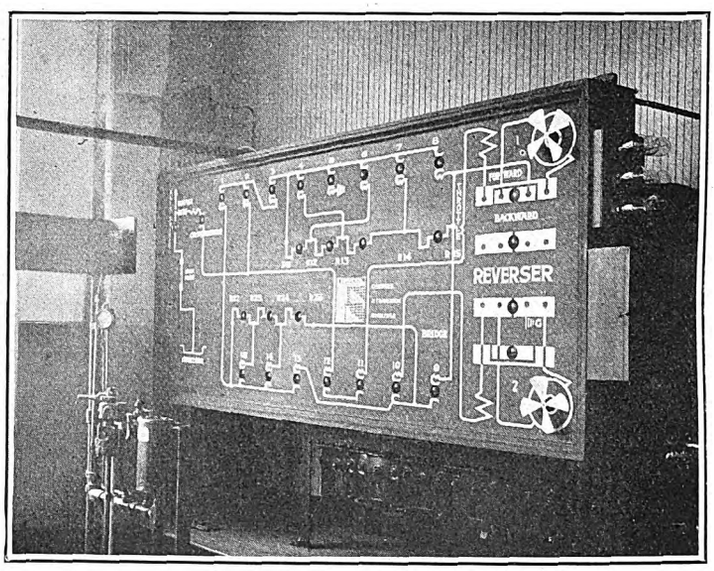
1. Regenerative braking unit: A railway motor operated as a series motor from 600 volts d.c. with a series resistance and a K type controller.
2. Elevated car unit, complete, with G.E. type M control and Westinghouse type AMME brake equipment, operating two railway motors. This unit is provided with electric couplers so that it can also operate in train connections with Westinghouse ALFM control and two other railway motors, the complete unit being a replica of that in use on the cars of the elevated division.
3. Elevated car unit with Westinghouse ALFM control and Westinghouse type ALME brake equipment, operating two railway motors. This equipment is provided with electric couplers so that it can operate in train with type M control and two railway motors. It is a replica of the train operated with type ALFM and type M control used on the elevated division.
4. East Boston Tunnel car unit with Westinghouse type AMME brake equipment.
5. Semi-convertible car unit with G.E. type M control and Westinghouse type AMM brake equipment operating two fan motors.
6. Semi-convertible car unit with G.E. type K-71-A control and Westinghouse type SM-3 brake equipment operating four fan motors.
7. Semi-convertible car unit with Westinghouse type HL control and Westinghouse type SME brake equipment operating four railway motors.
8. Center-entrance car unit with G.E. type PCS control and Westinghouse type SMKE brake equipment operating four railway motors.
9. Center-entrance car unit with Westinghouse type SMEE brake equipment.
10. Birney safety car unit with G.E. type K-63 control.

Students are classified into groups as motormen, conductors, and guards. Training of motormen is further subdivided for surface service and rapid transit service. The first part of the training of surface motormen is general instruction in the policies of the company and in the duties and responsibilities of the position. After this brief course, specialized training follows.

Each student is taken to the equipment room and there is instructed in the mechanism of the type of car that he is to operate. He is coached in the operation of control and braking. Much care is taken to make certain that he understands what constitutes abuse of rolling stock and what harm results from such abuse. It is deemed important that every motorman shall know not only why a car runs, but also in case of accident why it does not run. Each man must know the nature of every "hook-up," the purpose of every valve, and the function of every part. He must know how to prevent trouble; and what is more important, he must know how to trace trouble—how to overcome the problem of breakdowns.

After the preliminary instruction in the equipment room has been completed, the student is assigned to an instructor for platform training. The equipment room instruction is supplemented there. All points discussed in the classroom are demonstrated in actual operation. He is carefully coached in the stopping of a car by means of the air brake, and in the use of the hand brake; he is informed concerning regeneration; the effect of bad rail conditions and greasy track are explained; also the cutting out of motors, the replacement of fuses, diagnosis and remedy of minor troubles encountered on the road; the releasing of brakes that are set unexpectedly, the operation of electric track switches and rules of the road.





At Left, Various Types of Rapid Transit Equipment for Subway and Elevated Service Have Been Installed in the Instruction Room. At Right, Schematic Wiring Diagram of Rapid Transit Car Is Behind the Instructor's Platform

Following this intensive training on the platform, the candidate is further trained by a platform instructor who is assigned for the purpose of observing the efficiency of the previous training. This checking-up procedure takes on an average about 10 days.

After this the candidate returns to the school and again undergoes training in the equipment room. Smooth starting and stopping are insisted upon, as is also the proper handling of cars in all kinds of emergencies, such as failure of power, failure of brakes, traffic jams, etc. On the completion of this advanced training he is sent back to his station for further breaking in. He then is ordered to cover all routes, to acquaint himself with stops and street crossings. He is instructed in jacking up cars and the prevention of accidents. Having finally satisfied his breaking-in instructor concerning the operation of a car, he signs a breaking-in card and returns to the instruction school for a final written examination for a motorman's position.

This examination, if passed, merely certifies the

Digitized by Google

student for the operation of one type of car. Before he is assigned to service on a division, he must pass examinations on all types of cars used on that division. In addition, he must also pass satisfactorily the test given for conductors, and when he has proved to the satisfaction of the supervisor of instruction that he has acquired a knowledge that covers the duties of both motorman and conductor, he is then allowed to go to work as a motorman and is placed on probation for 60 days.

On the rapid transit lines motormen are recruited from the train guards. If a guard wants to become a motorman he files his application with the supervisor of instruction and is first given an examination on rules. A man is allowed 20 days to prepare for this examination, and if it is passed satisfactorily, he is instructed in brake equipment and control, and is shown by means of the demonstration board in the equipment room how the current from the third rail passes to the motors, how the control and motor circuits act in service, the location and function of all switches and fuses, and the handling of the air brake.

The next step is his assignment to a breaking-in instructor. The candidate is given a thorough course in handling cars. During this period of training he returns as often as is deemed necessary to the equipment room, where special points are made clear and emphasized. When in the judgment of the breaking-in instructor the candidate seems competent to operate a car or train he is sent to the yard for two days, where he is shown how to make up trains, replace jumpers, couple cars, and where he acquaints himself with the position and function of switches, cocks and valves.

Having completed this course in training the candidate then presents himself for examination. After passing a written test he is certified and allowed to go on probationary duty. If he makes good he is given a permanent assignment. If not, his training and probationary period are extended 30 days, or he is denied appointment as a motorman and returns to his former rating as guard.

The student conductor is instructed in the use of fare boxes and registers, and is trained in the making out of trip reports and car cards. Special emphasis is given to methods of checking results of day cards, and, when necessary, simple arithmetical computations are explained in detail. Accident reports and other incidental forms are discussed and used as practice reports. No trouble is spared in the preparation of the applicant for the duties of this position. Special attention is given to those rules most frequently broken and their significance is pointed out.

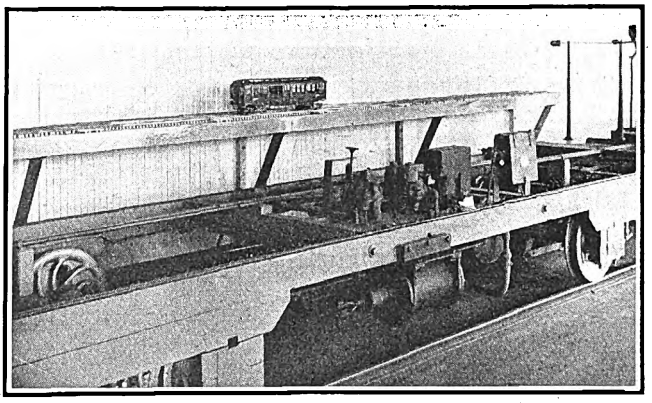
When a student understands the fundamentals of his position he is sent to a divisional carhouse and assigned to a traveling instructor, who places him with a platform instructor for breaking in. A final examination is then required. This is a written test which thoroughly covers the rules and procedure involved in holding a position as conductor. This examination is corrected by one of the staff of assistants in the presence of the applicant, who is further instructed on points which he had failed to answer correctly, or fails to make clear.

The prospective guard is trained in much the same manner as the conductor. First, the qualifications necessary to fill a guard's position are explained in detail; accident reports are discussed and explained; rule books and instruction books are provided, and general information relating to the position is given.

After this preliminary course has been completed, the candidate is sent to a traveling instructor, who places him with a platform instructor for breaking in. Four days are usually required for this purpose, after which the candidate is called back to the instruction school and further informed concerning the location of all switches, cocks and valves, as well as their functions. He is carefully coached with regard to flag, lantern and whistle signals, and after the completion of this training he is given practical training in flagging trains past a defective signal, together with the use of all signal appliances carried on trains.

The candidate, accompanied by his traveling instructor, continues until he has proved that he is thoroughly familiar with his duties as a guard. He receives a breaking-in card at the expiration of the train instruction and then reports back to the instruction school for a final written examination. If this is passed satisfactorily, he is placed on probation for 60 days.

The time required to train a man depends on the individual. According to Mr. Morgan, an average would be about 2 weeks for a motorman. For a conductor less time is required, but no specified time is actually allotted. The only safe principle to follow is that the training period shall be as long as necessary to make the candidate secure in knowledge and experience before he is allowed to operate a car independently. The actual cost to the company varies, but computing on the basis of 2 weeks required, and wages of $3 per day for the candidate, the cost per man averages somewhat more than $75.



Braking and Coupling Operations Are Taught by Means of This Equipment

Harrow for Removing Packed Snow

THE Auburn & Syracuse Electric Railroad has found that a disk harrow is a most effective machine for removing packed snow from tracks in city streets. The company's first experience with a harrow for this service was after a very heavy snowstorm on Jan. 29 of this year. At the end of the storm, the snow was at a general level in the country of 36 in., and in the city of Auburn it had become so packed that an electric rotary sweeper made little impression on it. At first, an effort was made to clear the rails by workmen with pick and shovel. Finally, resort was made to a disk harrow, obtained from the local office of the International Harvester Company. This harrow was dragged by horses over the tracks and the furrows cut by it so loosened the snow that it could be easily removed.

On the interurban section the snow was removed by the Russell and rotary electric plows owned by the company.

Electrification of Paris Suburban Railways

Multiple-Unit Equipments Made Up of Permanently Coupled Motor and Trail Cars Have Double-End Control—Faster and More Efficient Operation Has Been Secured

DURING 1924 considerable progress was made in the electrification of the suburban lines of the Chemins de fer de l'État (State Railways) in the Paris district. These routes lie in the heavily populated districts on the west of the city. Owing to the rapid growth of this territory and the difficulties of steam operation, electrification had been considered for a long time, but was delayed by war and post-war conditions. As a matter of fact, suburban electrification in the Paris district began as early as 1900, when the Compagnie des Chemins de fer de l'Ouest (Western Railway Company) electrified the stretch of track between its Invalides station and Versailles.

The State Railways operate out of three stations in Paris, viz., Saint-Lazare on the right bank of the Seine and from the Invalides and Montparnasse stations on the left bank. Of these the Saint-Lazare station is by far the most important. Some years ago a count showed that 60,000,000 of the 70,000,000 passengers leaving Paris on the State Railways made use of it.

Since 1910 the traffic has grown in volume and intensity, the latter being due to the advent of the 8-hour day. Traffic leaving Saint-Lazare during the evening peak, 5:30 to 6:30 p.m., increased from 13,000 passengers in 1910 to 18,000 in 1920 and to more than 23,000 in 1924.

Under steam operation the schedule speed of locals was 25 km. (15.5 m.p.h.) and of semi-expresses and expresses 35 to 45 km. (21.7 to 27.9 m.p.h.). With electrification, double-end trains can be broken up into any desired lengths, better distribution of seats secured and schedule speed increased. To permit this increase in speed, the tracks have been individualized according to the character of the trains run thereon, and the stops have been arranged in zones according to the traffic characteristics. Under steam operation 16 of the 27 tracks in the Saint-Lazare station were required for the short-haul suburban service. Electric operation will require only 11 tracks and increase the capacity to 44 trains an hour.

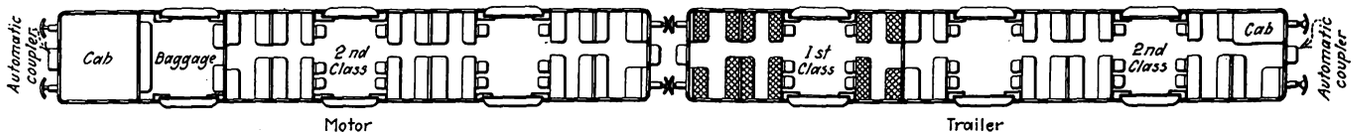
Power is generated at two stations, namely, Bezons in the north and Moulineaux in the south. Both are equipped with 5,000-kw., 15,000-volt, three-phase, 25-cycle turbo-alternators. Each station has a present output of 20,000 kw. and an ultimate output of 40,000 kw. Four of the nine eventual substations are now in service. They are equipped with 1,000-kw. converters, except two in the busiest territory, which have 1,500-kw. converters.

Current is furnished at 650 volts through a protected third rail weighing 76 kg. per meter (practically 152 lb. per yard) mounted in thermit-welded lengths of 18 m. (59 ft.) with expansion joints at intervals of 250 m. (820 ft.). The bonded track rails serve for the return circuit. Electrical equipment, both of the new lines and of the re-equipped original Invalides-Versailles electrification, is operated now at 650 volts, but can be used at 1,500 volts d.c. if the higher potential is later considered desirable.

The first electric locomotives installed had control at each end, a length of 13 m. (32.5 ft.), a weight of 51 metric tons (2,204 lb. per ton), four 120-hp. motors and a speed of 45 km. (27.9 miles) per hour. A larger type of multiple-unit control locomotive was developed when it was decided to run all trains electrically between Invalides and Versailles to eliminate the smoke nuisance of the Meudon tunnel, which is 3,600 m. (11,800 ft.) long. In April, 1922, 30 locomotives of this type were ordered from a group formed by the Thomson-Houston, Schneider and Jeumont interests. These machines are 12 m. (39.3 ft.) long, have truck centers of 6.1 m. (20 ft.), weigh 60 metric tons and have an output of 1,100 hp. with four motors at 750 volts. The normal speed on level track is 63 km. (39 miles) per hour, with a shunt connection to permit 70 km. (43.8 miles) per hour. On a 1 per cent grade the corresponding speeds are 42 to 45 km. (26 to 28 miles) per hour. The motors may be operated either self-ventilated alone or plus blowers which draw air from the interior of the locomotive through filter-fitted conduit. These locomotives may be run in twos and threes when necessary. They carry four third-rail shoes for line use and a compressed-air pantograph for station use.

Motor cars of multiple-unit type were installed as early as 1912. These carried two 235-hp. motors. The seating capacity is 40 and the maximum speed is 70 km. (43.8 miles) an hour. A second series of motor cars installed in 1921 were of the same design, but differed in trucks and electrical equipment. The two trucks per car had three axles, of which two were driving axles. The wheels were 0.925 m. (36.8 in.) diameter. These cars therefore carried four 165-hp. motors. The seating capacity is 62.

Greater capacities were necessary for the new electrification on the right bank of the Seine. The trains, therefore, are made up of one, two or three pairs of cars, comprising one motor and one trailer of the multi-side door type (three pairs of doors per side). These vehicles are of steel, having the maximum permissible width of 2.95 m. (9.64 ft.) and a height of 4.02 m. (13.2 ft.) above the rail. The over-all length outside of buffers is 19.92 m. (65 ft.). The wheels are of 1.1 m. (43.3 in.) diameter. The two trucks of the motor car carry four 165-hp motors. The seating capacity of a motor car is 72. The seats are arranged to permit a central aisle instead of the more customary European plan of a side corridor or no corridor at all. The closing and locking of the doors are con-



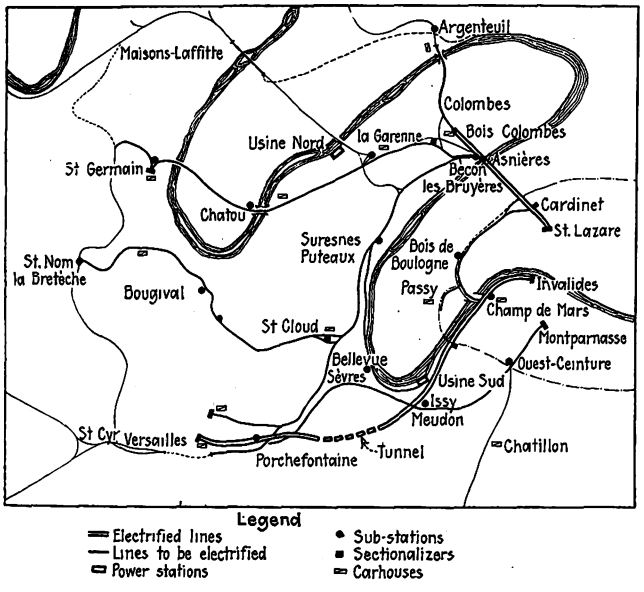
Floor Plan of One of the New Multiple-Unit Equipments

Digitized by Google

trolled electro-pneumatically by the motorman. Door opening is manual.

These latest motor cars weigh only 57 tons compared with the 73 tons of the smaller 1912 type. The capacity of 660 hp. per two-car unit equals 5.5 hp. per ton of train at maximum load.

The trailers are of the same general dimensions and appearance as the motor cars. They have control at the far end, so that every motor car-trailer unit can be run as a flexible double-ended unit. The weight of a trailer empty is 37.5 tons. The first-class compartment seats 34 and standing is not supposed to be permitted; the second-class compartment seats 56 passengers.



Paris Suburban Area Served by the State Railways

The new cars have been in use since May, 1924, with perfect satisfaction. They make the run to either Bécon-les-Bruyères or to Bois-Colombes in 11 minutes with stops at Pont Cardinet, Clichy-Levallois and Asnières. A 15-minute headway is maintained during the rush hours, to give the common intermediate stations a 7.5-minute service. It is expected that the electrification from Rueil to Saint-Germain and to Saint-Cloud will be carried out in 1925. The complete electrification of the Versailles lines on the right bank to Issy, Saint-Nom-la-Bretèche and Argenteuil is set for 1927.

Good Accident Record in Columbus

DURING the past 6 years the Columbus Electric & Power Company, Columbus, Ga., has reduced the number of accidents per 1,000 car-miles from 5.09 to 1.20. Each year has shown an improvement over the one before.

The gradual change-over in 1919, 1920 and 1921 from the old two-man type cars to the standard one-man safety car, together with the care taken by the operators, was responsible for a reduction in the number of accidents in those years.

In April of 1922 the operators were divided into two groups of teams known as the "Lions" and "Tigers." At a meeting of the trainmen held every 3 months two captains, one for each team, are elected. These captains then choose their men for the following 3 months. A friendly spirit of rivalry exists among these teams, each one striving for the best record. This has resulted in a further reduction in the number of accidents. Out of a total of 127 accidents in 1924, 75 were automobile accidents, and of these 75 accidents 40 were cases where the automobile ran into the street car.

ACCIDENT RECORD, COLUMBUS ELECTRIC & POWER COMPANY

		Accidents Related to Car Operation		Total Accidents		
Year	Car-Miles	Number	Per 10,000 Car-Miles	Number	Per 10,000 Car-Miles	Fatalities
1918	860,800	432	5.01	438	5.09	1
1919	941,957	549	5.84	553	5.87	1
1920	1,002,981	412	4.12	419	4.19	0
1921	1,028,309	299	2.91	305	2.97	2
1922	1,055,125	210	1.99	213	2.02	0
1923	1,094,672	171	1.56	179	1.63	0
1924	1,075,508	127	1.18	129	1.20	0

All accidents, regardless of who is to blame, are included in the total. For example, if an automobile collides with a street car while at a standstill it is counted as an accident despite the fact that the operator was in no way to blame. Taking into consideration the increase of automobile registration during this 5-year period, the record is thought to be extremely good.

Transfer Use Reduced 63 per Cent

WHEN the New York & Queens County Railway inaugurated 100 per cent one-man operation about 2 years ago it was found that the type of transfer used had a noticeable effect in reducing the speed of operation. Investigation showed also that many transfers were being fraudulently used. At that time transfers were of the P.M. coupon type with the month, day and year printed on the face. Separate transfers were used for each route and the one-man operator was required to indicate the time limit with a hand punch. As a result many transfers not properly punched, or not punched at all, were issued during busy periods by one-man car operators. After a study of the situation, the Moran type transfer was adopted. This transfer was described in ELECTRIC RAILWAY JOURNAL for Feb. 3, 1923, and July 7, 1923.

All four routes of the Queens County system now use the same Moran transfer. Round-trip riding and stop-over trips are prevented by cancellations made by the carhouse dispatcher when issuing transfers to the car operator. These cancellations indicate that the transfer is not good going to either of the terminals of the route issuing the transfer. The date is indicated by a "V," cancellation made in the edge by the dispatcher. The month is printed boldly in red. In addition to protection of the time limit given by the printed coupons transfer abuse is prevented by using contrasting colors in the morning and afternoon.

A marked reduction in the use of transfers has followed the adoption of this new style, as shown in the following table:

	Number of Transfers Ordered	Cost of Transfers
Dec, 1, 1922, to May 31, 1923.....	2,101,000*	$1,031.00
June 1, 1923, to Nov. 30, 1923.....	2,400,000	976.00
Dec. 1, 1923, to May 31, 1924	1,775,000	710.00
June 1, 1924, to Nov. 30, 1924.....	1,040,000	436.80
Dec. 1, 1924, to May 31. 1925.....	780,000	327.60

* Final order of the old style transfers.

Reduction in the use of transfers has come without any changes in routing and is attributed by the management to the decreased desire of passengers to take transfers which have an enforceable time limit, and also to the elimination of waste due to abolition of route transfers with a printed date.

The Readers' Forum

New Name Proposed for A. E. R. A.

THE UNITED RAILWAYS & ELECTRIC COMPANY
BALTIMORE, March 3, 1925.

To the Editor:

For a while back some of us have been discussing the desirability of changing the name of the American Electric Railway Association. To my mind, this has rather been brought to a head by the appointment of a managing director of the association and the remarks of Mr. Brush at the Midwinter Meeting in Washington. I wish to suggest that perhaps we should change the name of our association to "The American City and Interurban Transportation Association" and that we should broaden its scope, so as to include other forms of transportation. This will put us not only potentially but practically in the position of wanting to furnish all the transportation for the territory we serve.

A committee on the revision of the constitution and by-laws of the association has just been appointed. It seems to me this particular problem can well be settled so that whatever changes are wise can all be included in the revised constitution, which will be presented to the convention next October. L. H. PALMER,
Vice-President and General Manager.

More on Inspections for Special Trackwork

R. W. HUNT COMPANY
CHICAGO, Feb. 25, 1925.

To the Editor:

The editorial reference to the importance of special trackwork in the JOURNAL of Feb. 14, 1925, is timely and pertinent.

If competent inspection service on this class of material is as rare as assumed it is almost entirely due to the failure of purchasers to specify thoroughly and accurately just what is desired, but rather to leave questions of quality and workmanship for argument between the inspector and manufacturer. Orders are frequently issued for an important and expensive frog or crossing with no mention of a specification, but simply to some manufacturer's design. Then the inspector is more or less helpless, and the inspector's chief function is merely to check the dimensions.

When special trackwork is bought to a definite specification and design, agreed to by both purchaser and manufacturer, exactly as rails are bought, inspection service will be found adequate in every detail. It would be interesting to know what electric railway mileage actually specifies A.E.R.E.A. specifications for the purchase of special trackwork. C. W. GENNET, JR.

Rapid Transit Traffic Grows 80 per Cent in Ten Years

STATISTICS on the rapid transit traffic in New York City recently compiled for the New York Transit Commission by Daniel L. Turner, its consulting engineer, show an increase of 86 per cent between 1913 and 1923. During this time there have been a number of new routes and new stations, resulting from the dual contracts, which were signed in 1913. The total number of passengers on the rapid transit lines in 1913 was 809,600,000, and in 1923, 1,506,100,000.

Special study was made of the increase in traffic districts in Manhattan Borough, New York, below 59th Street. For the purposes of comparison, Mr. Turner has divided this district into nine groups or territories, as shown in the accompanying table. Two of these, groups 5 and 8, include a single cross street only. The notable feature of this compilation is the great increase in the uptown district or that from 33d Street to 59th Street, as compared with either the downtown groups (1 to 3) or the intermediate groups (4, 5 and 6). The results indicate that there has been a marked movement of business activities from downtown to the upper district.

The figures in the table are also divided as between the two rapid transit companies, the Interborough Rapid Transit Company and the New York Rapid Transit Corporation (B.-M.T. Company). It should be pointed out that the latter company had only two stations in lower Manhattan in 1913, before the construction of its Broadway subway line. These two stations were the terminals of the Williamsburg Bridge and of the Brooklyn Bridge. The figures that are given for 1913 are of its traffic at those bridge stations.

Making Friends on the North Shore Line

A RECENT article in *Advertising and Selling Fortnightly* cites the experience of a member of its staff in using the service of the Chicago, North Shore & Milwaukee Railroad. This experience illustrates in a striking way the interpretation which is placed on the term "service" and is an example of the methods by which this road makes friends of its patrons. The article in part reads as follows:

"One of the *Fortnightly* staff recently had occasion to test the sincerity of this road's service advertising. Illness in his family made it imperative for him to catch a 10 o'clock train out of Milwaukee for Chicago. He was in Fond du Lac, Wis., 64 miles from Milwaukee, and had but 2 hours to drive there in his car. He called the North Shore Line train dispatcher and told him the situation. Would he hold the train a few minutes? 'We'll do our best,' said that obliging official.

"He arrived at the station at 10.02, two minutes after the train's leaving time, but there it was, waiting. Not satisfied that they had done enough, the North Shore Line officials went out of their way to see that the rest of the party in the automobile, who had to drive on to Chicago with the car, were taken to the outskirts of Milwaukee and started on the right road, which they might have missed in the dark.

"Ten years ago this road was in the hands of a federal receiver. Today it is a profitable growing property. That's what happens when a company gets the service attitude—and let's people know it."

Association News & Discussions

Iowa Association to Meet at Waterloo

A JOINT convention of the Iowa Electric Railway Association and the Iowa section of the National Electric Light Association will be held at Waterloo on June 3 and 4. One of the sessions on the second day will be a joint meeting of the two associations. June 5 and 6 will be devoted to a golf tournament to those who desire to participate.

Joint Utility Meeting in Illinois

THE fifth joint convention of the three Illinois utility associations, comprising gas, electric and railway companies, will be held on March 18 and 19 at the Hotel Sherman, Chicago. For the first time at a state utility convention there will be a utility advertising exhibit.

Joint sessions will be held each morning, while the individual sections will hold their own meetings in the afternoon. On the program for the first morning session is an address on "The Future of Electric Railways," by J. P. Barnes, president Louisville Railway. Merchandising, maintenance, safety, and the bus are among the subjects to be discussed at the electric railway sectional meetings. The meeting will conclude with the annual banquet on Wednesday evening.

Regional Planning Congress to Meet in April

THE first international town, city and regional planning conference in the United States will be held in New York City, April 20 to 25, at the invitation of Governor Smith and several local organizations interested in this work. An exhibit of city planning material from all over the world will be shown at the Hotel Pennsylvania and also at the Grand Central Palace, the latter as part of the exhibit of architectural and allied arts, under the auspices of the American Institute of Architects and the Architectural League of New York, which will meet in conjunction with the city planning congress.

The conference is expected to be of especial interest and value as it will give opportunity to secure first-hand information upon an important field of city and regional development, namely, the better distribution of population and its effect on problems of transportation and traffic.

City planning in European countries has been approached chiefly from the angle of planning for housing and for the better use of land, rather than the mere platting of streets and laying out of land. The housing shortage in this country and the increased cost of building have emphasized the need of giving more attention to the actual distribution and character of building.

A preliminary program of subjects to be discussed at the conference includes the following which are likely to be of interest to railway men: "Transportation in the New York Region," "Traffic," and "City Planning as a Permanent Solution of the Traffic Problem."

Birney Club Elects

THE regular monthly meeting and dinner of the Birney Club was held at the Missouri Athletic Association, St. Louis, on March 2. For the ensuing year the following officers were installed: Edwin B. Meissner, president; F. A. Richards, vice-president; B. W. Stemmerich, secretary; Otis Turner, treasurer. An interesting paper was read by B. W. Stemmerich, St. Louis representative of the Westinghouse Electric & Manufacturing Company, on railway motors covering developments in the last 34 years.

American Association News

Special Reports Available

THE following special reports of the Bureau of Information and Service of the American Electric Railway Association have been prepared and are available to member companies in good standing upon request.

Bulletin No. 11—Wages of Trainmen.—This is an entirely new edition of the regular Wage Bulletin, based on replies of more than 450 companies to a questionnaire sent out in February. It shows the present wage scale, effectitve date and date of expiration, previous scale, union affiliations of trainmen, number of men employed, contract conditions governing wage scale and the average weekly wages earned by the men under the scale.

Bulletin No. 12—Wages of Bus Men.—This is the first bulletin of bus men's wages issued by the association. It has been made necessary by the rapid increase in the bus operations of electric railways. The bulletin shows substantially the same information for bus operators as is shown in our bulletin of trainmen's wages, namely, present scale paid, effective date, date of expiration, union affiliation of bus men, number of bus men employed, average weekly wages earned under the scale, etc.

Bulletin No. 13—Schedule Analysis.—A summary of schedule data on fifteen of the larger operating companies. Shows, for average week-day schedules, proportion of hours used in running time and layover, the car-hours, run pay-hours and trainmen's pay-hours, the distribution of run allowances and pay allowances, car-mile schedules, schedule speeds, proportion of early, late and swing runs and one and two-man runs; also contains reproductions of the schedule summary sheets used by the several companies.

Bulletin No. 14—Motor Bus Operations in the United States, Part III.—This is the third installment of the list of motor bus lines, the first part of which was issued Dec. 1, 1924. It shows the name and address of all motor bus operations and, where the information is available, statistical data on the character of their operations. The present installment covers the states of Kentucky and New York.

In addition to the above, supplements to the Fare Bulletin and Cost of Living Studies have been prepared, bringing them down to date.

Maintenance of Equipment

Removing Motors Without Lifting Car Bodies

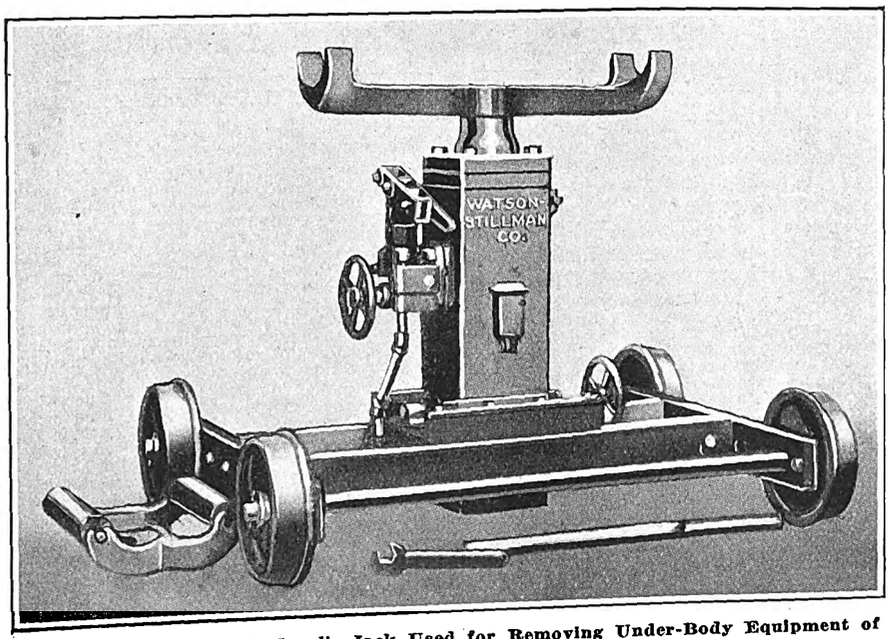
THE shops of the Northern Indiana Power Company at Kokomo, Ind., were originally provided with a drop pit and stationary jack for removing wheels and motors from electric cars. Difficulty was sometimes experienced from the necessity of stopping the car exactly over the jack in order properly to remove the motors. Frequently it was necessary to move the car back and forth over the pit several times, and as the clearance was small, the method was found to consume considerable time as well as being a source of danger to workmen.

An adjoining pit in the shops has recently been fitted up with a Watson-Stillman traveling telescopic motor-lift hydraulic jack, which has been found ideal for changing wheels, armatures, compressors, grid resistors, brake cylinders, air reservoirs and other under-body car equipment parts. The traveling jack in its original design was intended to run at the top of the pits. The track gage of the jack was thus considerably greater than that of the standard track. In the installation at Kokomo the track for the jack has been placed in the lower corners of the pit, which is 80 ft. long.

To remove a motor with the new equipment the car is run over the pit so as to leave from 3 to 5 ft. of open pit space at one end. The jack is then pushed into position and raised under the motor, which is to be removed, so as to support the motor. The axle caps, gear case, suspension bolts and the bolts from one end of the truck suspension bars are then removed, so as to make it possible to swing the entire motor around the axle and lower it with the jack. A man can then push the jack with the motor to the end of the pit, where the motor can be lifted off with a crane.

The usual maintenance method of the railway is to use spare motors and armatures and one of these is installed in place of the parts removed. With this new arrangement it has been found possible to remove and change an armature from a 90-hp. motor in 45 minutes, whereas with the previous stationary drop pit an average time of 3 hours was taken.

The jack is built on a rigid frame with flanged wheels for running lengthwise of the pit. Crosswise movement is also provided by movement on the framework on two channel irons. In the Kokomo shop a special cradle fits under the armature housings.

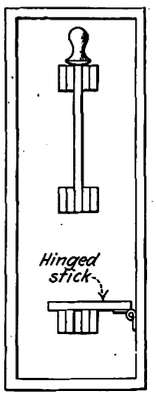


Telescopic Motor-Lift Hydraulic Jack Used for Removing Under-Body Equipment of Electric Cars at Kokomo, Ind.

Hinged Stop for Double-Throw Switches

BY G. H. MCKELWAY
Engineer of Distribution Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y.

IN USING double-throw switches it is quite important to provide a protection so that when the switch blade is pulled out from either set of contact clips gravity will not cause it to drop down into contact with the lower clips. This trouble is particularly likely to occur when the switch blade is pulled out quickly from the upper clips and the person opening the switch releases the handle before it has been brought to a stop.



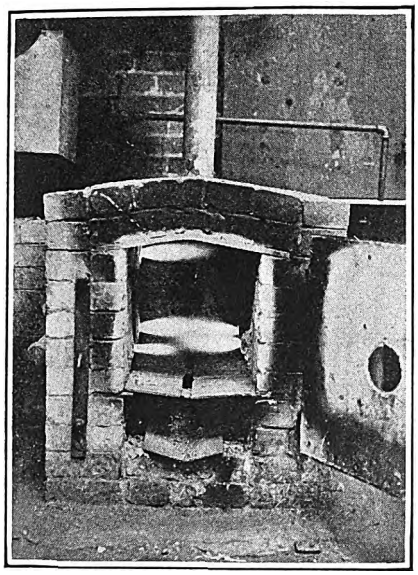
Hinged Wood Bar Prevents Accidental Closing of Switch

Many types of stops or housings have been used to prevent this, but a majority consist of loose parts which frequently become misplaced. The accompanying illustration shows a type of stop which has been used with considerable success for switches installed in boxes out on the line. It consists of a wooden stop bar hinged on the side of the switch box, and so arranged that when the upper connection is made, which is normal position, the bar drops by gravity over the lower clips. To make use of the lower clips it is necessary only to raise the bar to the vertical position until the switch blade is thrown down. Whenever a switch is thrown to the upper position the stop will drop across the lower contacts by its own weight.

Melting Babbitt from Old Bearings

THE accompanying illustration shows a furnace used for melting babbitt out of old bearing shells in the Hillcrest shops of the Toronto Transportation System. The furnace is constructed of brick and has a sheet-iron door in one end. The interior is provided with a shelf on

Digitized by Google



Furnace for Melting Old Babbitt Out of Bearing Shells

which the bearings are placed. The furnace is gas-heated and the shelves are sloped toward the center and front so that the babbitt will drop to the lower part and run to the front end, where it is formed directly into pigs in the molds which are placed just in front of the furnace. The exhaust system of the forge shop in which the furnace is located is connected so that the fumes are drawn away.

The advantage claimed for this method of removing babbitt metal from bearing shells is that as soon as the babbitt reaches a low melting point it is recovered in the molds, with the result that it has in no way been injured for further use.

Sanding Truck a Great Time Saver

A SANDING truck recently constructed in the 96th Street shops of the New York & Harlem Railroad, New York, N. Y., has been found a great convenience as well as a great time saver. Where a particular piece of track or car line is to be sanded the truck can go directly to the job by the shortest route, and does not need to follow the car tracks. When once on the job the work can be done more rapidly and with less danger of congestion. If the truck overtakes a car in operation it can pull out around it and sand the track ahead, and in sections where street traffic is congested the truck can pull to either one side or the other of the track a considerable distance and still not interfere with the sanding operation.

Accompanying illustrations show the construction of the truck. A standard Mack 5-ton truck chassis is used. The body was constructed in the company's shops and has capacity for 7 cu.yd. of sand. Standard mechanism is used for raising and lowering the front end of the truck, and in regular operation the body is raised slightly at the front, so as to provide for sand flow to the rear by gravity. A false floor is also provided which slopes to the rear and also transversely to the openings for receiving the sand. A large hopper is provided at the rear left-hand side and a 4-in. pipe runs along this side to the front of the truck underneath the false flooring. From this pipe six branches are taken off to run to each side of the bin.

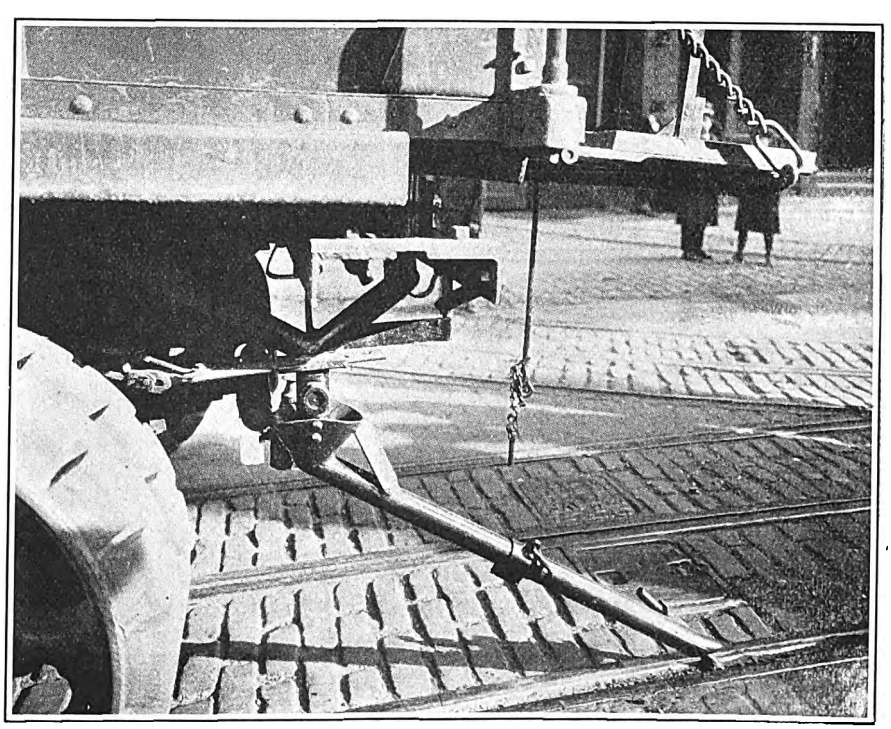
The sand valve and pipe for conducting the sand to the rail are located at the rear left-hand side. The valve consists of a casting with a 2-in. inside diameter. The top of this is provided with a slide, which regulates the size of the opening or provides for completely shutting off the sand as required. This slide is actuated from the driving cab by two types of control. One method of control is through the foot brake lever, so that whenever this is depressed to apply the brakes and slow down the speed of the truck the flow of sand is automatically decreased or shut off when the brakes are completely applied. Another control is

Sanding Track by Means of a Truck Sander

by means of a side lever. This is independent of the foot control and is used whenever it is necessary to shut off the sand entirely and still continue operating the truck in the normal manner. The connections from the foot and hand lever to the slide are made by steel rods.

From the close-up of the valve and pipe for conducting the sand to the rail it will be noticed that there are two lead-in pipes. The one to the rear of the truck is from the hopper, while the one toward the front end of the truck comes from the pipe with branches which run along the left-hand side. It is found with this method of providing several places where the sand can enter that the body can be almost completely emptied of sand without difficulty.

The pipe which conducts the sand



Sanding Valve and Pipe for Conducting the Sand to the Track

The truck is also arranged so that a snow plow nose can be mounted on the front for snow removal. The rear has two angle-iron cross-members with connection to the rear axle. This is provided for mounting a slot cleaning scraper for cleaning the underground conduit slot used in New York City.

Digitized by Google

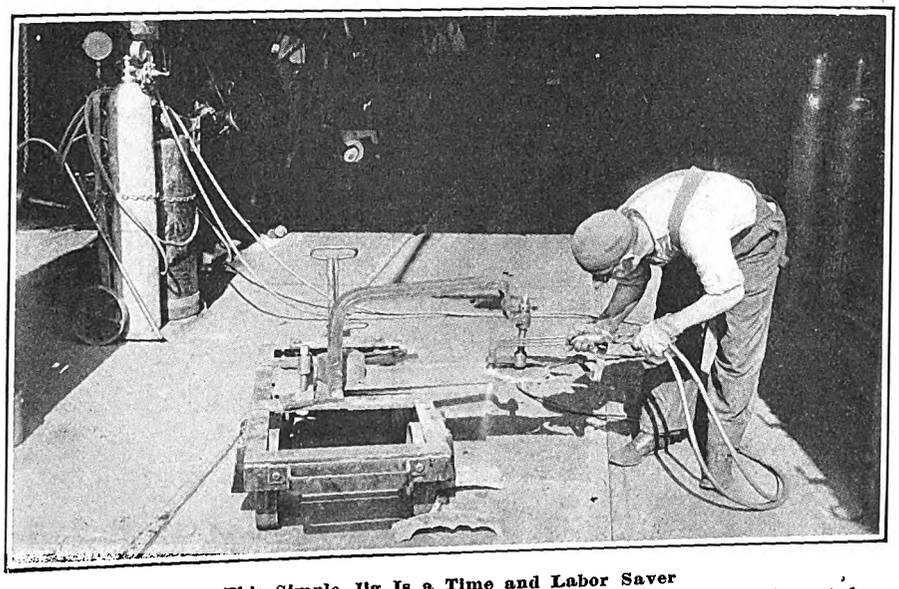
to the track is arranged with a swivel joint at its upper end so that it can be raised and lowered and also will swing sidewise of the track. The lower end of this pipe has a steel rod which fits into the groove of the rail and so follows this regardless of whether the truck is following the track exactly or not. The sand bin is made of wood with steel reinforcing. The covers are also of wood, but are covered with canvas so as to make them watertight. The covers are also sloped toward the edges so as to shed water readily.

A small platform is provided at the rear with a chair, so that a man additional to the driver can be carried. The duties of this man are to raise and lower the principal conducting arm at the back whenever it is necessary to pull out from the car track or to stop the sanding operation. A buzzer signaling system is provided so that the man at the rear can signal the driver the same as a conductor of a street car does. When the sanding arm is not being used it is swung around crosswise of the truck and hooks up out of the way. The truck is also arranged so that a snow plow nose can be mounted on the front for snow removal.

Jig for Cutting Circular Disks with Torch

BY T. E. WOOD
Master Mechanic Omaha & Council Bluffs Street Railway, Omaha, Neb.

CIRCULAR disks are cut from sheet steel with an oxyacetylene torch and the simple jig shown in the accompanying illustration, which was taken in the shops of the Omaha & Council Bluffs Street Railway. When special machinery for the purpose is not available, the method illustrated offers a handy and satisfactory substitute. A forged arm with a base plate at one end is arranged so that it can be mounted in any convenient position by means of an ordinary machinists' clamp. A supporting frame for the torch is pivoted in the end of the arm and is arranged so that it can be adjusted to give a circle of any given radius within the limits of the jig.



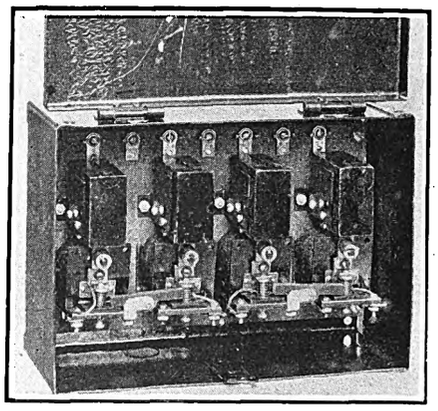
This Simple Jig Is a Time and Labor Saver
In the shops of the Omaha & Council Bluffs Street Railway this equipment enables circular disks of various sizes to be cut from sheet steel with an oxyacetylene torch.

New Equipment Available

Starter for Motors in Hoist Service

A NEW reversing starter bearing the designation "CR-7009-M4" has been designed by the General Electric Company, Schenectady, N. Y., particularly for monorail hoist service such as is common in electric railway shops. It is very small and compact and is recommended for other applications in addition to that of hoist service where economy of space is essential.

This starter may be used with either alternating or direct-current motors, and in operation throws the motor directly on the line. It consists of four single-pole contactors mechanically interlocked and mounted on a suitable base which is inclosed in a small sheet metal case for wall mounting. A push-button station is provided for operating the contactors, which are so arranged that the motor will run only as long as the push-button remains depressed.



Reversing Starter for Monorail Hoist Service

The over-all dimensions of the inclosed device are width 14 in., height 9 in., depth 6 in. Knockouts are provided for ¾-in. conduit. The construction is so arranged that the cover may be locked shut if desired.

Recording Instrument for Car Tests

AN ELECTRICAL measuring and recording instrument which provides five simultaneous records is being marketed by Evershed & Vignoles, electrical measuring instrument manufacturers of London, England. The instrument is designed to be connected in the electric car circuit so as to give simultaneous records of speed, motor amperes, voltage, brake application and stops. The five records are plotted side by side on two charts driven by a common clock mechanism. In order to prevent cramping of the records, the instrument is fitted with a chart speed of 6 in. per minute. Other chart speeds down to ½ in. per minute can be arranged without change of the clock mechanism.

The time lines on the records are straight, and so it is a convenient matter to compare simultaneous values of the various records. Particular attention has been given in the design of this instrument to prevent interference from vibration of the car and equipment. Difficulties from vibration have been overcome in the new instrument by special damping devices and special pen construction. An oil dashpot is used of tapered form, so that wave motion on the surface cannot be built up to increase the vibration effect.

The News of the Industry

Eight Cents in Buffalo

Commission Rejects City's Five-Cent Fare—Allows Eight per Cent on $22,857,335 Value

Fares in Buffalo, N. Y., were increased to 8 cents or two tickets for 15 cents on March 3 after the Public Service Commission had announced its decision on the application of the International Railway for a higher rate. The fare previously had been 7 cents or four tokens for 25 cents. The new rate will remain in effect until April 1, 1926, or until changed by another order of the commission. Tokens will be accepted by conductors with the payment of an extra cent for fare, but tickets are to replace them in future.

For rate-making purposes, the Public Service Commission fixed the value of the properties of the International Railway in Buffalo at $22,857,335, a cut of 85 per cent in the valuation of $60,000,000 placed on the property within the city by the International Railway and an increase of more than $8,000,000 over the valuation placed on the property by the city in its fight for restoration of the 5-cent fare. The legal expenses and other costs to the city in its unsuccessful attempt to have a 5-cent fare restored were more than $25,000.

In arriving at the new rate of fare, the state utilities board disallowed claims for funds turned over to Mitten Management, Inc., Philadelphia, by the Buffalo system for services performed for the local company. The commission held the company has an executive staff competent to manage its own affairs, but that if the owners of the property desire additional management, it is a matter with which the commission has no concern except to say that the expenses should be borne by stockholders and not by car riders.

VALUATION FIXED

The commission permits an 8 per cent return on the valuation allowed for the city properties. The board estimates that the 8-cent fare or two tickets for 15 cents will produce for the company in 1925 the following results: Return, $1,828,335; operating expenses and taxes, including depreciation, $7,096,689; revenues required to meet return and expenses, $8,925,276. The revenue is estimated as follows:

Passengers	
3,975,000 at 3 cents	$ 119,250
101,500,000 at 7½ cents	7,612,500
14,000,000 at 8 cents	1,120,000

This makes a total revenue from fares of $8,851,750. Revenue from other sources is estimated at $95,000, making the total revenue for the company $8,946,750.

The commission in fixing the new rate says the annual fixed charges of the International for interest on funded debt and other deductions from gross income are more than $1,500,000, not all of which can be chargeable to the Buffalo system. In 1924 the International operated 444,799 more car-miles and 56,228 more car-hours than in 1921, while revenues decreased from $8,078,775 to $7,777,072. Expenditures for maintenance of way, structures and equipment, traffic and general and miscellaneous expenses were higher in 1924 than in 1921, but expenses for power, conducting transportation and taxes were lower. The commission found a progressive falling off of passenger traffic in recent years, due, it says, to increasing competition of privately owned automobiles.

The decision of the commission says:

> Adequate street car service, however, is vital to the prosperity of any community. As yet no other system of transportation has been devised to handle urban traffic as well, especially during rush hours. Adequate service depends upon an adequate rate of fare. With an adequate fare, however, there should be adequate service. One goes with the other. The company did not receive in 1924 that reasonable return on the value of its property devoted to public service to which under the statute it is entitled, and it can no more continue to serve the public at a loss and survive than can a merchant.

Members of the City Council say they will not appeal from the decision of the commission unless after adequate time the management does not provide more frequent service on all lines and does not definitely announce its intention of making certain improvements.

Chicago's Interest Their Interest

Offer of Railway Heads to Sell Properties to City Made in Behalf of Effort to Advance Chicago to Magnitude of First Rank Through Co-ordination

VAGUELY conceived nearly 20 years ago, the purchase proposition at Chicago which will go before the voters on April 7 represents 2 years of labor by Mayor Dever, Henry A. Blair, Samuel Insull, Alderman U. S. Schwartz, Major R. F. Kelker, Jr., and a host of associates to realize the ambition of an ideal local transportation system. This ideal consists of subway, elevated and surface carriers operated as a unit for one fare with free universal transfers and co-ordination of train movements.

The proposal is unusual in many ways, particularly the plan by which the city purposes to finance the purchase out of the system's earnings and without putting up a nickel. For their equity the owners of the property are to accept so-called Schwartz certificates, or notes. The state law makes these a first charge upon income.

The 50-ward Aldermanic election of Feb. 24 is regarded as making the referendum result practically certain. Only five of the opponents of the measure out of twenty-three backed by William Hale Thompson and the Hearst newspapers were elected. Seven others got enough votes to go into a run-off election on April 24. Twenty-seven Aldermen friendly to the plan were elected outright. When the ordinance reached the final vote in Council on Feb. 27 forty men voted in favor and five against. This is the Council strength, five seats being vacant.

As indicated at greater length elsewhere in this issue of the ELECTRIC RAILWAY JOURNAL, the ordinance provides tripartite control by a board of nine men during half the payment period, or 20 years. The city will name three men, the security holders of the surface and elevated lines will name three and a joint conference will name three subject to vote of the County Superior Court *en banc*. Terms will be for 9 years. When the city has retired 51 per cent of the notes, the operating board will be reduced to seven, with four named by the city.

It is purposed to name the board in May and have it issue some Schwartz certificates, which will be subjected at once to a friendly test case to be carried to the Supreme Court. The required amount will then be issued to pay for the elevated and surface lines. More paper is outstanding for both systems than is represented by the sale prices. Notably in the case of the surface lines will the need arise for working out an arrangement under which holders of the many issues may share equitably in the new traction notes.

Meanwhile Major Kelker will rush subway engineering details so that digging can begin in September. The city has $40,000,000 in cash for the first unit. Most of the work will be cut and cover. Much has been planned on the layout of the tubes by Bion J. Arnold.

Samuel Insull, though sharing with other utility men the justified mistrust of either municipal ownership or operation, had refused for a long time to set a figure on the elevated lines, but at the last minute he reopened negotiations and even made a substantial compromise in the city's favor. He explained this later over the radio to the public. He said:

> I want to urge you to give very friendly consideration to the transportation proposition that will come before the voters. A development of rapid transit in the largest sense of the word is urgent and we must have it, I care not by what scheme.
>
> This scheme primarily brings together the surface and elevated lines. The prices

Digitized by Google

do not represent two-thirds of what it would cost to reproduce them. Speaking for the elevated lines, I am a long way from being satisfied with the price and so will be everybody else. But what we owners want is what the whole city wants; that is, to provide the facilities that will lead the community ultimately to become the greatest city of this western hemisphere.

There is a possibility that the assessment method of financing extensions giving service to particular districts may be adopted. Alderman Wiley W. Mills, head of the Public Ownership League of America, offered an amendment to that effect, but it was sidetracked when the authors of the ordinance expressed the belief that a method of this kind was possible under clauses already written in the bill. After lawyers have considered and determined the matter definitely, this will be taken up again.

Several hundred amendments were waiting for the ordinance on the floor and forty-seven, relating mostly to misplaced commas or undotted i's, were adopted. Two were important. Eight miles of subway formerly listed for construction in the second 10-year period was moved up to the immediate list. Provision was made that subway stations downtown should not be more than 1,000 ft. apart.

Interstate Bus Case Decided

United States Supreme Court Rules that Regulations Sought to Be Imposed by State Commissions of Washington and Maryland Are Unconstitutional

IN AN opinion read on March 2 by Justice Brandeis, the United States Supreme Court declared unconstitutional the Washington State law prohibiting common carriers for hire from using the highways of that state between fixed terminals or on regular routes without having obtained a certificate of public convenience and necessity from the state, in so far as it applies to interstate carriers.

On the same day the Supreme Court, also through Justice Brandeis, reversed the Maryland Supreme Court in the case of George W. Bush & Sons Company against the Public Service Corporation of Maryland. Maryland requires a permit for common carriers using its highways with fixed routes on regular schedules. The Bush company applied for a permit for exclusively interstate freight carriage and was refused. The state trial court and the state Supreme Court held for the Public Service Corporation. The United States Supreme Court reversed this case on the ground that the attempted administration of the state law was an invasion of the commerce clause of the Federal constitution. The highways involved in the Maryland case were not built or maintained with Federal aid.

Justice Brandeis, who delivered the opinion of the court, said in full:

This is an appeal, under Section 238 of the Judicial Code, from a final decree of the federal court for western Washington dismissing a bill brought to enjoin the enforcement of Section 4 of Chapter III of the laws of Washington, 1921. That section prohibits common carriers for hire from using the highways by auto vehicles between fixed fermini or over regular routes, without having first obtained from the director of public works a certificate declaring that public convenience and necessity require such operation. The highest court of the state has construed the section as applying to common carriers engaged exclusively in interstate commerce. (Northern Pacific Railway vs. Schoenfeldt. 123 Wash. 579; Schmidt vs. Department of Public Works, 123 Wash. 705). The main question for decision is whether the statute so construed and applied is consistent with the Federal Constitution and the legislation of Congress.

Buck, a citizen of Washington, wished to operate an auto stage line over the Pacific Highway between Seattle, Washington and Portland, Ore., as a common carrier for hire exclusively for through interstate passengers and express. He obtained from Oregon the license prescribed by its laws. Having complied with the laws of Washington relating to motor vehicles, their owners and drivers (Carlson vs. Cooney, 123 Wash. 441), and alleging willingness to comply with all applicable regulations concerning common carriers, Buck applied there for the prescribed certificate of public convenience and necessity. It was refused. The ground of refusal was that, under the laws of the state, the certificate may not be granted for any territory which is already being adequately served by the holder of a certificate; and that, in addition to frequent steam railroad service, adequate transportation facilities between Seattle and Portland were already being provided by means of four connecting auto stage lines, all of which held such certificates from the states of Washington. Re Buck, P.U.R. 1923 E, 737.

NOTE 1

An additional ground for refusing the certificate was that the applicant did not appear to have financial ability. This ground of rejection does not require separate consideration; among other reasons, because the plaintiff later asserted, in his bill, that he possessed the requisite financial ability, and the motion to dismiss admitted the allegation.

To enjoin interference by its officials with the operation of the projected line, Buck brought this suit against Kuykendall, the director of public works. The case was first heard under Section 266 of the Judicial Code, before three judges, on an application for a preliminary injunction. They denied the application. (295 Fed. 197). A further application for the injunction made after amending the bill was likewise denied. (295 Fed. 203). Then the case was heard by the district judge upon a motion to dismiss the amended bill. The final decree dismissing the bill was entered without further opinion. (See also Interstate Motor Transit Co. vs. Kuykendall, 284 Fed. 882.)

That part of the Pacific Highway which lies within the state of Washington was built by it with federal aid pursuant to the act of July 11, 1916, C. 241, 39 Statute 355, as amended Feb. 28, 1919, C. 69, 40 Statute 1189, 1200, and the Federal Highway Act, November 9, 1921, C. 119, 42 Statute 212. Plaintiff claimed that the action taken by the Washington officials, and threatened, violates rights conferred by these federal acts and guaranteed both by the Fourteenth Amendment and the Commerce Clause. In support of the decree dismissing the bill this argument is made. The right to travel interstate by auto vehicle upon the public highways may be a privilege or immunity of citizens of the United States. Compare Crandall vs. Nevada, 6 Wall. 35. A citizen may have, under the Fourteenth Amendment, the right to travel and transport his property upon them by auto vehicle. But he has no right to make the highways his place of business by using them as a common carrier for hire. Such use is a privilege which may be granted or withheld by the state in its discretion, without violating the due process clause or the equal protection clause. (Packard vs. Banton, 264, U. S. 140, 144). The highways belong to the State. It may make provision appropriate for securing the safety and convenience of the public in the use of them. (Kane vs. New Jersey, 242, U. S. 160). It may impose fees with a view both to raising funds to defray the cost of supervision and maintenance and to obtaining compensation for the use of the road facilities provided. (Hendrick vs. Maryland, 235 U. S. 610. See also Pierce Oil Corporation vs. Hopkins, 264 U. S. 137). With the increase in number and size of the vehicles used upon a highway, both the danger and the wear and tear grow. To exclude unnecessary vehicles—particularly the large ones commonly used by carriers for hire—promotes both safety and economy. State regulation of that character is valid even as applied to interstate commerce, in the absence of legislation by Congress which deals specifically with the subject. (Vandalia R.R. Co. vs. Public Service Commission, 242 U. S. 255; Missouri Pacific Ry. Co. vs. Larabee Flour Mills Co., 211 U. S. 612). Neither the recent federal highway acts, nor the earlier post road acts, Rev. Stat., Sections 3964; Act of March 1, 1884, C. 9, 23 Statute 3, do that. That state statute is not objectionable because it is designed primarily to promote good service by excluding unnecessary competing carriers. That purpose is within the states' police power.

The argument is not sound. It may be assumed that Section 4 of the state statute is consistent with the Fourteenth Amendment; and also, that appropriate state regulations adopted primarily to promote safety upon the highways and conservation in their use are not obnoxious to the Commerce Clause, where the indirect burden imposed upon interstate commerce is not unreasonable. Compare, Michigan Public Utilities Commission vs. Duke, No. 283, decided Jan. 12, 1925. The provision here in question is of a different character. Its primary purpose is not regulation with a view to safety or to conservation of the highways, but the prohibition of competition. It determines not the manner of use, but the persons by whom the highways may be used. It prohibits such use to some persons while permitting it to others for the same purpose and in the same manner. Moreover, it determines whether the prohibition shall be applied by resort, through state officials, to a test which is peculiarly within the province of federal action—the existence of adequate facilities for conducting interstate commerce. The vice of the legislation is dramatically exposed by the fact that the state of Oregon had issued its certificate which, despite existing facilities, declared that public convenience and necessity required the establishment by Buck of the auto stage line between Seattle and Portland. Thus, the provision of the Washington statute is a regulation, not of the use of its own highways, but of interstate commerce. Its effect upon such commerce is not merely to burden but to obstruct it. Such state action is forbidden by the Commerce Clause. It also defeats the purpose of Congress expressed in the legislation giving federal aid for the construction of interstate highways.

By motion to dismiss filed in this court, the state makes the further contention that Buck is estopped from seeking relief against the provisions of Section 4. The argument is this: Buck's claim is not that the department's action is unconstitutional because arbitrary or unreasonable. It is that Section 4 is unconstitutional because use of the highways for interstate commerce is denied unless the prescribed certificate shall have been secured. Buck applied for a certificate. Thus he invoked the exercise of the power which he now assails. One who invokes the provisions of a law may not thereafter question its constitutionality. The argument is unsound. It is true that one cannot in the same preceeding both assail a statute and rely upon it. (Hurley vs. Commissioner of Fisheries, 257 U. S. 223, 225. Compare Wall vs. Parrott Silver & Copper Co., 244 U. S. 407, 411). Nor can one who avails himself of the benefits conferred by a statute deny its validity. (Pierce Oil Co. vs. Phoenix Refining Co., 259 U. S. 125; St. Louis Co. vs. Prendergast Co., 260 U. S. 469, 472). But in the case at bar, Buck does not rely upon any provision of the statute assailed; and he has received no benefit under it. He was willing, if permitted to use the highways, to comply with all laws relating to common carriers. But the permission sought was denied. The case presents no element of estoppel. (Compare Arizona vs. Copper Queen Mining Co., 233 U. S. 87, 94, et seq.) *Reversed.*

Georgia Railway Controls Transportation in Atlanta

Permission was granted to a subsidiary company of the Georgia Railway & Power Company on March 3 by the City Council to operate coaches to serve Morningside and Sylvan Hills. Service will be started not later than March 8, when the anti-jitney ordinance becomes effective. In granting the joint petition of Preston S. Arkwright, president of the Georgia Railway & Power Company, and H. M.

Digitized by Google

Atkinson, chairman of the board, the Council denied the applications of the Crosstown Express, Inc., and the Atlanta Colored Coach Lines, Inc., to operate on the grounds that their proposed routes would violate the ordinance barring jitneys from Atlanta streets.

The fare for any distance on the railway's buses or for the combination use of coach and street car will be 10 cents. The lines, however, will be only temporary and may be changed following the report of the special traction committee which is now studying the report of the John A. Beeler organization in connection with the relief petition of the railway.

The granting of full control of the transportation of the city to the Georgia company is the second of the recommendations of John A. Beeler that the City Council has acted upon favorably. Mr. Beeler and members of his staff recently returned to Atlanta from a four-day trip to New Orleans and Houston with Mayor Walter A. Sims of Atlanta and the special traction committee of the Atlanta City Council, headed by the Hon. J. L. McLendon. The party was accompanied by three reporters, representing all the daily newspapers of Atlanta.

Capital Traction Offers Old Scale in Lieu of Higher Wage

Motormen, conductors and bus operators of the Capital Traction Company, Washington, D. C., filed a petition on Feb. 25 seeking an increase from 58 cents to 70 cents an hour in their wages. The petition included a request of 25 per cent increase for workers other than trainmen. About 1,000 employees are involved. Immediately following the application, the company denied the petition and countered with a proposal to reduce the present scale. This will result in the matter going to arbitration and the company took the first step in that direction by announcing that Santon C. Peelle, an attorney, would be its arbiter.

The present wage scale is 52 cents an hour for the first 3 months, 56 cents for the next 9 months and 58 cents thereafter. The company will ask the arbitrators to consider the following reduced scale: For conductors, motormen and bus operators in the service on March 30, 1923—first 3 months' service, 51 cents an hour; next 9 months, 54 cents, and after 12 months, 56 cents; for conductors, motormen and bus operators employed after March 30, 1923—first year, 50 cents; second year, 52 cents; third year, 54 cents, and fourth year and thereafter, 56 cents; motormen and conductors acting as instructors or operating one-man cars would receive 5 cents an hour additional. The company proposes that no change be made in the wages of employees other than motormen, conductors and bus operators.

George E. Hamilton, president of the company, stated in conclusion that in view of the fact that the company and the men were so far apart in judgment and conclusions on the subject it would be useless to attempt an agreement by conference. He suggested that arbitration be resorted to as provided in the contract.

Home Rule for Buses

Ohio Cities Will Have Say Over Operating Rights—Cleveland Railway to Use Buses

Ohio cities are given full control over bus transportation within their boundaries, under a bill passed recently by both the Senate and House in the General Assembly. The bill becomes a law 90 days after the Governor affixes his signature to it. It is believed he will approve the measure inasmuch as he has declared himself to be in favor of the move. Up to this time the State Public Utilities Commission had jurisdiction over bus operation in cities.

The bill not only gives City Councils the right to say whether or not there shall be bus transportation in their cities and who shall run this form of transportation, but also takes from the control of the state commission the right to regulate bus transportation in Ohio municipalities and places contiguous to municipalities.

The bill was passed by both houses of the General Assembly only after a long and bitter fight. The new regulation was drawn specifically to meet the situation in Cleveland, where the Cleveland People's Motor Bus Company had sought a certificate of convenience and necessity from the State Utilities Commission. The Cleveland City Council and civic organizations fought the right of the state commission to grant any motor bus company the right to operate in Cleveland.

It is expected now that the Cleveland City Council will authorize the Cleveland Railway to operate buses in Cleveland; in fact, the railway is seeking to finance the use of buses as feeders to the railway system.

Council Approves New Milwaukee Operating Contract

The Common Council of Milwaukee, Wis., has voted 21 to 4 in favor of the ordinance containing the proposed service-at-cost contract to be entered into between the city and the Milwaukee Electric Railway & Light Company. The measure will be submitted to a vote of the people on April 7. If the contract is approved at that time it will go into effect on July 1, provided the Railroad Commission and the North American Company are agreeable. The contract will run for a period of 10 years, with the privilege of canceling it at the end of 8 years. It will be renewed automatically every 10 years, with the right reserved to the city to purchase the properties if the people vote in favor of municipal ownership.

Fare Plea Made to New York Governor by Interborough

The Interborough Rapid Transit Company, New York, on March 3 addressed to Gov. Alfred E. Smith and to the State Legislature a memorial and petition asking legal authority to charge a fare higher than 5 cents, as the speediest practicable way not only to insure the building of new subways for New York but also to provide improved service on the rapid transit lines now in operation.

The petition did not specify any precise figure for the desired rate of fare. In the brief recently filed by its general counsel, James L. Quackenbush, 7 cents was suggested, with the proviso, generally speaking, that 1 cent of each addition to the present 5-cent fare should revert to the city and the other to the corporation. It has been pointed out that, as the I.R.T. is now carrying 1,000,000,000 passengers a year, the additional 1-cent increment alone would put into the City Treasury $10,000,000 annually, which would provide for the annual interest upon the so-called "frozen credit," now a continuous burden upon the city's taxapayers.

Agreement in Albany Results in Continuation of Seven-Cent Fare

The 7-cent fare will be continued in Albany, N. Y., and permission will be granted the United Traction Company to operate gasoline-electric buses this spring over Western Avenue and over the route now served by the Arbor Hill trolley line. This was virtually agreed to at a conference on March 4 between city and traction officials. The agreement has no bearing on the application for a 10-cent fare on other United Traction lines in the Capitol district.

A meeting has been called for March 12, at which the final agreement is expected to be reached, and petitions will be presented to the Common Council at its next meeting for operation of buses. Mayor Hackett said the company had requested permission from the city to operate buses over Western Avenue and the Arbor Hill route and in return proposed either to withdraw or postpone for 12 months its application for a 10-cent fare in Albany. He said he would also withdraw his petition for an investigation of affairs and for a 5-cent fare.

One-Man Car Protest in New Jersey Peters Out

Despite complaints previously made against the operation of one-man cars on the Bloomfield line of the Public Service Railway, a hearing held by the Board of Public Utility Commissioners in Newark, N. J., on March 5 was very poorly attended. Fewer than 25 people were on hand when the meeting opened at 11 a.m., and the attendance dwindled to less than half a dozen by afternoon. More interest was manifested in the question of fare zone limits and connections between cars and trains at the railroad station in Montclair than in one-man car operation.

A general statement made at the hearing to the effect that all one-man operation of double-truck cars was unsafe was answered by A. T. Warner, assistant to the vice-president in charge of operation. He showed that there had been a reduction of nearly 20 per cent in boarding and alighting accidents, as told elsewhere in this issue. He also pointed out that because of the high cost to the railway of supplying this service no extension of the present fare zone limits could reasonably be asked for. The company volunteered to make a study of ways to furnish closer connections with railroad trains.

News Notes

Seeks Higher Fare.—The Elmira Water, Light & Railroad, Elmira, N. Y., has filed with the Public Service Commission a complaint against the present 6-cent fare charged on its system and has asked the commission to fix a just and reasonable fare. The company alleges that the 6-cent fare is unjust in that it does not yield a sufficient revenue to pay the cost of service and give the company a fair and reasonable return upon the value of its property.

Wants 7-Cent Fare.—Having obtained consent of the municipalities through which its lines run to an increase in fares for a period of at least a year, the New York & Stamford Railway petitioned the Public Service Commission on Feb. 26 for permission to put a new tariff in effect on 3 days' notice. The line extends from Depot Square, New Rochelle, through Larchmont, Mamaroneck, Harrison, Rye and Port Chester to Stamford, Conn. It is proposed to charge 7 cents in each of the six operating zones except the first zone, the city of New Rochelle, where the 5-cent fare will not be changed. In the second and third zones the fare is now 5 cents, and in the fourth, fifth and sixth zones it is 6 cents. In 1921 the company's net income was $14,744. In 1922 there was a deficit of $18,979, in 1923 a deficit of $23,151 and in 1924 one of $13,290.

Another Hearing on Ten-Cent Fare Petition.—The Public Service Commission will hold a further hearing at Albany on March 11 in the matter of the application of the Poughkeepsie & Wappingers Falls Railway, Poughkeepsie, N. Y., for permission to charge a 10-cent fare. On Feb. 23 the company petitioned for a reopening of the case for the presentation of further evidence to the end that the full increase sought in the original petition might be granted. The commission on Nov. 12, 1924, issued an order granting permission to charge a 9-cent fare, but it denied the 10-cent fare.

Car Checks for School Children.—The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., will issue car checks for use by school children under 10 years of age to be sold in strips of 10 for 30 cents. The introduction of these tickets was urged by the superintendent of schools.

New York State Mayors Urge Bus Legislation.—The New York State Conference of Mayors, in midwinter session at Albany, on Feb. 26 unanimously adopted the resolution presented by Mayor Frank X. Schwab of Buffalo urging the Legislature to enact a law that would give municipalities the right to operate buses and trolley cars.

Wants Service Extended.—Agitation has been started in Wausau, Wis., to have the Wisconsin Valley Electric Company extend its railway to supply service to residents on the west side, who are now forced to walk about half way to the business section of the city before they can board a car. Should the company find it uneconomical to make this extension, it has been asked to establish bus service as a feeder to the railway.

Denies Bus Petition. — The Public Service Commission recently denied the petition of David W. Jeram and David W. Jeram, Jr., for a certificate of public convenience and necessity for the operation of a bus line between Albany and Schenectady, N. Y., by way of Fuilderland and Carman. The commission held that adequate accommodations were supplied by bus lines and existing electric and steam railroad lines.

West Philadelphia to Have Buses.—Double-deck buses will be put in operation next summer on Chestnut and Walnut Streets between 63d and Broad Streets under franchises with the city which the Philadelphia Rapid Transit Company now holds. Ralph T. Senter, vice-president in charge of engineering, recently made this announcement and at the same time indicated that the bus fare would be the same as the trolley fare, 8 cents or two tokens for 15 cents.

Forty-Cent Sunday Pass.—The Pittsburgh Railways, Pittsburgh, Pa., will give a 3 months' trial to a second transferable Sunday pass selling for 40 cents. The pass will be good for unlimited riding by the holder in any and all fare zones on the system excepting the interurban routes, Charleroi, Washington, Donora, Harmony and Butler Short Line. It will not be good in the city of Washington nor on night cars. The installation of the second Sunday pass is an attempt to stimulate riding in the suburban zones. The 25-cent Sunday pass will still be available.

Hearing Set on Cancellation of Bus Privilege.—Hearing on application of the Community Traction Company, Toledo, Ohio, asking for cancellation of the license of the Toledo Motor Bus Company, a competing independent line, has been set for March 13 by the Ohio Public Utilities Commission. The railway alleges that the bus company has violated the state laws. The bus company operates in direct competition with the traction service on Dorr Street. A 5-cent fare is charged by the bus line. Some phases of the case have already been before the commission and testimony of the bus operators showed that a license originally granted to a partnership had been used for several months by the corporation, to which it was transferred.

Seeks Fourth Bus Line Permit.—Application has been made to the City Council of Buffalo by the International Bus Corporation, a subsidiary of the International Railway, for permission to operate a double-deck bus line in Richmond Avenue at a 10-cent fare. This would give the International its fourth bus line in Buffalo. The company asks a 10-year franchise, with the right reserved to the city to purchase the line on April 1, 1928, or any April 1 thereafter on 6 months' notice to the company, at its appraised valuation, the Public Service Commission to be arbiter if there is any dispute. It is agreed no valuation shall be placed upon the franchise.

City Will Take One-Man Car Issue to Supreme Court.—An appeal from the decision of Judge Isaac Wolfe in the Superior Court making permanent the temporary injunction restraining the city from enforcing the ordinance banning one-man double-truck cars of the Connecticut Company, New Haven, Conn., will be entered soon by counsel for the city. The ordinance was passed by the Alderman and if allowed to stand would have prevented the Connecticut Company from operating its double-truck one-man trolley cars on its lines in the city. In his decision making the injunction permanent, Judge Wolfe found nothing in the city charter giving the Aldermen express or implied power to pass such an ordinance. The case will now be carried to the Supreme Court, which will be called upon to review the decision in the Superior Court.

Higher Fare in Effect. — A 7-cent fare on cars of the Chicago, South Bend & Northern Indiana Railway operating in and between South Bend and Mishawaka, Ind., has been put into effect following the authorization by the Public Service Commission. Four tokens will be sold for 25 cents, good on local lines in each city in which the company operates.

Railway Sells Another Service.—The San Diego Electric Railway, San Diego, Cal., has put into effect another novelty. This time it is the selling of newspapers and magazines to riders along the way. The service is in charge of F. A. Jeffres, who will have a staff of 45 men to sell the leading magazines and San Diego papers. The plan will be to cover the morning cars starting from the outer terminals and sell to downtown districts and in the afternoon to sell from the downtown central points to the outer districts. Mr. Jeffres has filed a surety bond to guarantee a faithful performance of contract. The management of the railway reserves the right to approve all newspapers and magazines to be sold.

Learning "How to Hang."—The United Railways, St. Louis, Mo., has posted cards in its cars which read: "When standing in car, take firm hold of strap or seat back. This will enable you to avoid a fall if motorman has to start car suddenly."

Street Guide to Aid Patrons.—A general order has been issued by the Detroit Department of Street Railways, Detroit, Mich., providing that each street car conductor shall carry at all times when on duty a street guide as part of his regular equipment. It is the desire of the department to have the men prepared to furnish complete information to those inquiring as to the location of certain buildings, factories, schools and hospitals as well as street numbers and how to reach them by street car or motor coach. Complaints have been made by strangers in the city that due to the inability of the conductors to answer questions difficulty is experienced in reaching destinations. The order to the conductors instructs them not to answer any questions by saying that they do not know. They are to give the desired information if they can possibly do so, using the street guide when necessary.

Financial and Corporate

Montreal Financing Explained

Plan Advanced to Give 6 per Cent Bonds for Debenture Stock on Basis of 101

The Montreal Tramways, Montreal, Que., has decided to ask the holders of the 5 per cent debenture stock to exchange this stock for 5 per cent 30-year general and refunding mortgage sinking fund gold bonds. These bonds will be authorized for a total principal amount of $100,000,000, bearing a rate of interest not exceeding a maximum of 6 per cent per annum, and will be issued from time to time. The basis of exchange will be $101 of bonds for each $100 of debenture stock, and it is desired that the exchange be effective as and from April 1, 1925.

At the present time the company has an authorized issue of first and refunding mortgage gold bonds amounting to $75,000,000. Of this issue $21,351,000 are issued and outstanding. It is intended to close this issue at $25,000,000.

The company has an authorized issue of debenture stock amounting to $75,000,000, of which $17,600,000 has been issued and is outstanding. The company desires by means of the proposed exchange to bring about the retirement of all this outstanding debenture stock, and on the completion of the exchange the trust deed securing the debenture stock will be canceled.

Of the new issue of general and refunding mortgage sinking fund gold bonds, a sufficient amount will be held by the trustee to retire an equivalent amount of the first and refunding mortgage bonds as presently issued or as may hereafter be issued up to the total amount of $25,000,000. It is intended that these bonds shall be issued as a series "A" and bear interest at the rate of 5 per cent per annum.

It is further intended that a second series, to be known as series "B" and bearing interest at the rate of 5 per cent per annum, be authorized and issued fully to provide for the proposed exchange of bonds for the outstanding debenture stock of the company. The remaining general and refunding mortgage sinking fund gold bonds are to be issued from time to time for the corporate purposes of the company and proper restrictions will be inserted in the trust deed with respect to such further issues.

The directors feel that the creation of this new security and the retirement of the presently outstanding debenture stock is in the best interests of the debenture stockholder. Further issues of debenture stock do not command a sufficiently wide market to provide for future financing on reasonable terms. The first issue of debenture stock was made at the time of the company's organization in 1911, but since that time small issues have been made. In 1918, $1,000,000 was issued and sold and in 1922 a further amount of $500,000 was disposed of. It is explained that debenture stock is not a security generally known on the Canadian or American markets, and the same is not readily salable on favorable terms. It is obvious that as the activities of the company extend and broaden the company must have available for its purposes a security which will find a ready market throughout the world. It was explained that:

> If the proposed exchange is authorized, the present first and refunding mortgage bonds will be closed at $25,000,000; the debenture stock will disappear as a security of the company, and the holders of such debenture stock will receive an amount of the general and refunding mortgage sinking fund gold bonds which the company proposes to issue with a premium of 1 per cent on the exchange. Bonds of the issue so authorized will provide a means for the retirement at maturity of the first and refunding mortgage bonds maturing in July, 1941, and from that date all holders of bonds of the proposed issue of general and refunding mortgage sinking fund gold bonds will rank *pari passu* in the security provided by the trust deed securing the same.

Abolition of Jitneys Increases Revenue in Houston

Traffic on the railway lines of the Houston Electric Company, Houston, Tex., has increased markedly since jitney competition was abolished some time ago. This fact is disclosed in the report covering the first 6 months of operation without competition from the jitney lines. The six months has brought 4,300,000 more rides with an increase of $187,218 in revenue.

The company published figures to show that for the 6 months' period just ended it failed to make an 8 per cent return on its investment by $122,868. For a similar 6 months of the year 1923 the company failed to make an 8 per cent return on its investment by $278,831. The report shows a decrease in the deficit of $155,968 for the 6 months, or, at this rate, a deficit of $245,000 a year for 1924, as against one of $558,000 for 1923.

"This means," said W. E. Wood, manager, "that the company has been pulled from a concern on the brink of bankruptcy to a point where a fair return on the investment may be expected soon."

Dividends Paid and Property Kept Up

Unfavorable Weather and Adverse Business Conditions Diminish Revenue of Minneapolis Property—$900,000 Spent on Extensions, Reconstruction and Equipment

FOR the year ended Dec. 31, 1924, the Twin City Rapid Transit Company and subsidiary companies operating in Minneapolis and St. Paul, Minn., earned sufficient to pay regular quarterly dividends at the rate of 7 per cent per annum on the preferred stock and two semi-annual dividends of 2 per cent, aggregating 4 per cent, on the common stock.

It is the belief of the management that the decrease in operating revenue during the year was due largely to unfavorable business and weather conditions. The decrease in net income transferred to profit and loss for the year was $301,059.

In his report to the stockholders, Horace Lowry, president, said that as soon as the value of the property was finally fixed and the directors had reasonable assurance about the amount on which the company would be permitted to earn a return, the question would be taken up of putting the common stock on a quarterly dividend basis, the same as it was prior to the year 1918, instead of the semi-annual basis which the directors have been forced to adopt due to unusual conditions. He said that after many months of hearings before the Railroad and Warehouse Commission proceedings to fix the valuation of the property of the Minneapolis Street Railway and St. Paul City Railway were concluded on Dec. 13, 1924.

During the year $958,455 was spent for extensions, reconstruction, paving and equipment. The money for these expenditures was taken from the renewal reserves, but after the value of the property has been finally determined, it will be possible to finance capital expenditures by the issue of capital securities.

The $5,000,000 first consolidated mortgage extended 7 per cent bonds of the Minneapolis Street Railway, due Jan. 15, 1925, have been refunded to Aug. 15, 1928, by the issue of $5,000,000 of Minneapolis Street Railway first mortgage collateral 5½ per cent gold notes, due Aug. 15, 1928. The first consolidated mortgage extended 7 per cent bonds, payment of which has been extended to Aug. 15, 1928, with interest at 5½ per cent per annum after Jan. 15, 1925, were pledged with the trustee to secure the payment of the 5½ per cent gold notes.

The $500,000 first mortgage 5 per cent bonds of the Minneapolis & St. Paul Suburban Railway, secured by one of the suburban lines of that company, payment of which was guaranteed by the Twin City Rapid Transit Company, became due Sept. 1, 1924, and the directors authorized the company to buy these bonds and hold them in its treasury, uncanceled and without satisfying the mortgage securing same, until such time as a comprehensive plan of refinancing could be worked out based upon values to be determined by the Railroad and Warehouse Commission. All of this issue of bonds is now with the treasury of the Twin City Rapid Transit Company.

BUS COMPANY PURCHASED LAST AUGUST

For some years past the Twin City Motor Bus Company has been operating between the business districts of Minneapolis and St. Paul, and early in 1924 the directors decided to acquire this company. This was accomplished and since Aug. 1 the Twin City Rapid Transit Company has owned all of the capital stock of the Twin City Motor

Net adjustments	$77,063	
Dividends on preferred stock	210,000	
Dividends on common stock	880,000	
Balance carried forward	1,876,038	
	$3,043,101	$3,043,101

company is run separate from the railway but in harmony with that property.

In his report Mr. Lowry referred to the making of a contract with the Light-Weight Noiseless Electric Street Car Company for the construction of 50 street car bodies, which the company had sold in Chicago. Under the terms of this contract, a large amount of the shop overhead items of the company were absorbed which under normal conditions would have been charged to operating expenses, and in addition thereto a net profit was made.

The revenue passengers carried during 1924 totaled 209,202,818, against 221,542,298 in 1923, 226,543,924 in 1922 and 227,727,748 in 1921. During the year recently ended the company operated 491.13 average miles of track, with a gross passenger car revenue of $12,555,513. The income account for the years 1924 and 1923 and the profit and loss account are shown in the accompanying tables.

Gain in 1924 $6,000

For the year ended Dec. 31, 1924, the Tygarts Valley Traction Company, Grafton, W. Va., which operates 7 miles of line at a 7-cent fare, had total earnings of $52,471 and operating expenses of $39,416. This left net earnings of $13,054. After payment of interest on bonds, dividends on preferred stock and deduction of damage reserve, there was a net gain of $6,114. The cash fares for the period ended Dec. 31, 1924, amounted to $45,932 and ticket earnings to $6,305.

Paving and Snow Costs Hit New York Company

The Third Avenue Railway, New York City, did not earn enough to pay 2½ per cent interest on the 5 per cent adjustment bonds for the 6 months' period ended Dec. 31, 1924. Because of the necessity for setting aside money for proper maintenance and depreciation the directors have decided to declare an interest payment of 1½ per cent on these bonds, payable April 1, 1925.

Since the company resumed payment upon its 5 per cent adjustment bonds April 1, 1922, it has paid out in interest practically the entire amount earned during each 6 months' period. During these periods it has been necessary for it to draw upon funds heretofore set aside and the funds for depreciation and contingencies in order to meet the expenditures for capital account made necessary by the purchase of new equipment and to pay the expenses of new paving in existing tracks.

The management explains that to have taken care of these capital expenses by the sale of securities under present conditions would have resulted in a serious sacrifice. The result of this draft upon these funds has been to decrease them very substantially. In addition these funds have been further reduced by reason of the fact that it was necessary during the last year to pay $750,000 in paving bills in litigation decided against the company or compromised. Removal of snow in January cost approximately $100,000. This is in addition to the 12 per cent of its gross receipts, which the company pays in taxes to state and city.

Abandonment in Palo Alto

The Peninsular Railway has definitely decided to abandon its local lines in Palo Alto, Cal. Application for abandonment has been placed on the commission's calendar for hearing. The abandonment, which requires the consent of the Railroad Commission, had been sought in an application filed with that body, but had been withdrawn pending the outcome of negotiations over the transportation situation between the railway and the city of Palo Alto. The further trial of the system under modified conditions, including a time schedule providing for five cars instead of three and a 12-minute schedule instead of a 20-minute one, failed to popularize the service as had been expected. This marks a conclusive stage in the long controversy between the city and the railroad over the local transportation situation. When asked whether the company would substitute bus service for the railway system Mr. Shoup replied that that question would be decided in a few weeks.

Palo Alto is a town of about 6,000 inhabitants. The mileage of the local line of the Peninsular Railway there is small, but the trackage is not segregated in the manuals of reference from the rest of the company's system.

Valuation Bill Withdrawn in Indiana

Representative Charles Mendenhall of the Indiana House of Representatives has withdrawn from that body his bill which proposed to define the fair value or the rate base of a public utility corporation as the last value of the property assessed for tax purposes by the state Board of Tax Commissioners, plus the cash betterments and capital additions made since the time of that assessed valuation. Mr. Mendenhall introduced the bill as a companion measure to his utility bill, which was killed previously.

This bill sought to increase the power of the Public Service Commission in the matter of the regulation of security issues by utility corporations. One of the provisions would have made it unlawful for the commission to authorize a utility to issue securities when the amount of the issue plus outstanding stocks, bonds, notes and other evidences of indebtedness would be in excess of the fair value of the property. The bill which he withdrew was to define fair value as expressed in the first bill. There was no purpose to be served by the second bill since the first measure had been killed.

New Interests Reported in Winnipeg Property

It is understood by the Canadian *Financial Post* that control of the Winnipeg Electric Company, Winnipeg, Man., operating the Winnipeg Electric Railway, has passed to A. J. Nesbitt, president of Nesbitt, Thompson Company, Toronto. While no statement has been issued, it is understood that the large block of common shares of the company that has been in the hands of the Mackenzie-Mann group has been acquired by Mr. Nesbitt and associates, and that these shares, together with the extensive holdings formerly owned by Mr. Nesbitt and his group, give to the Eastern financiers control of the company.

The *Post* says that the move is regarded as highly constructive in two ways; first, in removing from the market the pressure of a large block of overhanging shares that have been a depressing factor since the death of Sir William Mackenzie, and, second, in putting control of the company's affairs in the hands of a successful public utility financier who has given to all of his companies effective and public-spirited leadership.

The Winnipeg Electric Company is offering 2,000 shares of 7 per cent cumulative preferred stock to its customers. The campaign will continue 10 days and will be conducted by the employees, each of whom is to call on ten of his friends during the drive. The stock can be purchased on the partial payment plan—$10 a share with the order and $10 a month a share. This is the first attempt at customer-ownership ever made in Winnipeg on a big scale. The prime purpose of the offering, according to General Manager McLimont, is to secure an increasing measure of customer-ownership and not to secure new capital.

Negotiations Under Way for Purchase of Rainier Valley Line

While city officials are preparing an appraisal of the Seattle & Rainier Valley Railway, Seattle, Wash., with the view of negotiating for purchase, two factions in Rainier Valley have developed. One is in favor of the purchase of the lines and the other opposes such purchase, on the ground that the company should be made to meet its financial obligations relating to gross earnings tax and delayed paving, before the city takes over the lines.

The company now owes the city approximately $60,000 in delinquent franchise tax and is in arrears in paving between its tracks A suit to force the company to do the paving is pending in the Federal Court. City officials agree that if the city took over the system now it would have to assume the responsibility of paving. The company has persistently given lack of funds as its reason for not living up to its paving clause in the franchise. The franchise tax is 6 years overdue.

The Council recently adopted a resolution instructing Corporation Counsel T. J. L. Kennedy to take immediate steps for collection, but the finance committee has modified this resolution to provide that Mr. Kennedy recommend what steps should be taken.

With the cost of the paving required by the company's franchise estimated at about $1,000,000, the company again takes the position that it cannot raise the money. Gradual increase of population led the company, not long ago, to apply to the Council for the privilege of operating auto-bus feeder lines. The bus-operating privilege was refused.

The combination of circumstances has created a deadlock with the city authorities, the railway and the people of the valley, and the only solution so far suggested is that the city shall take over the system. No purchase price has been discussed as yet.

29,000,000 More Passengers on Chicago Surface Lines

A hands-off policy has been adopted by the Chicago Surface Lines toward the purchase campaign being conducted by the city of Chicago, and while municipal ownership proponents and opponents are debating and demagogues are denouncing, the men doing the detail work in the operation of the system are aggressively pushing improvements and service extensions.

Beginning March 1 75 multiple-unit cars, all new, were put into service on the 19-mile Milwaukee Avenue run. A few were replacements. Most of the new cars went into the formation of 36 two-car trains with a schedule of increased headway and increased service.

A summary of growth for the fiscal year ended Feb. 1 shows 1,492,000,000 rides, an increase of 29,000,000 and a gain of a little more than 1 per cent in revenue passengers. Mileage was increased 4.60 per cent, one of the highest ratings in the country.

Officials announced that the lines would not be permitted to lapse at any time regardless of the purchase campaign. Franchises on which the lines depend have only 2 years to run.

Dividend Raised in Philadelphia —Stock Sale Successful

The Philadelphia Rapid Transit Company, Philadelphia, Pa., has increased the dividend on its common stock from 6 per cent to 8 per cent annually to take care of accumulated dividends. It is explained that in 1907 the company entered into an agreement with the city of Philadelphia under which sinking fund payments are provided which may be used to pay off the $30,000,000 of capital stock at par in 1957 and will no doubt be used for that purpose. Under this agreement holders of the capital stock were to receive 6 per cent per annum cumulative. At present common stock holders are about $20,000,000 short of having received their 6 per cent cumulative dividend. The railway management holds this deficit should be made up before the end of the city-company agreement in 1957 by an added annual dividend payment of 2 per cent. With this in mind $1 will be paid for the quarter commencing Jan. 1, 1925.

Passengers' Attention Was Attracted by Placards

The report of the Philadelphia Rapid Transit Company for the year ended Dec. 31, 1924, shows net income of $1,810,364 after depreciation, charges and taxes, equivalent to $3.01 a share (par $50) earned on $29,996,110 capital stock outstanding, as compared with $1,800,000 or $3 a share in 1923.

Car riders have already oversubscribed the proposed issue of 60,000 shares of 7 per cent cumulative preferred stock offered to them at par. The total of orders handed by passengers to conductors and subway-elevated cashiers was not disclosed, but 13,000 car riders oversubscribed the $3,000,000 offering in six days.

All stock orders except from bona fide patrons who are residents of the city will be rejected. The company will not, it was said, cut down the number of shares ordered by each car rider, the limit of which is ten to each individual. Applications will be filled in the order in which they are received, officials said.

There can be no delivery until the issue of $3,000.000 preferred stock has been authorized by the City Council and by the stockholders, who will meet on March 18. The city's assent to this issue is now being urged to accentuate this end.

Utilities Borrow on Better Terms —Marked Improvement by Rails

Public utilities issued in excess of $1,000,000,000, par value, of securities in 1924 at an average yield per dollar of 6.03 per cent and an average yield per issue of 6.14 per cent on offering price. With very few exceptions all classes of utilities borrowed capital at materially lower rates in 1924 than they did in 1923.

These facts are based on an analysis of public utility financing in 1924 by H. B. Dorau of the Institute for Research in Land Economics and Public Utilities. The study which was made further shows that average rates were materially lower in the last quarter of the year than in the first 9 months. During the first, second and third quarters of 1924 the average yield per dollar was 6.08, 6.10 and 6.14 per cent, while in the fourth quarter the average yield per dollar on new issues fell to 5.81 per cent. The simple average rates also show marked declines from averages of 6.20, 6.23 and 6.16 in the first, second and third quarters of the year, to 5.96 per cent in the fourth quarter. During the last quarter of the year a number of large issues were offered at prices to yield as low as 5 per cent—a rate only occasionally approached at any time since the years 1919 and 1920, when the yields on public utility securities were at their height.

Electric railway securities were issued to yield the highest weighted average rate of any utility class (6 per cent). The simple average yield is below the average for all utilities, but this is accounted for by the number of comparatively small issues of notes and equipment certificates at materially lower rates. The averages on electric railway bonds are more representative for this utility, being 6.25 and 6.22 per cent for weighted and simple averages respectively. This is a marked improvement over 1923, for which year similar calculations show the weighted average rate on bonds issued by electric railways to have been 6.52 per cent and the simple average rate 6.37 per cent.

Electric railway companies rendering other utility services also borrowed capital at decidedly lower average rates in 1924. The weighted and simple average rates on new bonds of this class of utilities in 1923 were 6.25 and 6.36 per cent, while in 1924 comparable average rates were 6.11 and 6.16 per cent.

New Directors for Eastern Massachusetts. — Charles E. Ober, J. Wells Farley, K. Otis Wardwell and Elliott Spaulding were elected directors of the Eastern Massachusetts Street Railway, Boston, Mass., at the annual meeting of stockholders. Other directors were re-elected. The number of directors was increased from seven to nine.

Net Income Lower.—The total operating revenue of the Department of Street Railways, Detroit, Mich., for January, 1925, was $1,867,256, against $1,973,453 for a similar month a year ago. These figures included $1,811,735 and $1,926,419 for transportation revenue, in January, 1925, and 1924 re-

Digitized by Google

spectively. The operating expenses were $1,354,260 in January, 1925, and $1,423,186 in January, 1924. Net revenue was $550,267 in January, 1924, and $512,996 in January, 1925. The gross income for January, 1925, and January, 1924, was $469,497 and $492,353, respectively. Net income fell from $89,023 in January, 1924, to $56,329 in January, 1925. Total passengers carried decreased from 41,451,043 in January, 1924, to 39,889,805 in January, 1925.

Northern Ohio Issues Authorized.—The State Public Utilities Commission of Ohio has authorized the Northern Ohio Traction & Light Company, Akron, to issue $7,000,000 in bonds and notes to reimburse the treasury for capital expenditures. The issue is to be divided as follows: $2,500,000 first lien and refunding 5 per cent bonds, $2,500,000 bonds bearing 6 per cent interest due in 1947, and $2,000,000 in two-year 6 per cent notes, dated Feb. 1, 1925. The common stock of this company is owned by the Northern Ohio Electric Corporation, the financial structure of which is being readjusted.

Reorganization Must Provide for Mill Tax. — The city of St. Louis, through counsel, has notified the Federal court that the municipality will oppose any plan for the reorganization of the United Railways which does not provide for the payment in full of mill tax judgments of $2,326,321. Notice to this effect was given when a motion was filed by the city on Feb. 20 to intervene in a request to deny Receiver Wells' application for the court's approval to take up $4,200,000 general 4 per cent bonds of the St. Louis Transit Company. The city complained that the reorganization plans do not provide for the payment of the back mill taxes.

Net Income Lower. — For the 7 months' period ended Jan. 31, 1925, the passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., was $6,625,686, against $6,854,569 for the period ended Jan. 31, 1924. Operating expenses, including taxes, increased from $5,648,858 in the 7 months' period ended January, 1924, to $5,762,400. The net corporate income fell off to $819,107 in the 7 months' period ended Jan. 31, 1925. For the similar period of last year the net corporate income was $1,143,871.

Park Tax Paid.—A check for $289,877 has been sent to the city of Baltimore, Md., by the United Railways & Electric Company, which is the park tax for the quarter ended Dec. 31, 1924. This park tax paid by the railway is 9 per cent of the gross receipts from lines within the city limits. It is paid in lieu of all other local taxes.

Will Abandon Service in City.—The Toledo & Western Railroad has been granted permission to abandon service within the city of Toledo, Ohio, and on March 21 plans to stop its passenger cars at Stop 4 in West Toledo. The company claimed it had been losing money on city operation. Recently it was forced to abandon part of its track within the city limits due to changes in street paving. No provision has been made for a connecting service other than that furnished by the Community Traction Company.

One Mile Abandoned. — The Public Service Commission recently granted to the Hornell Traction Company, Hornell, N. Y., permission to abandon the North Hornell line, extending to Hornellsville, a distance of 1.12 miles. The approval is on condition that the company remove all its structures from any streets in the city of Hornell on which the line is operated and restore the streets to good condition. The evidence showed that receipts of the North Hornell line averaged from $2 to $4 a day, and that the cost of operating was $12 a day.

Common Dividend Cut by Boston Elevated. — Directors of the Boston Elevated Railway, Boston, Mass., have declared a quarterly dividend of 1¼ per cent on the common stock. In the previous quarter 1½ per cent was paid.

Reorganization Move Made. — The Cleveland Trust Company, Cleveland, Ohio, as trustee, has filed suit in Federal court against the Chicago, Lake Shore & South Bend Railway, Michigan City, Ind., in which it seeks to foreclose property of the defendant in Indiana. A mortgage of $6,000,000 was made in 1907, securing money used in providing the lines. The trust company also asks that the court hold the mortgage valid; that it order an account of all property subject to the mortgage; that a receiver be appointed, and that an injunction be issued restraining the defendant corporation from interfering with or disposing of the property of the company. This action is understood to be one of a series of formal moves to be made in order to carry out the plans for the reorganization reviewed in the ELECTRIC RAILWAY JOURNAL for Feb. 7, page 238.

Promising Year Ahead.—The Connecticut Company, New Haven, Conn., which has not paid a dividend since 1916, shows encouraging returns for 1924. The past year is the fourth in succession in which fixed charges have been covered with a fair surplus. Maintenance charges have been unusually heavy because earnings have been put back into property liberally.

Illinois Power Gets Additional Roads.—The Illinois Commerce Commission has authorized the Illinois Power & Light Corporation to acquire all of the outstanding stock of the St. Louis, Troy & Eastern Railway, a 26-mile steam line, and the St. Louis & Illinois Belt Railway for $2,030,000, of which $1,700,000 will be paid in cash.

Customer-Ownership Plan Successful.—In the customer-ownership campaign ended Jan. 31, the Public Service Corporation, Newark, N. J., sold 77,572 shares of 7 per cent cumulative preferred stock to 19,545 subscribers throughout New Jersey. It was the most successful of the six campaigns since 1921. Since this method of selling securities was started the company has sold to customers approximately 260,000 shares of 7 per cent and 8 per cent cumulative preferred stock.

Operation Will Cease.—Notices have just been posted that the Gates Mill line of the Cleveland & Eastern Traction Company, Cleveland, Ohio, will cease operation. The company received permission from the State Public Utilities Commission to abandon service on account of heavy losses from month to month, extending over more than a year. Operators of the line, however, have been postponing the day of abandonment, in the hope that some way would be found to make the line pay. The principal towns affected are Gates Mill, Middlefield, Chardon and Burton.

District Merger Bill Passed.—The House has passed the Senate bill authorizing a voluntary consolidation of the electric railway companies in the District of Columbia. The measure sent to the President provides, however, that no actual amalgamation shall be made until its terms have been ratified by Congress. The bill was passed under suspension of the rules. It is said that "as soon as the merger bill becomes law Congress expects the Public Utilities Commission to bring the Washington Railway & Electric and the Capital Traction Company officials together to work out a plan of consolidation to be submitted to the next Congress for approval."

Tax Valuation in Ohio Higher.—The total 1924 valuation upon which the public utility industry in Ohio will pay taxes in 1925 is $1,484,450,600, compared with $1,408,728,070 a year ago. In 1910 the tax valuations of the electric railways was $32,693,904; in 1923, $185,873,530, and in 1924, $183,440,700.

Deficit for Seven Months' Period.—The statement of the Interborough Rapid Transit Company, New York, N. Y., for the 7 months ended Jan. 31, 1925 shows an increase of $630,944 in total revenue over the similar period ended Jan. 31, 1924. This gain was more than offset, however, by higher taxes and the increase in the Manhattan (elevated) rental effective on July 1, 1924, under the readjustment plan. Though the company was able to lower operating expenses during this period, the reduction was insufficient to escape a deficit after allowing for all charges. This deficit was $136,302, which represented an increase of $1,211,025 over the corresponding 7 months in 1924.

Another Payment on Seattle Debt.—The city of Seattle, Wash., paid another installment recently on the purchase price of the Seattle Municipal Railway, including $833,000 on the principal and $312,525 on the interest. This makes a total of $7,582,100 interest and principal paid on the agreed purchase price. The city still owes $11,688,000 of the $15,000,000 debt incurred.

Collateral Notes Offered.—Blodget & Company, New York; W. W. Armstrong Company and the First Wisconsin Company are offering at 98 and interest to yield more than 6.20 per cent $1,530,000 of 15-year 6 per cent collateral gold notes of the Western United Corporation. The notes are dated Jan. 1, 1925, and are due Jan. 1, 1940. The Western United Corporation on Jan. 1, 1924, acquired ownership of the Aurora, Elgin & Fox River Electric Company, which operates the 30 miles of street railway in Elgin and Aurora, with a population of more than 80,000; also 36 miles of interurban lines serving the Fox River Valley, connecting Aurora and Elgin. The interurban line offers the only direct passenger service between Aurora and Elgin.

Legal Notes

CALIFORNIA.—*Slackening of Speed Not an Invitation to Alight.*

Where a street car slackens its speed when rounding a curve and approaching a stopping place, an intending passenger should not consider this an invitation to alight from the car, and it was not in itself negligent for the motorman to increase the speed at such a time. (Hildebrand vs. City and County of San Francisco, 231 Pacific Rep., 1008.)

FEDERAL COURT—*Character of Business Determines Common Carrier Conditions.*

A state cannot fetter an interstate carrier by the imposition of unreasonable burdens. A common carrier must serve all, up to the capacity of his facilities, without discrimination and for reasonable pay. Where a motor truck operator had only three customers, made no effort to solicit public business, had no power of eminent domain or franchise and made no greater use of the highways than any other member of the body politic, he was not a public carrier. [Michigan Public Utilities Commission et al. vs. Duke, 45 Supreme Court Rep., 191.]

GEORGIA.—*Stop at Flag Station.*

A motorman made a stop at night on signal at a flag station, but stopped about 50 ft. beyond the station. The signaling passenger, walking down the track to board the car, fell into an underpass. The company was held responsible. (Atlanta Northern Railway vs. Brown, 125 Southeast Rep., 465.)

IOWA.—*Rail Higher than Pavement.*

The elevation of street railway tracks 1 in. or 1½ in. above the pavement does not in itself constitute negligence or present an issue for the jury. (McClosky vs. Iowa Railway & Light Co., 200 Southwest Rep., 913.)

KENTUCKY—*Injury at Turnstile.*

At a loading station a railway company had a series of turnstiles, through which intending passengers passed before reaching the boarding platform. The turnstiles were kept locked, but were released when passengers paid their fares to an operator. The court held that the company had the right to maintain this system of collecting fares and that the operator could keep turnstile locked until he was reasonably satisfied the fare had been paid. Hence, when the operator claimed a fare had dropped on the floor and a woman passenger nevertheless pushed against the turnstile with such force as to injure herself, she was guilty of contributory negligence. [South Covington & C. Ry. vs. Elder, 266 Southwest Rep., 1088.]

MASSACHUSETTS.—*Alighting Passenger Injured by Crowd Attempting to Board Car.*

Where a company should reasonably have expected that a crowd would attempt to board a car and be likely to act in a manner dangerous to other passengers, it should take means to protect them, but the mere knowledge that a crowd would be present at a certain time and place and there was no showing of previous violent misconduct by such crowds, the company is not liable to injuries to an alighting passenger. (Dullea vs. Boston Elevated Railway, 146 Northeast Rep., 237.)

MISSISSIPPI. — *Uninsulated Wire in Trees Near School.*

It is negligent for a company to place an uninsulated feed wire in the branches of trees adjoining a public school playground, where such trees are of such nature as to attract children to climb them. (Laurel Light & Ry. Co. vs. Jones, 102 Southern Rep., 1.)

MISSOURI—*Wife's Negligence as Husband's Chauffeur Chargeable to Him.*

A wife, acting as her husband's chauffeur in taking him in his automobile to a business appointment, was his servant, and her negligence, contributing to his injury, was chargeable to him. [Rose vs. Wells, 266 Southwest Rep., 1015.]

NEW JERSEY—*Injury from Center Door.*

A passenger entering a car at a station was injured when the center door of the car prematurely closed. There was evidence that an unauthorized person had pushed the button permitting the door to close. The trial court ruling in refusing to direct a verdict for the defendant and submitting the case to the jury was upheld. [McPherson vs. Hudson & M. R.R., 127 Atlantic Rep., 23.]

NEW YORK.—*Right of Way at Crossings.*

Priority in time of reaching an intersection of streets is only one of the elements which should be considered in determining the care to be exercised by a motorman in proceeding across a crossing. (Geyer vs. International Railway, 206 N. Y. Sup., 715.)

OHIO.—*Denial of Rehearing by Commission Without Taking Evidence Not Unreasonable — Control of Buses by Commission Constitutional.*

The Public Utilities Commission issued a certificate of public convenience and necessity to a motor bus operator, according to law. Another common carrier filed a complaint, alleging misstatements had been made in the affidavit of the motor bus operator, upon which this certificate was based, but not controverting any of the material statements set forth in the affidavit. The commission overruled the complaint and denied a hearing, without taking evidence on the question of facts raised in the complaint, and its action was upheld. The statute requiring the commission to issue a certificate of public convenience and necessity to bus operators, who were in good faith operating on the date of the filing of the act with the Secretary of State, is a valid constitutional enactment. (Cincinnati Traction Co. vs. Public Utilities Commission of Ohio et al., 146 Northeast Rep., 84.)

PENNSYLVANIA. — *Public Service Commission Cannot Annul Improvident Contract Unless It Affects Adversely the Welfare of Public.*

A street railway company agreed with a railroad company to pay half the expense of watchmen at their crossings, in case it should become necessary later to maintain such watchmen. Without knowledge of this agreement, the Public Service Commission directed the railroad company to provide these watchmen. The court held that the right to annul a contract can be exercised only under the police power of the state, and unless it appears that a contract in some way adversely affects the welfare of the public, the Legislature cannot interfere. (Director General of Railroads vs. West Penn Rys., 126 Atlantic Rep., 767.)

TEXAS.—*"Proper Lookout" Defined.*

The law imposes on the motorman of a street car the duty to keep such a lookout for persons who might be on or near the track as an ordinary person engaged in a like or similar capacity would keep. Where the sole act of negligence of a motorman relied upon for a recovery is his failure to keep such a proper lookout, the charge of the court to the jury should explain what constitutes such a lookout. (Northern Texas Traction Co. vs. Jenkins, 266 Southwest Rep., 175.)

WASHINGTON.—*Advertisement of Intoxicating Liquors.*

A contract for advertising brewery products, which provided for cancellation when prohibition laws went into effect, was effectually cancelled on the enactment of the laws and the adoption of the constitutional amendment in December, 1914, notwithstanding such legislation was not to be enforced until January, 1916. (Street Railways Advertising Co. vs. Olympia Brewery Co., 230 Pacific Rep., 405.)

WISCONSIN.—*Street Railway Is "Railroad" Within Statute Requiring Junior Railroads to Bear Costs of Crossing.*

A Wisconsin statute requires, when one railroad desires to cross another at grade, that the cost of installation and maintenance of the crossing must be borne by the junior railroad. Under this law the Wisconsin Railroad Commission required an electric railway to pay the entire cost of construction of a crossing of two steam railroads and 75 per cent of its maintenance, the other 25 per cent being apportioned to each of the steam railroads, the theory being that this cost of maintenance placed upon the steam railroads would be the same as the cost of maintenance of that section of track had no street car lines been built over the crossing. The electric railway company appealed, but the commission's decision was upheld by the Supreme Court. (Wisconsin Public Service Co. et al. vs. Railroad Commission et al., 201 Northwest Rep., 977.)

Personal Items

E. S. Fitz Succeeds B. T. Longino at Beaumont

E. S. Fitz has replaced B. T. Longino as general superintendent of the Eastern Texas Electric Company, Beaumont, Tex., who resigned to enter business for himself in Florida. Mr. Fitz's actual business connections began with Stone & Webster in 1911, with the Blackstone Gas & Electric Company of Pawtucket, R. I., where he was employed 2 years as a student in the meter department. He stayed with the company until 1917. In that year he entered the U. S. Army air service. Following his return from abroad he went to the Houghton Electric Light Company and Houghton County Traction Company, Houghton, Mich., as electrical engineer. He remained with this property until 1923.

From the Houghton County property he was transferred to the Betterment Division of Stone & Webster, where he gained an even wider experience in the public utility field. During this connection a few months of this time were spent in Jamaica, W. I., making a study of power units. Six months were spent in Terre Haute, Ind., and two months in Boston doing preliminary work on the starting of new power stations. Mr. Fitz was graduated as an electrical engineer from Brown University, Providence, R. I. His electrical education began while in high school and continued in his spare time and during the summer preceding his final year at Brown when he accepted assignment for Stone & Webster.

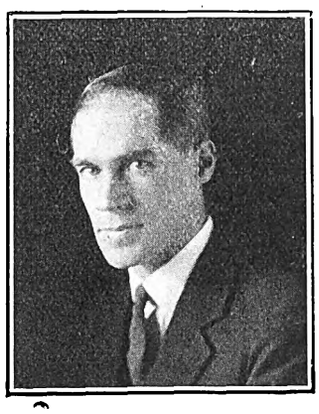
W. H. Goodenough has recently been advanced from the position of master mechanic of the Ohio Public Service Company, Mansfield, Ohio, to that of general superintendent. In this capacity he succeeds H. A. Cowgill. In 1918 he had been transferred from Toledo to Mansfield as master mechanic. In Toledo he had held various positions in the mechanical department of the company since 1910.

H. A. Cowgill, formerly general superintendent of the Ohio Public Service Company, Mansfield, Ohio, has gone to Port Clinton as vice-president and general manager of the Northwestern Ohio Railway & Power Company. This property came under control of Henry L. Doherty & Company last summer and is now part of the Ohio Public Service group through a purchase from the General Gas & Electric Corporation. Mr. Cowgill was superintendent at Mansfield for 6 years.

W. H. McIntyre general manager of the Ottawa Car Works, Ottawa, Canada, has been elected vice-president of that concern in succession to the late W. Y. Soper. Mr. McIntyre entered business in 1891 with the old Standard Electric Company and has worked himself up from the ranks in both the Ottawa Electric and Ottawa Gas Companies, until in 1918 he became assistant general manager of both companies. In 1920 he was appointed assistant general manager of the Ottawa Car Works, later being made general manager, and then being promoted to his present position. In addition to his work with the Ottawa Car Company, Mr. McIntyre is vice-president of the Auditorium, Ltd., vice-president of the Ottawa Artificial Ice Company, president of the Ottawa Auto Dealers' Association, and a director of the Ottawa Motor Club.

Alex. M. Lindsay, Montreal Official, Had Wide Experience

Alex. M. Lindsay, whose appointment as superintendent of rolling stock of the Montreal Tramways, Montreal, Que., was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 21, 1925, entered the service of the Montreal Tramways in the summer of 1908. From that time until 1912 he was assistant to D. E. Blair, superintendent of rolling stock, who was recently promoted to be general superintendent.



A. M. Lindsay

Mr. Lindsay was born in Waimate, N. Z., in 1883. He was educated at the public and high schools and served part of his apprenticeship in mechanical engineering at Southland Engineering Works, Invercargill, N. Z. His time was completed at John Brown & Company's works at Clydebank, Scotland. Here he worked on the first large turbine installation on the *Carmania* and *Mauretania*. He spent some time at sea and went to Canada in 1905. His electrical education was started immediately and 4 years later he was graduated at McGill University.

In the year 1912, after he had served under Mr. Blair, he was chief inspector at the Canadian Steel Foundries on trackwork and general railway equipment. For the next 3 years he was general manager of the Record Foundry & Machine Company in the shell department in Moncton, N. B. His next post was factory manager of the National Acme Company, Montreal. His last affiliation, extending from 1923 to 1924, before his return to the Montreal Tramways, was with the J. T. Donald Company, Montreal, in charge of the inspection department.

The promotions of Messrs. Thornton and Blair were also referred to in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 21.

Change in Titles at Pittsburgh

F. R. Phillips, mechanical and electrical engineer of the Pittsburgh Railways, Pittsburgh, Pa., has been appointed general manager in charge of maintenance and operation, effective March 1. W. T. Rossell, superintendent, has been appointed general superintendent in charge of maintenance. Their headquarters will be at the central office building, Pittsburgh. Oscar Williams has been appointed superintendent of way, with headquarters at the Manchester office.

C. W. Gifford, vice-president, general manager and purchasing agent of the Plymouth & Brockton Street Railway, Brockton, Mass., resigned to become general superintendent of the Gary, Street Railway, Gary, Ind. Mr. Gifford started with the Bay State Street Railway in 1910 as a conductor. He then served as night foreman, dispatcher, day foreman and traveling inspector. Later he worked as efficiency and service man under Hiram Sparks, transportation manager. In 1919 he was appointed general manager of the Plymouth & Brockton Street Railway. In July, 1923, he was made vice-president of the property. The railway at Gary with which Mr. Gifford will become identified operates 29 miles of track in Gary, Hammond and East Chicago, Ind.

A. W. Baker has been appointed assistant to G. C. Hecker, special engineer of the American Electric Railway Association. The need for an assistant to Mr. Hecker with the qualifications possessed by Mr. Baker has long been apparent. In his new work Mr. Baker will relieve Mr. Hecker of a considerable amount of detail. Among other things, Mr. Baker will take charge of the question box department run monthly in *Aera*, will edit parts of the engineering manual of the association and will assist at committee meetings. For all of this work Mr. Baker, although a very young man, is well qualified. He has behind him the recommendation of the head of the English department of the Polytechnic Institute of Brooklyn and has a short but adequate experience in the application of engineering knowledge which followed his work at the Brooklyn college, from which he was graduated in June, 1924, with the degree of electrical engineer. Before he was graduated from the Polytechnic Institute but after he was graduated from the scientific course of the Brooklyn High School Mr. Baker was connected with the research department of the Western Electric Company. After he was graduated from college Mr. Baker enrolled in the student course of the Westinghouse company at East Pittsburgh. There he assisted in the locomotive erecting plant and in the railway section of the engineering department.

A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Standard Contract Form Adopted for Engineering Construction

A standard form of contract for suggested use in engineering construction was agreed upon by the Joint Conference on Standard Construction Contracts held in New York on Feb. 25. Copies will be issued to the organizations composing the conference and to allied associations within a few weeks.

Owing to the varying conditions necessarily involved in work in the engineering field, it is not expected that it will always be possible to use the standard contract without changes, but the idea in drafting this document has been to embody certain fundamental principles, based upon the best existing practice and the ideal toward which the professions involved and the contractors are aiming.

Representatives of the joint conference at the New York session met with legal representatives of the American Arbitration Society and of the Chamber of Commerce of New York State to redraft the suggested arbitration clause. This was the only point that had remained undecided after a previous conference in Washington, when the building construction standard contract form was adopted and material progress on the engineering contract was made. As redrafted, the arbitration clause lays down a recommended practice as to arbitration procedure.

It is expected that organizations interested will from time to time propose modifications of the engineering standard contract, the understanding being that the document as it stands now is subject to future revision.

Another Big Garage for Boston Elevated

One of the largest unobstructed floor spaces for garage purposes in the New England States, if not east of the Mississippi, is at the new Forest Hills garage of the Boston Elevated Railway, Boston, Mass. There is space for 42 buses. This garage, with future additions for growth, will take care of the buses in the southern portion of the city. In order to take care of the buses in Somerville and Medford it is planned to build a similar unit at Salem Street, Medford.

The dimensions of the Forest Hills building are 151 ft. x 125 ft., 14 ft. 6 in. high from the floor to the under side of the trusses, with the trusses 15 ft. high at the center of the building. The roof trusses have a span of 150 ft.

A two-story portion comprises stock room, welding room, wash and locker rooms, adjoining the garage, 22 ft. by 103 ft. in area and 18 ft. in height. Driveways are provided so that the operation is carried on in a definite direction by means of large entrance and side doors. The buses are stored across the garage, between the doors, ready at all times for service. In order to eliminate danger from fire provision is made by an island in the driveway for the proper filling of gasoline for the buses, rather than inside the building.

The building is of fireproof construction throughout, with facilities for light repairs and inspection, proper washing and filling of buses. There are proper washing and toilet facilities as well as shower baths and a smoking room.

American Brake Shoe & Foundry Extends Operations

The annual report of the American Brake Shoe & Foundry Company, New York, issued on March 1, recites the purchase by the company during 1924 of the National Car Wheel Company, which has since been consolidated with the Southern Car Wheel Company under the name of the latter corporation as one of the subsidiaries of the American Brake Shoe & Foundry Company. Another subsidiary, the Ramapo Ajax Company, has acquired the plants of the Eliot Frog & Crossing Company at St. Louis and Pueblo. The patent rights, tools and machinery of the Pittsburgh Brake Shoe Company were also purchased during 1924 to aid the company in the development of a composite brake shoe. Experimental work with this shoe is being conducted.

Business fell off between May and October last year, but beginning with the latter month there was a distinct increase in sales. The net profits of the company for 1924 were $2,454,904. These compare with $2,727,097 reported in 1923. After reserves for dividends of subsidiary companies and preferred dividends, the company reported a balance equal to $11.46 a share earned on the 154,918 shares of no par value common stock, against $13.35 in 1923.

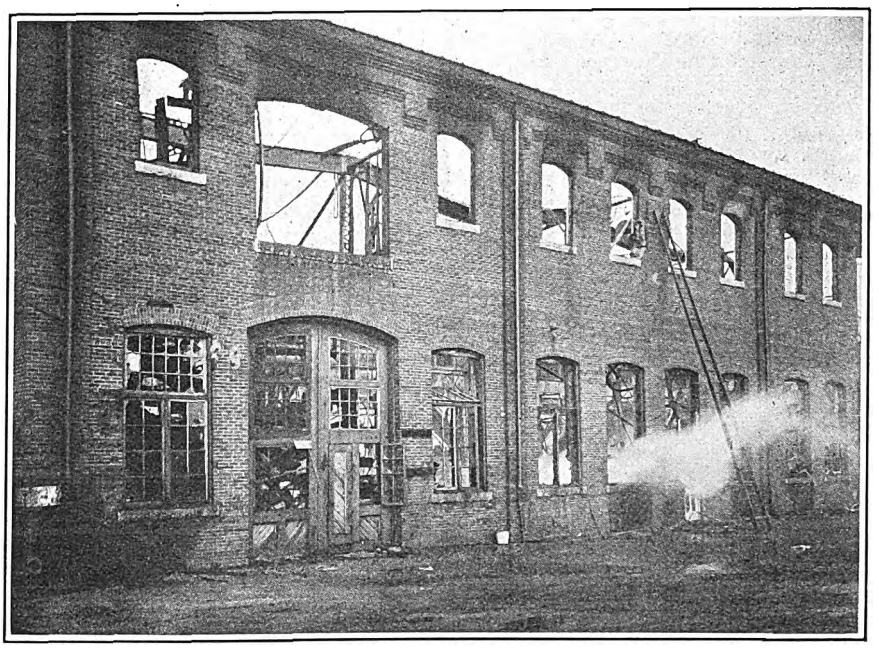
The consolidated statement of earnings for 1924 and 1923 follows:

	1924	1923
*Net income	$2,454,904	$2,727,097
Subsidiary companies' dividends	11,617	113
Preferred dividends	667,695	667,694
Common dividends	789,598	792,083
Surplus	$985,994	$1,267,207

*After depreciation and estimated Federal taxes.

Burned Long Island Railroad Shop to Be Rebuilt

Plans are under way for the construction of new buildings to replace those destroyed in a fire of unknown origin which started in the pipe fitting department of the Long Island Railroad's shop at Morris Park, L. I., early on March 2. It spread to adjacent departments, which include the section used for the repair of air brakes, the tin shop, wood mill, upholstering shop, cabinet shop, dipping room, wheel shop, armature room and department of electrical repairs. In the buildings destroyed repairs to the electrical equipment were carried out. The estimated loss in machinery and equipment is $500,000. The truck overhauling shop, inspection shop for electric rolling stock and the paint shop were not damaged. No rolling stock was burned.



All That Remained of the Long Island Railroad Shops After the Fire

In order to carry on the work of the departments which were destroyed, a section of the paint shop has been cleared out and equipment is being installed to take care of all the bench work. A section of the shop of the

Digitized by Google

Columbia Machine Works has been taken over by the railroad and the company's men will carry out armature winding, coil winding and repairs to electrical equipment there.

The new buildings will include a modern layout with solid concrete building. The latest type of equipment for repairing rolling stock will be installed in the new building.

Metal, Coal and Material Prices

Metals—New York	March 3, 1925
Copper, electrolytic, cents per lb.	14.60
Copper wire base, cents per lb.	16.75
Lead, cents per lb.	8.975
Zinc, cents per lb.	7.75
Tin, Straits, cents per lb.	55.30
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.325
Somerset mine run, Boston, net tons	2.05
Pittsburgh mine run, Pittsburgh, net tons	1.95
Franklin, Ill., screenings, Chicago, net tons	1.925
Central, Ill., screenings, Chicago, net tons	1.875
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$7.00
Weatherproof wire base, N.Y., cents per lb.	19.50
Cement, Chicago net prices, without bags	2.20
Linseed oil (5-lb. lots), N. Y., per gal.	$1.18
White lead in oil (100-lb. keg), N. Y., cents per lb., carload lots	0.1272
Turpentine (bbl. lots), N.Y., per gal.	0.94

Money Needed for Construction

According to John Griffith, superintendent of public works, reconstruction of the Eureka Municipal Railway, Eureka, Cal., will have to be stopped unless a bond issue is authorized. All the rails that have been purchased with the proceeds of the last bond issue have not been laid, there are no new rails available for J Street, because at first there had been no inkling that J Street was to be paved, and with the laying of high T-rails on E Street and A Street the ability of the company to proceed further without more money will be exhausted. Another bond issue must be ready to provide money with which to complete the last 2½ miles of rails, purchased under the $100,000 bond issue voted by the people more than a year ago. From the $100,000 appropriation approximately $65,000 was spent for rails and other materials, leaving $35,000 with which to perform the repairs. Of this latter sum only $15,000 now remains. The calling of a second bond election for the purpose of raising the $50,000 or $60,000 necessary has been suggested.

American and German Manufacturers to Co-operate

The Westinghouse and the Siemens & Halske electrical interests have entered into a 10-year "patent, experience and practice" agreement whereby the American and German concerns will benefit mutually from the research, inventive genius and electrical methods of each other.

Rolling Stock

Los Angeles Railway, Los Angeles, Cal., is working on changes in motor equipment in a number of types of cars. The installation of four motors in place of the original two motors on the first 75 multiple-unit type cars is practically completed. These cars will then be interchangeable for train service with the other cars of types H and K of the company, of which the company has now 326. Sixteen type F multiple-unit cars are now going through the shops for changes in brake equipment. They are being changed from outside to inside hung type brakes and are having the motor armatures dipped and baked. Although these cars have four motors, they usually are operated independent of the other four-motor cars due to a different motor capacity. The first of 82 type B cars to be changed from two-motor to four-motor equipment is now in the shop.

Duluth Street Railway, Duluth, Minn., has announced specifications on five new cars. The details follow:

Date order was placed	September, 1924
Date of delivery	February, 1925
Builder of car body	Light Weight Noiseless Electric Street Car Company
Type of car	One-man, double-truck passenger
Seating capacity	43
Total weight	22,000 to 24,000 lb.
Bolster centers, length	17 ft. 6 in.
Length over all	35 ft. 10¼ in.
Truck wheelbase	4 ft. 6 in.
Width over all	9 ft. 0 in.
Height, rail to trolley base	10 ft. 5¼ in.
Body	Steel
Interior trim	Philippine mahogany
Headlining	Agasote
Roof	Arch
Air brakes	General Electric CP-25
Armature bearings	Ball
Axles	Center bored
Bumpers	Oak with steel plate
Car signal system	Electric
Car trimmings	Bronze
Control	General Electric K-28
Destination signs	Hunter
Door operating mechanism	Air
Fare boxes	Cleveland
Wheelguards	Local standard
Heaters	Electric
Headlights	Golden Glow
Journal bearings	Hyatt roller
Motors	Four General Electric 258, inside hung
Sash fixtures	Twin City
Seats	Cross and longitudinal
Seating material	Rattan—spring cushion
Springs	Combination coil and elliptic
Step treads	Twin City
Trolley catchers	Knutson No. 5
Trucks	W. J. Smith No. 12
Wheels	26-in. rolled steel
Special devices	Simplex safety system

Lake Superior District Power Company, Ashland, Wis., plans to purchase one new car.

York Utilities Company, Sanford, Me., has ordered two new buses for use between Sanford and Biddeford when the commission authorizes such service.

Track and Line

Lake Superior District Power Company, Ashland, Wis., plans to spend approximately $25,000 on track and other improvements at Hurley, Wis., and Ironwood, Mich.

Wisconsin Public Service Corporation, Green Bay, Wis., plans to spend $100,000 improving its city property and $6,000 on its interurban property.

City of Ashtabula, Division of Street Railways, Ashtabula, Ohio, has plans under way for an extension of its line into the Bunker Hill residence section, a suburb. Material has been purchased for the new line and work will be started as soon as the supplies arrive.

Pacific Electric Railway, Los Angeles, Cal., plans to spend some $10,500,000 for new equipment and development in southern California during 1925.

Shops and Buildings

New York, N. Y.—The Board of Transportation recommended recently to the Board of Estimate and Apportionment the award of the contract for the construction of the foundations for the main repair shops of the Brooklyn-Manhattan Transit Corporation at the Coney Island yards to John H. Duncan, Inc. The bid price was $534,702. It was the lowest of seventeen bids received on Feb. 13.

Trade Notes

Carl P. Nachod has been awarded by the Franklin Institute of Philadelphia, Pa., through its committee on science and the arts, its Edward Longstreth medal for ingenuity, novelty of design and general excellence of construction as embodied in his system of signals for electric railways.

Morton Manufacturing Company, Chicago, Ill., announces the appointment of the Crowe-Matthews Company, with offices at 212 Douglas Building, Seattle, Wash., and 1177 Dock Street, Tacoma, Wash., as its exclusive and direct representative covering the sale of its Acme line of railway appliances in the Northwest.

Okonite Company, Passaic, N. J., manufacturer of insulated wires and cables, has opened a sales office in St. Louis at 444 Frisco Building, with L. R. Mann in charge.

Gibb Welding Machine Company, Bay City, Mich., successor to the Gibb Instrument Company, manufacturer of electric welding equipment, announces the appointment of the Welding Service & Sales Company, Donovan Building, Detroit, T. M. Butler, manager, as agent in the Detroit territory for its arc, spot and seam welding machines.

Michigan Electric Railway, Jackson, Mich., has ordered Economy meters with inspection dials to equip all of its cars. This includes freight and passenger interurban equipment and also the city cars in Jackson, Lansing, Kalamazoo and Battle Creek.

New Advertising Literature

Vielé, Blackwell & Buck, New York, N. Y., United States representative of Mannesmann Röhren-Werke, has issued bulletin No. 12 on "Weldless Steel Poles." The pamphlet lists 15 advantages of Mannesmann steel poles.

Irving Iron Works Company, Long Island City, N. Y., has issued a catalog 4A-166 on open steel flooring.

Wagner Electric Corporation, St. Louis, Mo., has issued Bulletin No. 143 describing Wagner fans and to sell them.

Nichols-Lintern Company, Cleveland, Ohio, has issued "Ventilator Tests," a 28-page pocket size booklet which describes N-L bus and railway ventilators by illustrations and dimensional drawings, together with actual service tests of the exhaust capacity of each type ventilator at various speeds.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review

Published by McGraw-Hill Company, Inc.

MORRIS BUCK, *Managing Editor*

Volume 65 New York, Saturday, March 14, 1925 *Number* 11

An Analysis of the St. Louis Situation

ATTENTION was recently focused on existing conditions in the St. Louis transportation situation as a result of the statement made at the Midyear Meeting of the American Electric Railway Association last month by Col. A. T. Perkins, general manager for the receiver of the United Railways of St. Louis. This was to the effect that destructive competition was being carried on by the bus company which has for the past 2 years been doing business in that city, largely along the streets on which the railway operates. He stated specifically that a bus manufacturer started a competing bus service with the result, if not the purpose, of giving that service a big nuisance value.

The matter appeared to be of such importance that the editors of this paper and *Bus Transportation* determined to see first-hand the actual conditions and to present them to the industry. The article on the subject in this week's issue is an unbiased analysis of the present situation in St. Louis and of the events that have led up to it.

The additional service as given by the competing buses does not appear to be a necessary addition to the transportation facilities, or essential to the welfare of the public. The street cars have capacity to provide better than a seat per passenger in the normal hours, and have sufficient capacity to handle all passengers in the rush. The buses merely duplicate the car service except in the outlying districts. There does not appear to be anything peculiar about these districts that would justify exclusive individual routes through to the center of the city. Whatever advantages there might be in the bus service are nullified by the fact that by using the car line streets the buses are causing added congestion and delays to traffic in the heart of the business district. With unified control, buses may well be used in St. Louis to give a different type of service from that furnished by street cars. This will mean rerouting of both cars and buses so as to segregate the two and eliminate direct competition. A close study will indicate many ways through which this may be brought about.

The real responsibility for the situation rests on the city government, first for permitting competition to get a foothold, and then allowing it to expand to its present proportions. Local transportation is a natural monopoly, as much so as any other utility. Perhaps the original grants of street railway franchises in St. Louis permitted destructive competition with lines on adjacent streets. After the lesson had been learned that this arrangement was unwise for the welfare of the people, the competing lines were allowed to consolidate and then were brought under drastic public regulation. But now to allow a transportation system with little or no regulation to compete against a closely regulated utility is, to say the least, not productive of the best results to the public and the investor. The speculator or the promoter who takes a chance in the inauguration of such competition unquestionably expects to reap a harvest. This, however, can only be done at the expense of the residents of the city—the car riders—who in the end will have to pay the bill.

Interstate Bus Lines May Be Under I.C.C. Jurisdiction

THAT it was a pronouncement of dangerous doctrine was the first reaction to the news that the Supreme Court in two decisions rendered on March 2 denied the right of the states to interfere with interstate commerce passing over their highways in motor vehicles. That reaction was the natural one. It appeared at first that interstate bus lines, which in some instances have flaunted the authority of state commissions, would be free to continue carrying on their nefarious practices, which in some cases have interfered with established bus lines as well as with interurban electric railways.

Technically, the states lost these cases, but the type of carriers it was sought to bring under jurisdiction are not to be permitted to continue to run without any measure of adequate responsibility either to the states or to the nation. Not only does the latest decision of the court distinctly say that the highways belong to the states and that certain rights to regulation adhere to the states, but the rendering of the decision serves to call attention anew to the need for the more definite fixing of regulatory responsibility. As a result a new measure has been introduced into Congress that would authorize the Interstate Commerce Commission to "make all rules and regulations of said motor transportation companies applicable to interstate business over public highways."

As the court saw it in the cases under review, the primary purpose of the state was not regulation with a view to safety or to conservation of the highway, but the prohibition of competition. The state denied to one and gave to another. One state approved the line; the other did not. Thus the Washington provision was interpreted as a regulation not of the use of the highways but of interstate commerce, which the court held it not only burdened but obstructed.

The new measure just introduced into Congress seeks definitely to fix responsibility. That is as it should be, but even now appropriate state regulations adopted primarily to promote safety upon highways and conservation in their use are not obnoxious to the commerce clause of the federal Constitution where the indirect burden imposed upon interstate commerce is not unreasonable. It is not an easy task, however, for the states to exercise the power that adheres in them and still not contravene the provisions of the commerce clause. It was in drawing this fine distinction that the state of Washington erred. If the new legislation goes through there will apparently be no need hereafter for the states to attempt to draw any fine distinctions.

Renaming the American Association

A SUGGESTION that has caused widespread comment in the electric railway industry is that the electric railway men change their name. This suggestion was made at the Midyear Meeting of the American Electric Railway Association by Matthew C. Brush, president of the American International Corporation and formerly president of the Boston Elevated Railway. With his long experience in the street railway business, he feels that the men in the industry are not street railway men or electric railway men. Rather they are transportation men, and should stand ready to handle urban and interurban transportation of all sorts, "whether run by a gallon of gas or a few kilowatts."

The possibility of changing the name of the association is not entirely new, as was pointed out by L. H. Palmer in last week's issue of this paper and by H. L. Brown this week. It was discussed editorially by the JOURNAL in the issue of Feb. 2, 1924, at which time "American Transportation Association" was proposed. Mr. Brown this week points out the desirability of this name from the standpoint of euphony and ease in adapting it for the affiliated associations.

There may be some argument that the name is too inclusive. While the term is broad, the same thing may be said of the "American Railway Association," which might easily be interpreted to include electric railways.

It is desirable before any change such as this is proposed in definite form that it receive full discussion, and that arguments be brought forth representing all viewpoints. It is to be hoped that others will add their views to those already presented so that it will be apparent whether a change in the name of the association is desirable, and if so, what will best express its aims and purposes as they exist today.

Lessons to Be Drawn from the Pittsburgh Report

AN EDITORIAL in this paper about a month ago, in connection with recent figures on cost of subway construction in New York, pointed out that only the very largest cities in the country can afford the construction of subways. It is equally true that only the largest cities in the country need subways. To determine whether Pittsburgh has reached this point, Messrs. Turner and Haydock recently used the measuring stick of 5 miles from the business center to the built-up city limits. This distance was selected because it is about as far as can be covered in three-quarters of an hour by a passenger traveling by a street car or bus when he has a walk at each end of his trip. According to this criterion, Pittsburgh does not need a subway because most of the city is now within a circle with the radius mentioned.

There are two conditions, however, which suggest the desirability of a subway in Pittsburgh. One is that its main business district is contained in a small triangle, hemmed in on two sides by rivers and on the third by steep grades. This is very unusual. Logical expansion of this district is across one of these rivers where some business development has already taken place. It is partly to make this new business district more accessible and partly to reduce the street congestion in the triangle that a short subway through the old business district and extending to the new one is recommended by the engineers studying the situation. This subway would be used at present by surface cars, and a gallery or floor above the tracks is suggested for pedestrians.

The other condition favoring subways in Pittsburgh is that several of the districts outside the city limits are sufficiently populated so that with the city districts they could support a rapid transit line to Pittsburgh now or in the early future. The engineers therefore recommend that a rapid transit commission be organized promptly by the metropolitan district of which Pittsburgh is the center. The first work of this commission, after laying out desirable routes but before building subways, would be to acquire rights-of-way for high-speed surface transit in the suburbs. This should be done before the ground becomes too expensive, which will happen when the territory is settled.

The advice given to Pittsburgh in this particular can well be repeated to other cities. The principle too often followed is to postpone all thought of future transit needs on the theory that the future can care for itself. It can, but only at greatly increased expense and often discomfort. Transit planning should precede, not follow, the population. Every expanding city should be locating and reserving for future public use radial avenues in all reasonably possible directions of growth, and these avenues should be wide enough to accommodate rapid transit lines as well as future vehicular traffic. Many cities in Europe are following this plan now.

Preventing Carhouse Robberies a Present-Day Need

DESPERADOES appear to be making a popular pastime of holding up electric railway employees. There have been at least half a dozen of these occurrences in the last year. The latest successful coup was at Chicago recently. The bandits are said to have got away with $9,000. The amount may be exaggerated. It is to be hoped that it is. Entirely aside from the matter of the difference between the actual and the estimated loss in cases of this kind, there is always the attendant physical danger to the employees and the likelihood of the breaking down of the morale among the men. Fortunately in the Chicago case there were no untoward circumstances other than the loss of the money.

The Chicago hold-up was unusually spectacular. The carhouse appears to have been fairly well protected from approach by the ordinary channels. Evidence, however, indicates connivance from the inside, not deliberate, perhaps, but connivance based on fairly exact knowledge of what was going on at a particular time and of the best means of indirect approach. It is nearly always difficult to guard against such knowledge getting abroad, but it is particularly difficult to do so where so many men are employed and the same processes are carried out day in and day out and year in and year out.

The criminal is not slow to ponder the news of the day. The successful hold-up has a meaning all its own to him. With him, no less than with others, success is something to be emulated.

The dangers to which the Chicago company was open are largely inherent everywhere in electric railway work, not only at carhouses but at passenger stations on interurban and rapid transit lines. It behooves companies everywhere to be doubly on their guard against the temptations which the accumulation of ready cash offers to the culprit.

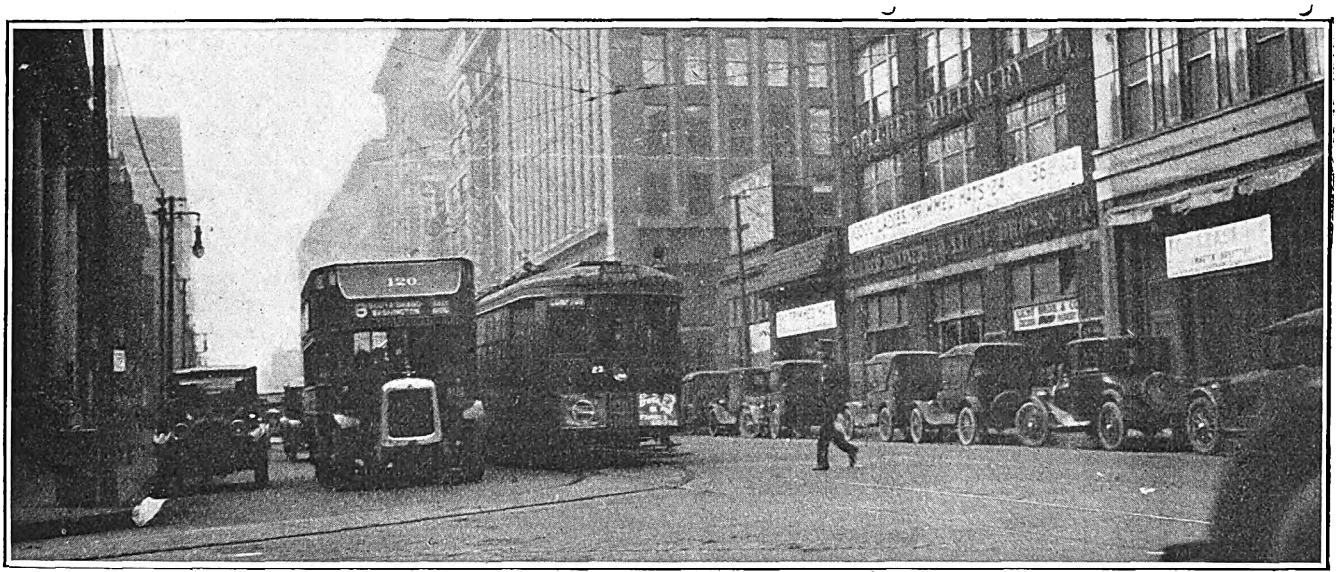
Transit Conditions in St. Louis Today

Traffic Congestion on Principal Streets Is Directly Traceable to Inadequate Traffic Ordinances and to Lax Enforcement—Competition Between Street Cars and Buses on Same Streets Leads to Much Interference—Conditions Surrounding Entrance of Competing Bus Systems in City Are Given, as Well as Developments Leading Up to Present Situation

By Morris Buck and Carl W. Stocks



Washington Avenue, St. Louis, Looking West at 18th Street, as It Appeared on the Afternoon of Feb. 24. Note Parked Vehicles and Lack of Clearance Between Car and Bus

ST. LOUIS at the present time has what may be termed two major and one minor passenger transportation systems, a street railway, a bus system and a jitney line operating in several instances over double-tracked narrow streets in the heart of the city on which parallel curb parking is permitted for the greater portion of the time. This means that the traffic strip consists very largely of that part of the street occupied by the car tracks, with the result that in actual operation there is continual interference between the different classes of street users to the detriment of the passenger traffic of the transportation systems. Each of the two major transportation systems covers the city to a greater or lesser extent. The United Railways Company, which operates the street cars, is the result of a consolidation some 25 years ago of all the surface car lines of the city. The buses operated by the People's Motorbus Company have been in use only since May 28, 1923, when the company began service with its first series of 17 buses.

St. Louis is situated on a bluff on the west bank of the Mississippi River. The business district extends from the riverfront westward for nearly a mile. The portion of the business district extending from the river front up to Third Street is on the side of the bluff, and is of no importance in the transportation picture. The city has an area of 61 square miles, with a population as given by the 1920 census of 772,897. There are more than 1,000 miles of streets, some 70 per cent of which are paved.

Street car lines cover the entire city, with the exception of a few residential districts developed in the last few years. The United Railways operates 436 miles of single track, exclusive of the interurban line from Hodiamont to St. Charles. Practically 90 per cent of this is double track. There is proportionally more track in St. Louis than will be found in almost any other large American city, or more than 7 miles of track per square mile.

In addition to the United Railways, the Illinois Traction System enters the city over the McKinley Bridge and reaches an interurban station at 12th and Lucas Streets. Through trains are operated between St. Louis, Springfield and Peoria and connections are made for Decatur, Champaign, Urbana and Danville. The East St. Louis & Suburban Railway and associated lines enter the city of St. Louis over the Eads Bridge, the terminal being at the end of the bridge at Third and Washington Streets.

Besides the electric railways covering St. Louis, the People's Motorbus Company, an independent system, gives service on several of the main streets. The principal downtown terminal of this system is at Third and Washington Streets, at the end of Eads Bridge. A number of the most important street car lines also terminate at this point on loop tracks in the plaza.

The minor means of passenger travel applies only to one route, along the line of the Washington-Delmar bus route. Here are operated a number of passenger automobiles, which are known as "service cars," and which in character of operation differ but little from the jitneys which have been familiar in various American cities. Their number is variously estimated at 100 to 400. Ne definite information was obtainable as

Digitized by Google

to the exact number licensed by the city authorities. These service cars carry between 2,000 and 3,000 passengers a day, as indicated by the checks taken last December and February. Details of the observations are given in an accompanying table.

The People's Motorbus Company in recent advertising states that it is operating 89 miles of lines, although the table on page 404 shows but 67 miles of streets covered. Over these streets 12 routes are in daily operation.

Representatives of the bus company say that only 25 to 30 per cent of the bus routes compete with the car lines. Inspection of the map of car and bus routes indicates, however, to what extent the bus system can be considered directly or indirectly competitive. At the ends of several of the bus routes exclusive territories are served, such as Lindenwood, Carondelet Park, University City, and several districts along Kingshighway.

The methods of routing the cars and buses differ. All the bus lines running into the heart of the city start at the Eads Bridge Plaza at Third Street and Washington Avenue with the exception of the route that terminates on Twelfth Boulevard. All but three of these lines run on Washington Street through the congested business district.

The railway owns 1,435 motor passenger cars and 179 trailers. Practically all are double-truck cars seating from 50 to 60 passengers. The older motor cars are of the rear-entrance, front-exit, prepayment type, while the more recent ones are of the front-entrance, center-exit, pay-as-you-pass type. The trailers are all of the center-entrance type.

Three different kinds of buses are in use. Those first placed in service, of which there are 17, are of the Fifth Avenue L type, seating 22 passengers on the lower deck and 29 on the upper deck, a total of 51. The newer double-deck buses, numbering 103, are of the Yellow Z type with a capacity of 67 passengers, 28 on the lower deck and 39 on the upper. In addition the company has 53 single-deck Yellow type Z buses seating 29 passengers.

There is some difference in the wage scales of platform men on cars and buses. Since Aug. 1, 1922, operators receive a maximum of 67 cents per hour after 3 years of service, the rates for earlier years being 50, 56 and 62 cents. Bus conductors receive as a maximum 60 cents and drivers 65 cents.

Fares Charged and Traffic Regulations

Street car fares have changed to some extent during the receivership period, which began in 1919. Present fares are 7 cents cash with universal free transfers, and 3 cents for children under 12 years of age. Tokens are sold in any quantity by conductors for convenience only, at the full fare rate.

On the buses operated by the People's Motorbus Company a straight 10-cent fare is charged. Free transfers are issued to provide a continuation of the ride in the same general direction but not to permit doubling back.

The St. Louis Bus Company, controlled by the reorganization committee of the United Railways, charges a 10-cent fare, with free transfers to street cars. The street cars issue transfers to these buses at 3 cents. This gives the same 10-cent rate of fare for through rides into the territory served by either bus company.

The many "service cars" in operation along the Washington-Delmar Avenue bus route charge a flat fare of 25 cents. Railway officials state that these cars furnish very little competition, though it is apparent that they do a considerable amount of business. The service cars or jitneys furnish the most rapid means of transportation in the city for the territory served.

Traffic movement in St. Louis is under control of a traffic council which was created by a city ordinance approved on Feb. 28, 1924. Under the terms of this

ordinance the traffic council has power to control and to prohibit parking as found necessary; to regulate the movement of vehicles and pedestrians; to erect traffic signals and signs; to establish safety zones and one-way streets.

What is known as the "congested district" has been established in the business section of the city. This extends from Franklin Street on the north to Market Street on the south, and from 12th Street on the west to Fourth Street on the east. This district is 9 blocks or approximately 3,000 ft. in each direction. On Olive, Locust and Washington Streets within the congested zone all parking is prohibited from 7 a.m. to 10 a.m. and from 4 p.m. to 6 p.m., except that commercial vehicles may park for periods not to exceed 15 minutes. These are the principal east and west traffic arteries. Washington Street terminates at the Eads Bridge and is the principal thoroughfare for reaching East St. Louis across the Mississippi River, although its width between curb lines is only 50 ft. On the north and south streets, Sixth, Seventh, Eighth and Ninth, parking is prohibited on the left-hand side in the direction of travel. Parking of one vehicle alongside another is also prohibited. Vehicles are not permitted to stop except near the right-hand curb, and so as not to obstruct the sidewalk crossing.

Continuous parking is not allowed in the congested district for a longer period than 1 hour. This is intended to include also the case where a vehicle is moved within the limits of the block in which it is parked or where it is moved out of the block and returned within 15 minutes.

Vehicular traffic is required to stop not less than 5 ft. behind any street car going in the same direction which has stopped for the purpose of taking on or discharging passengers, and is required to remain standing until the car has taken on or discharged its passengers. An exception to this is made at regularly established safety zones, or where the street width is great enough that the vehicle may pass at a distance not less than 8 ft. away. In such cases, vehicles are required to slow down and proceed cautiously. Drivers of vehicles are permitted the right-of-way along street car tracks, provided they do not interfere with the use of the tracks by street cars or violate other provisions of the traffic ordinances. The ordinary restrictions prohibiting passing a street car on the left or passing other vehicles to the left of the center line also apply.

Vehicular speeds in excess of 25 m.p.h. are prohibited anywhere within the city, and in the congested district the speed is limited to 15 m.p.h. Motor trucks with a capacity of 2 tons or less are limited to 20 m.p.h. and those with a capacity of more than 2 tons to 15 m.p.h. Vehicles with metal tires are restricted to 6 m.p.h.

Lax Enforcement of Traffic Laws

Observations made in St. Louis indicate that the traffic regulations are not strict enough, and that they are not rigidly enough enforced. The parking regulations allow a car to remain in a location for 1 hour. At the end of this time it must leave, but another vehicle can take its place, so that all the available parking space is likely to be occupied throughout the day. In fact, it is the more difficult for moving traffic on account of the continual changing of cars in the parking space.

Conditions on some of the streets in downtown St. Louis are shown in accompanying illustrations. Attention is called to Pine Street, which is typical. There is a row of parking on each side, extending from one street intersection to the next. Some years ago 12th Street was widened between Washington and Market. The wide roadway there is not being used as it should be, since the 120-ft. space between curbs is used for rows of automobiles parked parallel to each curb and in addition there is usually a row of automobiles parked crosswise on either side of the car tracks in the center.

Street car stops are laid out almost uniformly on the near side of street intersections and bus stops on the far side of the intersections. Parked automobiles were found to encroach on the space laid out by the department of streets and sewers for such car and bus stops. While it is perhaps not so serious at the street car stops on the near side, the intrusion of parked automobiles into the bus stopping places makes it the practice of the bus drivers to run up as close as possible to the curb near the street intersection and then turn the front end of the vehicle sharply toward the street car tracks, so the bus can start up without backing. Frequently, the front end of the bus when so stopped does not clear the street car track. This is particularly true on certain parts of Washington Street, that have not been widened. The large number of parked automobiles makes it necessary for the buses to run in the roadway between the line of parked vehicles

and the tracks. The space is so small that in order to obtain running clearance the buses frequently have to encroach on the car track area. In some cases, where there is a double line of automobiles next to the curb, the buses must run on the street car track if they are to operate at all.

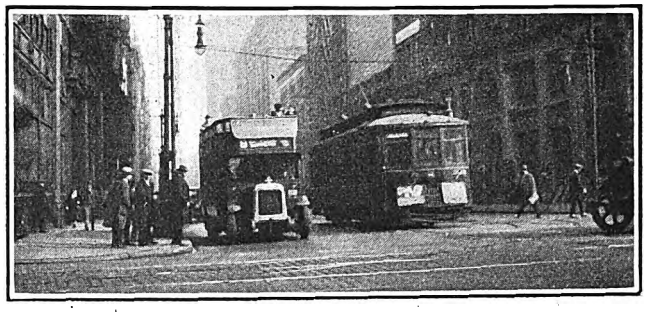
Naturally, under conditions such as these, there is considerable interference between street cars and buses operating on the same street. Charges are made that buses interfere maliciously with the operation of cars, and on the other hand that cars interfere in the same manner with the operation of buses. The writers, observing traffic conditions in St. Louis for several days, did not see conditions that actually confirmed these charges. Individual bus operators did run their buses too close to the car tracks and did operate between safety zones and curb, where there was considerably less space than would be considered ordinarily running clearance. In other cases, they passed between the street car and the curb where there was no safety zone and where the clearance was less than the 8 ft. provided by the traffic ordinance. Passengers attempting to board or leave standing street cars had to dodge to keep out of the way of the bus, even though it was running at comparatively low speed. The actions of the bus drivers, however, did not differ from those of the drivers of private automobiles which were passing along the street at the same time.

Observations made in the congested district and elsewhere showed that where there is considerable vehicular traffic, neither car nor bus has any decided advantage as to running time. The speeds of the two are about the same. The street cars accelerate more quickly than the buses, while the buses brake more quickly than the cars. Determination of which one leads appears to depend principally on which vehicle gets away first.

Naturally, with the buses running along the same streets with the cars and running on the tracks at certain points as they do, their operation slows down the street cars to an appreciable extent. A similar result would occur, of course, if the vehicular traffic increased from any other source.

Other competent observers say that the bus service is not elastic enough to take care of the afternoon rush, which is short and very sharp, coming between 5 and 5:30 o'clock. The loading does not all take place at one point in the evening, but it is distributed along the main arteries leading out of the business district, such as Washington Street. Queue loading is practiced for the buses at certain heavy loading points. Frequently passengers have to wait some time to get accommodation on a bus. An instance was cited where passengers had to wait as long as 17 minutes at a loading point.

In order to determine the comparative running time of cars and buses, and particularly the elapsed time, including waits, the men of one business firm rode both cars and buses to and from their work. The results are tabulated herewith. One man, for instance, took the bus 4 days and the car 7 days from Thekla and Kingshighway to Fourth and Lucas Streets. On the average, he had to wait 6½ minutes for the bus, followed by a ride of 37½ minutes, or a total of 44 minutes. Riding the street car for 7 days, the average wait was 1 minute, and the average ride 41 minutes, making a total of 42 minutes, or 2 minutes less than the time taken on the bus. Other men have had similar experiences. In general, the time required on the bus



Washington Street Looking East at 12th, about 3 o'Clock on Feb. 24. The Bus Is Stopped Opposite a Safety Zone

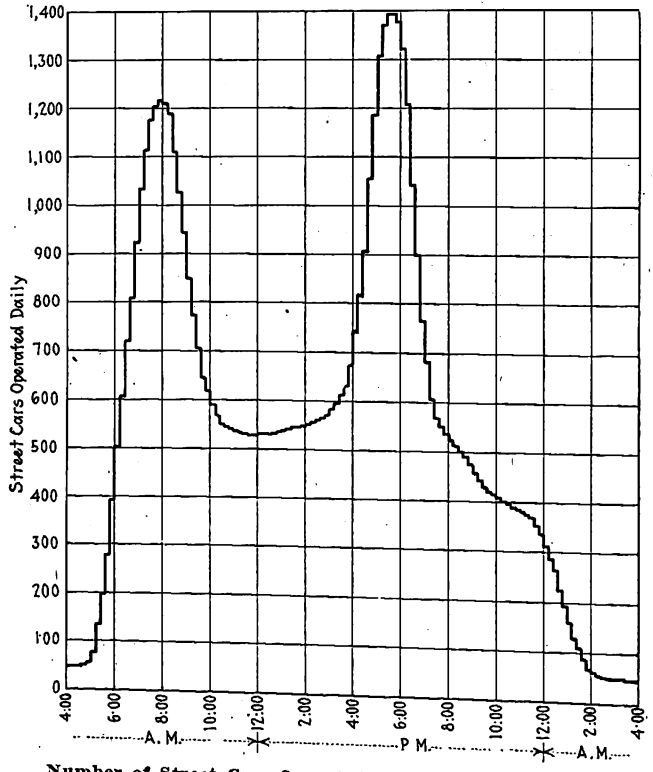
was from 2 to 11 minutes greater than on the car. Personal observations indicate that these figures are fair, although they do not give the total time between home and office.

These results indicate that the factor which makes the bus ride take more time is the greater street wait. In some cases, this was merely due to the longer headway, while in others it included an additional wait, due to buses passing up passengers on account of the seat for every passenger policy.

Schedule Requirements of Street Railway

The street railway is required by regulations of the state commission to operate a certain minimum schedule with a 6 to 7-minute headway in the non-rush hours. The regulations further require that seats furnished in the non-rush period shall average 30 per cent above the number of passengers. Extra seats must always be available in the street cars, and could be used by persons now riding buses without extra cost to the street railway.

The buses do cut down the peak loads on the street cars, but it is not yet apparent that the street railway has reduced service in the rush. This is evident from charts furnished by the railway and which are shown herewith. Car riders are glad to have the buses take



Number of Street Cars Operated on a Typical Weekday, Plotted by 12-Minute Periods

Digitized by Google

away a certain amount of the peak congestion, as more room is left for them on the street cars. This, of course, gives a certain amount of popularity to the bus even among people who do not care to use it regularly.

The gross revenues of the street railway last year were approximately $1,250,000 under those of 1923. In that year the United Railways carried approximately 280,000,000 revenue passengers, while in 1924 there were only 267,000,000, a reduction of 13,000,000. The number of people carried on the buses during 1924 was approximately 13,000,000. While this number is almost identical with the number lost by the railway, it would be inaccurate to state that the one balances the other. Business conditions were bad all over the country for a certain part of last year, and St. Louis was no exception. Then, too, the buses have obtained riders from other sources and there has been a certain increase in the riding habit due to the introduction of a new means of transportation.

Financial History of United Railways

The St. Louis railway system has always been a good earner since its constituent companies were consolidated in 1899. For the past 25 years it has earned well over its bond interest, except for 1918 and 1919. The present financial set-up of the company includes $100,000,000 of stock and bonds. There are about $60,000,000 in interest-bearing securities with an average rate of 4½ per cent. The gross income has averaged $3,500,000 or more, while the fixed charges were approximately $2,750,000. In 1924, it is said that the net income had fallen off to $2,900,000, while fixed charges had risen to about $3,000,000, so that it was necessary to dip into surplus to meet them. Actual figures for the year are not yet available.

SCHEDULE SPEED, UNITED RAILWAYS OF ST. LOUIS, 1919–1924

	Car-Miles per Car-Hour	
	Entire Year	Month of December
1924	9.73	9.55
1923	9.75	9.66
1922	9.85	9.79
1921	....	9.81
1920	....	9.83
1919	....	9.80

In 1900, just after the consolidation, the physical property of the United Railways had a value of not more than some $30,000,000 or $40,000,000. Earnings, however, were capitalized regularly, and this money was put back into the property. In several years, in the period from 1899 to 1909, the company paid dividends on its preferred stock amounting to $900,000 a year, just about using up net income. Nothing was ever paid on the common stock. While the business grew steadily, the net income remained about the same, operating cost rising approximately as fast as revenues.

There was, however, no attempt made to starve the property. Even at the time of the receivership, the property was not run down and it has been well maintained since the receiver has been in control.

In 1909, with several maturities approaching, the bankers would not refund with the then existing capital structure. Preferred dividends were cut off and the money was used for retiring the bonds as they came due, and also to make betterments in the way of tracks, loops, and new cars. In the period from 1909 to 1919, the company actually paid off about $6,000,000 worth of bonds and reinvested in the property some $10,000,000 of earnings.

In 1918 another bond issue of $3,500,000 came due. The company paid off $1,200,000 of this out of earnings. The War Finance Corporation supplied the remainder, or $2,300,000. After the close of the war the War Finance Corporation called its loan at about the same time that another $2,000,000 issue came due. With no funds available the company was forced into receivership. The receiver immediately issued receiver's certificates to the amount of $4,200,000 to apply in payment on the principal of the bonds. These certificates have been extended three years, or to Oct. 1, 1926.

Track Extensions

In 1899, when the companies were brought under one control, the city of St. Louis was already overtracked. By 1904, however, the lines were extended and new money was put in so as to make a fine system serving all parts of the city. It is said that all track extensions that could possibly be considered as necessary at any time within the last 10 years, or even today, could be built for less than $1,000,000. During the period from 1910 to 1914, when regulation was under control of the city, there was some demand for extensions, but the company could not finance them, due to lack of credit. After the formation of the State Public Utility Commission in 1914, those who had been seeking extensions appeared before it and the extensions were ordered. The company appealed to the courts, and finally the State Supreme Court decided that no state authority could order extensions not provided for in the company's franchise.

Reorganization Plans

After the receivership began in 1919, a reorganization committee was appointed, with instructions to reduce the capital to a reasonable basis. The first step was a valuation by the State Public Service Commission, in which the commission, the city and the company were represented. The valuation was made in line with present-day prices. Pre-war prices were adopted as a basis and 50 per cent added to bring them up to date, with a deduction made for depreciation. On this basis, the valuation as of January, 1919, amounted to $51,800,000. This amount has since been added to by the reinvestment of earnings from the property, until today the figure has gone up to about $58,000,000.

The reorganization committee has worked out a plan whereby the capital structure approximates this amount. This plan has been carried through in detail, and is now understood to be near acceptance.

No fixed return is provided for in this reorganization plan. A reasonable return in this case has been assumed at about 7 per cent, which means gross income of some $4,000,000. Last year the company made about $2,900,000 net. This year, unless there is a big resumption of business, it is likely that the net return of the railway system will be less. This is to a considerable extent because the latest bus lines were not installed until so late last fall that the full measure of competition will not be felt until such time as the buses obtain full riding on the top deck.

What Increased Fares Would Mean

It is said that an increase from the present straight 7-cent fare to an 8-cent cash fare with reduced-rate tickets would make up the loss caused by the reduction in business which has taken place since the buses have been in operation. An 8-cent straight fare would give

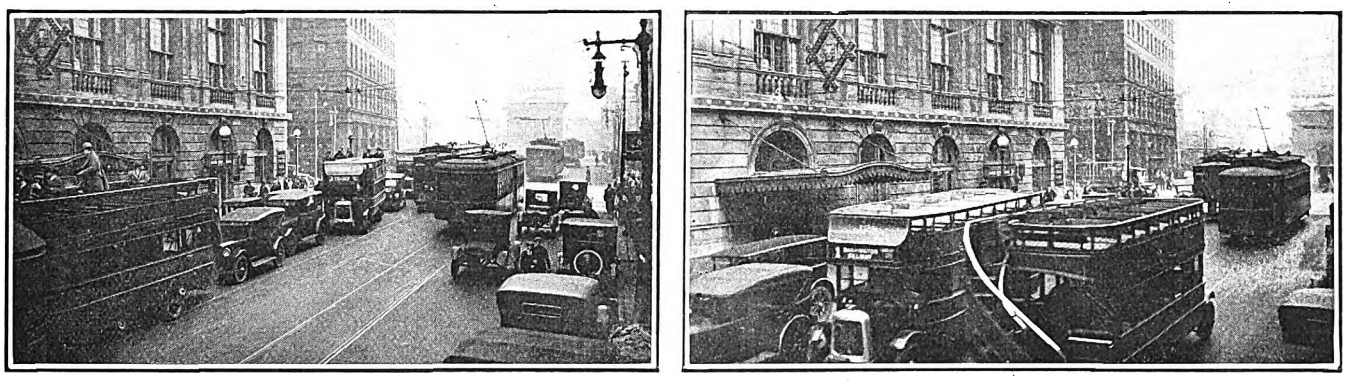
Digitized by Google

an increase over the present revenue of about $3,000,000, which would leave a considerable margin above the reduction due to bus competition.

One of the principal reasons why the company has not applied for a higher rate of fare at present is said to be that franchises for three-quarters of the system expire in 1939, while those for the remainder of the system, which includes the best-paying lines, expire in 1942. The bankers have been reluctant to furnish the necessary capital to effect the reorganization without a new long-term franchise.

Others familiar with the situation are of the opinion that it would be better to apply for an increased fare now and so get the company out of receivership, even though the franchises expire in a relatively short time. It would then be possible for the reorganized company to apply for a new franchise providing for a reduction in fare.

Scheduled speeds of the United Railways cars for a number of years previous to the advent of buses have risen to approximately 9.8 car-miles per car-hour actually run. In 1923, after the first bus line had been started, there was some reduction in speed, the average for December being 9.66 m.p.h. There was a further reduction during 1924, after the last series of bus lines was put in operation. The average speed for December was 9.55 m.p.h. These changes are shown in one of the tables. The reduction in speed, according to the company, is mainly attributable to the presence of buses on the streets, with resultant interference.



Congestion Caused by Buses and Other Vehicles. These Views, Taken Jan. 24, Are Looking East on Washington Street Near Fourth, with the Eads Bridge in the Background

Bus Competition Started

The Missouri Motor Bus Company, which was formed in 1919, began operating on Feb. 10, 1920, a bus line on a route approximately the same as the present Delmar line of the People's Motor Bus Company. A 10-cent fare was charged. The buses were not entirely satisfactory, being mounted on truck chassis. The management was not familiar with modern transportation methods, and the enterprise failed after about a year of operation.

Augustus Barnes next came into the picture. He was a theatrical man from New York. He obtained the passage of an ordinance known as 30,911, which gave to the Board of Public Service the right to grant permits for bus operation, thus taking it away from the province of the Board of Aldermen. This ordinance was approved on July 12, 1920. It includes general regulations regarding the granting of permits under which motor buses may be operated in the city, but states that buses may not be operated until properly licensed and bonded. The bond that must be provided is $3,000 for each vehicle operated, except that if one person, firm or corporation proposes to operate more than five such vehicles the total bond required shall be $10,000. When once granted permits are revocable only after an advertised public hearing similar to that for the granting of a permit, and revocation cannot become effective until 30 days after action by the board. It is also provided that in case the bus company shall have been in operation for a considerable period of time an additional 10 days shall be included for each year of operation above the 30 days. Competing motor buses are not permitted on a route already established unless the applicant shall demonstrate to the board that such additional service is necessary.

Permits are granted upon payment of $25 as an annual license tax for each motor bus, and in addition a sum equal to 3 per cent of the gross receipts derived from transportation. Payment of these taxes does not exempt the owner from payment of all the ordinary licenses and taxes levied by the city and state.

The rate of fare that may be asked for bus service cannot be in excess of 10 cents for the entire journey or any part thereof designated by the passenger. There is nothing in the ordinance, however, to prevent a lower rate being charged.

Bus permits may be transferred from one owner to another upon application with affidavit proving the sale. The license collector must then issue a new license in favor of the purchaser.

The original bus permits, which were granted on Oct. 3, 1922, and accepted on the 16th of the same month by Augustus Barnes, covered principally an east and west route along Washington Avenue and Delmar Boulevard from the Eads Bridge to the city limits at University City; a north and south route along Grand Avenue from Carondelet Park to the Water Tower at the intersection of 20th Street; certain deviations from the Washington Avenue route to cover the downtown theater district during the evening; a route from the east plaza of the Municipal Bridge in East St. Louis over the bridge and through the business district to the McKinley terminal at 12th and Lucas Streets; a route along DeBaliviere Avenue from Delmar Boulevard into the municipal theater in Forest Park. A fare of 10 cents was specified with free transfers between intersecting routes. Other conditions were inserted conforming to the terms of the ordinance of 1920. All these routes were later operated with the exception of the one over the municipal bridge to East St. Louis.

On Nov. 21, 1922, an additional permit was granted

Total schedule miles operated: Weekdays, 23,251; Sundays, 17,521.
The first bus out on each route leaves outer terminal at 6 a.m. weekdays, and on Sunday at 7 a.m.
The last bus leaves downtown terminal at 12:30 a.m. daily.

for a route running along Locust Street and Lindell Boulevard from the downtown district to Washington University.

The original permits issued to Augustus Barnes were transferred to the United States Bus Transit Corporation, which was incorporated under the laws of the state of Delaware on Nov. 12, 1922, with a capitalization of $3,000,000. The officers of this company were Joseph L. Rhinock, president; John H. Havlin, vice-president and treasurer; Benjamin L. Heidingsfeld, secretary and general attorney.

On May 25, 1923, the People's Motorbus Company of St. Louis was chartered under the laws of Missouri, with a capital represented by 10,000 shares of common stock of no par value, which were outstanding. On the date of its formation, the permits then held by the United States Bus Transit Corporation were assigned to the new company, and operation actually began on May 28, 1923. The officers of the People's Motorbus Company are Richard W. Meade, president; Robert Burkham, vice-president, and W. Frank Carter, general counsel.

Desiring to secure the protection of the Public Service Commission of Missouri, it applied to the commission for recognition as a common carrier and asked for certificates of public convenience and necessity along the streets occupied by the company at that time. The commission denied the application on Oct. 13, 1923, holding that the People's Motorbus Company was not a common carrier within the meaning of the public service commission laws of Missouri.

Chicago Motor Coach Enters Picture

In the latter part of 1923, interests representing the Chicago Motor Coach Corporation, which later was merged with the Omnibus Corporation, exercised an option obtained for the purchase of the People's Motorbus Company of St. Louis. This was done through a holding company, the St. Louis Motor Coach Corporation, which was organized with a capitalization of 35,000 shares of Class A or preferred stock and a like amount of Class B or common stock. The Class A shares were sold at $45 or $50 each, with a bonus of one-fifth share of Class B stock. Figured out roughly on the basis of sale price, the stockholders received around $62 a share on their original investment when the property was taken over by the Chicago Motor Coach Corporation. The principal owners are John Hertz of Chicago, F. F. Sims of Houston, Tex., and J. L. Rhinock of New York. The latter two formerly held 40 per cent of the securities of the People's Motorbus Company of St. Louis.

When the People's Motorbus Company interested other capital, 50 more buses were put on, principally on North and South Grand Boulevard, Lindell Avenue to Forest Park, and in increase of service on Delmar Avenue.

Realizing that the bus competition might prove serious, representatives of the railway reorganization committee obtained an option to buy out the bus company. The option price agreed on was as follows:

Physical property (82 buses and equipment)	$1,000,000
Cash, rights, etc.	1,400,000
From first year's operation as earned	400,000
Total	$2,800,000

The negotiations failed because holders of the St. Louis Transit 5s, one of the underlying railway bond issues, would not consent to the plan after a tentative agreement had been reached with the holders of all the bonds. Since these bonds had the lowest seniority rating, it was questionable, on the basis of a $58,000,000 valuation, whether they would receive the same satisfactory treatment as other bonds in the reorganization. Hence, the request was made by the reorganization committee that holders of these bonds assume the responsibility for raising funds for purchase of the bus property.

Following the failure of this agreement in August, 1924, the bus company pressed its application for additional permits. Fifty buses were purchased from the Yellow Coach Manufacturing Company.

The city administration is reported to have warned the railway company of developments with regard to bus operation. The railway company maintained that it could not put on buses nor build extensions, as the right to do these things had been refused by the federal court. The reorganization committee, however, believed that it was necessary to get into the bus business. The St. Louis Bus Company was formed by the committee and applications filed for a considerable number of routes practically identical with those asked by the People's Motor Bus Company. As for fares, each bus company proposed a 10-cent rate, but the St. Louis Bus Company offered free transfers between its buses and the street cars. The People's company, on the other hand, refused to consider any transfer arrangement with the street cars, but was willing to grant transfers between its own routes.

Digitized by Google

Public hearings were held by the Board of Public Works on both applications. It was here that the first clash of interests occurred between the two bus organizations. The city's public service board was then composed of E. R. Kinsey, president; J. A. Hooke, director of public utilities; C. H. Fiske, director of streets and sewers; Nelson Cunliff, director of public welfare; and J. A. McKelvey, director of public safety and building commissioner. Messrs. Kinsey and Hooke at that time appeared to favor the application of the St. Louis Bus Company. Mr. Hooke went away on a vacation in the latter part of August. Mr. Kinsey left St. Louis on Labor Day with a committee of the Board of Aldermen, which had been appointed to make a tour of the principal cities in the East for the purpose of investigating rapid transit and for studying motor bus policies. It is said by some that these two men left St. Louis under the impression that they had the promise of the other three to do nothing until they returned with regard to the granting of any bus permits. Others say that they left with the understanding that what the remaining three members did would be agreeable to them. On Tuesday, Sept. 2, the day after Mr. Kinsey left St. Louis, the remaining three members, who constituted the majority of the board, voted to grant the permits requested by the People's Motorbus Company. Soon afterward the board granted a few permits to the railway for the operation of stub-end bus lines as feeders to its railway lines in outlying territory.

Interviews with disinterested persons indicate that a great majority, possibly 90 per cent, of the population approves the attitude of the street car company. Its past mistakes have largely been forgotten in view of its present good performance. The track and paving are in good condition, the rolling stock is fairly modern and well kept, the service is adequate, and the speed is above that found in many cities.

Of course, there always are a few soreheads. Such persons often make the bulk of the noise that is heard in criticism. They do not, however, represent any large share of the riding public.

As for the buses operated by the People's Motorbus Company, they have made many friends since they have been in operation. The operating company is aggressive, it employs excellent publicity methods, and tries to render good and efficient service. Local opinion is that the buses in St. Louis are there to stay. The public does not care greatly who operates the buses, but does desire a co-ordination of service, so that a maximum of benefit will be obtained from the two systems. By this it is not inferred that the buses should be relegated to outlying areas. Undoubtedly, certain routes will have to come to the business district. Whether the present routes are the ones which should be retained will probably depend largely on developments of the near future.

It is understood that a plan is now under way for a rerouting of the street cars to provide more direct entrances to the business district.

Expressions of the Railway and Bus Managements Regarding Bus Expansion

THE opposing positions of the railway and the bus company's operating organizations are well expressed in the public statements made at the time the matter of additional bus permits was pending before the Board of Public Service. The expressions of opinion in these briefs have such an important bearing on the subject that quotations are given here covering the main points at issue:

The Railway's Position on Bus Permits

EXCERPTS from brief filed with the Board of Public Service on April 30, 1924, by Col. A. T. Perkins, manager for receiver United Railways, in the matter of certain petitions for motorbus permits.

The permits already issued to the People's Motorbus Company cover 19.82 miles of streets; the additional permits asked for 49.54 miles, a total of 69.36 miles. Of these 69.36 miles only 4.89 miles can in any way be deemed to extend the service into new fields and that only for small sections of the proposal routes. These sections are for the most part on streets over which the management of the United Railways has for several years desired to extend its service either by actual street railway construction or by supplementary motorbus service, but which both by reason of the receivership restrictions and the great financial cost involved, it has up to the present time been unable to do.

* * *

Out of the total authorized and proposed mileage, however, no less than 31.95 miles actually cover streets on which car tracks have been constructed under franchises which still have a considerable number of years to run.

The receiver of the United Railways of St. Louis is maintaining service on some 460 miles of line in St. Louis and St. Louis County, day and night, and in all kinds of weather, covering a widely varying volume of traffic. The average number of revenue passengers per car-mile for the entire system for the year 1923 was only 6.41, and of total passengers, including transfers, it was only 9.81. Taking into account the totals, including transfers, the number per car-mile varied on the approximately 40 lines operated from 1.84 per car-mile up to a maximum of 15.55. On not less than 10 lines the traffic is less than five per car-mile. Service has to be maintained at all times and in all weathers, for the benefit of the public generally on all of these lines, no matter whether profitable or unprofitable; and it has been the intention to extend service into additional districts as soon as financial and other arrangements could be made therefor.

The permits issued to the bus company have, on the other hand, been for the purpose of enabling it to cut in, as may be seen from the foregoing figures and from the attached map, to the better part of the business. The operation of buses on Washington Avenue and Grand Avenue has already seriously affected the earnings of many of the better paying street car lines which have to carry the non-paying lines; and these reductions in revenue not only reduce the ability of the United Railways to extend its service, but actually reduce the revenues to the city.

* * *

Outside of reduction in gross revenue due to the business directly taken from the street railways by the buses, the operations of street cars have been and are being seriously interfered with, the service delayed and the expense thereof materially increased by the buses (a) holding or "dragging" the tracks ahead of street cars, (b) stopping in car tracks to load and unload passengers, (c) turning front truck out so as to foul tracks while making their stops, (d) cutting into front of street cars in manner to cause frequent collisions and emergency brake applications, (e) stopping beside street cars in a manner to prevent safe loading and unloading of street car passengers, (f) passing street cars loading and unloading passengers, etc. This situation is causing a seriously increasing delay in moving thousands of street railway passengers to and from their homes and their business, and tending toward a necessity of increased fares.

* * *

As the receiver of the United Railways has not been in a position, on account of legal restrictions imposed by

Digitized by Google

court orders, to supply service perhaps really needed on the three stretches of line, totaling 4.89 miles * * *, he cannot object to permits being issued for temporary operation of buses on those stretches, notwithstanding the fact that he has desired to and has made efforts to procure authority to make extensions of his own service over those particular routes. But the receiver believes that this service can be given by a reorganized street railway company to much greater advantage to the public than by a separate motorbus company. The receiver also perhaps should not object to the present permit to the bus line on Lindell Boulevard, provided it were confined to its original route on Lindell Boulevard and Locust Street and not permitted to extend into the congested district on Washington Avenue.

It is further suggested that if permits are to be issued to an independent motorbus company there should in their terms be no discrimination against the millions of street car riders; but that the bus company should be subject to the same tax and street maintenance burdens, and to the same principle of service at cost as the receiver of the railway company.

Attitude of People's Motorbus Company

EXCERPTS from the statement of May 9, 1924, by the People's Motorbus Company of St. Louis to the Board of Public Service in answer to the railway's brief of April 30:

The People's Motorbus Company of St. Louis desires to point out that its service is supplemental, because it gives a character of service not supplied by the railway company—a service of a different class, and at a higher fare * * *. Filling a place somewhere between the street car and the taxicab, the 10-cent bus is a boon to that great body of people of all classes * * * who are unable or unwilling to subject themselves to the discomfort of street car crowding but cannot afford the expense of a private motor car or a public cab. The motorbus has been well termed "the poor man's automobile." While the wage earner may not be able or willing to pay 10 cents for daily travel, it is a sum he will gladly pay to take his family on a Sunday or a holiday for a picnic to Carondelet or Forest Park, as is testified to by the crowds that assemble at the Third Street Bus Terminal on such days. To this class the 10-cent bus line offers the best and cheapest excursion obtainable. Nor does it seem unreasonable that the taxpayer who is willing and able to pay 10 cents to assure himself of a seat should feel himself entitled to that privilege.

Because the People's Motorbus Company, in offering to meet the needs of certain isolated sections of the city, is obliged, in order to reach them, to traverse arterial thoroughfares on which the United Railways has its tracks, this distinctive *supplemental* character of its motorbus service should not be overlooked. * * *

* * *

But the motorbus furnishes something more. * * * The feature of an open-air ride on the upper deck of the bus will prove an important factor in the general health of the city if placed within reach of the people in its various residential localities. It adds a new and valuable form of wholesome recreation that can be availed of in the easiest possible way—notably as an incident to daily travel to and from work. * * *

There are many other ways in which a bus system is of value * * *: First, there is no better way for a visitor to a city to see it than from the top of a bus, and a comprehensive system such as is proposed is a definite asset in giving strangers a pleasant recollection of a city and fostering a desire on their part to return on some other occasion. * * *

* * *

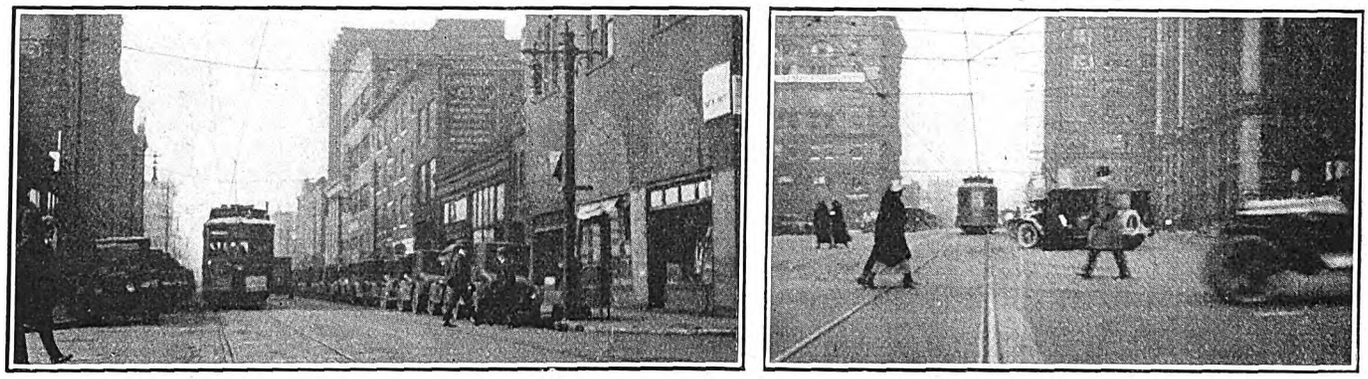
With regard to the paralleling of street car lines, about 11.5 miles of the mileage mentioned is on the routes already in operation and 8 miles on South Broadway and Union Boulevard. The South Broadway route was included in our application at the urgent request of the merchants and manufacturers in that district, who did not consider that the Seventh Street route, proposed by us, would meet their needs. We therefore included both routes, leaving the decision between the two to the judgment of your board. Union Boulevard being the only means of access from the west to the neglected West Walnut Park district (which is not one of those localities recognized by the United Railways as needing attention) it is necessary to use that route in order to reach localities to which access is desired by the West Walnut Park residents, but it is such a broad thoroughfare that, even with a line of cars parked at the curb, the bus service should not cause the least interference with that of the street railway. West Florissant Avenue, which is the only northern and eastern outlet of the West Walnut Park district, is used for about 2 miles alongside the United Railways tracks. This is also a fine, broad thoroughfare and for the most part the tracks are completely segregated from the remainder of the roadway.

In the 8 miles of the Kingshighway route there are 2½ miles of street car tracks, consisting of a block of the Olive-University lines, § mile of the Taylor-Euclid line, and 1⅞ miles of the Southampton line between Vandeventer and Devonshire Avenues. * * * We have indeed sought so to lay out our routes as to avoid, so far as possible, traversing streets occupied by tracks, and have only so routed them where we believed it was essential to the broad public interest. * * *

* * *

* * * The People's Motorbus Company of St. Louis has 72 motorbuses with a maximum carrying capacity of 4,552 persons and, on the present basis of operation, will carry from 13,000,000 to 15,000,000 passengers in the year 1924. Fully half of this bus traffic will be created—in other words, rides that would not be taken were it not for the presence of the motorbus service.

The bus came to St. Louis because it was needed, the lack of adequate transportation facilities being widely recognized. The United Railways' trackage is today substantially the same as it was 20 years ago, while the city and its metropolitan district, from which the street railway traffic is drawn, has forged ahead, as evidenced by every index of growth and activity that may be examined. * * * It is evident that the natural traffic of the street railway, which, cultivated and encouraged, should show a substantial increase year by year, has been steadily alienated by the lack of sufficient increase and improvement of facilities and serv-



At Left—Solid Rows of Automobiles Are Parked on Both Sides of Pine Street Between Tenth and Twelfth. At Right—Angle Parking in the Center of 12th Street Between Locust and Washington Cuts Down Roadway

Digitized by Google

ice; that traffic is today being largely carried by the private automobile, with the result that the disposition of the multiplicity of cars that enter the central business district in the mornnig and remain there all day has produced a critical situation that requires drastic treatment. If the parking of cars in the main streets of the business district is to be prohibited, some substitute must be given the people who have acquired this habit, and that substitute, as shown by experience in other cities, can be best supplied in the form of the motorbus with an assured seat.

* * *

The interference by the buses with the street car service of which the United Railways complains is due, almost entirely, to the presence of parked cars along the curb—especially in the district between Twelfth Street and Eads Bridge. In this district it has been practically impossible, during business hours, for a bus to reach the curb to load or unload passengers. Due to careless parking there is seldom sufficient clearance between the cars parked at the curb and the street car track for a bus to run or to stand. With this situation cleared up, as proposed by the Traffic Council, the whole problem will be simplified, and interference with the street railway service should be eliminated and the running time of both services effectively shortened. * * * [Note—Ordinance has since been passed by the City Council and approved.—Ed.]

* * *

As to the suggestion that the motorbuses should be subject to the same taxes and pavement maintenance as the street railway, we submit that any such policy would be grossly unfair. * * * The contention commonly made by street railways that their service does not damage the pavement and that they should, therefore, be relieved of the pavement burden is hardly well taken, as the most casual examination of the paving along the rails of the average street railway line will show. It is eminently proper that this extreme occupation of the public thoroughfare should be compensated for by taxes and paving requirements, while it would be entirely unfair to similarly penalize the motorbus, which involves no element of physical preemption of the public street, and which creates no appreciable damage to a pavement adequate for any heavy commercial traffic. A tax such as is imposed on motorbuses by the city of St. Louis in addition to the license fee is sufficient, if the fund is applied in that manner, to pay interest and debt service annually on an amount of reconstruction that, within a few years, will make St. Louis one of the best-paved cities in the country.

The Railway's Rejoinder

EXCERPTS from the address of Col. A. T. Perkins before the Board of Public Service on July 28, 1924, in the matter of the petition of the People's Motorbus Company for permits on additional routes:

* * * On the other hand, the motorbus company operates simply under temporary permits issued by the Board of Public Service, based on provisions of Ordinance 30911, is owned primarily and controlled in Chicago, with only nominal headquarters in St. Louis, making public simply its gross receipts in its quarterly reports to the city, and is under no obligation to and is without the jurisdiction of the Public Service Commission.

Whatever the validity of the present permits under which it operates, I shall beg the liberty later of arguing that under no circumstances can the agreements or even general understandings under which the permanency of these bus lines has been asked for by your honorable body and promised by the motorbus company be legal under the terms of Ordinance 30911.

* * *

Now, frankly, it seems to me that the continuance of this policy of issuing bus line permits will have certain very serious consequences both during and at the close of the receivership.

First—During receivership, the issuance of these permits will make necessary either

1. An increase in street car fare affecting fully 90 per cent of the traveling public, and
2. A material reduction in service, or
3. A material reduction in wages, and
4. The loss of regular runs by a considerable number of motormen and conductors, and reduction in number of other employees.

* * *

As I have stated repeatedly in the past and in my brief of April 30, 1924, I realize the urgency of extensions of service into certain districts now not supplied by service; and near as we believe a reorganization of the United Railways to be we cannot insist that such an extension of service should necessarily wait even on the reorganization, but we thoroughly believe that all this service should be a co-ordinated service between the street railways and the buses. For example, I believe, as I stated to your honorable body fully two years ago, that a bus system should be put in to take care of the Lindenwood District, which I understand to be at present the most pressing case before your body. I therefore propose that, subject to permission of the U. S. Court and the Missouri Public Service Commission, which I believe can be obtained, a permit be issued to the bus company for service beginning at Wood Street, where transfers should be made to and from the Tower Grove line street cars and looping through Lindenwood. The 10-cent fare in that district within the city limits to cover transfer to the street railways, and the street railway fare plus 3 cents to cover transfer to the buses. This would make for a very large proportion of the people to their destinations a 10-cent fare instead of a 17-cent fare; as in a considerable proportion of cases they would have to use the street cars anyway. The division of this 10-cent fare as between the United Railways and the buses in this case we should be willing to leave to the decision of the Missouri Public Service Commission.

* * *

If this arrangement is not acceptable to the motorbus company, I have been authorized by certain parties interested in the reorganization of the United Railways to say that a separate bus company will be immediately formed to provide this supplemental service with transfers for the 10-cent rate to and from the street railway cars, under the direction of your honorable body, and that this new company will be prepared to make further extensions of such service as needed. The parties in question are prepared to have a sufficient number of buses in operation within 90 days.

Large Single-Phase Locomotives

THE Loetschberg Railway has just placed an order with the Société Anonyme des Ateliers de Sécheron, Geneva, Switzerland, for two large single-phase locomotives. Each of these engines is to be rated at 4,200 hp. on the 1-hour basis. More powerful engines are, of course, being built in America, but these locomotives will be equipped with phase converters for changing the single-phase current collected from the overhead wire into polyphase current. The new Swiss locomotives are to be used for freight and passenger traffic, and will be employed more particularly on the heavy grade division of the railway, between Frutigen and Kandersteg.

The engines are to be designed for a normal speed of 31 m.p.h., and a maximum speed of 43.8 m.p.h., the load on each driving axle being 19 tons. Trains weighing 560 tons, excluding the weight of the locomotive, will be hauled on a gradient of 2.7 per cent at a speed of 31 m.p.h. The locomotives will be of the 2-6-6-2 type with six twin motors, each capable of developing 700 hp. for 1 hour, thus giving a total output of 4,200 hp. Power will be transmitted to the driving wheels by means of an individual drive of the Sécheron type. Oil immersed transformers are to be used for reducing the line pressure and for supplying a variable voltage to the driving motors, which will be controlled by means of electro-pneumatic contactors, the arrangement being the same as that adopted on the single-phase

Digitized by Google

locomotives built at the Sécheron works for the Swiss Federal Railways.

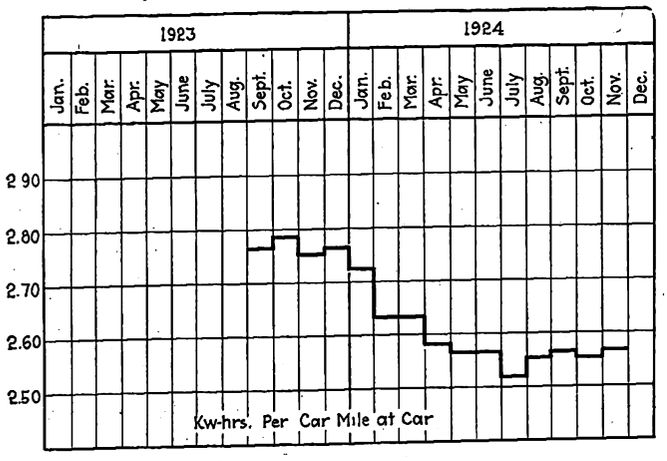
The principal dimensions, weights, and capacities of these new engines are as follows:

Length over buffers	66 ft. 3½ in.
Diameter of driving wheels	53.1 in.
Number of twin motors	Six
One-hour rating measured at the rim, at a speed of 31 m.p.h.	4,200 hp.
Tractive effort measured at the wheel rim, 1-hour rating	22.6 tons
Tractive effort at starting	34 tons
Total weight of the mechanical parts	67 tons
Weight of electrical parts, including individual axle drive	68.5 tons
Total weight in service	135.5 tons
Adhesive weight	114 tons
Maximum speed	43.8 m.p.h.
Line voltage	15,000 volts
Frequency	16 2/3 cycles per second

Power-Saving Chart Stimulates Interest

Each Man's Record on Denver Tramway Is Shown in Comparison with Average for His Time, so as to Stimulate Individual Interest in Saving Energy

FOR stimulating interest on the part of its motormen in energy saving an interesting form of chart is used by the Denver Tramway Company. This is made up as a semi-monthly report, which shows the standing of each motorman with reference to the average power consumption per car-mile during that period on the line on which he operates. It is posted where it may be seen by all motormen in each division.



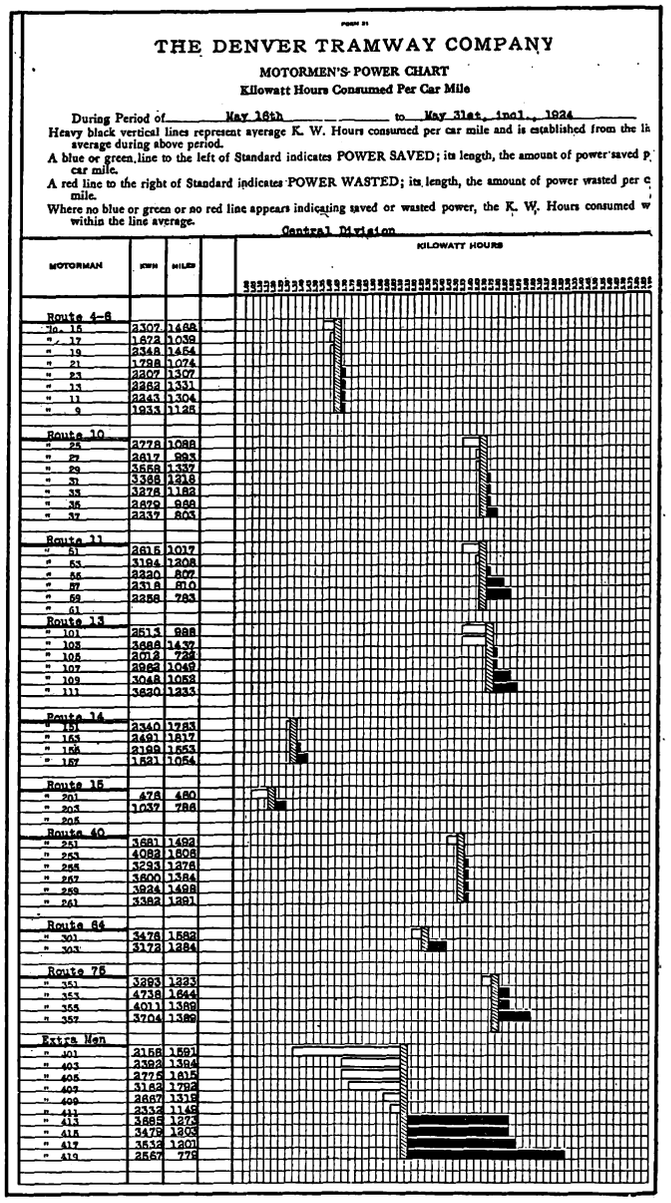
Results Accomplished by Attention to Power Saving Are Shown by This 15-Month Graphic Record of the Denver Tramway

This chart has been adopted from a similar idea originally developed in San Diego. The cross-hatched vertical line indicates the average energy consumption per car-mile for each line on the system. Individual motormen's records are shown by horizontal lines extending either to the left or right of the average. Lines to the left, drawn in green, indicate the records of men whose consumption during the month is less than the line average, while those higher than the average are drawn to the right in red.

As the average for each line on the property varies from period to period, the cross-hatched line will change accordingly. The purpose of the chart is to stimulate those men whose records appear on the right of the average line to improve their performance. As this occurs, the average on the chart for that line moves toward the left, and inspires those men whose records are still posted in red to increase effort to save power. The men with records in green must continue to improve as their power consumption approaches the average.

An explanation at the top of the chart gives the meaning of the different colored lines. In the first column at the left appear the various route numbers, together with the run numbers of individual motormen. In the next two columns are the kilowatt-hours used for the period covered by the report and the total miles operated, respectively. The remaining space is cross-ruled to facilitate plotting the chart according to the scale of kilowatt-hours at the top. From the figures given in the columns headed "Kilowatt-Hours" and "Miles" at the left, each man may readily check his own performance to insure that the curve for his record is shown in the proper position.

The net result accomplished by this form of chart in connection with Economy meters for inspiring interest in power-saving results is strikingly illustrated in the summary curve in an accompanying illustration which shows a decided reduction in kilowatt-hours per car-mile in a period of 15 months.



THE DENVER TRAMWAY COMPANY

MOTORMEN'S POWER CHART

Kilowatt Hours Consumed Per Car Mile

During Period of May 16th to May 31st, incl., 1924

Heavy black vertical lines represent average K. W. Hours consumed per car mile and is established from the la average during above period.

A blue or green line to the left of Standard indicates POWER SAVED; its length, the amount of power saved p car mile.

A red line to the right of Standard indicates POWER WASTED; its length, the amount of power wasted per c mile.

Where no blue or green or no red line appears indicating saved or wasted power, the K. W. Hours consumed w within the line average.

Subway Proposed in Pittsburgh

Engineers of Bureau of Traffic Relief Find Pittsburgh Needs Limited Subway—To Be Used at First by Surface Lines, but to Form Part of System Later for Train Operation—Co-ordinated Service with City Surface Railways Recommended at All Times

ACTING for the Bureau of Traffic Relief of the city of Pittsburgh, Daniel L. Turner, consulting engineer, and Winters Haydock, chief engineer of the bureau, have been studying the causes of street congestion in the downtown streets of Pittsburgh and the extent of relief which might be given by a subway. The study is being conducted because of an ordinance, ratified in July, 1919, by popular vote, authorizing the expenditure of $6,000,000 for providing a subway in the first and second wards of the city, adapted to the use of either surface cars or high-speed trains or both.

The conclusion of the engineers, as shown in a progress report just rendered, is in favor of a limited amount of subway construction, to be operated in connection with the local street railway system and to be used at first by surface cars, which would thus be removed from the streets above. A feature of the proposed subway is the combination with the construction in the downtown streets of sub-surface sidewalks to take part of the pedestrian traffic off the street. The report lays great stress on the assistance which such a subway would give in spreading the business district over a greater area. When the needs of the city require it, this subway can be extended. The engineers think very definitely that the needs of Pittsburgh at present do not require an extensive subway system. An abstract of the report follows:

Pittsburgh Triangle District

The principal office and business district of Pittsburgh is in a triangle between the Allegheny and Monongahela Rivers. Approximately two-thirds of all the street car transportation in the city now centers in this triangle, and between 6 a.m. and midnight the street cars bring in and take out of the triangle approximately 355,000 passengers. Of the 1,431 buildings in this territory, 48 are from 10 to 26 stories in height, and every new 21-story building adds approximately 1.28 per cent to the working population in this restricted area.

The street system in this area is inadequate now and is becoming increasingly less adequate. A third of the streets in this business district are only 40 ft. wide and most of the remaining streets 60 ft. wide. Moreover, they are badly articulated. Alleviation can come in three ways: (1) Spreading the district, (2) restricting the use of the streets for some of all classes of traffic, or (3) securing more efficient use of existing street space. The first and last of these plans are obtained by a subway through the district and under the Allegheny River, where the only possibility for expansion exists, and where there is a district capable of being developed for business purposes over three times as large as the triangle district. This is shown in the accompanying diagram.

Additional street capacity in the triangle will be obtained if all rail transportation and some pedestrian use of the streets are removed from the surface to underground. While the automobile is chiefly responsible for the traffic congestion in the triangle, street car movement in the congested area is relatively slow. It is simpler to remove the cars from the streets and provide them with exclusive rights-of-way below ground than to do so with any other kind of vehicular traffic.

Street Car and Rapid Transit Subways

In general, there are serious objections to street car subways, one being that the passenger traffic capacity of street cars operated in a subway is only about half of that of a rapid transit train service in a subway. For example, 180 cars per hour in each direction represents about the maximum street car operation of a subway; whereas a rapid transit service of 35 ten-car trains, or 350 cars per hour, can be operated in the same subway, and the subway cars will carry more passengers per car. For this reason, such a subway as that contemplated, if street cars are to be operated in it at first, should be located, planned and constructed so it will eventually form a component part of a rapid

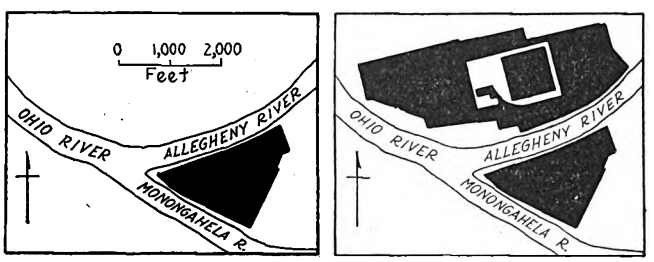

Diagram Showing Possible Increase of Central Business District of Pittsburgh. At Left, Present Area. At Right, Possible Area

transit system, whenever such a system may be inaugurated in the future.

The chief functions of a rapid transit system are to furnish (1) high speed, long-distance service, or (2) mass transportation by means of train operation, or (3) high-speed and mass transportation combined. Another function that a rapid transit line (not a system of lines) may perform to advantage where suitable conditions prevail is as a high-speed connecting link between two widely separated community centers.

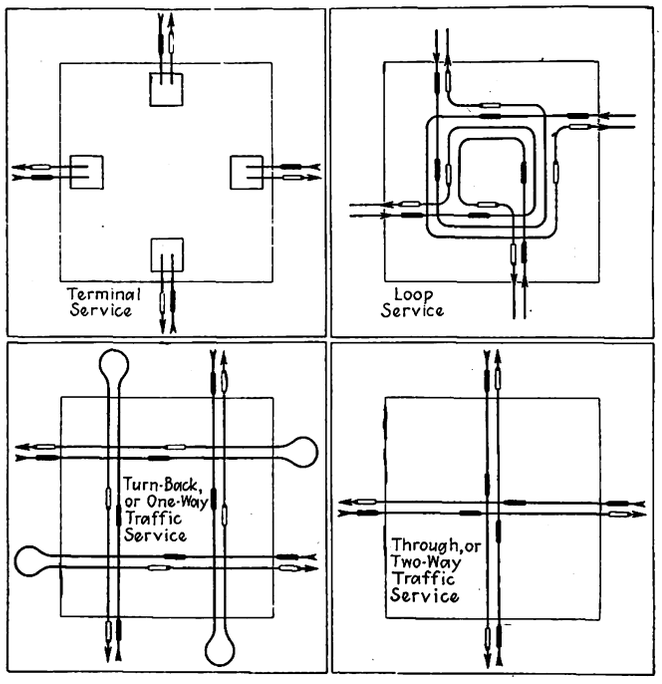
Below is a table showing the travel range for the several modes of transportation now chiefly available for local transit:

TABLE SHOWING SPEEDS OF DIFFERENT TRANSPORTATION MEDIA AND AREAS SERVED

	Foot Travel	Street Car or Motor Bus	Local Service Rapid Transit
Speed in miles per hour	2½	8	16
Ratios of above	1	3.2	6.4
Radius of travel from center	1.6	5	10
Ratios of above	1	3.2	6.4
Approximate circular area served in square miles	8	80	320
Ratios of above	1	10	40

The table is based on the assumption that the maximum total travel time desirable, including walks at each end of the line, should approximate three-quarters of an hour. It indicates generally that one can travel

Digitized by Google



Four Ways by Which a Hypothetical Business District Can Be Served with Transportation

twice as far on a rapid transit line as on a street car or motor bus in a given time, and 6.4 times as far as one can walk in the same time. It also shows that the trolley car or motor bus adequately serves the city included within a 5-mile circle from the center and (if a circular city) having an area of about 80 square miles. Similarly, a rapid transit local service, with stations about a half mile apart, will serve a 10-mile radius city, having an area of 320 square miles.

The proposed expansion of the triangle district to the north side of the Allegheny River cannot be accomplished by setting a new area apart and designating it as belonging to the central business district. This will not insure its development and use as such by the public. It must be made conveniently accessible to the whole city. The circulating and distributing systems of the city—the street system and the transportation system—must serve this new business area just as conveniently as they now serve or will serve the triangle area itself. When this is effected, then and then only will the business district automatically break through its encircling barriers and spread across the river to the north as the development of business makes it necessary.

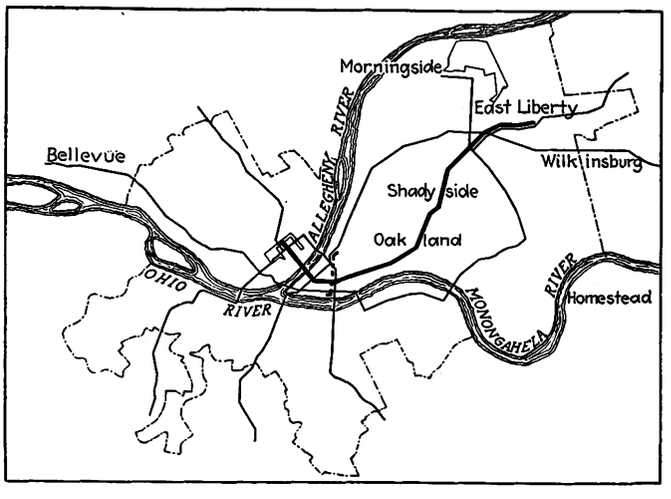
TRANSIT METHODS OF SERVING A CENTRAL BUSINESS DISTRICT

There are four methods of serving any central business district. They are illustrated in the accompanying diagram as follows: (1) Terminal service, (2) loop service, (3) turn-back or one-way traffic service, (4) through or two-way traffic service. The central area is assumed to be ½ mile square.

From a municipal transit standpoint, there are nothing but disadvantages in the first service shown, namely, terminal service. It does not furnish any through service. It does not distribute any traffic within the central area. Instead, it unloads it on the edges and requires it to use other facilities or to walk to its destination. It does not provide for any circulation or distribution of the traffic from the standpoint of the city as a whole. One cannot ride from one side of the city across the central area to and through the opposite side without changing cars twice and using two terminals. From the municipal transit standpoint, it is the worst kind of service that can be supplied to a city.

The loop service, illustrated in the second illustration, differs from a terminal service in that it distributes its traffic around the area in which it circulates instead of unloading it at the edges. Although it does not provide a direct through service, one can travel through by transferring from one line to the other in the loop. In these two respects, it is superior to a terminal service. But these slight advantages are more than offset by the evils that result from a loop. It will induce, facilitate and crystallize congestion within and directly adjacent to the areas circumscribed by the route. This is where high buildings will concentrate, and to which all kinds of business efforts will be attracted. As a result, this is where the pedestrian and vehicular congestion will become most intense.

Besides producing these objectionable conditions of congestion, a loop service will require the maximum amount of facilities to furnish a given transit capacity into and out of the central area. Every track entering the area will traverse it on all four sides. This means that 16 tracks will be necessary in the central area to develop the full capacity of the four tracks entering from the four quarters around the area. Entering in the morning rush hours, the train will be fully loaded as it starts on its trip around the loop. It will gradually unload until it becomes empty as it leaves the loop and starts on its outward trip. For a large proportion of the trip around the loop, the train is traveling empty. This means a wasteful use of trackage. Since all trains will travel in only one direction around the loop, a great many passengers workward bound in the morning will have to travel practically all around the loop and consequently circle all around in the central area before arriving at their destination. Similarly, at night a great many homeward bound passengers, after boarding the trains, will have to circle all around in the central area before they can start on their outward journey. Therefore, because it creates and crystallizes congestion, because it does not furnish a direct through service, and because it requires the maximum facilities to accommodate a given traffic capacity, a loop service from the community interest standpoint is wholly wrong in



The Metropolitan District of Pittsburgh

The heavy solid line shows the recommended subway in the triangle district, with possible extension to East Liberty. The dotted line shows the suggested second north and south subway in the business district. The light solid lines show the suggested routes for a rapid transit system for the metropolitan district of Pittsburgh.

Digitized by Google

principle and should not be utilized in a city transit plan.

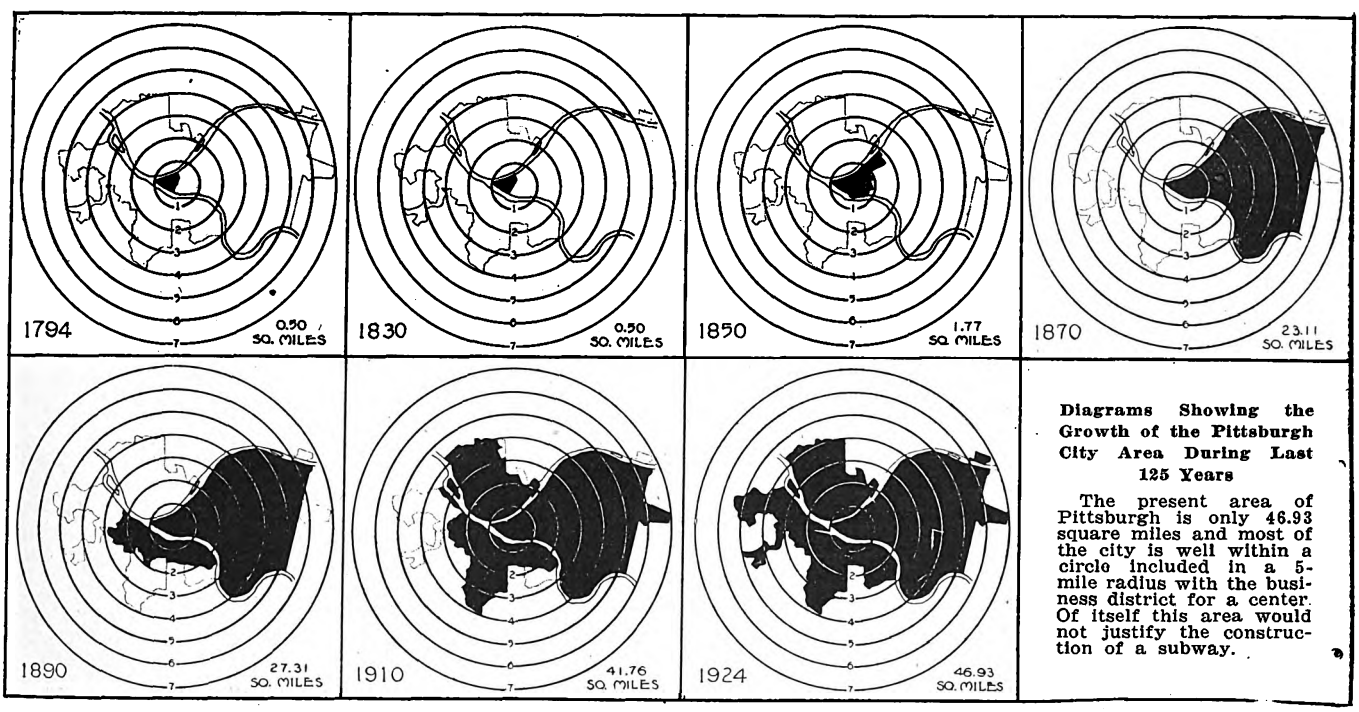
The turn-back, or one-way traffic service, shown in the third illustration, more nearly approaches the proper service, but it has some disadvantages. It furnishes a direct through service through the central business district, but after that area has been passed, the train is switched back and journeys through the central area on its outward journey to the point of origin. As the center expands, the turn-back point for the train (on the side opposite to the entrance point) can be moved outward, and this process can be continued indefinitely. Therefore, such a service does not induce congestion but permits the central business district to spread out as business develops. For this reason, a one-way traffic service is greatly superior to either a terminal or loop service. But there is a drawback from the service standpoint. One cannot cross one quarter of the city to the opposite quarter without changing cars. Four separate lines are necessary to serve the four opposite quarters. This means eight tracks traversing the central area. In the morning rush hour, the trains enter the center fully loaded, but return in the opposite direction empty. Thus, only four tracks accommodate loaded trains, the other four being used by empty trains. During the evening rush hour there are similar conditions except that the movement is in the opposite direction. Therefore, this system should not be used except as a temporary expedient.

The through or two-way traffic service, shown in the fourth illustration, is more nearly the ideal transit service for a city. It furnishes a complete and direct through service without change of cars. It encourages the spreading out of the business center and a diffusion of the population over the whole city. It furnishes direct and convenient service not only all the way through the present business center, but the same service is furnished to the new business center as it expands and spreads out in response to the growth of business and the necessity of overcoming the physical limitations of the old area. Such a line means only one track through the center to furnish exactly the same capacity as two tracks on a one-way traffic line. Each track traversing the center on a two-way traffic line is utilized by loaded trains during each rush hour. It therefore utilizes the line to 100 per cent capacity and efficiency for loaded trains.

The routing principle described as related to rapid transit does not apply to surface car operation to the same degree because of factors in surface car operation that do not obtain in the case of rapid transit.

Rapid Transit System Not Yet Needed

While a comprehensive rapid transit system for the metropolitan district of Pittsburgh is indicated in the accompanying map, such a system is not required under present conditions. The diagram showing the area of Pittsburgh shows that most of the city is now within a 5-mile radius of the city-county buildings. Only a very small area on the eastern boundary extends out as far as 7 miles. The area of Pittsburgh is now only 46.9 square miles. As already pointed out, a 5-mile radius city with a circular area of 80 square miles does not require anything but trolley car or motor bus transportation for adequate service. Obviously, then, Pittsburgh with only a little over half of the area of a fully developed 5-mile radius city (46.9 as compared with 80 square miles) cannot justify the inauguration of a rapid transit system at the present time.



Diagrams Showing the Growth of the Pittsburgh City Area During Last 125 Years

The present area of Pittsburgh is only 46.93 square miles and most of the city is well within a circle included in a 5-mile radius with the business district for a center. Of itself this area would not justify the construction of a subway.

The charts of area and population growth of the city show the city had an area of 23.11 square miles in 1870, and that its area has only doubled in 54 years. In other words, the rate of expansion of the city in the past does not justify the expectation of any material expansion beyond the existing 5-mile radius at a very early date. No rapid population increase (except by annexation) seems in prospect. Pittsburgh has now a population of about 626,000, and a reasonable estimate appears to indicate that in 1940 the population of the city may be about 780,000 and in 1950 may approximate 900,000. These figures do not indicate the likelihood of a very dense population. Moreover, the topographical condition, owing to the fact that there are very few

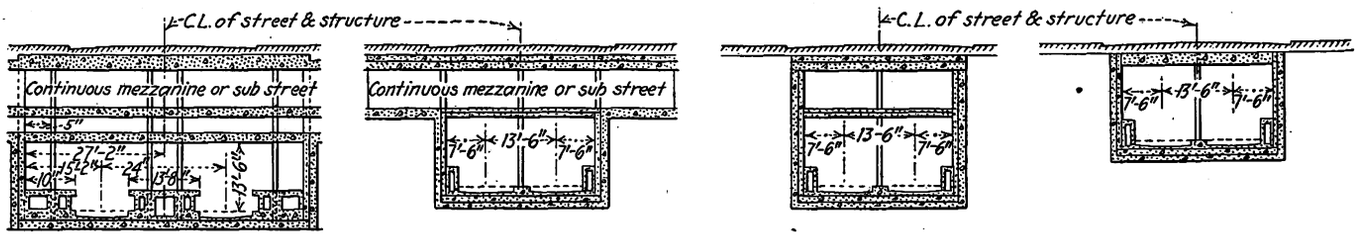
Digitized by Google

level spaces of any considerable area upon which a large population can obtain foothold, preclude the idea of a dense population. These statements refer to the city alone and not to the metropolitan area.

A metropolitan system of rapid transit lines will probably be required long before the city itself will need such a system to serve itself alone. Legislation that will create the machinery necessary to develop and carry out a metropolitan rapid transit plan cannot be obtained too soon. Such a metropolitan plan can utilize the surface type of rapid transit line to the utmost extent possible, thereby enabling approximately 5 miles of surface rapid transit lines to be constructed through the metropolitan area for the cost of 1 mile of subway line in the center of the city. The metropolitan district machinery is needed as early as possible to permit the rights-of-way necessary for surface rapid transit lines to be acquired before land values become too great and therefore prohibitive.

Proposed Initial Rapid Transit Line

Pittsburgh now needs and should construct an initial rapid transit line. That recommended is shown by the solid line in the accompanying map. It will be about 7 miles long and will be served by 17 stations. It should be a two-track subway line throughout, and a subway in the sense that it will be an underground line. The under-river section will be a tunnel, as will be also some other short sections where the topography makes such construction desirable.



Various Sections of Subway with Two Tracks Suggested in Report. An Imporant Feature Is the Mezzanine or Sub-Street for Pedestrians

It is proposed that the street car system shall be rerouted, where practicable, so as to act as a collecting and distributing system for this rapid transit trunk line. This will permit the street car lines to be abandoned where they operate on the same streets traversed by the rapid transit line. These changes in street car operation presuppose that the rapid transit line and the street car system will be operated as a unit. The first section of the subway to be constructed should be part of the Fifth Avenue line included within the limits of the first and second wards. At the two ends of this short downtown section, temporary portal approaches can be constructed for the use of the street cars, as long as the subway is used as a street car subway.

Gradually, as the growth of the city warrants it, this line can be expanded into a system of lines.

The Subway as a Sub-Street

In this downtown section, the recommended subway will be unusual in one respect, as shown in the sectional illustrations. It will be served with a continuous underground mezzanine platform extending across the entire width of the street and very nearly for its entire length. To this sub-street there will be entrances and exits as frequently as abutting building owners desire to have them. At least they will be provided at every cross-street. This means that the passengers may enter and leave the sub-street, and hence the subway, at every building and cross-street, just as one does now in the case of surface streets. It will also mean, as far as pedestrians are concerned, that the grades will be separated, so that pedestrians will no longer have to cross the street on the surface in the face of vehicular traffic, nor will they have to cross on the surface to reach the subway station.

Directly over each station, where the depth is sufficient, and as close to the station platforms as clearances will permit, there will be a station mezzanine below the level of the sub-street. That is to say, at the stations, where they are deep enough, the subway will have three underground levels—the sub-street, the station mezzanine, and the station platform.

Another advantageous feature included in the subway design is the use by two tracks of three platforms, two side platforms to be used for loading and a center platform for unloading. In this way, the incoming and outgoing traffic streams will be separated. The approximate cost for the subway in the first and second wards only is $6,950,000.

The construction of the proposed downtown section would permit the removal from service of street cars except those running in the north and south direction. The construction of the north and south subway would care for these cars, and, as explained, they would enter the subway at the triangle.

The second section of subway proposed is that shown by the dotted line on the map.

Methods of Financing

Three financial plans are available: Private capital can be called on to provide all of the necessary funds or at least to assist in financing the enterprise; city credit can be utilized by issuing bonds; or an assessment plan for raising the money can be developed.

If private capital is called upon to assist in the financing, it would logically mean that the Pittsburgh Railways Company should furnish it, because it is the natural operator of such a line, for the reason that the city can be served best by a unified transit system under which the rapid transit line and the street car facilities are co-ordinated. But before starting the construction of a rapid transit line to be financed on this basis, the city and the company must agree upon the form of contract to be entered into between them covering all the details of financing, constructing, equipping and operating the joint system.

If city credit is used, it presupposes, just as in the case of private capital financing, that the rider must pay a fare high enough to meet the interest and amortization charges on the total capital outlay, as well as to meet all operating expenses.

The third plan proposes an assessment of part of the cost on the owners of the property benefited. The assessment should be such that the gain from them, combined with the riders' fare, will pay for the cost

Digitized by Google

of the line and the service on it, thereby avoiding the use of private capital or city credit for the purpose.

Undoubtedly, the value of the property abutting the proposed line on Fifth Avenue will be increased by its construction. Interested land owners and prospective land buyers should take these matters into account. Under the plan proposed, the owner may have to give up some of his benefit to the city in the form of assessments. Likewise, the buyer of a prospective benefit may leave all of the benefits to the seller and pay an assessment instead, without receiving any additional benefits commensurate with his later assessments. For these reasons, it is undesirable to announce rapid transit routes until an assured plan of financing their construction has been developed. It causes what may later prove to be unjustifiable real estate speculation along the proposed routes, in case the project falls through. In this case, there is no alternative at the start, because the policy of financing the subway in the first and second wards, at the cost of the city, was determined when the bond issue was voted by the people. Later subways should be financed under an assessment plan.

On the Older Buses White Numbers Painted on a Metal Background Indicate the Route

Route Numbers for Bus Lines

Public Service Company Adopts System of Numbering Routes as an Aid to Its Patrons—Similar System May Be Adopted for Car Lines

ONE of the interesting developments which has followed the taking over by the Public Service Railway, Newark, N. J., of more than 500 independent buses has been the adoption of a system of route numbers. Originally the independent buses indicated the route on which they were running in whatever manner best suited the individual owners. Later, however, various color schemes were adopted for the different routes and a good many of the buses were painted in conformity with this plan. Thus the prospective passenger could distinguish his bus by its color.

After the railway took over these buses, however, it repainted them a uniform color. For this purpose the same yellow which has been used for many years on its railway cars has been adopted. The distinguishing characteristic of the buses on the different lines having been thus eliminated, a new way to accomplish this result had to be devised. This has been done by the use of route numbers which are displayed prominently on the front and side of the vehicle as shown in the accompanying illustration. On the older buses a white number is painted on a piece of metal fastened to the roof. On the side of the bus another metal sign gives the route number and destination. On the newer buses this information is displayed on roller signs.

Only even numbers are used to designate the bus routes. The adoption of route numbers for the car lines is under consideration, and it is planned to use the odd numbers for this purpose. In cases where a car line and a bus line serve the same general territory, consecutive route numbers will be used.

Route Numbers and Destinations Are Displayed on Roller Signs on Newest Public Service Buses

Modern Ferryboats Part of Oakland Company's Equipment

TWO new ferryboats are to be built for the Key System Transit Company to make the run between San Francisco and Oakland, Cal. The cost of each will be about $500,000 and they will be constructed in a San Francisco Bay shipyard. Edward McCauley, San Francisco, has been retained to design the two all-steel steamers, each 275 ft. long and of 70 ft. beam to accommodate 4,500 passengers.

When the new boats are completed the Key System Transit Company will have a fleet of four modern ferryboats. Two others, the *San Leandro* and the *Hayward,* built in a Los Angeles yard about a year ago, are now in commission. It is necessary, however, that the new craft be put into service as soon as possible, as traffic is increasing rapidly and there is much overcrowding now during the rush-hour periods.

Ben H. Allen, director of public relations, says that the new boats will be started just as soon as plans have been accepted and contracts let and that they will be the fastest, most comfortable and most up-to-date ferryboats on San Francisco Bay. They will have turbo-electric drive.

Digitized by Google

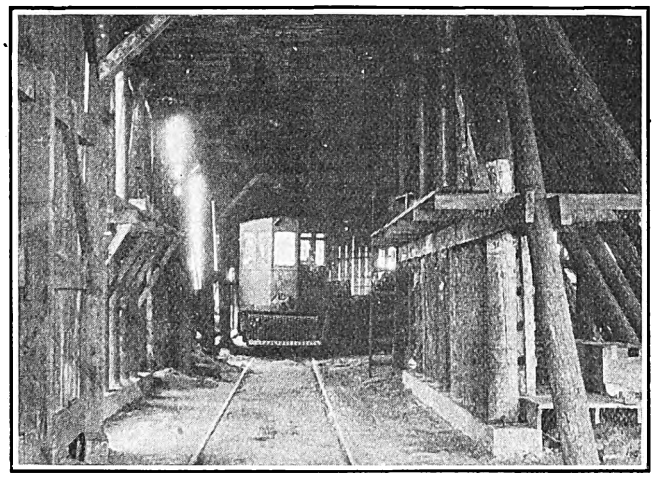
Modern Sand Dryer in Kansas City

Combined Plant to Manufacture Asphalt in Summer and Dry Sand in Winter Proves Economical—Large Quantities of Sand Used Because of Many Hills—Elevated Bin Reduces Handling Cost

DUE to the extremely hilly conditions in Kansas City, a comparatively large quantity of dry sand is required to keep the rails in safe condition, and the drying and handling of this material is an important operating item. From 6,000 to 7,000 cu.yd. of dry sand are used per year. This is distributed to the rail from the sand boxes of regular cars, and also by special sanding cars operated for this purpose only during bad weather.



Dry Sand Is Loaded by Gravity Directly from the Overhead Storage Bins to Work Cars for Distribution to Carhouses

The operation of drying sand in winter has been combined with that of manufacturing asphalt in summer, through the use of a 15-yd. per hour Hetherington burner asphalt plant for this double purpose. Wet sand is delivered on a railroad switch track to the drying plant, and is unloaded from the freight cars with a clamshell bucket and stiff-leg derrick. This derrick is arranged so that it can handle material through almost a complete circle. In this way one piece of equipment unloads sand from the cars to the storage pile and also handles the material from the pile to the wet sand hopper at the dryer. The general arrangement of the plant is shown in the accompanying illustrations.

Dry Sand Stored Overhead

From the drying drum, the sand is discharged to an inclosed hoist which elevates it to overhead storage bins in the dry sand house. This is so arranged that work cars in which the dry sand is distributed to carhouses are run directly under the bins, as shown in an accompanying illustration, and are loaded by gravity. Special sanding cars for distribution of sand directly to the rail are also loaded at this plant.

The cost of drying sand is 60 cents per cubic yard. This includes the total cost of handling during the drying operation, until the dry sand is stored in the overhead hoppers at the plant.

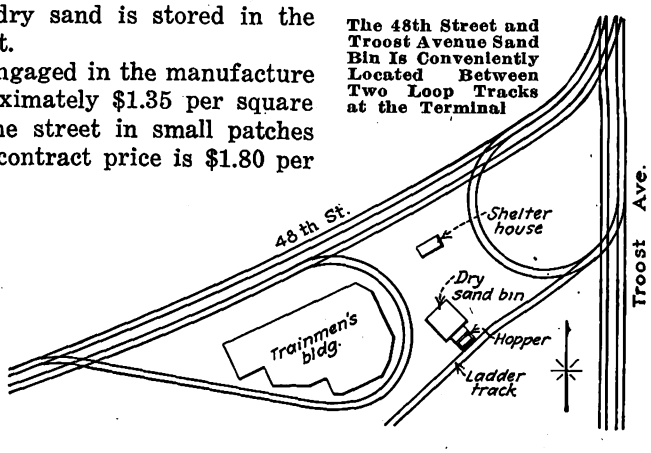
When the drying plant is engaged in the manufacture of asphalt, the cost is approximately $1.35 per square yard for material laid on the street in small patches 2 in. thick. The prevailing contract price is $1.80 per square yard, for the same thickness of material, but this price applies to resurfacing in extended areas and would probably be considerably higher for small lots. Combining the sand drying and asphalt manufacture, therefore, provides an efficient plant for drying the large quantities of sand required, and also makes a considerable saving in the cost of asphalt for paving maintenance.

When the sand is handled from the dryer to carhouses in work cars and is shoveled by hand to carhouse storage boxes or bins, an additional handling cost of 60 cents per cubic yard is entailed. At the 48th and Troost Street carhouse, a modern sand-elevating plant has been put in and has resulted in reducing the cost of handling at this location from 60 cents to 10 cents per cubic yard. A plan view and a section through this plant are shown in accompanying illustrations.

Under the storage bin, a concrete pit and foundation are arranged so that sand is dumped directly from the work cars into a concrete hopper. From here it is raised by a motor-driven elevator to the overhead storage bin. The bottom of the bin is above the track level, and several spouts extend out from opposite sides so as to discharge the dry sand directly into pails used to fill the sand boxes on passenger cars. These spouts are made of cast iron and are arranged with suitable shut-off slides so that the flow of sand can be regulated conveniently by the operator and thus is not discharged on the ground.

Construction of Bin

The bin proper is made of heavy wood construction, with 2-in. x 6-in. studs supported from the outside by 6-in. x 6-in. horizontal stringers and tied across with reinforcing rods. The inside of the bin is lined with 2-in. tongued and grooved plank and the outside is covered with drop siding to give the entire structure a neat appearance. It is so located between two loop tracks at the terminal that cars may be run in adjacent to the bin for loading with sand, as shown in the accompanying plan of the general layout. Plans now in process of formulation contemplate securing wet sand directly from its source along the Kaw Valley Electric Railway and handling this material in Differential Dump trains directly to the sand plant. It is expected that this will make an additional saving in the cost of handling the material.



The 48th Street and Troost Avenue Sand Bin Is Conveniently Located Between Two Loop Tracks at the Terminal

Park Tax Not in Lieu of Other Taxes in Baltimore

THE UNITED RAILWAYS & ELECTRIC COMPANY
OF BALTIMORE

March 11, 1925.

To the Editor:

Referring to article on page 390, March 7 issue of the JOURNAL, entitled "Park Tax Paid," I wish to call your attention to the last sentence, "It is paid in lieu of all other local taxes." This is incorrect.

In addition to the park tax stated this company pays an easement tax on streets not subject to park tax within the city; also the usual state, city and county taxes on its assessed property, capital stock tax, paving maintenance obligations, car and pole licenses.

Will you kindly make the necessary correction through the JOURNAL?

L. H. PALMER,
Vice-President and General Manager.

A New Name for the American Association Discussed

THE OHIO BRASS COMPANY

MANSFIELD, OHIO, March 9, 1925.

To the Editor:

In last week's issue of the ELECTRIC RAILWAY JOURNAL, L. H. Palmer, vice-president and general manager of the United Railways & Electric Company of Baltimore, commented on the desirability of changing the name of the American Electric Railway Association so that it would be more in keeping with the times. He suggested the name "The American City and Interurban Transportation Association." It is good to see this thought get out into open discussion. It seems so obvious that the name of the association should be modernized in keeping with the general movement throughout the industry that the desirability of such a change can be accepted almost without debate.

The name suggested by Mr. Palmer was probably designed to start discussion and would likely not be his final choice. It seems cumbersome and too hard to use practically. This long name would be further complicated by the necessity to incorporate the names of the affiliated associations, for example, "The American City and Interurban Transportation Engineering Association." To use the initials for a handy reference, we would have the "A. C. & I. T. A." and the "A. C. & I. T. E. A." This would be about as hard to keep straight as that euphonious name "The Amalgamated Association of Street and Electric Railway Employees of America," or whatever it is.

A shorter name, so long as it was distinctive, even though not quite so descriptive, would seem to be better because easier to use. Why not the name "American Transportation Association," as suggested in an editorial in the ELECTRIC RAILWAY JOURNAL for Feb. 2, 1924. This is a broad name which would cover all the activities of the association, would differentiate it from the steam railway association, and would not become greatly complicated by expansion to express the affiliated associations. We would then have the following names: American Transportation Association; American Transportation Engineering Association; American Transportation Accountants' Association; American Transportation Claims Association; American Transportation and Traffic Association.

It would be virtually impossible to select a name that would be truly descriptive of the association work, as this would mean that Mr. Palmer's suggestion would have to be amplified to "The American City and Interurban Electric Railway and Bus Transportation Association." Thus, as long as full description cannot easily be had, why not select the shortest practical name?

HARRY L. BROWN.

Reduced Fares Without Special Tickets

Beaver Valley Traction Company Grants Half Rates for Dollar Day Sales by Carrying Inbound Passengers Free

FOR a number of years past the Beaver Valley Traction Company has co-operated with merchants in its territory, as at Beaver Falls, Pa., to make Dollar Days more successful by means of half-rate fares during shopping hours. The plan has hitherto involved the printing of special tickets at the expense of the Chamber of Commerce. Those passengers who presented the cards printed for the purpose paid the regular fare but retained the ticket after it had been punched by the conductor. On the return trip from Beaver Falls, the passenger who presented this punched card returned free. In this way the passengers received an effective half-rate, off-peak fare. However, the cost to the merchants came to about $175, whereas the number of cards turned in by the operators might not exceed 150, partly because some riders did not bother about the reduction.

It occurred to C. D. Smith, general manager of the Beaver Valley Traction Company, that the process could be simplified by making use of the "honor system" now successfully applied in regular zone-fare operation, which does away with all zone checks. Mr. Smith proposed that the Beaver Falls merchants donate to the railway the $175 subsidy hitherto expended for the cards. The railway in its turn would make it still easier to attend the sales by announcing that passengers bound for Beaver Falls between 8:30 a.m. and 3 p.m. on Dollar Day need pay no fare at all on the inbound journey, needing only to say that they were bound for Beaver Falls. Returning at any time whatever, they would pay the regular fare for whatever ride they took.

The simplified plan was first tried in August, 1924, and repeated on Feb. 19 of this year. Under the old plan, the extra revenue on Dollar Day was something under $100. Under the new plan, the last Dollar Day brought about $250 in excess of the normal weekday revenue. Of this amount $175 came from the merchants in lieu of printing expenses.

The management's investigation shows that although a passenger could ride free to Beaver Falls during the limited period by merely announcing his intention to shop, no large proportion of the riders availed themselves of this privilege. It was, of course, good psychology to put the passenger in the position of deciding whether he would or would not pay for the ride both ways. Undoubtedly the ability to take the ride inbound without spending any money was a stimulus to going to Beaver Falls on Dollar Day.

Tramways Better for Mass Transportation

WHILE congestion is bound to occur with a large volume of traffic moving in a restricted area, tram cars carry more people than would be possible with motor buses under like conditions. This is the conclusion of the royal commission which is investigating the railways and tramways of Australia in New Zealand, as mentioned in the issue of this paper for Dec. 13, 1924. The commission, which is made up of Sir Sam Fay and Sir Vincent Raven, with Charles Travis, secretary, has now made public the results of its study on the New South Wales system of railways and tramways.

In the portion of its report relating to the Sydney tramways, the commissioners say that they are impressed with the excellent operation of the system, and favorable reference is made to the movement of 1,000 to 1,200 people a minute from the racetrack at Rantwick. Commenting on the subject of street congestion, the report says, in part:

In London, among other cities, congestion is at its worst where trams do not run. So great is their obstruction to movement that omnibuses progress within the city limits at the average rate of from 3 to 4 m.p.h. The fact is that, given enough traffic of any sort in any type of vehicle, converging upon a comparatively small central area, congestion must ensue. Whether vehicles roaming over the streets at will are less liable to cause street obstruction than trams fixed to a line of route and having the same number of passengers is questionable. That the Sydney trams carry more people during the peak hours than would be possible with a similar number of motor buses is certain, and although the former do in certain times constitute what has been called a moving platform, they do no more than is necessary to provide for the traffic offering. . . . The immediate remedy, as in the case of the railways, is the completion of the city railway and the electrification of the suburban lines.

In their conclusions, the commissioners recommend that determination in regard to the finance of the railways be taken out of the control of the treasury officials and be turned over to the railway commissioners and that the railway and tramway systems should be so conducted that their gross receipts should be no more than sufficient to cover working expenses, reserves and interest on capital, including sinking fund. Gains from operation would go toward improving the service and lower fares.

The report, as published by the government printer, occupies 204 pages, of which 120 contain the report itself and the remaining pages the testimony presented by the various witnesses examined.

Association News & Discussions

Oklahoma Association Holds Large Convention

THE seventh annual convention of the Oklahoma Utilities Association, held March 10-12 at Oklahoma City, was the largest in the history of the association. More than 60 persons were on the program. The sessions included general meetings, participated in by all branches of the industry, and special meetings held by the telephone, gas and electrical divisions. The feature of the convention was an address on "Community Transportation" by Frank R. Coates, of H. L. Doherty & Company, New York.

Mr. Coates declared that nothing can take the place of electric railway transportation in cities of America, pointing out that notwithstanding the tremendous increase in the number of automobiles during the last 10 years the number of street car riders had also increased.

The tendency today is to look upon all local public transportation as essentially of a monopolistic character. The electric railway company is in the best position to conduct this business, and it should be charged with the operation of all facilities, regardless of the type of vehicle used. This should include even the taxicab service. A coordinated unified system of transportation under one reliable management will give to the community the maximum service at the minimum cost.

The speaker made a plea to electric railway companies to pay special attention to their public relations questions and also to use merchandising methods in the sale of transportation. One of the surest ways to build up traffic, he said, is to make the service attractive. Properly maintained tracks, rolling stock well maintained and painted and kept clean, service fitted to the public requirements—all of these the community has the right to expect, provided it is willing to pay for them.

Committee on Standard Classification of Accounts

PRESIDENT DAVIS of the American Electric Railway Accountants Association has appointed M. W. Glover chairman of the committee on standard classification of accounts of the association. Mr. Glover, who is general auditor West Penn Railways, with headquarters at Pittsburgh, takes the place on the committee of Mr. Wallis, who died several months ago.

New England Street Railway Club

THE annual meeting of the New England Street Railway Club will be held at the Copley Plaza Hotel, Boston, on Thursday, March 26. The meeting for the election of officers will take place at the hotel at 3 p.m. The feature of the meeting will be the banquet in the evening.

The main speeches in the evening will be two in number; one by John N. Shannahan, president of the American Electric Railway Association, and the other by Lucius S. Storrs, now president of the Connecticut Company, but just elected as managing director of the American Electric Railway Association. There will also be vaudeville. The toastmaster of the evening is Charles E. Peirce.

Proposed Standards for Track Bolts

PRELIMINARY sheets showing proposed standard dimensions for track bolts and nuts are being issued by subcommittee No. 4 of the sectional committee on the standardization of bolt, nut and rivet proportions, organized under the procedure of the American Engineering Standards Committee. These provide for two different types of track bolts, one with oval necks and the other with elliptic necks.

The dimensions of the various bolts have been arrived at through a very exhaustive study of the various bolts now manufactured and in use. Preliminary analysis showed that nearly every railway in the country had its own particular design so that there were almost as many types as there are railways. The adoption of these standards should thus prove to be of great value.

The threads provided for the proposed standards are either American standard or Harvey grip thread and they may be formed by cutting, drawing or rolling. In order to specify tolerances for the threads and still make certain that a tight fit is obtained such as is necessary in railway service, manufacturers have made up a large number of special bolts and nuts for both the maximum or minimum tolerance. These have been tested very carefully to determine the pounds pull

Digitized by Google

that is necessary at the ends of various length wrenches in order to start and turn the nuts.

Property Ownership Spreading

Commerce Secretary Hoover Tells Academy of Political Science Diffusion of Ownership Is Force for Social Stability

DIFFUSION through the country of ownership of the kind of property that carries with it a voice in business management was put forward as the greatest contribution to social stability by Herbert Hoover, Secretary of Commerce, in a speech delivered by radio from Washington, D. C., to the annual dinner of the Academy of Political Science, held at the Hotel Astor, New York City, on March 9.

"I am convinced," he said, "that one of the continuous and underlying problems of sustained democracy is the competent and wider diffusion of property ownership. Indeed, I should become apprehensive of the ultimate destruction of democracy as such if I believed that the result of all our inventions, all of our discoveries, all of our increasing economic efficiency, would be toward further and further concentration of property ownership. In the large vision, we have a wider diffusion of ownership today than any other nation in the world."

Mr. Hoover's speech was the principal event in a day devoted to various phases of the subject "Popular Ownership of Property: Its Newer Forms and Social Consequences." Harry L. Stimson, former Secretary of War, presided at the banquet. Other speakers of the evening included Howard T. Sands, vice-president National Electric Light Association; Donald R. Richberg, counsel for the railway unions, and William A. Prendergast, chairman New York State Public Service Commission.

In surveying the tendency toward diffusion of ownership, Mr. Hoover pointed particularly to the need for facts upon which national policies could be based. He continued, in part:

"Since the beginning of the republic there have been periods when tendencies were toward concentration of ownership, and other periods when economic forces and public action made toward greater diffusion. Certainly the courses of diffusion were dominant during the great migration which occupied the West. Again, I believe that one of the by-products of the last war was still another period of increasing diffusion of ownership of property.

"Our high wages during the past three years with the consequent general expansion of savings has, I believe, also marked another period of diffusion.

"For purposes of analysis of the diffusion of ownership we might divide property ownership into two categories: On one hand, the bank deposits, the bonds, the mortgages, the preferred stocks, that is the priority securities; and on the other hand, the common stocks, the land holdings, the stocks of goods, tools, and so on.

"No doubt, saving among the people at large is in the direction of greater safety for their investments. The vast increase in the number of savings, bank deposits, the great growth of industrial and insurance companies, the large expansion of building and loan associations, the unprecedented absorption of all kinds of governmental securities, are all evidences of this.

"But there is another field of property ownership, that of home ownership, that I regret to say we are going backward in. During a period of 10 years we have fallen nearly 10 per cent in the national ratio of owned homes.

"One of the first requisites for adequate economic discussion, and thus the development of any economic or social form, must be the determination of the economic facts.

"I believe your discussions will be a valuable contribution to this subject. Elaboration and development, of course, is the first and fundamental step toward well directed national economic government, and if from your discussions can come the development of the first step, that is, of methods by which we may secure more searching, scientific investigations, more accurate determination of facts, you will have made a great offering."

American Association News

Maintenance Night Held by Metropolitan Section

Papers Describing Maintenance Practices of Rapid Transit Lines and Surface Railways Were Presented and Discussed by Leading Men in the New York Section—Three Hundred Attend

THE regular March meeting of the Metropolitan Section of the American Electric Railway Association, held in the Engineering Societies Building, New York, on March 6, was devoted to a discussion of maintenance problems. About 300 men connected with the electric railways of this section were present, and reports of the officers show that this section now has a membership of 825. This is made up largely of the men who actually do the work of operating and maintaining railway equipment.

Maintenance on High-Speed Electric Lines Discussed

A paper on the inspection and maintenance methods of the New York, Westchester & Boston Railroad was presented by J. T. Hamilton, master mechanic. This road has a trolley potential of 11,000 volts a.c., and the maintenance work on car equipment is divided into inspection, light repairs and general overhauling. At regular inspections, made every 2,600 miles, car body inspectors look after the interior of the car generally and include such equipment as doors, windows, curtains, seats, etc. Truck inspectors look after all truck parts and the adjustment of air-brake equipment. Motor inspectors look after the propulsion and auxiliary motors. Control inspectors give attention to switch groups, reversers, line switches, master controllers, pantograph trolleys, etc.

The shopping for light repairs occurs after operating from 45,000 to 55,000 miles. At this time worn commutators are turned and wheels with sharp flanges are given attention. At the same time, wearing parts are given a close inspection, and replacements are made of the bushings, pins, guides, slides, etc.

General overhauling is carried out on a 200,000-mile basis. At this time, both the interior and exterior of cars are painted, sash, doors, trapdoors, etc., are overhauled, and all car equipment is placed in efficient working condition. The practice on the New York, Westchester & Boston Railway is to overhaul electrical apparatus, such as switch groups, transformers, etc., on every second general overhauling or painting period.

Mr. Hamilton emphasized the value of proper co-operation of the various departments of electric railways, and also of the value that manufacturers' engineers could be to the various operating companies by having their engineers follow up the performance of various parts of the equipment, so as to recommend methods for overcoming troubles and also collecting information which could be used to good advantage in bringing out new designs, which would incorporate valuable improvements.

Maintenance Practices of B.-M. T. Discussed

W. G. Gove, superintendent of equipment Brooklyn-Manhattan Transit Corporation, spoke briefly of the development of rapid transit lines and the progress made in providing equipment that would stay on the road for longer periods with less frequent inspection. He said that with the first introduction of electric cars it was necessary to adjust the brakes every night and also to oil certain parts. Now, through the introduction of improved methods of lubrication and the use of mechanical devices, such as slack adjusters for brake equipment, the inspection periods for rapid transit cars on the B.-M. T. lines has been increased to 1,500 miles. As these cars average 166 miles per day, cars come in for inspection about every nine days.

The basis for making inspection and overhauling in Brooklyn has changed somewhat since Mr. Gove first took charge about 20 years ago. At first, inspections and overhaulings were made on a time basis. Next, this was changed to a mileage basis and the intervals were varied to accommodate

Digitized by Google

different types of equipment. Today a mileage basis is used, supplemented by a time inspection. The time inspection occurs every 120 days, and the average time consumed per car is approximately 20 minutes. Inspectors of the railway also make the repairs. In addition, there are checkers at each shop reporting directly to the head of the inspection forces and who make certain that the work is done properly.

Mr. Gove stressed the value of an efficient organization for carrying out maintenance methods, and also said that the age of the equipment had much to do with the amount of work required. In New York, particular attention is devoted to avoiding all kinds of failures and to keeping ahead of the time when defects might occur by making renewals and replacements at frequent intervals.

Mr. Gove also referred briefly to the keeping of records regarding the performance of equipment. He said that when the system was small with comparatively few cars, this worked out very satisfactorily, but with the large increase of equipment which has occurred through extension of rapid transit operation in New York, such a system became unwieldy and failed in its desired results. He said that the quality of maintenance must depend primarily on the organization's ability to detect and remedy defects, and that the co-operation of sales representatives in the metropolitan district had been of great help. Engineers of the various manufacturers have investigated failures and sought out remedies to problems as they occur and thus helped materially to effect the high grade of maintenance now carried on. In referring to the close co-operation between departments which exists on his system, Mr. Gove said that this had come about principally through necessity, since all departments have come to realize that if they were to carry on transportation economically, there must be close co-ordination between all departments.

Manufacturers' Side of Maintenance Presented

H. H. Wentworth, transportation sales engineer Westinghouse Electric & Manufacturing Company, gave several examples of what the various operating companies in this district have done to improve maintenance. He said that the duties of manufacturers' engineers were first to design equipment that could be easily and efficiently maintained at low cost, and second to help out on the maintenance problems of the operating companies. He called attention to the advisability of specifying limits of wear to determine the life of parts and to make certain that repairs were made in time. If wearing parts are left in service too long, they eventually destroy themselves and so require an entire replacement, while if repairs are made before their period of usefulness is over, the parts can be reconditioned and considerable expense saved. In order to make certain that limits when once established are lived up to, the work of inspection and replacement must be made as easy as possible. Mr. Wentworth expressed the opinion that there were some advantages from having the inspection and repair departments separated.

C. E. Morgan, vice-president and general manager Brooklyn City Railroad, said that the yardstick for measuring maintenance results must be different for different properties. The operating companies, he said, offer to the manufacturers laboratories for development and trial of equipment, and it was to their advantage that these be utilized to the fullest extent. He said that he considered the mechanical and transportation departments the backbone of any railroad system, and that their results could make or break a property. He referred to his early experience in operating high-voltage equipment and said that such lines offered problems not ordinarily encountered in regular 600-volt operation.

Maintenance of Surface Equipment Discussed

A paper on surface car maintenance was presented by D. J. Locke, staff engineer Public Service Railway, Newark, N. J., who gave some statistics as to the size and number of cars maintained by his company, and outlined the various maintenance methods. There are many problems encountered in surface car operation that do not occur with rapid transit lines. A grooved rail must be used, which makes the track inelastic and complicates special work layouts. It is also more difficult to keep track in proper repair and bad joints or excessively worn crossovers result in much jar to the rolling stock, which requires more frequent maintenance.

Drainage problems in connection with surface operation also present some difficulty, and frequently equipment must operate through water and the accumulation of dust and dirt is also more apparent. Traffic congestion is also a factor and operation through congested sections results in frequent damage from collisions and necessitates repairs that would not be encountered in rapid transit service.

About 2 years ago the Public Service Railway began the use of Economy meters for determining inspection periods. These meters register kilowatt-hours of energy consumed, but by knowing the average consumption of the different cars, a car-mile basis is readily established. The meters used have three dials which provide for three inspection periods. The red hand is set to provide for a general inspection period equivalent to every 750 miles. On this inspection bearings are oiled, brakes and brake riggings are adjusted, light repairs are made to the electrical equipment, car bodies, etc. This work is done in the carhouses over pits. General overhauling and painting are done annually. The principal parts that require attention are brake rigging and truck parts. At this time motors are removed and overhauled and car body repairs are made, together with the repainting.

Mr. Locke referred briefly to the revamping of motor equipment which is being carried out on his property and which was described in the ELECTRIC RAILWAY JOURNAL for Dec. 20, 1924. He said that this work had reduced the annual cost of bearings to one-quarter the previous cost and that failures of bearings in service were now almost unknown.

Another part of the equipment which is receiving particular attention by the Public Service Railway is the insulation of field coils and armature coils. A system of insulating these parts has been developed in the shops of the company which while of high first cost is far cheaper in the end since it has resulted in very few failures. Field coils receive seven successive dippings and bakings in as many days before they are installed. Armature coils receive three dippings and bakings after the coils are assembled in the armature slots.

In discussing maintenance practices of the Third Avenue Railway, J. S. McWhirter, superintendent of equipment, said that the men who actually do the work are the important parts of a maintenance organization, and that these of course must be supplemented by men who direct the work. He referred to the effect which operating abuses have on increasing maintenance costs, and the value of co-operation from the operating department in order to reduce these. He said that while it is necessary to keep ahead of failures by making renewals and replacements, the scrapping of parts which still have service is a waste which should not be countenanced by maintenance superintendents. He referred to the increase in time for the inspection periods which had occurred through the use of better and more modern equipment, so that daily inspections no longer were necessary.

The inspectors make repairs on the Third Avenue System and Mr. McWhirter described a type of record card which he had found most satisfactory. This provides a list of the various parts of the car equipment and space for signature opposite each part by the man who makes the inspection. He said that collisions and accidents in service were most frequently laid to bad brakes and he stressed the importance of making certain that handbrake equipment and air brake parts were kept in a high degree of repair, so that there could be no cause for complaint on this score.

L. T. Carter, assistant engineer General Electric Company, spoke of the assistance that manufacturers' engineers could give to solving maintenance problems. He said that the duties of such engineers were first to make sure that the equipment is of proper capacity. If it is too large, excessive power consumption and cost result, and if it is too small, maintenance costs will be high. He spoke of some of the improvements which had been made in modern motor design to decrease maintenance costs, and said that wherever possible old motors should be revamped so as to incorporate modern methods. He spoke briefly of the maintenance requirements that were necessary for gasoline-driven buses, trolley buses and the new types of electric drive for buses as used in Philadelphia. One of the particular advantages of electric drive and also of the use of the trolley bus was from the fact that electric railways could use the same maintenance forces for this equipment.

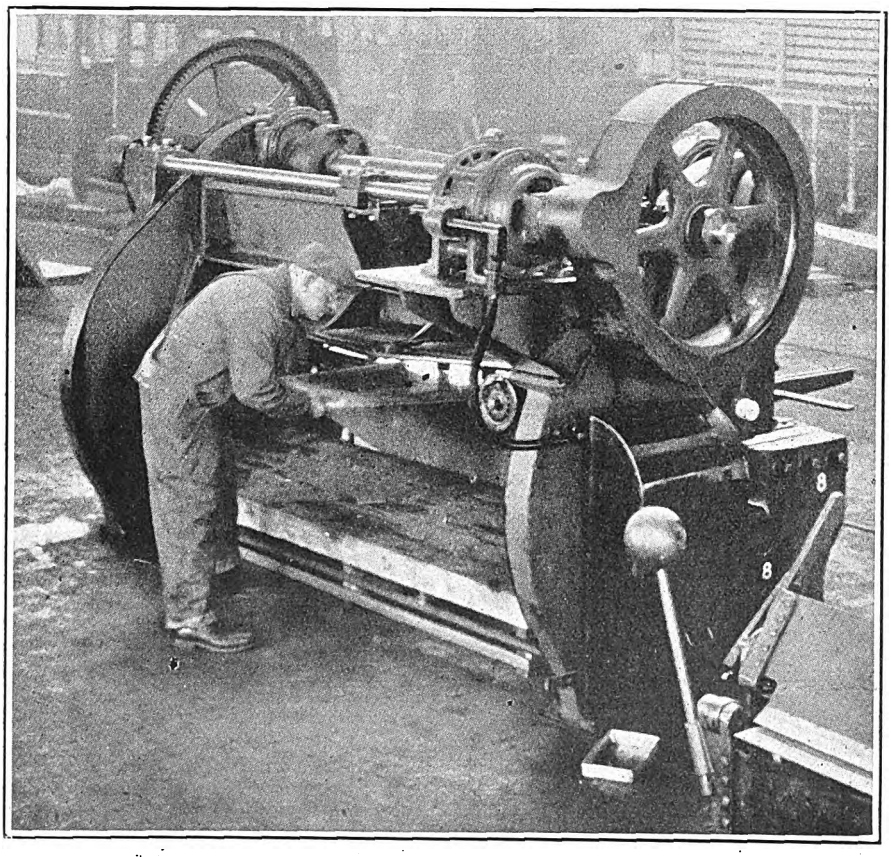
Maintenance of Equipment

Squaring Shears in Constant Use

AMONG the new machine tools installed in the Everett shops, Boston, Mass., is a Niagara power-driven squaring shear. This machine weighs 12,800 lb., is driven by a 7½-hp. General Electric motor and is used to cut up all kinds of sheet metal up to ¼ in. thickness. It is kept in constant use cutting raw sheets to size for metal panels for the sides of cars, dasher signs, ventilators, cams and tank pans and more than 3,000 panels for the sides of cars have been cut with it since it has been installed. Officials state that the saving from the use of this new machine over older types previously used will pay for its cost, which was $2,750, in less than 2 years' time. The economies resulting from its use are more accurate work, greater speed of operation and finer adjustment of the cutting edge.

In operation a sheet of metal is put into the machine and automatically clamped into position. Then a descending knife cuts off a strip of any predetermined width. The width can be varied with extreme accuracy by a fine adjusting gage to give a variation of 1/16 in. The knife cuts a length of 96 in. at one operation, and it is possible, provided the strip to be cut off is not more than 15 in. wide, to cut up a sheet of indefinite length by subsequent cuts. For accommodating this type of work a gap is provided in the frame of the machine which allows the sheet to move along after each cut.



Cutting Sheet Metal with Squaring Shears in New Everett Shops, Boston, Mass.

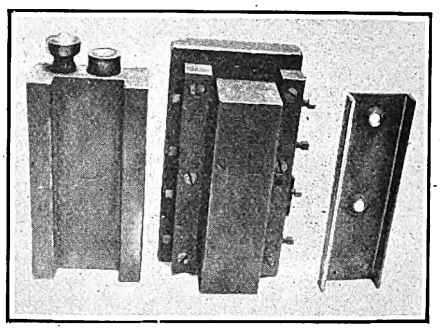
Die-Formed Pedestal Wear Plates

BY T. E. WOOD
Master Mechanic Omaha & Council Bluffs Street Railway, Omaha, Neb.

WEAR plates for truck pedestals on the Omaha & Council Bluffs Street Railway are formed from ¼-in. flat steel stock with the punch and die equipment shown in the accompanying illustration.

After forming to the proper shape, the plates are punched to receive counter-sunk plow bolts, with which they are fastened to the pedestals. The small conical shaped punch and die shown in the illustration are used to punch and countersink these bolt holes in one operation.

It will be noted that the forming punch consists of a base member and



Pedestal Wear Plates Are Formed and Punched in Omaha with This Die Equipment. The Block in the Punch May Be Changed to Handle Different Thicknesses of Material

a removable block held in place by eight set screws. Wear pieces are made from both ¼-in. and 5/16-in. material, to take care of variations in the clearance between journal boxes and pedestals on different trucks. To form these different thicknesses of material, it is only necessary to change the projecting block in the punch.

After the punch and die have been securely clamped in place on the press slight adjustments in the relative position of the parts may be made with the set screws on the punch.

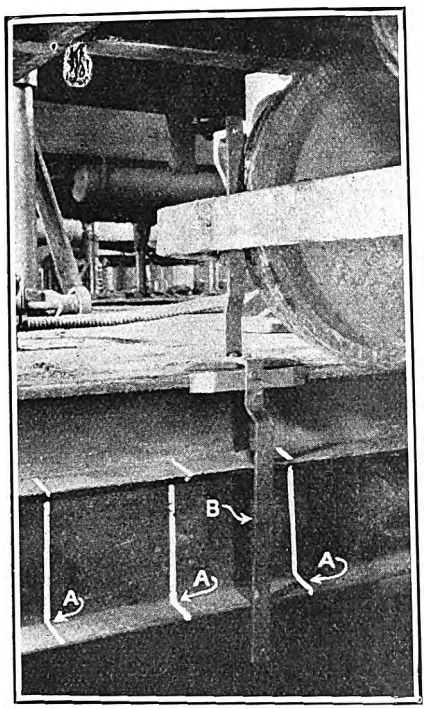
Truck-Squaring Device

BY H. F. FERGUSON
General Foreman Highland Park Shops, Department of Street Railways, Detroit, Mich.

AN ARRANGEMENT which provides a simple and easy method of checking trucks for squareness while they are in normal position over the shop pits is used by the Department of Street Railways, Detroit.

A number of hacksaw marks are made on the base of the rail as shown at *A* in the accompanying illustration. These are spaced 18 in. apart and painted white lines make them readily visible. Duplicates of these

Digitized by Google



This Simple Arrangement Is Used by the Department of Street Railways, Detroit, for Checking Trucks for Squareness

marks are carefully laid off at right angles on the opposite rail. This allows the use of the scheme with the trucks at any position on the track.

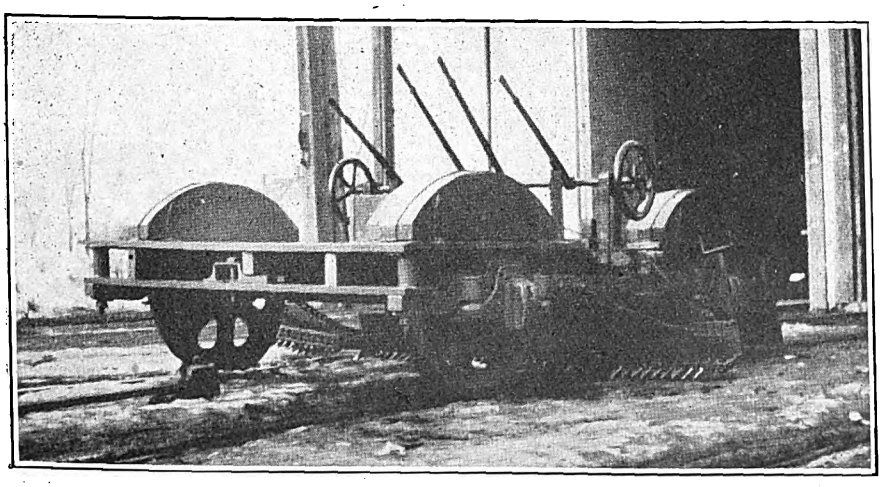
A gaging device of steel, shown at *B*, serves in the nature of a square, reaching from the base of the rail to the center of the wheel tread. With a truck in position the gage is set on the rail as shown in the illustration, with the upper edge of the straight edge against the tread of the wheel. The distance between the lower projection of the gage and the hacksaw mark is measured with a steel rule. The same procedure is repeated on the opposite wheel. After calipering the two wheels, the combined measurements indicate whether or not the truck is square.

On trucks with motors of such size as to make the axles accessible, a similar gage is used, but in this case the upper arm is offset to come inside the wheel. A steel rod held parallel to the rail between the center of axle and the upper arm of the gage allows measurements to be taken as in the previous case, but by this method the diameter of the wheel need not be considered.

Ice Cutting Saves Gear Cases

AN ICE cutter constructed in the shop of the Biddeford & Saco Railroad, Biddeford, Me., by the master mechanic and the regular shop employees has proved very satisfactory. The apparatus consists of an old truck frame, on which there has been built a plank floor. Underneath the truck frame a 6-in. x 6-in. angle iron has been arranged with ice picks attached to it. These are bolted on as shown in an accompanying illustration. The end sections are hinged so that the center can be used alone or with one or both ends, as desired. Sections are raised or lowered by four levers.

This cutter is hauled by a regular motor car and requires a crew of two men on the car and two on the cutter. Behind the cutter a snow plow is operated, requiring two more men, or six in all. With this equipment the railway has been able to cut down the hard ice center between the rails and on both sides to ½ in. above the track level. This was done on a 5-mile stretch of track in exactly 2 hours, without interfering in any way with regular operation of passenger cars. To have done the same work by hand would have required a crew of 50 men and taken several days. It is thought that the saving on gear cases alone has more than paid for the cost of the apparatus.

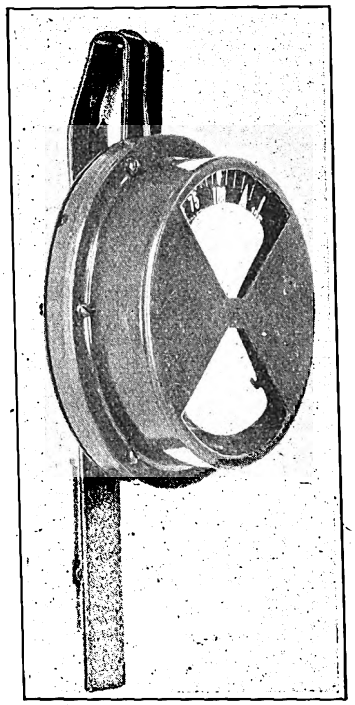


Six Men Using This Ice Cutter on the Biddeford & Saco Railroad Have Cut Down the Hard Center in Less Time than 50 Men Working by Hand Used to Do

New Equipment Available

Load Indicator for Transformers

A LOAD-INDICATING device for distribution transformers which compensates for ambient temperature is a recent development of the General Electric Company, Schenectady, N. Y. It is suitable for transformers of the types used for



This Device Indicates the Average Load that Is Being Carried on a Transformer

miscellaneous purposes on the a.c. circuits of electric railway systems. This instrument consists of two thermometers connected in series. The first thermometer is actuated by the heat of the transformer's top oil; the second, located in the external case, is actuated by the ambient temperature and modifies the reading of the first.

The composite reading given by the hand closely approximates the internal coil or hot spot temperature and, for convenience, is given in terms of "per cent equivalent load." This is the proportion of the safe continuous output of the transformer, represented by the load cycle causing the indication. The dial is calibrated to indicate from 50 to 125 per cent equivalent load. A semaphore is tripped by the mechanism and swings into view

Digitized by Google

when the instrument registers more than 100 per cent, equivalent load.

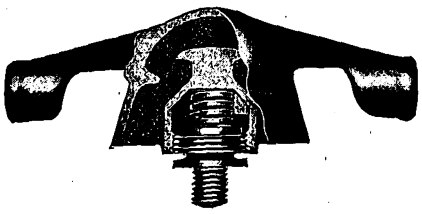
Readings in excess of 100 per cent show that the transformer is too small, since it has carried a continuous load, or a short time overload equivalent to a continuous load sufficient to bring the internal winding temperature to 100 deg. C. or higher.

A resetting lever extends below the external case.

Spring-Lock Hanger

A SPRING - LOCK trolley wire hanger with new principles in design is being marketed by the Ohio Brass Company, Mansfield, Ohio. This is made in two forms, one for cross-span work and the other for bridge, barn and trough suspension. Improved features include a flexible connection between the hanger and ear and provision for aligning the ear with the trolley wire without loosening its hold on the hanger stud.

The cushion feature is provided by a spring which is interposed between the hanger body and the stud. The latter has, on its upper end, a



Hammer Blows from Wheel Passes Are Damped Out with Spring-Lock Hangers of This Type

grooved portion held in position by a bushing which is screwed into the bottom of the hanger. This grooved section is free to rotate in the bushing and is normally held down by the spring. The stud member moves vertically against the spring action when the trolley wheel passes under the ear boss, or with a slight pivoting motion as the wheel approaches or leaves the ear.

The cushion serves to dampen out the shock and reduces wear of the trolley wire and ear at the suspension point. Alignment of the trolley ear is taken care of by a lug cast on the upper part of the stud and a corresponding projection in the upper part of the cavity in which the spring is assembled. These two projections engage each other when the stud is rotated. The ear can be securely fastened on the stud in the usual manner. To align with the trolley wire the ear is turned back and carries the stud with it. The lugs separate without disturbing the union between the stud and the ear.

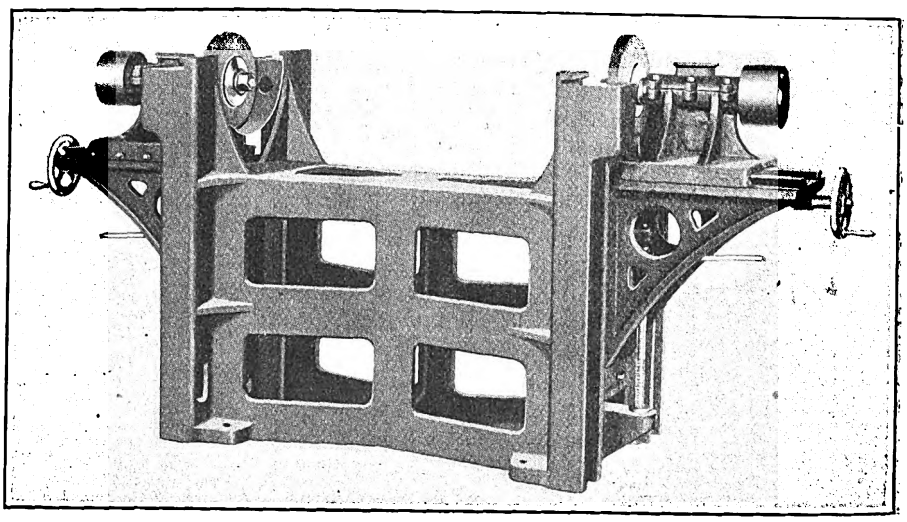
The ear can be removed by unscrewing in the usual manner and the lugs are brought into engagement in the opposite direction to hold the stud against further rotation.

The insulating material of the spring-lock hangers is of standard design. The metal parts are malleable iron, hot-dip galvanized. The spring is tempered steel, electro-galvanized, and as a further protection against corrosion the chamber in which it is mounted is packed with fiber grease.

Car Wheel Grinder

THE Hanna Engineering Works, Chicago, Ill., has recently brought out an improved type of QMS car wheel grinder. The frame of the new machine is in one piece, whereas in previous types it was built of a number of parts. This construction reduces the liability for misalignment of co-ordinating parts and affords a substantial support for the knee and saddle members. The mounting is movable, horizontally and vertically. The two removable sections of the track rails are rigidly supported at four points by the frame. When these rail sections are removed space is provided for the grinding wheels of the machine.

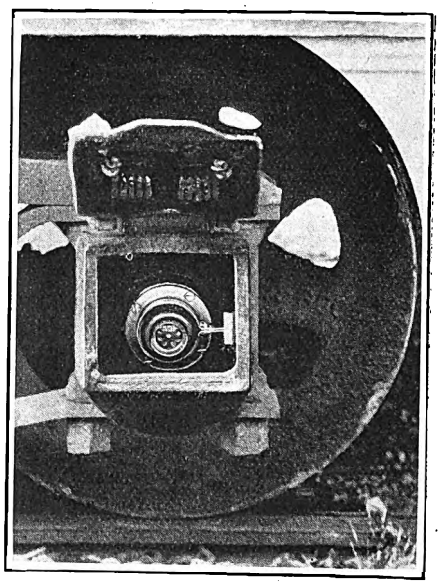
The operation of the grinder is similar to that of previous types. The car is run over the grinder pit and the axle is jacked up. In the grinding operation the axle and wheels are driven by the car motor, with the grinding wheels in contact. The grinding wheels used in the new type grinder are 14 in. in diameter by 2 in. face. They are driven at a peripheral speed of 5,500 ft. per minute.



Car Wheel Grinder with One-Piece Frame Preserves Alignment

Hub Odometer Applied to Cars

THE accompanying illustration shows the device known as the "Hub Odometer" attached to the axle of one of the cars of the Peoples Railway, Dayton, Ohio. This type



A Device for Measuring Mileage Directly Applied to the Journal of an Electric Car

of instrument as developed for recording mileages of trucks and motor buses was described in the ELECTRIC RAILWAY JOURNAL for August 9, 1924, when it was first placed on the market by the Ohmer Fare Register Company, Dayton, Ohio. It records mileage, regardless of the direction of motion of cars. In backing, the mileage is added instead of being subtracted, so that the record of distance covered is the total. The instrument is fastened directly to the axle without flexible shafts or gears, and the figures are always right side up so that they can be read conveniently.

The News of the Industry

Bold Buffoonery in Buffalo

Officers of International Railway Resent Caustic Comment of Local Papers—Jitney Idea Persists

Mayor Frank X. Schwab of Buffalo, N. Y., has served notice on Herbert G. Tulley, president of the International Railway, that unless there is a substantial improvement in service by April 1, 1925, he will declare a transportation emergency exists in the city. The courts have upheld the contention of the International Railway that the Mayor of the city is without authority to declare a transportation emergency and issue jitney bus permits. The Mayor has been making statements to the public press criticising the management of the company and the service rendered.

In his attacks on the company, Mayor Schwab has had the support of Frank C. Perkins, the Socialist member of the City Council, who is pushing his pet idea of a municipal bus system providing for an expenditure of $1,000,000 for complete motorization of the city under municipal ownership. The application of the International Bus Corporation, a subsidiary of the railway, for a permit to operate a bus line equipped with double-deck vehicles in Richmond Avenue has been sidetracked in the City Council because of the decision of the Public Service Commission in granting a higher fare to the railway.

Because of the violent attacks made by the Buffalo *Evening News* against the railway management and Henry W. Killeen, of counsel for the traction interests, Mr. Killeen has sought to institute John Doe proceedings in the courts to determine whether or not warrants for criminal libel could be obtained against the publisher, the city editor and several members of the editorial staff of the newspaper. The specific editorial aimed at Mr. Killeen was published under the caption, "Thumbing His Nose," in which the counsel for the railway is claimed to have defied the courts and the Public Service Commission in his efforts to get a higher fare for the International.

Contracts at Detroit Still Subject to Council's Approval

The Council of Detroit, Mich., has defeated a proposed amendment to the city Charter intended to remove the Department of Street Railways from the jurisdiction of the Common Council in so far as all deeds, contracts, leases or purchases are concerned. The proposed amendment was sent to the Council for submission to the voters at the election on April 6. It was recommended for approval by the Street Railway Commission and really was the outcome of the commission's refusal to abide by the Council's demand for the purchase of motor coaches not considered best fitted to meet the city's needs.

The Council's action was in accordance with advice from Mayor John W. Smith.

Charles P. O'Neil, Corporation Counsel, quoted Section 13 of the city Charter to mean that the Street Railway Commission had no right to submit a matter to the Council when it was disapproved by the Mayor.

In his letter to the Council Mayor Smith pointed out that the intention of the proposed amendment was to remove from the Council the power granted by the people to approve contracts entered into by the Board of Street Railway Commissioners. He said from the fact that the Charter states that the actions of the board are subject to the approval of the Mayor, the impression might be gained that the proposed amendment bore the approval of the chief executive. On the contrary, he disapproved of it. The present method of acting on the Board of Street Railway contracts is believed by the Mayor to be eminently proper.

"Memorial" Praised and Blamed

Railway in New York Says It Is Not in Politics and that Its Proposed Plan Is the Quickest Way of Obtaining New Subways —Recent Moves Reviewed

THE Interborough "Memorial" that was presented to the Governor and Legislature of the State of New York on March 5, and briefly mentioned in the issue of this paper of last week, has been severely criticised in some of the New York daily newspapers as an unwise political move and an aid to Mayor Hylan. Other representatives of the metropolitan press indorse the policy of the company in making the statement. Spokesmen from the company itself say that it was issued to give the public and the Legislature the facts and that the company is seeking neither to elect nor to defeat Mayor Hylan.

The memorial was mentioned only briefly last week owing to the fact that it was made public the day on which the issue of this paper went to press. It declares that the company is financially unable to defray the expense of lengthening those local platforms which now are suitable for only six-car trains, as recommended in the McAvoy report. It points out that in 1922 a reduction was made in the sinking fund requirements of the company's 5 per cent bonds, the rental on the elevated lines was reduced, the stockholders paid $10,500,000 into the treasury and the employees voluntarily reduced their wages 10 per cent. These voluntary concessions made it possible for the company to avoid a receivership. Only one-half of this reduction in wages has been restored. New rolling stock has been purchased through equipment certificates. No dividend has been earned or paid on the stock of the company since Jan. 1, 1919. The company is willing even now to continue as it has been doing and do the best it can under the circumstances, but it cannot meet the additional requirements of more service or extensive station improvements without additional revenue.

The memorial also pointed out that the city is in like condition as regards credit for the construction of new subways. A constitutional amendment is proposed to give the city more credit, but at best it will take 3 years to pass this and it may take longer. If $275,000,000, the amount proposed to be freed, is added to the present non-self-sustaining investment in subways, the aggregate will be $526,500,000, the interest and sinking fund of which must be carried in the annual tax budget. In addition the city proposes to expend as many millions ($60,000,000 in 1925) as can be allocated to subway purposes each year thereafter. This would mean that in 5 years $826,500,000 could be added as a burden on the taxpayers as long as the 5-cent fare remains the maximum chargeable.

Constructive Plan Suggested

A way to avoid all delay in subway construction is through a statutory increase in the rate of fare sufficient to release immediately the city's frozen credit of $251,500,000 in the present subways. It is with the hope of taking the subject out of politics, the company said, that it made this appeal and that it was willing "and requests that the statute shall provide for impounding the amount of increase in the rate of fare enacted so that it may receive no return greater than what the statute may declare necessary to enable it to render adequate service and make such additions and betterments as may be found necessary or advisable by the public authority having jurisdiction in the matter." No rate of fare was mentioned in the memorial, but it is believed that the directors had in mind a 7-cent fare, as this was the sum mentioned in a brief submitted to Judge McAvoy by James L. Quackenbush, counsel for the Interborough, as an unofficial suggestion during the hearing. Of this amount Mr. Quackenbush

Digitized by Google

suggested that 1 cent of the increase go to the city to pay interest on its unproductive subway bonds. This would be adequate to free the city's present subway investment from the debt limit and make $250,000,000 available as a revolving fund for new subways. Mr. Quackenbush further suggested that the rental on the Manhattan Railway be limited by the new arrangement to 5 per cent and Interborough dividend to 4 per cent and that a similar provision for a fixed return could probably be made in the case of the Brooklyn roads.

Memorial Attacked

After its publication, the memorial was attacked by several of the daily papers, by Mayor Hylan, Commissioner McAneny and William J. Schieffelin, chairman of the Citizens' Union. The *Times* declared that if the directors were in a tacit conspiracy with Mayor Hylan to bring about his election and to prevent all subway building, they could have hardly acted in a way better fitted to attain those ends. They must know, it said, that their petition to the legislature will never be granted. The *Evening World* said: "There is not the least possibility of any such authorization being granted. More than that, it should not be granted." The principal newspaper defender of the company was the Brooklyn *Citizen.* An editorial in that paper was concluded as follows:

> The Interborough directors, at least, are not seeking to delude the people. They know that the solution of the question lies in an increase in fare and that there is no other solution, because the transit problem is not a political but a business proposition, and every business proposition is determined by intake and outgo.

The *Wall Street Journal* considers that the plan of the Interborough offers the sole chance of early transit relief. It said it is unfortunate that circumstances require the question of a reasonable fare to be put to the Legislature, but that power, at the request of the Transit Commission, does not lie with it now except in concurrence with the Board of Estimate, so that appeal to the Legislature was necessary.

Another important contribution to the discussion was the report of the committee of the Merchants' Association, abstracted on page 372 of last week's issue. This report condemned the policy of the City Board of Transportation in projecting plans for a completely isolated system. Such a policy, the report points out, involves a needlessly great capital outlay, additional fares for many passengers, reduced earnings and probably the necessity of making up a deficit by taxation. Instead, the committee recommended "a policy of unified operation" with utilization of both old and new facilities. Figures were published to show that the proposed isolated subways would require capital charges per route-mile more than twice those of the present subway. On fares, the committee said that while it was in full accord with the city authorities in wishing to see the 5-cent fare maintained, if possible, the aim should be to have the lowest possible rate of fare consistent with satisfactory service.

The New York Transit Commission, through George McAneny, chairman, declared the commission was "totally out of sympathy" with the request for an increase in fare. Chairman McAneny pointed out that the commission had opposed previous attempts to raise the fare and no member of the commission had changed his mind. If the question of money stringency was the controlling consideration, he was unable to see why the city of New York should not issue its bonds in full, if necessary, to cover needed improvements. It would simply be putting its own money into its own investment, and it could carry that added investment at a lower rate of interest than the company, therefore a larger net return would be earned from operation. The large expense of the item of improvements mentioned in the McAvoy report to be borne by the company was one of the reasons set forth in its memorial for a change in conditions.

Mayor Hylan, who had just returned from Palm Beach before the memorial was presented, indulged in a characteristic statement. "The increased-fare crowd have marched up the hill at Albany with a big fanfare," he said, but "they have been routed in the past and they will be routed again. It has taken the people a little time to get on to their maneuvers, but they are no longer being duped by traction professions of interest in the public, when experience so often proves that it is an interest limited solely to swelling traction pockets."

Another criticism of the move, on the ground that it "would help re-elect Mayor Hylan," was made by William J. Schieffelin, chairman of the Citizens' Union, at a luncheon of that organization on March 7.

The Company's Reply to Criticisms

James L. Quackenbush, general counsel of the Interborough, replied to the comments of Mr. Schieffelin in a letter to him published on March 11. He said in part that the position of the company is not and cannot be influenced one way or the other by political consideration. The memorial described the only method by which new subways could be obtained and existing subways made more efficient. These statements have not been denied, only the charge is being made that the company is helping to re-elect Mayor Hylan. In conclusion Mr. Quackenbush said:

> If we have misstated facts, if we have exhibited merely greed for more income, if we are wrong in thinking that there is no other way quickly to obtain new subways, we shall be very glad to have you put us right. But we cannot believe that it is an answer to a carefully studied plan to assail that plan on the ground that it would be of political advantage or disadvantage. We are not in politics; we are operating a railroad and endeavoring to show the way to get additional service and to supply additional facilities as rapidly as possible.

$6,000,000 Needed for San Francisco Municipal Railway

M. M. O'Shaughnessy, city engineer of San Francisco, Cal., has recommended submission to voters of a new bond issue of $6,000,000 to care for municipal railway development needs. It is estimated that the sum or $635,000 is immediately necessary. It will be obtained by diverting funds intended for other purposes, chiefly depreciation reserve. Needs listed are chiefly railway and bus line extensions, a $1,256,000 tunnel and a $2,045,000 cut for line extension. Four extensions and five new bus lines are listed as necessary.

Railway Meets Emergency with Buses

Bus service is proving popular in Ann Arbor, Mich., a city of 20,000 population. The first day the buses were run there to replace the street cars 2,942 persons were carried. This was on Feb. 1. Sunday, Feb. 22, there were 3,099 passengers and on Feb. 28 there were 6,100. For the fourth week of operation the buses carried 32,942 passengers, an increase of 3,406 over the preceding week. The routes are arranged so that almost all of them touch the center of the city and the University of Michigan Campus. There is a 20-minute service over most of the routes, with one or two operated at intervals of 15 minutes.

For many years six single-truck trolleys traversed a few streets from the university to the depot, and from the non-collegiate section of the city to the manufacturing district. It was too expensive to lay rails to the rapidly growing suburbs. Early in November, 1924, the People's Motor Coach Company, a subsidiary of the Detroit United Railway, suggested the substitution of buses for the cars. The fare structure agreed upon was: 10 cents cash, three tickets for 25 cents, a weekly pass for $1.25, and a 50-ride, non-transferable book at $3, good for 40 days. The fare schedule is based on a formula which will provide the necessary operating and overhead charge, but will, with sufficient traffic, amortize the electric railway investment over a period of years. The present arrangement is a temporary one to run for a year. At the end of that time the granting of a franchise will be taken up.

The new service was ushered in with considerable ostentation. On Friday afternoon, Jan. 30, twelve Yellow coaches lined up behind one of the old street cars. A veteran "dinkey" led the procession. It bore a sign which read: "Good-by, Folks! The scrap heap for mine." On the other side this bad but effective verse was displayed:

> I leave you now without reproach,
> I humbly bow before the coach.

The coaches carried signs which read: "Our up-to-date service for this up-to-date city begins Feb. 1."

Railway Attacks Philadelphia Power Plan

The Philadelphia Rapid Transit Company, Philadelphia, Pa., has aligned itself in opposition to the five applications filed with the Pennsylvania Public Service Commission by the Philadelphia Electric Company and the Susquehanna Power Company asking approval of their development plans for the Conowingo (Md.) hydro-electric project. The Philadelphia Rapid Transit Company bases its action on the assertion that it uses about 20 per cent of the output of the Philadelphia Electric Company in the operation of the street-railway system of the city, two-thirds of the energy

Digitized by Google

for this system being purchased from the other utility. It maintains that the present rates of the Philadelphia Electric Company are excessive and discriminatory and asks for their reduction. The rapid transit company says that in 1923 the electric company earned 20 per cent gross income on the estimated original cost of its properties, whereas the Public Service Commission in 1916 approved a stipulation that the power company's earnings should not exceed its bond interest and 7 per cent on its then outstanding capital stock.

The railway company's brief maintains that the electric company is to pay an excessive price for the site, that Drexel & Company, who held the options on the Conowingo site and are the fiscal agents for the undertaking, are to receive excessive promotion commissions, and that Stone & Webster, who, it is understood, are to build the plant, will make excessive profits.

Referendum Proposed in Tacoma

At a recent meeting of the City Council of Tacoma, Wash., a proposal was submitted by the Tacoma Young Men's Business Club for a referendum on the question of a settlement of the car-jitney controversy. The club wants to send out a ballot by mail to secure "yes" or "no" answers to the following questions:

1. Shall the City Council negotiate a settlement of the railway problem?
2. Shall the city make franchise concessions to the railway if a reduction in fares is obtained thereby?
3. Shall jitney buses, now paralleling railway lines, be discontinued and buses allowed to operate only in territory not served by the railway if a reduction in street car fare can be obtained thereby?

The club plans, if it can secure the approval of the Council, to bind the Tacoma Railway & Power Company to abide by a settlement based on the desires of the people. The matter was referred to a committee of the whole Council for review at a meeting to be held in the near future.

More Study and Greater Discussion Needed at Toledo

The transportation system of Toledo, Ohio, has become the subject of political discussion again through various proposals lodged in the City Council in the last few weeks. At a meeting on March 6 attended by councilmen, the street railway commissioner, officials of the Community Traction Company and administration officials, including the Mayor, no decision was reached, but it appears that the city will ask a modification of some of the terms of the Milner service-at-cost plan.

Prior to the meeting Councilman Grant F. Northrup suggested before the Council that existing schedules and service in effect at the time of the adoption of the Milner ordinance be restored. Since that time many rerouting changes have been made and some lines abandoned. In an open letter to Mr. Northrup, Judge John M. Killits of the federal court blamed the high fares and difficulties in obtaining improvements on the fact that nontaxpaying competitive bus lines had been fostered and that the Council had failed to take advantage of the clause in the Milner ordinance forcing the Doherty interests to invest an additional $1,000,000 capital in extensions and a crosstown line.

To make matters still worse the *News-Bee*, a Scripps-Howard newspaper, which fought the service-at-cost plan originally and favored municipal ownership, has returned to the attack with renewed energy. It now insists that the car lines shall be junked and bus service substituted.

Other matters aggravate the situation. The home-rule bus bill will bring several new proposals for complete city-wide bus systems. The Toledo People's Motor Bus Company already has an application before the state body for permission to duplicate the service now rendered by the Community Traction Company, and it is known that an Eastern group has been making a survey of the city with the idea of offering to install a complete bus system to operate on a sliding fare scale with 10 cents as the maximum.

Further agitation is aroused by the appearance of Joseph J. Beierla, head of the Toledo Motor Bus Company, with an offer to operate buses to all parts of the city at a 6-cent fare with universal transfer if granted a 15-year franchise. Mr. Beierla's present 5-cent line competes with the Dorr Street line of the Community Traction Company.

It is expected that the major problems will be taken up at a series of conferences between the city and company representatives following a further study of the problem by them.

Franchise Ready in Kansas City

For several months conferences have been held at Kansas City, Mo., at which the Council committee and the general manager and the receivers for the Kansas City Railways have considered conditions under which the railway should operate buses in auxiliary service. On March 9 the draft of the franchise was practically finished, with all major points considered more or less satisfactory. The ordinance will now go before the Council.

Service-at-Cost and Purchase Contract

Milwaukee Stockholders Recommended to Accept New Grant to Be Submitted to Voters on April 7—Provisions of New Operating Arrangement Reviewed

STOCKHOLDERS of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., have been called for a special meeting on March 23 to vote on the proposal that the company accept the new "service-at-cost and municipal acquisition" contract with the city of Milwaukee. The directors recommend that the ordinance be accepted. While one result of operation under the contract will be definitely to limit the earning power of the company in the principal district which it serves, the directors are said to feel that the advantages to be anticipated on the other side, which include stability in earnings, improvement of relations with the community and protection to the company's actual investment in the event that the city desires to purchase, will compensate for the loss thus involved.

Acceptance of the contract ordinance by the company involves among other things the giving of an option to the city of Milwaukee to purchase the properties owned by the company within the contract area and an undertaking on the part of the company to place an additional mortgage upon its properties within the contract area for the security of such bonds as the city may in the future elect to purchase from the company.

The contract applies to approximately 80 per cent of the business and property of the company, being the property in Milwaukee and the adjacent suburban communities. The ordinance proposes that the contract go into effect July 1, 1925, and that it shall be subject to termination at the end of any 10-year period thereafter upon two years notice from the city to the company.

The contract has a threefold scope:

1. To assure to the community utility service at cost (including therein a stipulated return on the company's investment) and to enable the company to earn the cost of the service rendered and so defined.
2. To vest the utility regulatory function in the city rather than in the state administrative authorities.
3. To give the city an option to purchase the properties at a price to be determined by application of an agreed formula and meanwhile to participate in the financing of the properties.

The fixed properties comprised within the rate base and those subject to purchase by the city are to be identical. The agreed value of the investment in these properties as of July 1, 1925, the effective date of the proposed contracts, is tentatively fixed at $56,456,506, subject to adjustment upon the completion of the joint audit now being conducted by representatives of the city and the company. In case of inability of the parties to agree upon this adjustment the matter will be determined by arbitration. Sixteen per cent of the value of the investment of the company in these fixed properties has been allowed as reserve for depreciation accrued to the effective date of the contract.

Cost of service is defined as all operating expenses including taxes and rentals, reasonable allowances for depreciation and operating reserves and a stipulated return upon the company's investment. For the first year the return is to be at the rate of 7.7 per cent. This is the return to which the company is now entitled under state regulation. Thereafter the rate of return will be increased or diminished by one-half of the amount by which the rate of cost of the company's borrowed money exceeds or is less than 5.7 per cent. In the contingency of certain investments by the city in the company's funded debt, the contract provides that the company shall receive a somewhat lower return upon that portion of its capital which is borrowed from the city. Service rates are to be raised or lowered from time to time with a view

Digitized by Google

to enabling the company to earn the full amount of the cost of the service rendered but no more than that amount.

Under the proposed contract the corporate autonomy of the company is to be respected and the physical custody and operation of the properties are at all times to remain in the hands of the company. However, the city, acting through its own commissioner, will be vested, in lieu of the state administrative authorities, with the power to specify and control the quantity and the quality of the service to be rendered and the additions, extensions and permanent improvements to be made to the property within the contract area, subject to the condition that such regulation shall not jeopardize the prospect of earning the full cost of the service rendered. In the event of disagreement between the parties to the contract the matter may be submitted to arbitration.

In lieu of the present right of the city to acquire the properties by condemnation proceedings, the contract gives the city an option to purchase the properties within the contract area as an entirety, upon 6 months' notice, at a price equal to the agreed value of the investment in the properties with certain adjustments for reserves, etc. The city is also given an option to invest from time to time in the funded debt of the company (but only when the company is requiring and seeking new capital) either by purchase of mortgage bonds or by making long term unsecured loans bearing interest at the average preferred stock dividend rate. For the purpose of providing a vehicle for this investment by the city, the contract provides that the company shall execute a new mortgage upon its properties within the contract area for the security of those bonds which the city may elect to purchase. The contract also provides that any balances in the reserves built up by charges to the cost of the service under the contract which are in excess of reasonable requirements may be transferred to the credit of the city's investment account.

The proposal that now goes before the stockholders of the company is the result of deliberations that have been in progress since February, 1919. The ordinance was passed by the Common Council on March 2, 1925, and was approved by the Mayor on March 3, 1925. The contract ordinance provides that it shall not become effective until it shall have been accepted by the company and approved by the Railroad Commission and further approved by a majority vote of the qualified electors at a special election to be held on April 7.

Conviction of Dynamiters Upheld.—The United States Circuit Court of Appeals has upheld the convictions of four men who were found guilty in the United States District Court at Buffalo of conspiracy in connection with the dynamiting of the Buffalo-Niagara Falls high-speed line of the International Railway at Elwood Station during the strike of July, 1922. The prisoners will begin to serve their sentences at once. They are Francis Reilly, Healy Breeze, William L. Van Dell and William H. Smith. Each was sentenced to a year in Atlanta Federal prison and to pay a fine of $2,000.

Chicago Campaign Started

Speakers' Bureau, Press Bureau and Advertising Department Pushing New Franchise Ordinance

An expensive campaign financed by unknown sources was formally launched on March 9 to put across the Chicago traction ordinance at the April referendum. A suite of offices has been opened with a speakers' bureau, press bureau and advertising department and the politicians and leading organizers have been recalled from winter resorts. The most intensive drive for a civic proposition ever undertaken in Chicago appears to be ahead.

Forty Aldermen who voted for the ordinance in Council, all heads of city departments, party counsellors, civic students, public ownership proponents and technical men are listed as speakers.

The public attitude is paradoxical. Four separate branches of thought may be given as an example:

A party favoring the ordinance because it is municipal ownership.

A party opposing the ordinance because it is municipal ownership.

A party opposing the ordinance because it is not municipal ownership.

A party favoring the ordinance because it is not municipal ownership. This support comes from those won by the consolidation arrangement.

All are given hearings by civic bodies and by "town meetings," which a corporation has been formed to foster.

Mayor Dever has taken an important step regarding extensions and new building which he hopes to finance partly by assessment on benefited property to avert a repetition of the familiar shower of gold into the pockets of real estate developers at the expense of the utilities financing the extensions.

Part of the Massachusetts assessment law has been written into an amendment for the Illinois law and will be voted on by the Legislature. This will permit, primarily, the immediate digging of the downtown subway arteries by assessment and the apportionment of the assessments after the work is done. On a $45,000,000 subway under the loop district the property owners would have to pay about $18,000,000, based on precedents recently made by the courts. The proportion for the remainder of the rapid transit lines, about $380,000,000, will have to be worked out without precedent. Subway building experience in Boston, New York and Philadelphia was studied but appeared to be of little value.

New York State Railways Expands Bus Business

Entrance of the New York State Railways into the interurban bus field on an extensive scale is presaged by the company's purchase of the Rochester Interurban Bus Company, operating eight buses on routes from Rochester to Livonia, Hornell and Le Roy. The company will be continued under the same name, with James F. Hamilton, president of the railways, as president of the bus company.

This initial step is expected to be followed by absorption of other interurban lines in Rochester, Syracuse, Schenectady and Utica, all served by the New York State Railways. The purchase of the interurban line puts the New York State Railways among the most active bus operators in railway circles. It operates the East Avenue and Browncroft lines in the city of Rochester, the Dewey Avenue feeder line and a crosstown trackless trolley line, as well as routes in Syracuse and Utica. The railway has a permit pending for a line over the Ridge Road in the suburban town of Greece and plans for a network of bus lines along the lake shore to serve Ontario summer colonists and adjacent towns.

The company's new acquisition is a corporation with a capital stock of $50,000. L. M. Caves was president. The company acquired the Hornell line last fall from C. G. Abernathy. Hornell is about 70 miles from Rochester, Le Roy about 20 miles and Livonia 15 miles. The three routes serve a rich farming community, connecting, in the cases of Le Roy and Hornell, two prosperous trade centers with Rochester.

The eight buses acquired in the purchase will be used for the time being, but later will be replaced by larger and more luxurious buses. An additional line to Perry, a mill and farm center 35 miles from Rochester, is planned. Improved highways furnish the route for all these lines.

Besides Mr. Hamilton, officers of the reorganized Rochester Interurban Bus Company, are: Vice-president, Daniel M. Beach; treasurer, J. C. Collins, and secretary, Howard Reichert.

Big Developments Reported Ahead for Insull Properties

Persons at Fort Wayne, Ind., in touch with the activities of the Insull interests see ahead, in the passing of control of the properties of the Indiana Service Corporation to the Insull interests, the proposed amalgamation of these newly acquired properties in a supermodern electric transportation system which will link Chicago, Fort Wayne, Toledo and many other important cities in Illinois, Indiana, Ohio and Michigan. The recent changes are also construed to be the forerunner of a plan to cover the entire district with a series of power connections, bringing power directly from southern Indiana mines to supply this entire section of Indiana. As another step in the plans, the Insull interests announced on March 5 the purchase of the properties of the Indiana Utilities Company of Angola, an organization which dominates the electrical power and like fields in that city and twenty other communities, and the acquisition of the Goshen and Warsaw utilities.

Certainly there is a great deal that is still nebulous about the plans for tying the properties together, but credence is lent to some of the recent reports because of the rapidity with which other properties are being bought so soon after the acquisition of the Indiana Service properties, which control light and power concessions in a large area of northeastern Indiana as well as three interurban traction and three city traction systems.

On March 12 a $1,300,000 program of improvements was announced.

Corrective Legislation Introduced

Legislation has been introduced into Congress which is intended to correct the situation created by the recent decision of the United States Supreme Court regarding buses run in interstate service, which apparently makes such buses subject neither to state nor national authority except in so far as purely local police and tax regulations go. The new measure would authorize the Interstate Commerce Commission to make all necessary rules regarding motor transportation companies and for other purposes. The text of the measure follows:

Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled,

That the following words and phrases used in this title shall be construed as follows:

(a) The term "commission" shall mean the Interstate Commerce Commission and the term "commissioner" one of the members of such commission.

(b) The term "transportation" shall mean the carrying of passengers or property from one state or territory of the United States or the District of Columbia to any other state or territory of the United States or the District of Columbia.

(c) The term "motor transportation company" shall mean every corporation or person, their lessees, trustees, or receivers, owning, controlling, operating, or managing any motor-propelled vehicle not usually operated on or over rails, used in the business of transportation of persons or property, or both, as a common carrier for compensation over any public highway.

(d) The term "public highways" when used in this act shall mean any public street, road or highway extending from one state or territory of the United States or the District of Columbia.

Sec. 2. No such motor transportation company shall begin to operate any motor-propelled vehicle for the transportation of persons or property, or both, for compensation between fixed termini or over a regular or irregular route extending from one state or territory of the United States or the District of Columbia to any other state or territory of the United States or the District of Columbia, without first obtaining from the Interstate Commerce Commission a certificate declaring that the public convenience and necessity requires such operation.

The Interstate Commerce Commission is hereby authorized to make all necessary rules and regulations with reference thereto and the operation of said motor transportation companies applicable to interstate business over public highways.

News Notes

Two Arbiters Chosen.—Trainmen of the Capital Traction Company, Washington, D. C., have selected James A. Gallivan, Representative of Massachusetts, to act on the board of arbitration which is to determine what change, if any, should be made in their wages at this time. As already announced in the ELECTRIC RAILWAY JOURNAL, the company named Stanton C. Peelle, an attorney, as its arbiter. Both these arbiters will select a third member to complete the board.

Franchise Revoked.—The City Council recently revoked the franchise of the Titusville Traction Company, Titusville, Pa., and has served notice on S. W. Platt & Company of Pittsburgh, which firm purchased the plant with the intention of scrapping it, to vacate the occupied streets within 60 days. The Public Service Commission has granted a temporary certificate of convenience to the Citizens' Traction Company of Oil City by which buses are run every two hours between Pleasantville and Hydestown through Titusville. The certificate also provides permission to run buses over the new McKinney road from Titusville to Oil City.

One-Man Car Operators Seek More Pay.—An 8-hour working day and an increase in wages of 13 cents an hour were included in recent demands of the railway union employees of the Manchester Traction Light & Power Company, Manchester, N. H. At the present time the operators of one-man cars receive 67½ cents an hour for a ten-hour day.

Extended Bus Service Planned.—The North Carolina Public Service Company through its subsidiary, the Greensboro Bus Company, Greensboro, N. C., plans to extend a bus line to serve west of the North Carolina College, out Spring Garden Street as far as Pomona, and a second line through Glenwood and Piedmont Heights. At present the company operates two bus lines from Jefferson Square to the county home through Westerwood and West Market terrace. The new line will parallel the present car line for practically the entire distance. The fare on the buses, it was stated, will be 10 cents.

Reduces Fare Voluntarily.—The International Railway, Buffalo, N. Y., has voluntarily reduced the fare on the Buffalo-Kenmore-Tonawanda interurban line from 17 cents to 10 cents. It is the aim of the company to divert travel from Tonawanda to Buffalo over this route so that the old Buffalo-Niagara Falls line via the Military road can be abandoned. The old Buffalo-Niagara Falls line now runs as far as Gratwick via Tonawanda. A 25-cent fare is charged from Tonawanda to Buffalo via this line as compared with 10 cents to the Buffalo city line and an 8-cent city fare on the Kenmore-Tonawanda route. The International plans to substitute buses for its interurban cars on the Buffalo-Kenmore-Tonawanda division. The consent of bondholders to the abandonment of tracks in Delaware Avenue on this line is being sought by the International Railway.

Wants Fare Reduced.—The Missouri Public Service Commission has notified the United Railways, St. Louis, that it must reduce the fare between Clayton, Mo., and St. Louis over the Log Cabin or Clayton line from 14 cents to 7 cents, the fare now charged for the same trip via the Kirkwood-Ferguson and Olive Street lines. Rolla Wells, receiver, has presented data to the commission showing that the company was losing money on the Clayton line even at the 14-cent fare. The deficit in 1924 was $9,593. The reduction does not apply to the stretch beyond the Clayton Court House.

Bill Would Mean Loss to Cities.—A fight has been started in New Jersey to prevent the passage of Assembly Bill No. 24, under which loss of revenue would result to the communities in which the trolleys and buses operate. The bill sets forth that where a state tax is levied a local tax cannot be imposed. The new measure was introduced by Assemblyman William H. Iszard, Camden. It has been referred to the committee on municipal corporation. It is declared that if the bill is enacted it will mean a loss of about $150,000 annually to Newark alone.

Refuses to Extend Fare Zone.—On the ground that it would discriminate in favor of one class of passengers as against other classes, the Board of Public Utility Commissioners of New Jersey has refused a request of the town of Harrison to extend one of the fare zones on the Jersey City line of the Public Service Railway between Newark and Harrison, N. J. The zone extension was asked for the convenience of employees of a factory at Kearny, N. J.

Transfer Trial Period Extended.—Announcement was made recently by W. H. Boyce, commercial manager of the Pittsburgh Railways, Pittsburgh, Pa., that in response to many requests, permission had been given for an extension of the trial period of the 10-cent transfer to March 31. Under the plan, a passenger boarding a car and depositing a cash fare of 10 cents is entitled to a transfer to any point in the first fare zone, or to any point which can be reached by a one-token ride from the downtown district.

Trip Tickets Reduces Fare.—The sale of trip tickets, which in effect is a reduction of fare, has been started by the Worcester Consolidated Street Railway on the run from Worcester and Wheeler's stop in North Grafton, Mass., and the administration building of the Grafton state hospital. The regular fare from Worcester to these two stops is 24 cents, but the tickets are sold in strips of five and save the purchaser 4 cents a trip. Passengers who use the tickets are entitled to a transfer in Worcester.

Petitions to Operate Buses. — Receivers of the York Utilities Company, Biddeford, Me., have petitioned the Public Utilities Commission for permission to operate buses from Sanford to Biddeford via Alfred. Electric railway lines are still in operation from Sanford and Springvale to Kennebunk, Kennebunkport, and Biddeford. The trolley line branches from Kennebunk, Kennebunkport, and Cape Porpoise will be discontinued and bus service substituted on the Kennebunkport branch. On the Cape Porpoise branch it is proposed to junk the rails this spring. Buses have been running between Sanford and Springvale. Two new buses have been ordered.

London Railway Outlook Uncertain.—The Canadian *Financial Post* says Sir Adam Beck has the city of London, Ont., in a quandary over its railway. The city has held off making its application to the Legislature for permission to raise funds to purchase the railway. Permission for the company to operate at the present 5-cent fare expires March 8 and as a result the city will face an embarrassing position if the company refuses to carry on at the old fare schedule, at which rate the company says it will be losing heavily. Sir Adam has been dickering to purchase the railway. In the meantime, since he got back in his seat in the Legislature, he got a measure put through the House which canceled the permission which the company had received from the previous house to charge a 5-cent instead of a 7-cent fare with nine tickets for 25 cents.

Financial and Corporate

New Interests Elected to Fort Wayne Board

Samuel Insull and associates on March 10 joined the management of the Indiana Service Corporation, Fort Wayne. Election of a new board of directors at the annual meeting of stockholders marked the passing of control of the company from Eastern men to public utility operators in the Middle West, chiefly residents of Indiana.

The new members of the board are Mr. Insull, Charles W. Chase, president of the Gary Street Railways, and Samuel Insull, Jr. They take the places of Henry Sanderson, New York, who was chairman of the board; Frank M. Tait, New York, and Percy M. Chandler, Philadelphia. Directors who were re-elected are Robert M. Feustel, James M. Barrett, Henry C. Paul and Harry E. Vordermark, all of Fort Wayne.

Mr. Insull becomes chairman of the company and Mr. Feustel was re-elected president, in active charge of the management of the company. Mr. Vordermark was re-elected vice-president and treasurer and Fred M. Schmidt continues as secretary of the company. No changes in the personnel of the company or its plans of operation are contemplated.

Electric railway lines owned and operated by the company total about 200 miles, of which 56 are city lines and the balance interurban.

Scranton and Altoona Railways Pass to Fitkin Interests

The so-called Fitkin interests of New York have contracted to purchase the Scranton Railway, Scranton, Pa.; Altoona & Logan Valley Electric Railway Altoona, Pa.; the Scranton Bus Company, Logan Valley Bus Company, and several gas and lighting properties, all located in Pennsylvania, and the Florida Power Company, a hydro-electric company which will be connected by high-tension transmission lines with the Pinellas County Power Company, a subsidiary of the Tide Water Power Company, now owned by the Jersey Central Power & Light Company.

It is more than likely that all of these properties will come under the direction of the General Engineering & Management Corporation, New York, of which A. E. Fitkin is vice-president. In fact, the Fitkin interests plan the National Public Service Corporation to be the holding company for their utilities in eight states and a successor to the present Jersey Central Power & Light Company.

In furtherance of this plan stockholders of the Jersey Central Power & Light Company are called to meet at Richmond, Va., March 17 to approve the formation of the National Public Service Corporation. It is proposed to sell $11,500,000 principal amount of first mortgage and refunding 20-year 5½ per cent gold bonds and $4,000,000 par amount of 7 per cent preferred stock, the proceeds of which will retire existing indebtedness. The latter includes more than $6,000,000 in short-term notes which mature within 2 years. A part of the proceeds will furnish funds for the purchase of the new properties.

In addition it is proposed to sell $6,000,000 principal amount of 30-year 6½ per cent sinking fund collateral trust gold bonds for funds to complete the purchase of other companies. Stockholders will vote on the proposal to authorize an issue of collateral trust bonds limited in an aggregate amount of "not more than $500,000,000 at any time outstanding."

The number of shares of common stock without par value will be increased from 220,000 to 1,000,000. The common is to be divided into 500,000 shares of class A and an equal amount of class B stock, and one-half share of class A is to be offered in exchange for each Jersey Central common share now or later outstanding.

The Scranton Railway and the Altoona & Logan Valley Railway were at one time included in the holdings of the American Railways, which was succeeded by the American Electric Power Company, which in turn has passed to Electric Bond & Share interests, which have disposed of the railways included in the group as not essential to their plans for the development of the properties sponsored by them.

Passenger Revenue in Philadelphia Up $753,340

Net Income of $1,810,364 Sufficient to Pay 6 per Cent Dividend and Provide for Co-operative Wage Participation by Men—Reasons Given for Recent Dividend Increase

NET INCOME of the Philadelphia Rapid Transit Company, Philadelphia, Pa., for the year ended Dec. 31, 1924, increased $10,364 over the previous year. Railway operating revenue for the year increased $724,526. The details of the earnings of the company are all contained in the accompanying statement of the income account for the year taken from the recently issued pamphlet report. The company says that the passenger revenue increase of $753,340 was due to the 7½-cent token-8-cent cash fare which became effective Sept. 25, 1924. Net income of $1,810,364 was earned during 1924, thus providing for the P. R. T. 6 per cent dividend, and in addition thereto the amount required to pay the co-operative wage participation to the men.

Seven-Cent Fare Forced Upon Management

In discussing the matter of fares President Dunbar says in part:

P. R. T. was reluctant to lose the short riding built up around the 5-cent fare through long years of painstaking management and employee salesmanship. T. E. Mitten publicly declared that the 5-cent fare was "almost a religion" of his. Mounting costs forced P. R. T. in 1920 to seek a means of increasing its revenue. Mitten Management recommended a straight 5-cent fare, with the elimination of all free transfers and 3-cent exchanges. P. R. T. bankers urged an increase to 7 cents, fearing the effect upon their interests elsewhere if P. R. T. proved continuingly successful under a 5-cent fare.

Mitten Management fought the 7-cent fare throughout the summer of 1920. In July 476,000 car riders signed petitions favoring the straight 5-cent fare. P. R. T. employees passed up a wage increase to which they were entitled, and went so far as to offer their savings without interest to aid in the fight Mitten Management was waging. In October our patrons showed their approval and support by voluntarily paying more that 2,000,000 additional 5-cent fares instead of using the free transfers or 3-cent exchanges to which entitled.

The 7-cent fare, in spite of our efforts, was forced upon this management in November, 1920. In 1921 P. R. T. carried 75,000,000 fewer riders than in the previous year—$3,750,000 worth of nickel fares. P. R. T. has never since reached the record riding of the 5-cent fare days. The 7-cent fare results proved the engineers' estimate to have been wrong, while that which Mitten Management prophesied actually came true.

Considering the normal increase which we would have had with the 5-cent fare, the actual loss because of the 7-cent fare was upward of 100,000,000 passengers—or more than 10 per cent of P. R. T. 1920 patronage. If the straight 5-cent fare had been granted in 1920, P. R. T. would each year have earned so much more than it did under the 7-cent fare that not only would the increase to 8-cent cash-2 tokens for 15-cent fare have been unnecessary, but the straight 5-cent fare still would be sufficient for our needs. The folly of overriding the opinion of a successful operating management, as was done in this case, should have been apparent before the colossal mistake of the 7-cent fare was made.

Elsewhere the company says that the Public Service Commission duly approved its application for authority to

PHILADELPHIA RAPID TRANSIT COMPANY
INCOME ACCOUNT FOR THE YEARS ENDING DEC. 31

	1924	1923
Gross passenger earnings	$45,002,700	$44,249,360
Other operating revenue	652,317	681,130
Railway operating revenue	$45,655,017	$44,930,491
Way and structures, equipment and power—Maintenance, renewals and depreciation	$8,560,400	$8,560,400
Power operation	3,772,643	4,416,306
Conducting transportation	14,31>,232	14,003,087
General	4,593,019	4,060,159
Taxes, including paving tax	2,760,903	2,695,708
	$34,000,199	$33,735,661
Operating income	$11,654,817	$11,194,829
Non-operating income	560,470	621,539
	$12,215,288	$11,816,369
Interest	$1,371,252	$1,161,637
Rentals	8,541,591	8,518,692
Frankford Elevated rental	312,079	156,039
Sinking fund—City contract	180,000	180,000
	$10,404,924	$10,016,369
Net income	$1,810,364	$1,800,000

Note.—Net income exactly $1,80J,000 in 1923, due to wage participation of men being short earned, after first setting aside $1,800,000 for P. R. T. dividend. This shortage has been made up by extraordinary economies during the current year as promised, and the whole of the 1924 wage participation has been fully earned.

* Provided for in the Co-operative Welfare Association, in which P. R. T. pays dollar for dollar with the men.

increase the rates in the city of Philadelphia from 6¼-cent ticket-7-cent cash fare to 7½-cent token 8-cent cash fare, eliminating the 3-cent exchange ticket outside the delivery district and establishing 5 cents as the rate for zones on suburban lines.

In the rate case proceedings before the Public Service Commission the company submitted estimates of the financial results under the higher fare, conforming to the operating budget formula approved by the commission in the valuation proceedings and showing an estimated return of less than $12,000,000, as against the authorized annual return of $14,000,000, representing 7 per cent on the minimum rate base of $200,000,000. The order of the Public Service Commission to charge the higher fare has been upheld by the Superior Court.

It is explained that the company did not contest the "upward of $200,000,000 valuation" handed down by the Public Service Commission, for the reason that, with the 7 per cent allowed by the commission thereon, the net income of $14,000,000 per annum then permitted was sufficient to cover all that the company could be expected now to earn over and above the amount required to carry out its program of improved service.

With respect to the Broad Street subway the company has stated that it will offer a fixed rental when this subway nears completion, and that if its offer be unacceptable P. R. T. will stand ready to operate this city-built line for the city's account in order that the actual results may be made available to determine the amount of rental to be paid thereafter.

The company says that upon the opening of the Broad Street subway a 5-cent fare thereover and a 5-cent fare upon the Market-Frankford elevated will be necessary in order that these main trunk lines be most effectively used in carrying the maximum number of passengers. Five-cent zones for surface cars will then also be necessary to insure a maximum fare of not more than 10 cents between the central delivery district and the farthest city limits, otherwise the combined use of surface cars and subways will so increase the proportion of unprofitable long distance riding as to overwhelm the combined system with increasing costs.

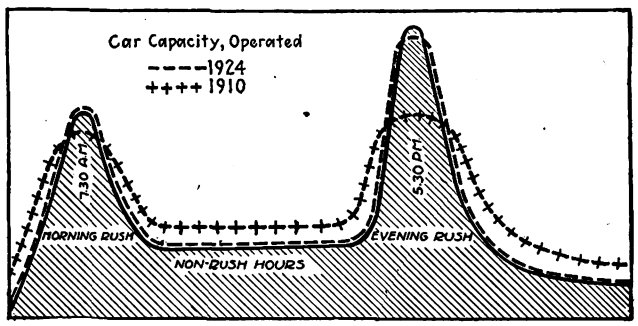
Reason for the Recent Dividend Increase

With regard to the existing agreement between the city and the company the report says:

Under the 1907 city-company agreement sinking fund payments are provided which may, and no doubt will, be used to pay off P. R. T. $30,000,000 of capital stock, at par, in 1957. P. R. T. stockholders paid in their $30,000,000 under the city-company agreement that they should receive 6 per cent per annum cumulative.

P. R. T. stockholders are now about $20,000,000 short of having received their 6 per cent cumulative dividend. This deficit should be made up before the end of the city-company agreement in 1957, by an added annual dividend payment of 2 per cent. With this in mind $1 per share will be paid for the quarter commencing Jan. 1, 1925.

P. R. T. property values make $14,000,000 per annum the minimum payable to owners, $12,000,000 covers all fixed charges and dividends. The use of the entire $2,000,000 remaining to pay back dividends is not advised, as this would interfere with P. R. T. plans.



Shaded Area Shows Passengers Carried on Typical Day from 4:30 A.M. to 11:30 P.M. in Philadelphia

In discussing the matter of employee relations the company says:

No one is more entitled to share in P. R. T. prosperity than the employees who made P. R. T. prosperity possible. This management has, therefore, encouraged the trustees of the employees' co-operative wage participation fund to purchase P. R. T. capital stock in the open market. They are now the pround possessors of more than 150,000 shares, which is in excess of one-fourth of the common stock outstanding.

Motor bus operation as an auxiliary to the railway shows a constantly increasing loss, but it is explained that while increased bus operation is planned, no profit is expected therefrom. As the company sees it "since it must supply even non-paying service where there is any real need therefor, motor buses will cost less than would the extension of our street car tracks to meet this need."

Mitten Management Compensation

In 1911 Mitten Management fee was fixed at $158,000 a year—$50,000 for supervising construction, 3 per cent of the estimated expenditures; $108,000 for supervising operation, one-half of 1 per cent of the estimated gross earnings. This arrangement continued during 14 years past at the lump sum

of $158,000 "despite the fact that the construction expenditures and gross earnings have been so greatly increased." On this matter the report says:

Mitten Management expenses have greatly exceeded the fees paid by P. R. T. for its services. This management will, with your assent, from Jan. 1, 1925, forward, credit itself with 3 per cent of the actual expenditures for supervising construction and with one-half of 1 per cent of the actual gross earnings as its fee for supervising operation.

With respect to the results to the company under the present management the report says:

During the 14 years 1911-1924 under Mitten Management, P. R. T. earned a surplus of $16,896,967. Of this $11,244,385 has been paid in P. R. T. dividends and $5,652,582 put back into the property.

Twin City Valuation $42,949,191

Commission's Findings May Require Fare in Excess of 7 Cents Cash for 7½ per Cent Return—1912-1921 Average Unit Prices for Physical Property

THE Minnesota Railroad and Warehouse Commission has fixed the valuation of the Minneapolis Street Railway at $25,346,080 as of Jan. 1, 1922, and of the St. Paul City Railway at $15,998,849 as of Jan. 1, 1924. This is the first step toward fixing fares in the two cities that will result in an adequate return to the companies. In each instance the fare is now 6 cents flat, with universal transfers.

The commission in its report fixes the fair value of the properties on Jan. 1, 1925, as follows:

St. Paul City Railway:	
Physical property depreciated as of Jan. 1, 1924	$14,998,921
Going concern value	999,928
Total fair value as of Jan. 1, 1924	15,998,849
Net additions for 1924	162,650
Total value Jan. 1, 1925	$16,161,499
Minneapolis Street Railway:	
Physical property depreciated as of Jan. 1, 1924	$23,494,863
Fort Snelling and Como Terminal property	153,284
Value of water power leases	113,803
Going concern value	1,584,130
Total fair value as of Jan. 1, 1922	$25,336,080
Net additions for 1922, 1923 and 1924	1,441,612
Total value as of Jan. 1, 1925	$26,787,692
Combined value as of Jan. 1, 1925	$42,949,191

The decision of the commission was rendered on March 6. The body did not set a date for hearing on the question of fares, but contented itself with giving out at 10 a.m. the result of its investigation as to the valuations of the properties. Experts hold that the figures justify a continuation of a fare of 6 cents in Minneapolis and a fare of 6½ or 7 cents in St. Paul. In the Duluth case, recently decided, the commission fixed the rate of return at 7½ per cent. In either instance it is expected there will be an appeal to the district courts—in Minneapolis, if the fare is more than 6 cents, an appeal by the city, if not more than 6 cents by the company; in St. Paul the city already has filed notice of appeal from the valuation announced on March 6.

In Minneapolis the fixed valuation is $14,346,080 more than the city's request of "fair value" for rate-making purposes. The company had set out five general valuations of its property of various dates, starting with estimated original cost at $27,553,509 and running to $49,465,864 as of July 1, 1921, at current prices.

In St. Paul the $15,998,849 valuation of the commission compares with the company's figure of $34,249,374 and the city's figure of $12,051,744.

It was found that in the Minneapolis case the company's figure for going concern value was reduced from $6,000,000 to $1,584,129, and the working capital claimed from $480,315 to $150,000, while the claim of $1,032,123 for water power assets was eliminated.

Operating income of the Minneapolis company for 1923 was $1,902,863 and for 1924 $1,761,930. On a valuation of $25,346,080 at 7½ per cent the company must earn $1,900,956, or $1,906 less than the 1923 income and $130,025 more than the 1924 operating return. With the 1924 figure as a standard the required increase in gross revenue from operation would be 1.8 per cent.

In St. Paul the operating income would be $1,199,913, or $460,381 more than the reported income for 1923 and $571,058 more than the 1924 figure, or an increase of 9½ per cent in the case of 1923 and 12½ for 1924.

Since the date of the appraisal the company has added about $600,000 annual capital improvements.

The commission denied the contention of the city of St. Paul that the company's paving between tracks before April 1, 1921, should not be included as property. It was determined the fair value of paving as of Jan. 1, 1920, was $1,549,061, "before structural and general overhead are added." The commission denied the company claim of $782,229 for water power leases and reduced the going concern claim from $4,000,000 to $999,928.

In the case of the Minneapolis Street Railway the company valuation figure as of September, 1923, undepreciated was $53,248,423, the city valuation undepreciated as of April, cost base was $26,929,828, but for rate-making purposes the city contended $11,000,000 was a "fair value."

Going Concern Value Discussed

The commission approved the company's plan of car allocation on the principle of apportioning cars among the three operating systems on a demand basis. The company was allowed $150,000 on two power plant generators. The commission found a per cent condition of 87 as proper to apply to the cost-new figures utilized to find the fair value, as compared with the A. L. Drum estimate of 87.9 and the D. F. Wilcox expert figure of 56.7 per cent.

In discussion of the going concern value the commission said:

The injunction of the Supreme Court is that "this element of value is a property right upon which the owner has a right to make a fair return when the same is privately owned, although dedicated to public use." Therefore, we find the going value of the Minneapolis Street Railway to be $1,583,283, which we include as a part of the rate base.

A table of 1923 and 1924 revenues of the two companies involved as presented at the hearings by Engineer H. E. McWethy of the commission is as follows:

	1923	1924
ST. PAUL CITY RAILWAY		
Total railway operating revenue	$4,851,243	$4,589,120
Total railway operating expense	3,596,904	3,491,263
Net operating revenue	$1,254,339	$1,097,856
Taxes	514,807	469,001
Operating income	$739,532	$628,854
MINNEAPOLIS STREET RAILWAY		
Total railway operating revenue	$8,054,924	$7,669,002
Total railway operating expense	5,346,277	5,161,470
Net operating revenue	$2,708,647	$2,507,531
Taxes	805,784	745,601
Operating income	$1,902,863	$1,761,930

Among several moot questions were the track extensions outside the Minneapolis limits, including the Fort Snelling and Columbia Heights lines. The Columbia Heights line is in the next county and the Fort Snelling line is in Hennepin County. The city's contention was observed in the rejection of the Heights line, but in the case of the Fort Snelling extension, which is operated as part of an interurban line to St. Paul, the extension was held property of the Minneapolis Street Railway as an operating system and a depreciated value of $140,579 was allowed for the extension. The private right-of-way of the Lake Harriet line was excluded from the valuation. The commission did not accept the company's cost of

Digitized by Google

financing of 5 per cent of the various valuations.

The Twin City railway cases started four years ago. On June 23, 1921, both companies asked the commission to determine a fair value of the properties and "fix and establish" rates of fare. These petitions followed passage by the Legislature of the law putting the rate-making power in the hands of the commission.

Both cities appealed to the courts from an order of an emergency rate of 7 cents and four fares for 25 cents granted Aug. 24, 1921, in the case of Minneapolis and Aug. 29, 1921, for St. Paul. The Hennepin County Court set aside the Minneapolis order on Sept. 6, 1921, and the Ramsey County Court the order in the St. Paul City Railway case Dec. 28, 1921.

Hearings took place in the valuation proceedings from time to time upon the clauses affecting the values and rate fixing in the two petitions. Arguments began Dec. 8, 1924, and were concluded Dec. 13, 1924.

The city of St. Paul seeks an injunction to prevent the Minnesota Railroad and Warehouse Commission from fixing a fare rate in that city based on the trolley property valuation handed down on March 6. Judge R. D. O'Brien of the Ramsey District Court directed the commission to appear on March 9 to show why it should not be required to make a return of its finding to the court, so the city can proceed through Corporation Counsel C. F. McNally to apply for an order restraining the commission. In his petition for an order to show cause the Corporation Counsel said the findings of the commission were "excessive, wholly unwarranted and unjustified by the evidence."

The accompanying table shows the figures which have been set up as the valuations of the Minneapolis and St. Paul railways over a period of many years.

Horace Lowry, president of the railway, refused to comment on the valuation and rate matters until the court has spoken. He said:

> On Friday morning we appeared at the duly appointed hour to hear the report of the commission. We were instructed by the commission to study the figures and to consult with the cities as to their application. In our judgment this meant that all parties would carefully analyze the reports and meet to discuss them. Many things are involved, the most important of which are the rate of fare necessary to produce a fair return on the value and the standard of service to be maintained, as well as the capital expenditure which would be expected of us.
>
> Our plan was to follow the instructions of the commission and see if it would be possible to agree on the matter in question, but within an hour of leaving the room the City Attorney of St. Paul started proceedings in the Ramsey County District Court to enjoin the commission from entering an order to fix the rate of fare necessary to maintain the properties as efficient operating units. In view of this premature court action we cannot comment on or discuss the matter until the court has spoken.

Eugene Lund, Minneapolis street railway inspector, has made a table to show what the result will be if the bill becomes a law that is intended to have the commission consider the Twin Cities as a metropolitan district. His computation is based on the 1924 reports of the two companies:

	Minneapolis	St. Paul
Population	409,125	241,891
Cash passengers	126,492,460	75,627,955
Total car-miles	16,689,755	10,855,837
Car-miles per capita	40.77	44.87
Miles of single track	224. 2	158.60
Population per mile of track	1,819	1,525
Operating expenses per car-mile, cents	30.94	32.16
Passenger revenue per car-mile, cents	45.51	41.80
Gross income	$1,816,102	$631,993
Deductions	1,006,875	631,392
Net income	$809,227	$701

Receivers for Detroit United

Constructive Move Intended to Expedite Reorganization of 600-Mile Interurban

Upon petition of the Yellow Coach Manufacturing Company, Chicago, Ill., one of many creditors, the Detroit United Railway was placed in receivership late on March 10. The defendants consented to the action.

The petition came before Judge Charles C. Simons in the United States district court, who appointed as receivers the Security Trust Company, Detroit, and Joseph W. Simard, vice-president of the Municipal Debenture Corporation of Montreal, Canada.

An ever-decreasing volume of business, with bus and general automobile competition daily becoming keener, and the mounting cost of operation are among the factors said to have contributed to a crisis in D. U. R. financial affairs. Assurance was given that the court proceedings would not interfere with the company's normal service.

The petition conceded that assets of the railway are "of a value approximately 50 per cent in excess of all indebtedness and liabilities." On the other hand, it was set forth that "the defendant has no means at hand with which presently to meet its immediate pressing needs."

Further apprehension was expressed because "some of the creditors are threatening to, and will, bring suits in respect of their claims and will levy attachments and executions on the lines of the railway owned by the defendant," thus hampering operation and creating a danger that one or many of the lines now operated as united might be cut off from central control and operation.

As a result "it was contended that it is essential to the interest of the defendant and of the public and of your orator (the Yellow Coach Manufacturing Company) that the property of the defendant should not be sacrificed or broken up, but that it should continue to be operated as an entire system."

Simultaneous with the announcement of the receivership came a statement from A. E. Peters, secretary of the Detroit United Railway, to stockholders of the company. This follows in part:

No Default in Interest or Sinking Fund Payments

The depression in business in the territory served by your lines still continues. Indeed the situation as affecting your company has grown worse, and in consequence its revenue, particularly from passenger traffic, has been and is much less than was anticipated.

While some important economies in the operating expenses have already been effected, they do not yet offset the decrease in revenue and the net results are far from expectations.

In consequence of this and of other circumstances, it has been found impossible to effect certain temporary financing which it was hoped could have been arranged, pending further financing of a more permanent character, and your directors have decided that it was in the best interests of the shareholders to let the court take custody of the property, assets and business for the preservation thereof and protection of the interests of the shareholders, creditors and all concerned until it was possible to submit to the shareholders a plan under which the necessary funds might be obtained to place the company in such a financial position that complete control of their property can be resumed by them.

Your directors have under consideration a plan having this object in view and they will submit it for the consideration of the shareholders as soon as possible.

It may be added that it is not to be inferred that the placing of the property in the custody of the court indicates or contemplates any default in the regular payment of interest on any bonds or of sinking fund under any mortgage and the receivers have been directed by the court to make all such payments.

INCOME ACCOUNT OF THE DETROIT UNITED RAILWAY

	1924	1923
Gross earnings	$8,360,035	$8,863,598
Operating expenses	7,275,797	7,243,270
Net earnings	$1,084,238	$1,620,328
Other income	692,924	873,582
Total income	$1,777,162	$2,493,910
Interest and taxes	1,625,779	1,630,264
Depreciation	.....	533,826
Balance	$151,383	$329,820
Discount on securities	150,789	78,784

Deficit Lower in Buffalo

Operations of the International Railway, Buffalo, N. Y., for the years 1924 and 1923 are compared in the accompanying statement:

INTERNATIONAL RAILWAY—
INCOME ACCOUNT

Year	1924	1923
Operating revenue	$10,276,330	$9,795,185
Operation and taxes	9,509,345	9,293,905
Operating income	$766,984	$501,280
Non-operating income	46,225	44,721
Gross income	$813,210	$546,001
Income deductions	1,479,723*	1,573,239
Net income	*$666,513*	*$1,027,238*

*$87,106 credited to fixed charges, being the amount contributed by I. R. C. stockholders through return of interest on underlying bonds held by voting trustees.

Will Not Abandon City Service.—Charles Folwell, an official of the Monongahela-West Penn Public Service Corporation, Fairmont, W. Va., recently stated that his company did not contemplate abandonment of its city service in Marietta, Ohio, but rather realizes that the system must be built up. He said it was true that neither the bus service nor the railway was a profitable venture just now and that it was true that most of the bus service would likely be discontinued after the year's trial. He said the company would continue to serve the outlying sections when business justified it.

P. R. T. to Sell Bonds.—The plan of the Philadelphia Rapid Transit Company, Philadelphia, Pa., to sell $10,000,000 of a bond issue of 1912 in the open market and increase the rate from 5 to 6 per cent was approved on Feb. 18 in a stockholders' meeting of the Union Traction Company, the principal underlying corporation of the Philadelphia Rapid Transit. The Council a few weeks ago approved the sale and the increase of the interest rate.

Will Abandon One Line.—The Springfield Street Railway plans to substitute bus service for one of its non-paying lines in Westfield, Mass. It also expects to establish a new loop line in the city by coupling up two existing lines. As a first step in this plan, the railway has petitioned the Westfield Board of Aldermen for permission to establish bus service to that city.

Surplus in January.—The Youngstown Municipal Railway, Youngstown, Ohio., in reporting a surplus of $2,337, during the month of January, makes the first substantial payment toward the alleged $1,000,000 deficit. This is the deficit that the Chamber of Commerce committee held was not a legal debt. Traction Commissioner Engle made the report for January at a recent meeting of the Council. It was the second month in succession that the railway showed a surplus after meeting all operating and maintenance costs and paying interest. January also brought a new high figure of $188,788 in gross revenue, and a new high mark in the number of passengers carried of 3,900,708 as against 2,900,000 carried in December, the next highest month. January's profit was well above that of the other paying month, December in which a surplus of $18,767 was shown. Actual cost of operation was $186,453. Total mileage from both cars and buses was 480,295. The total deficit in the stabilizing fund now is $1,234,297, the report showed.

Branch Line to Be Abandoned.—The petition of J. H. McClure, receiver of the Indiana, Columbus & Eastern Traction Company, Springfield, Ohio, to abandon the Union City to Dayton branch of the line, has been granted by the State Utilities Commission. The branch, 55 miles long, may be permanently abandoned after 60 days' notice to the public. Mr. McClure says the line is a losing proposition. It was stated at the time the application was made that the company proposed to use buses to take care of the transportation needs of the residents affected by the abandonment.

Line to Be Wrecked.—Frank Davies of Nevada City has been awarded a contract by M. Davison, Stockton, to dismantle the line of the Nevada Traction Company, Nevada City, which ceased to operate in December, 1923. Mr. Davison purchased the property at a commissioner's sale under foreclosure proceedings. The carhouse and other buildings at Glenbrook will also be dismantled. The portion to be dismantled extends from the Plaza in Nevada City to the city limits of Grass Valley. The rails within the city limits of Grass Valley were torn up some time ago. The rails within the business portion of the Nevada City will not be taken up until after a meeting by a board of city trustees to determine what action, if any, the city will take in that regard.

$17,000 Placed in Stabilizing Fund.—January revenue figures of the Des Moines City Railway, Des Moines, Iowa, do not indicate that a fare increase will be sought. The company placed $17,721 in its stabilizing fund after payment of all charges. There were 2,633,785 revenue passengers in the month and revenue was $220,749, with additional income of $8,257. Operating expenses and taxes were $173,128, including $14,000 set aside for taxes. These fixed charges were indicated: Bond interest, $20,087; note interest, $7,075; other interest, $9,851; miscellaneous, $1,142.

Abandonment of 17 Miles Allowed.—The Sharon & New Castle Street Railway has been authorized by the Ohio Public Utilities Commission to abandon service on its line from Hubbard, Ohio, to New Castle, Pa., a distance of 17 miles subject to issuance of similar authority by the Pennsylvania Public Service Commission. The Pennsylvania & Ohio Coach Line Company, controlled by the same interests that own the Sharon & New Castle Street Railway, has filed with the Ohio Public Utilities Commission an application for a certificate to operate buses from the public square in Youngstown to Sharon, Pa. The Sharon & New Castle property is controlled by the Pennsylvania-Ohio Power & Light Company.

Book Reviews

Subway Nickels, New York City's Transit Problem

By Harry A. Gordon, Special Corporation Counsel. Published by the direction of the Board of Estimate, New York City. 305 pp., with index.

This book is a special survey of the rapid transit situation in New York by the city's special counsel, retained during the recent hearing before Judge McAvoy to present the charges of the city for the removal of the transit commissioners. To make the survey more accessible, it has been put in book form and presents what might be called the side of the Mayor in the current transportation situation. The history of rapid transit development in the city, also contained in the book, is from that standpoint.

Connecting and Testing Direct-Current Machines

By F. A. Annett, Assistant Editor *Power*, and A. C. Roe, Industrial and Insulation Engineer Westinghouse Electric & Manufacturing Company. First edition, 231 pages, illustrated. McGraw-Hill Book Company, Inc., New York. $2.50.

Two distinct sections make up this book, which is written specifically for the shop man and armature winder. The first section, on reconnecting direct-current machinery, gives rules and principles that govern the changes made in the windings to meet new conditions of service, and shows how these principles may be applied to actual problems of reconnection, so that the man who does the work will have a guide when attempting to apply them to his own problems. The second section, on locating faults in direct-current machines, is presented from the practical side so as to show how such tests are made and gives the reasons for the tests and states why certain results may be expected. Diagrams of windings and test connections make it easy to follow the instructions in the text.

Overhead Line Construction (Fahrleitungsanlagen für Electrische Bahnen)

By F. W. Jacobs. Published by R. Oldenbourg, Munich, Germany. 290 pages and 400 illustrations.

A book devoted entirely to overhead line construction for electric railways is unusual. Nevertheless, Mr. Jacobs has found material on this subject sufficient to fill 290 pages, and his book should be of interest to every one interested in overhead line work who can read German. The first 80 pages are devoted to the mathematics of calculating the sizes of working conductors and feeders for outgoing and return circuits for various kinds of layouts. There is also extended mathematical treatment of permissible spans with different variations in temperatures. Other subjects considered are: Shapes of working conductors, types of collectors, curve construction, overhead appliances, different methods of trolley wire suspension, high-tension lines and insulators, wind pressures, steel and concrete poles, line and pole erection, bracket construction.

Connecticut Officials Advanced

Messrs. Punderford, Flickinger and Bennett Will Have Increased Responsibility on Retirement of Mr. Storrs to Take Up His New Association Duties

PROMOTIONS all along the line are announced by the Connecticut Company, New Haven, Conn., effective April 1, on which date L. S. Storrs, president, will retire from the company in order actively to assume the duties of his new office as managing director of the American Electric Railway Association. John K. Punderford, long vice-president and general manager of the company, has been elected president and general manager. Walter J. Flickinger, formerly assistant to the president, has been elected vice-president. Richard J. Bennett, who has been attached to Mr. Punderford's office, has been appointed assistant general manager.

J. K. Punderford

NEW HEAD HAS WIDE EXPERIENCE

Mr. Punderford has been connected with the Connecticut Company or its predecessor in New Haven for 33 years. He is a native of New Haven and went to Yale University. He took the combined electrical and mechanical engineering course and was graduated in 1892. His first job was an electric railway one, assisting in the erection of the power station of the West Haven Street Railway. In the autumn of 1892 he went to Schenectady to take the students' course in electrical engineering then being given in the Edison works, but returned to New Haven and became connected with the Fair Haven & Westville Street Railway, then the largest electric railway property in the city.

At first he was engaged in the track department, but later entered the operating department, and when the company acquired the other electric railways in New Haven and vicinity he was made general manager of the combined system. Later, when the New York, New Haven & Hartford Railroad purchased the property and the other electric railways in the state, Mr. Punderford was retained as general manager of all of the combined properties which now comprise the Connecticut Company.

Mr. Punderford has always taken an interest in association affairs and served a year ago as president of the Transportation & Traffic Association.

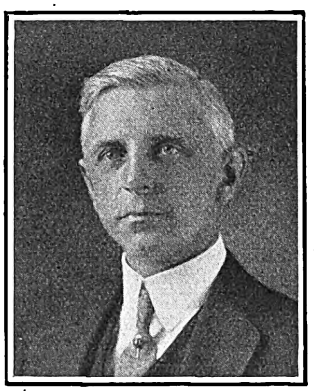
Mr. Flickinger, the new vice-president, has back of him a wealth of experience extending to 1898. In that year he entered the employ of the Lehigh Valley Railroad in the motive power and purchasing departments. Since then he has been connected with only three properties, i.e., the Lehigh Valley Railroad, the New England Investment & Security Company, which he served from April, 1907, to July, 1911, and the Connecticut Company, the employ of which he entered as chief clerk to the president in July, 1911. Since Jan. 19, 1918, he has been assistant to the president of the Connecticut Company.

Mr. Flickinger is one of those men who seek to know all angles of the work of the industry with which they are connected. The post of chief clerk to the president of the Connecticut Company, which Mr. Flickinger took in 1911, was a title only, for from the time that he went with Mr. Storrs to New Haven, it was he who directed all the vast routine of the president's office. Mr. Storrs knew that he could delegate more and more authority to Mr. Flickinger, and his assistant, in turn, never winced at the increased amount of responsibility.

Not only did Mr. Flickinger carry on successfully in the posts of chief clerk and of assistant to Mr. Storrs, but he exercised a lot of independent initiative. He became the contact man with the public authorities and regulatory bodies and to him was allotted the task of inquiring into the many phases of the vast operation of the company. What Mr. Flickinger did not find out himself about the property, he had others find out for him. To him was assigned the work of inquiring into the possible use of the bus by the Connecticut Company at the inception of that movement, and the operation of buses by the company today is very largely a reflection of his foresight and of his appreciation of the more modern methods of conducting and selling transportation. He was chairman of the first committee of the American Electric Railway Traffic & Transportation Association on the use of the bus. A great deal of the credit for the organization of the Connecticut Company Section also is his.

Mr. Bennett has been supervisor of time-tables and attached to Mr. Punderford's office. Before he came to New Haven he was with the Grand Trunk Railway and later with the Canadian Pacific Railway. In 1904 Mr. Bennett entered the service of the Connecticut Company in the office of E. H. McHenry, then vice-president of the New York, New Haven & Hartford Railroad. In 1905 he was made chief clerk in the office of Calvert Townley, then vice-president of the Connecticut Company. Mr. Bennett's close connection with the general manager's office of the Connecticut Company has made him peculiarly fitted for the greater responsibilities that now become his by the appointment as assistant general manager.

It is an indirect commentary on the ability of President Storrs as an executive that he had in his organization men of the caliber of Mr. Punderford, Mr. Flickinger and Mr. Bennett, ready at all times to assume an ever-increasing measure of responsibility and, very largely because of that fact, now prepared to carry on without interruption the work of the company from which he is about to retire as head.



W. J. Flickinger

The Connecticut Company operates 802 miles of track and owns nearly 1,500 motor cars and a number of buses. It serves all of the large cities in the state.

Mr. Woodlock's Name Withdrawn

The nomination of Thomas F. Woodlock, New York, to be a member of the Interstate Commerce Commission will not be submitted to the Sixty-ninth Senate for confirmation. Mr. Woodlock's nomination was contested in the last Senate on the ground that he was closely identified with Wall Street and the nomination failed of confirmation.

A. F. Elkins, at one time auditor of the Columbus, Delaware & Marion Electric Railway, has just been appointed to take charge of the Cleveland office of Peat, Marwick, Mitchell & Company, accountants and auditors. After leaving the Columbus, Delaware & Marion Railway Mr. Elkins went with the Interstate Commerce Commission. For the past few years he has been chief of the railroad section, consolidated returns audit division, income tax unit, Treasury Department, with headquarters at Washington.

R. M. Hannaford and C. H. Boire Advanced in Montreal

Two important executive appointments were announced recently by Lieut.-Col. J. E. Hutcheson, general manager of the Montreal Tramways, Montreal, Que. R. M. Hannaford, formerly acting chief engineer, has been appointed engineer of maintenance of way and structures and C. H. Boire, formerly chief clerk of the treasury department, has been appointed assistant secretary-treasurer.

The association of Mr. Hannaford with the Montreal Tramways dates back to 1902, when he was appointed assistant engineer with the Montreal Street Railway. His first engineering work was in connection with surveys for the Montreal & Champlain Junction Railway. After this he spent a year in the drafting department of the Phoenix Bridge Company at Phoenixville, Pa. He then joined the engineering staff of the old Grand Trunk Railway first as instrument man and later as resident engineer on the double tracking of the line between Montreal and Toronto. After this he spent 2 years with Pratt & Whitney, Hartford, Conn., on design work, and in 1889 he was appointed chief draftsman with the James Cooper Manufacturing Company. He later became connected with the Montreal Tramways and has remained in that work ever since, with steady progress to his new appointment as engineer of maintenance of way and structures.

Mr. Boire entered the employ of the Montreal Street Railway in 1903 as timekeeper in the accountant's department. When the Montreal Street Railway Mutual Benefit Association was organized he was promoted to the position of accountant in that association and held that position for several years. He was then transferred to the secretary-treasurer's department as chief clerk. This position he held until his present appointment to an executive office as assistant secretary-treasurer for the tramways.

H. S. Earl, Vermillion, Ohio, agent for the Lake Shore Electric Railway, Cleveland, for several years, has been promoted to assistant superintendent of the Cleveland division, with headquarters at Cleveland.

Cornell S. Hawley, member of the executive committee of the American Electric Railway Association and president of the Consolidated Car Heating Company, Albany, N. Y., was elected president of the Albany Chamber of Commerce on Feb. 6.

Judge John C. Denney, Everett, Wash., has been appointed director of the state Department of Public Works of Washington, to succeed Walter B. Whitcomb, who returns to his old position as supervisor of public utilities other than transportation. From this position he was promoted when E. V. Kuykendall resigned as director.

Howard F. Fritch, who was assistant general manager of the Eastern Massachusetts Street Railway, Boston, Mass., but recently accepted a position with the Boston & Maine Railroad as manager of its bus department, has been elected president of the Boston & Maine Transportation Company, the bus subsidiary of the railroad, and has already worked out a bus schedule both for Massachusetts and New Hampshire. He says that for the short routes he will use the street car type of bus, but for the longer routes he will use the larger type that has been adopted by the Boston Elevated Railway.

H. A. Benjamin has been appointed vice-president and general manager of the Des Moines & Central Iowa Railroad with headquarters at Des Moines, Iowa. The appointment, effective Feb. 18, places Mr. Benjamin in charge of both the operating and traffic departments.

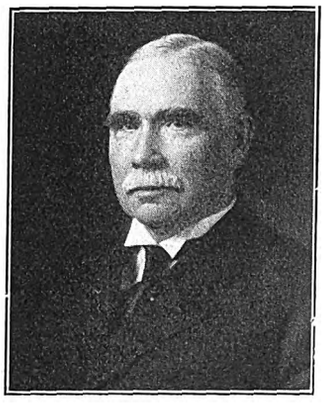
Charles F. Johnson, general manager of the Wason Manufacturing Company, Springfield, Mass., a subsidiary of the J. G. Brill Company, Philadelphia, was elected vice-president of the Wason company at a special meeting of its board of directors on Feb. 18. As vice-president, Mr. Johnson succeeds Austin H. Pease, whose death was announced in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 11, 1924. Mr. Johnson will continue as general manager of the company.

Obituary

Elliott G. Stevenson

Head of Detroit United Railway Was Lawyer with Nation-Wide Reputation

Elliott G. Stevenson, president of the Detroit United Railway, Detroit, Mich., since 1923 and before that acting president of the company for a year, died on March 7 at Coronado Beach, Cal., in his seventieth year, after an illness of only two or three days. For many years before he became operating head of the railway Mr. Stevenson, who was one of the leaders of the Michigan bar, was chief counsel for the company. In fact, it was as chief counsel for the company that he brought to a close the agreement by which the city of Detroit acquired the D. U. R. city lines, and it was to him personally that Mayor Couzens handed the city's check for $2,500,000 as a first payment on the lines.



E. G. Stevenson

Mr. Stevenson had big plans ahead for the Detroit United. It was he who arranged for the financing of the company carried out during the last few years and it was he who saw the need for the greater intensification of the merchandising activities of the company. It was a gigantic task that he set for himself so late in life, this proposed rehabilitation of the properties that remained after the lines in the city had been sold. He threw himself into the work with his usual vigor, but the strain told and he was recently forced to desist and take a vacation. As a practitioner before the bar Mr. Stevenson was accustomed to working single-handed, a method he carried over with him into his railway work, but one that drew heavily upon his mental and physical resources. He was a gracious man, friendly and unassuming, but it was foreign to his nature and to his long legal training to delegate to others tasks which he regarded that he himself could, perhaps, best carry out. He was conscious that he was trying to do too much, and had in recent months gradually worked around to the point where he was intrusting more and more detail and routine to others.

Of recent years, Mr. Stevenson's reputation became national through the two legal battles he fought against Henry Ford. The first was as attorney for the Dodge Brothers, when he compelled the Ford Motor Company to distribute $55,000,000 in dividends. In 1919 Mr. Stevenson was again pitted against Mr. Ford, and this case attracted not only national but international publicity. The Chicago *Tribune* had called Mr. Ford an anarchist in an editorial, and Mr. Ford brought suit for $1,000,000 against the paper, charging libel. This suit was tried in Mount Clemens before the late Circuit Judge James Tucker. The newspaper retained Mr. Stevenson as its Michigan counsel. The Ford libel suit ended in a technical victory for Ford. The jury awarded him damages of 6 cents. Neither side appealed.

At that time Mr. Stevenson was attorney for the D. U. R., which then owned the railways in the city. James Couzens was Mayor, and a crisis developed in the relations between the D. U. R. and the city. Late one afternoon, after Mr. Stevenson had put in a grueling day in the Ford suit, he was called to Detroit to bring the D. U. R. through the crisis. The employees were on a strike, and it was to settle this that the D. U. R. instructed him to fight it out with Couzens, before Judge Adolph F. Marschner. Far into the night the two personalities opposed each other. Fatigue seemed unknown to either, although both were under a tremendous strain. In the early hours of the morning an agreement was reached, and Mr. Stevenson rode back to Mount Clemens and was present when court opened.

Only a small part of Mr. Stevenson's

Digitized by Google

extensive legal business resulted in court trials. His attitude was that, as a general proposition, controversies instead of being litigated should be adjusted. In effecting such adjustments, he displayed extraordinary wisdom and skill and thus rendered his clients a far greater and more valuable service than would have been possible had these controversies been successfully litigated.

Mr. Stevenson was born May 18, 1856, in Middlesex County, Ontario, and a few years later moved to Port Huron. He finished school when 16 years old and studied law in the office of O'Brien J. Atkinson.

Herman K. Haupt, for 10 years chief clerk to J. V. Davis, vice-president and general manager of the Washington, & Old Dominion Railway, Washington, D. C., is dead.

Joseph P. Murphy, prominent in the development of Toledo's street car lines, died recently. He was born in New York State and went to Toledo in 1882 from Pittsburgh to become superintendent of the Robinson Street car line.

Charles Thornton Adams, for more than 35 years attached to the legal department of the Interborough Rapid Transit Company, New York, N. Y., is dead.

Charles Y. Kay, for two years vice-president of the Stark Electric Railroad, Alliance, Ohio, died on Feb. 10. Mr. Kay was prominent in business and political circles in Alliance for half a century, and was one of the guiding hands which placed the Stark Electric Railroad in control of Alliance capital. He resigned the vice-presidency and directorship of the Stark Electric Railroad about 2 years ago. Mr. Kay was 73 years old.

Frank S. Briggs, for a number of years claim agent of the Cumberland County Power & Light Company, Portland, Me., died recently. He had resided in Portland 25 years and all that time was employed by the Portland Railroad, which is now a subsidiary of the Cumberland County Power & Light Company. Mr. Briggs was 50 years old.

Franklin Woodman, one of the best known electric railway men in New England, died at his home in Haverhill, Mass., on Feb. 27, after a long illness. He was born at New Gloucester, Me., in 1857 and in early youth was employed by the Metropolitan Street Railway, Boston, Mass., as a gravel car checker. He was soon appointed a starter in the car service and later became superintendent of the Atlantic Avenue and Washington Street horse car service. In 1889 he became superintendent of various suburban lines running out of New Bedford, Mass., but in 1892 took charge of the electrification of the Haverhill & Groveland Street Railway and then of the Lowell, Lawrence & Haverhill Company lines. In 1901 Mr. Woodman was made general manager of the Haverhill & Southern New Hampshire Street Railway and later vice-president and general manager of the Massachusetts Northeastern Street Railway, which post he relinquished about 7 years ago on account of ill health. In 1911 he was president of the New England Street Railway Club.

McGuire-Cummings Builds Bus Bodies for West Towns Railway

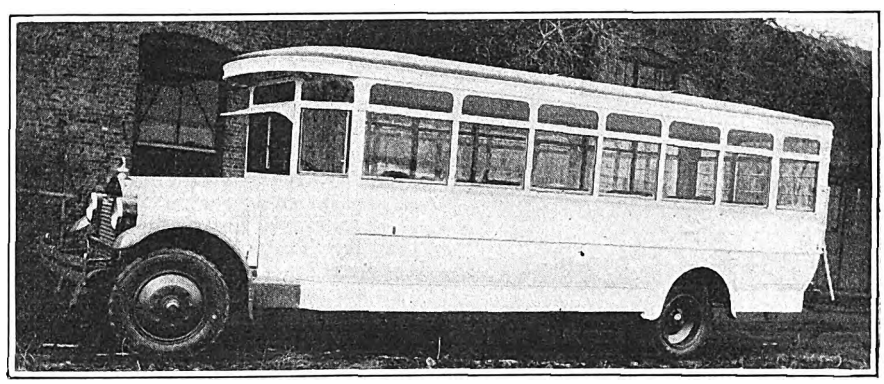
Street car type bodies built by the McGuire-Cummings Manufacturing Company have recently been bought by the Chicago & West Towns Railway, Oak Park, Ill., for five Mack buses. A combination of wood and steel framing is used. Side sills and posts are of ash, flooring of poplar and roof of $\frac{5}{16}$-in. three-ply Haskelite supported on ash carlines.

These bodies have a seating capacity of 26. They are 7 ft. 5 in. wide over the belt rail and the floor is 2 ft. $1\frac{5}{16}$ in. high at the entrance step. The side sheets are 14-gage aluminum. Battleship linoleum $\frac{5}{16}$ in. thick is used as a floor covering. This is cemented to No. 10 cotton duck, which is securely fastened to the floor over $\frac{1}{8}$-in. building paper.

Upper sash are cherry, made up in continuous lengths and fastened to the side posts. Lower sash are brass. The windshield is the Rostand Manufacturing Company's all metal type. Trimmings are nickel-plated bronze and stanchions are 1-in. aluminum pipe fastened into aluminum fittings. All inside finish is cherry. Doors, wainscoting and all moldings are made of this material.

The seats are Hale & Kilburn stationary type, upholstered in leather. Provision is made for a sign box over the windshield, and a curtain is so arranged that it can be pulled down and fastened to the back of the driver's seat.

An exhaust pipe heating system is included, and heater pipes within the body are protected with perforated metal shields. Six dome lights are arranged for interior illumination. In addition there are two front and two rear marker lights and another light at the step opening. The buses are finished in Ripolin enamel.



Bus Bodies Built by McGuire-Cummings Manufacturing Company for Mack Chassis

American Car & Foundry Issues New Stock

W. H. Woodin, president of the American Car & Foundry Company, has commented on the proposed change in the financial structure of the company by which the 300,000 shares of common stock, par value $100, will be replaced by 600,000 shares of no par value stock with voting right for the common of one vote for each two shares. He said that in announcing the proposed change, the directors stated explicitly that it was not expected that there would be any change in the company's dividend policy. On the common stock dividends for some years had been paid at the rate of $12 a year, but there was no reason to expect that the dividend on the common would be less than heretofore.

Metal, Coal and Material Prices

Metals—New York	Mar. 10, 1925
Copper, electrolytic, cents per lb	14.45
Copper wire base, cents per lb	16.75
Lead, cents per lb	9.00
Zinc, cents per lb	7.65
Tin, Straits, cents per lb	53.25
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.325
Somerset mine run, Boston, net tons	2.125
Pittsburgh mine run, Pittsburgh, net tons	1.95
Franklin, Ill., screenings, Chicago, net tons	2.00
Central, Ill., screenings, Chicago, net tons	1.90
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$7.00
Weatherproof wire base, N.Y., cents per lb.	19.50
Cement, Chicago net prices, without bags	2.20
Linseed oil (5-lb. lots), N. Y., per gal.	$1.17
White lead in oil (100-lb. keg), N. Y., cents per lb., carloadlots	0.1272
Turpentine (bbl. lots), N. Y., per gal.	0.93

Possibilities of 2½-In. Paving Brick

At the annual meeting of the National Paving Brick Manufacturers Association in St. Louis, Jan. 20, 21 and 22, steps were taken to make a study of the possibilities of 2½-in. brick for street and highway paving designed to accommodate light and medium weight

Digitized by Google

traffic. It was stated that in the early days of brick paving ordinarily no foundation whatsoever was used. Occasionally a layer of sand or gravel was used. Nowadays, however, a substantial foundation is employed, and with this development has come the viewpoint that a paving brick wearing surface of 3-in. or 4-in. thickness is unnecessary. Some 2½-in. brick pavements have been in service about 14 years and it is the intention to conduct a survey of their design and durability. Another feature of interest at this meeting was the almost unanimous vote in favor of using asphalt filler rather than cement grout filler between paving bricks.

Rolling Stock

Knoxville Power & Light Company, Knoxville, Tenn., recently placed orders for 16 new double-end safety cars at a cost of $130,000. The new cars will be 30 ft. long and will seat 30 people.

Hartford & Springfield Street Railway, Warehouse Point, Conn., is adding three Mack city-type buses to its equipment. Two have seating capacities of 29 passengers and one 25 passengers.

Indiana, Columbus & Eastern Traction Company, Springfield, Ohio, plans to order seven new safety coaches to be placed in service over the Union City to Dayton branch, on which the commission recently authorized abandonment of railway service.

Springfield Street Railway, Springfield, Mass., expects delivery shortly on four new Garford buses. One of these is equipped with a Superior body. The three others are being fitted with bodies at the Wason Manufacturing Company plant of the J. G. Brill Company in Springfield.

Madison Railways, Madison, Wis., has announced specifications on six new cars, which will be placed in service some time during the summer of 1925. The details of these cars are as follows:

Date order was placed	Feb. 21
Builder of car body	American Car Company
Type of car	Single truck, safety
Seating capacity	30
Total weight	17,250 lb.
Length over all	30 ft. 1 in.
Truck wheelbase	8 ft.
Width over all	8 ft. 2½ in.
Height, rail to trolley base	12 ft. 5 in.
Body	Steel
Interior trim	Cherry
Roof	Arch
Air brakes	General Electric
Car signal system	Consolidated
Control	General Electric
Destination signs	Hunter
Door-operating mechanism	National Pneumatic and American Car Company
Fare boxes	Cleveland
Gears and pinions	General Electric
Heater equipment	Consolidated
Motors	Two GE—264, inside hung
Paint	Sherwin-Williams Old Dutch Enamel
Seats	Hale & Kilburn
Seating material	Rattan
Slack adjuster	Brill
Trolley catchers	Ohio Brass Company
Trolley base	Ohio Brass Company
Trolley wheels	More-Jones

Los Angeles Railway, Los Angeles, Cal., has placed orders for four more double-deck buses. Two will be made by the Fageol company and delivered March 15; the other two are to be made by the Moreland plant for delivery April 15. This new equipment will be used on Wiltshire Boulevard line. This will provide double-deck buses exclusively for this line, releasing the single-deckers for other service.

Track and Line

Monongahela-West Penn Public Service Corporation, Fairmont, W. Va., will rehabilitate its tracks on Putnam and Second Streets in Marietta, Ohio. The work will begin probably by April 1.

Trenton, Hamilton & Ewing Traction Company, Trenton, N. J., will install a crossover, switches and frogs on the West State Street Division. Permission was granted by the Trenton City Commission.

Stockton Electric Railroad, Stockton, Cal., has been granted a certificate by the Railroad Commission to construct and operate a railway from the intersection of Wilson Way and East Main Street to the east city limits, a distance of approximately 5,750 ft. The authorization was made under a franchise granted by the city of Stockton.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has applied for permission to build a new interurban to extend west from 35th Street, Milwaukee, to connect with the Waukesha-Watertown interurban near West Allis. The line will cost $700,000 to build. It will run over a private right-of-way to obtain faster time to Waukesha, Oconomowoc and Watertown by avoiding the long runs over city streets through West Allis. S. B. Way, vice-president and general manager of the company, regards this project as one of the most important extensions of the company's lines into new territory that has been made for several years. Construction of the new line will begin this spring if the Railroad Commission approves the plan.

Power Houses, Shops and Buildings

Sacramento, Cal.—Permit has been granted for construction of the proposed new $54,486 terminal of the Sacramento Northern Railway. The building will be the combined terminal of all the electric lines operating in Sacramento. George D. Hudnutt is contractor.

Monongahela-West Penn Public Service Company, Fairmont, W. Va., plans to spend $1,000,000 in improvements and developments during the next year in the Fairmont and adjacent regions. One item on the list is a substation in Fairmont to take the place of the existing plant.

Aurora, Elgin & Fox River Electric Company, Aurora, Ill., will erect a $325,000 carhouse on South River Street, south of North Avenue, in Joliet. General Manager Egolf has asked the city to vacate streets and alleys in the vicinity of the proposed improvement. The carhouse will have a capacity for more than 100 cars.

Trade Notes

Bradford H. Whiting has severed connections with the Whiting Corporation, Harvey, Ill., and its subsidiary, the Grindle Fuel Equipment Company. Mr. Whiting has given up his directorship in each of the companies and also resigned the offices of vice-president and general manager of the Whiting Corporation and president of the Grindle Fuel Equipment Company.

Johnson Fare Box Company, Cleveland, Ohio, announces the installation of a complete equipment of registering boxes on the city system of South Bend, Ind., operated by the Chicago, South Bend & Northern Indiana Railway. The installation was made when the new fare of 7 cents cash or four tokens for 25 cents recently went into effect.

Gold Car Heating & Lighting Company, Brooklyn, N. Y., announces that W. H. Ivers has rejoined its organization as Southwestern sales representative. Mr. Ivers was connected with the Gold company from 1916 to 1921 in the Southwestern territory. Prior to that he was in Philadelphia with the Baldwin Locomotive Works. He comes back to the Gold company after having rounded out his experience by 3½ years as sales manager for the A. Gilbert & Sons Brass Foundry Company, St. Louis, a fast-growing concern engaged in the manufacture of bearings and bearing metals for railway uses.

Hisey-Wolf Machine Company, Cincinnati, Ohio, has announced reduced prices on Hisey electric tools effective Feb. 16 per price list No. 30. Electric drills of the most popular sizes have been reduced from 12½ per cent to 17 per cent and many other price reductions from 5 per cent to 10 per cent have been made.

New Advertising Literature

Pittsburgh Testing Laboratory, Pittsburgh, Pa., has issued bulletin 35, entitled "Better Foundry Sands."

International Steel Tie Company, Cleveland, Ohio, has issued a 24-page illustrated pamphlet on new construction methods for renewable paved track.

Hubbard & Company, Pittsburgh, Pa., has issued catalog 24, which contains a complete list of the company's pole line hardware and construction specialties. Information is included regarding the manufacture of the various part and specifications for hot-dip galvanizing of iron and steel. The catalog is illustrated. It contains 192 pages.

White Company, Cleveland, Ohio, has issued an attractive and interesting silver anniversary edition of its transportation magazine, the *Albatross*, featuring a quarter century of White transportation. The book in a large way is a history of the automotive industry. It contains a vast amount of information and reviews the progress made by this well-known truck and bus manufacturer from 1900, when the first White truck was built.

Annual Maintenance Number

The Maintenance Man Has a Real Job Today

MORE substantial progress has been made by the electric railways in the past two years than in any similar period of the industry's history. Business has increased, fares have been brought to the point where the average road can be made self-sustaining, and the financial structures of many properties have been strengthened. In a material way, too, the electric railways have come forward. Many new cars have been bought and much track has been built and rebuilt. Today the physical plant is in better condition than it has been for a decade or more.

Maintenance is the major problem that faces the industry today. For a short time, just after the various parts of the plant are renewed, they will work well even though but little attention is paid to repairs. If the railway systems are to be kept up to their present high standards, however, it will be necessary to pay more and more attention to maintaining the plant that has been built up in recent years, so that it will not fail to give its full measure of service.

In this lies the field of usefulness of the trained man who has made a study of problems of maintenance, and of methods of doing better work in less time and at lower cost. It is a real man's job. New cars and new track have brought with them changed problems. The maintenance methods of a generation ago are of little or no value today.

The leaders in the maintenance field are all the time developing methods which are fitted to present-day conditions. These are accomplishing the results sought and are providing a goal for others.

It is not so easy to be a follower, to adopt the methods that have been developed by another. But the wise leader is also a good follower. Not only is he at work on the development of new methods, but he is also reaching out into the field to draw to himself the best methods that have been worked out by others, changing them only if necessary to fit the conditions of a particular property.

Given a property, even though a poor one, the right sort of a maintenance man can find much to do, and he can reduce costs for his company so as to redound to his own credit. If he does his work faithfully and achieves results, the management should see to it that he receives a fitting reward in the way of remuneration and of promotion. For it is only by having an incentive that a man will put forth his best efforts and so obtain the best results.

Good Roadbed Maintenance an Important Factor in Interurban Popularity

DESPITE all that has been said of how the automotive vehicle has revolutionized the riding habit of the American citizen, the fact remains that the operation of commodious cars on smooth steel rails first gave him his taste for luxury in travel. Nothing has yet been developed to equal them in spaciousness and easy riding quality. Automobiling is extremely pleasant when the weather is fair and the road is good. By this means one can often reach attractive spots that are inaccessible by rail. Yet when all is said and done, if one takes a trip of any considerable length there is far greater comfort from a ride in a vehicle with steel wheels running on steel rails than in one with rubber tires running over the average highway.

A smooth roadbed well ballasted and well maintained is the greatest asset any interurban line can have. Possessing it, the electric railway can provide a service that has definite advantages over that of the automobile or the steam railroad. Usually the steam railroads make no particular attempt to attract passenger traffic between cities comparatively close together. The interurban railway, with more frequent service and equally commodious cars, is in a good position to secure much of this business. Compared with the automobile, the interurban is unquestionably cheaper and offers a more spacious vehicle operated over a smoother roadway.

It is surprising to see how some interurban managements throw away the great inherent advantage of steel wheels running on steel rails. By neglecting properly to maintain their track and roadbed they allow the surface of their rails to become so uneven that much of the pleasure of riding is lost. Often the same companies are careless about the maintenance of their rolling stock. What ought to be a pleasant ride, swift, quiet and comfortable, becomes an ordeal during which the passenger must endure the swaying, jolting, banging, rattling and creaking of a car operated over rough track.

Where such conditions exist it is not difficult to see why people prefer to travel by automobile or by steam railroad. This condition is not by any means true of all interurban lines. But on a considerable number of properties more attention should be paid to the matter of roadway maintenance.

Better Bus Maintenance in Railway Operation

ON MANY electric railways bus maintenance has now become a problem of considerable importance. Just as there is no ultimate economy in allowing track or rolling stock to deteriorate, there is none in neglecting the upkeep of buses. The necessity for adequate maintenance is sometimes overlooked. In reality it is of even greater importance because the bus is subjected to greater vibration. From its very nature the internal combustion engine racks the bus body and chassis more than the electric motor does the body of a street car. The weaving of the chassis frame due to inequalities in the road is another inherent cause of vibration.

One of the advantages of co-ordinated bus and railway service is that the railway managements are already thoroughly familiar with the necessity for and general problems of shop organization and rolling stock maintenance. They know that it is necessary to have a systematic plan, adequate facilities and to keep accurate records. Moreover, their resources are such that it is possible for them to provide these things.

As yet the bus is too young for maintenance to have become thoroughly standardized. A number of smaller railways have facilities for making repairs in existing carhouses. Where bus operation has replaced car operation, or where it has been possible to transfer cars to some other location, in some cases carhouses have been converted into bus repair shops. But generally speaking, the railways have provided buildings designed for garage purposes.

Bus maintenance personnel is ordinarily separate and distinct from the car maintenance personnel. This is largely because the equipment of the bus is so different from that of the car that its proper care requires men with specialized training.

Inaccessibility of parts has been one of the difficulties of bus maintenance. This is a matter that deserves careful consideration. Within a comparatively brief time, however, the bus has changed from being simply a body mounted on a truck chassis into a vehicle designed especially for passenger transportation, and it is not unreasonable to expect that as time goes on other improvements will come in the design to make maintenance cheaper and easier.

Reduction of Noise Is a Good Investment

THE interest being taken in the reduction of noise in street car operation cannot fail to mark the beginning of a new era. This subject must be taken seriously. Competitive conditions demand it, and the cost of noise reduction ultimately will be justified by actual savings effected as well as in the intangible valve in good will and increased revenue that may be laid to quieter operation.

A decided improvement in existing conditions is not impossible, nor even especially difficult. Consider the properties of today. Those that keep their track and equipment in good condition have the quietest operation. As pointed out in another editorial in this issue, the greatest wear comes from rubbing between parts that are not tightly held together. Is it to be wondered that a car with loose parts is disagreeably noisy? Practices that permit these conditions cannot be justified. Yet they do exist. It takes money to rectify them now. But if the necessary money be spent to correct them, is there any doubt that in the end real economy will be shown?

The justification for bringing the standards of maintenance to the highest plane is readily apparent to the mechanical man. It exists not only in the reduction of noise but in longer life of the parts. Higher maintenance standards, as applied to noise reduction, mean essentially closer fits. This in turn means less vibration and sound. It also means that these close fits will be maintained longer. This latter statement is demonstrable by test. The proportional added expense to secure higher standards of maintenance as compared with the value of the added life of parts has not been worked out, but it is doubtful if the net cost will be much if anything. There may even be a reduction in expense.

Some of the maintenance factors which will contrib-

Digitized by Google

ute particularly to reducing car noise were discussed in an editorial in the Feb. 28 issue of the JOURNAL.

As to changes in design, there is a wide field for endeavor. So long as steel wheels roll on steel rails there will be some noise, but the amount of that noise is capable of material reduction. Modern design of trackwork has tended toward rigidity. Car design has had a similar trend. Both of these aggravate the noise. Body and equipment noises by themselves are of relatively minor consequence now, because their volume is less than that of track and wheel noises. But if the latter are reduced to a minimum, these other noises will stand out more prominently, so that they should not be neglected. For both classes of noises there are remedies. Steps have been taken in individual cases to eliminate several of the sources. While they are experimental as yet, there is no inherent reason why a concerted effort should not be made to bring together all the plans that have been proposed and work out a real campaign for promoting quietness in operation.

In the quest for economy we have perhaps forgotten that we have something for sale that must be made popular—not only to the riding public, but also to the listening public along the car routes. In the end these are the potential riders who can be attracted or repelled by what they see and what they hear. So it would seem that as a question of policy the problem of noise should be attacked and conquered, entirely apart from the value of quietness from the mechanical standpoint.

Good Maintenance Is Cheap Maintenance

NOWHERE is the old adage "A stitch in time saves nine" more apt than in connection with electric railway maintenance. Vibration and rubbing between adjacent surfaces are major causes of failure in many parts of railway track and equipment. Rail joints that are tight never give any trouble; but let the joint begin to loosen, and motion between the rails, the joint plates and the connecting bolts is accelerated until within a short time it is impossible to make a satisfactory repair by any method short of cutting out the joint and inserting a new piece. Meanwhile vibration has broken the paving and the foundation. The same thing is true of car parts. Fitted joints in bodies, trucks or motors give no trouble until there is a slight tendency to looseness. Then chafing ensues and causes the abutting surfaces of the parts to wear away, increasing the trouble rapidly until they fail completely.

Accidents are often caused by the practice of letting the maintenance go until the wear has reached a point that it is considered unsafe to wait any longer for a repair. Sometimes the judgment of the inspector is faulty in that the repair is deferred until long after the danger point has been passed and the factor of safety wiped out.

Then, too, the cost of the repair, when it finally is made, increases much faster than in proportion to the length of time the work is deferred. A loose joint in a car part requires only tightening a few bolts when it is first observed. A little later it may require an expensive building up of the parts with the welder, followed by machining of the adjoining surfaces Usually this will require disassembling of the parts so that the work may be done, followed by a reassembly, with a considerable waste of labor.

Why a management can imagine that deferring maintenance saves money it is difficult to see. Yet the practice is indulged in by many roads every time there is a call for drawing down on the pursestrings. The number of trainmen cannot be reduced, nor can their pay be cut without the possibility of labor troubles. Maintenance work can, however, be partially neglected for a time without anyone being the wiser. Sooner or later it will be necessary to pay the piper—and the charge will not be a light one. It is far better to have the maintenance work done well, and done when its need first becomes apparent. The saving will be obtained not only in a direct reduction of maintenance costs, but in better performance on the street and a reduced number of interruptions to service. The cost of items such as these can never be measured directly; but it is a factor that always enters in the final analysis.

Central Master Mechanics Would Improve Their Work

IN THIS ISSUE is reported the organization of the Central Electric Railway Master Mechanics' Association. Its purpose, as expressed by representative speakers at the meeting, is to study and compare methods and practices so as to enable the mechanical men to serve better the roads on which they are employed —to enable them to improve their work.

The master mechanics contend—and rightly so—that upon them rests a very important part of the responsibility for maintaining a satisfactory interline business. They believe that greater uniformity in equipment design and maintenance and in inspection standards will bring about improved service to shippers and reduced costs to the carriers. They point out that it is imperative to reduce delays while waiting for special maintenance parts and transfer of shipments due to defective equipment.

To these objectives the new organization has been dedicated. If the executive committee approves the proposal the members of the new association will be affiliated with the C.E.R.A. much in the same way as are the Central Electric Railway Traffic Association and the Central Electric Railway Accountants' Association. The master mechanics expect to hold some of their meetings at various railway shops in the territory, so that they can compare and discuss practices at first hand. The new plan, it is claimed, will save time and produce more concrete results than has the Engineering Council, where maintenance-of-way and power distribution subjects were considered, as well as equipment practices.

The plan includes many potential possibilities for effective and constructive activity guided by group thinking and effort. The leaders in this movement are to be commended for their initiative and progressiveness. It is unfortunate that they felt the results desired could not be accomplished through the present Engineering Council, even with some modifications in its organization. But if the new plan helps the master mechanics to improve their work, the maintenance-of-way and power distribution men may follow a similar procedure. After all, the results are the only factors that are of importance—the mechanism is incidental.

Repair Shops of the Interborough Rapid Transit Company

THE Interborough Rapid Transit Company has two main repair shops. The one shown in the upper view is that originally used by the Manhattan Elevated Railway. It is between 98th and 99th Streets on Third Avenue and occupies the greater part of two city blocks. The yard on Third Avenue is on a level with the elevated structure. The lower view shows the new shops and the office building at 147th Street and Seventh Avenue. These shops, yards and storage space, when completed, will extend along the Harlem River from 145th Street to 151st Street, with western frontage for part of the property on Lenox Avenue and for part of the property on Seventh Avenue. Of the detail views accompanying this article those on pages 442 to 445 inclusive were taken at the 98th Street shops, and those on pages 447 to 449 inclusive were taken at the 147th Street shops.

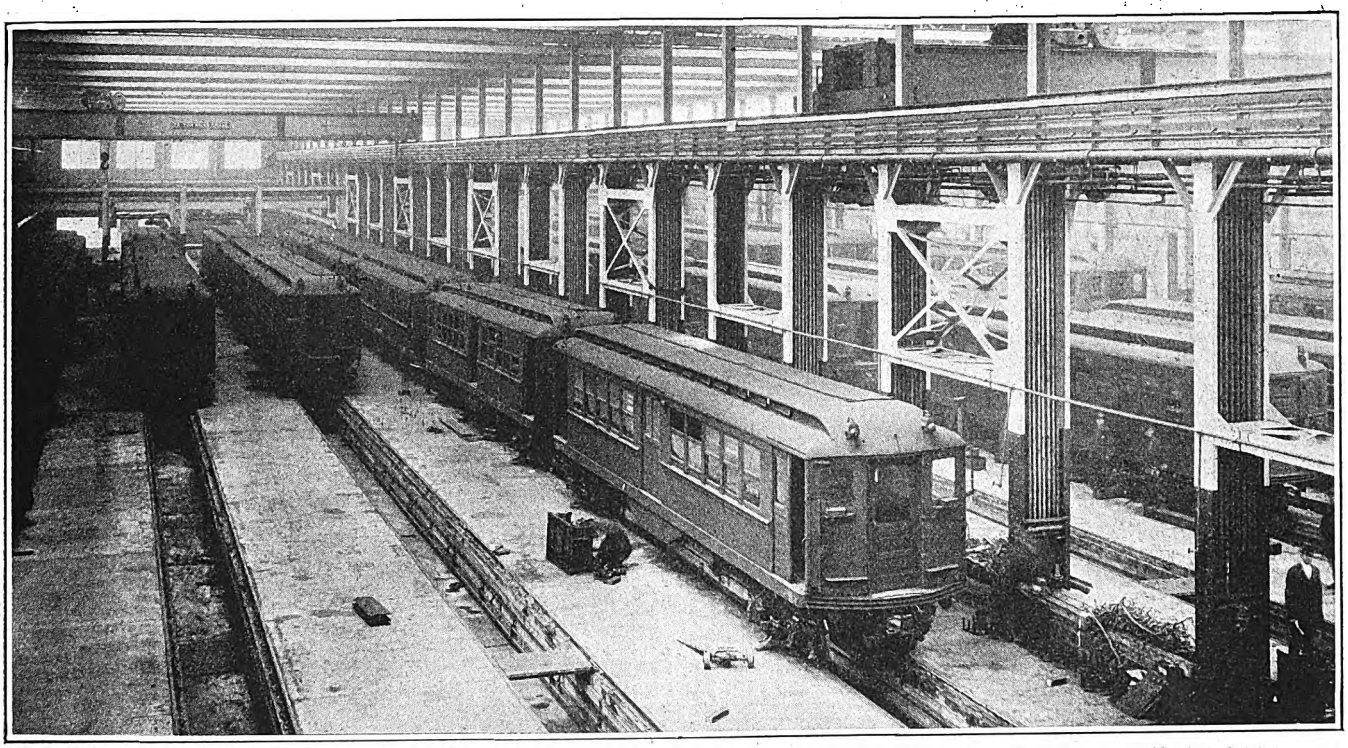
Maintenance Methods on the Interborough

Under a Most Exacting Service, an Efficient System of Car Maintenance Has Been Built Up, by Which Delays per 1,000,000 Car-Miles Have Been Kept to a Low Figure



One of the Inspection Bays at the 147th Street Shops

THE immensity of the task of maintaining the rolling stock of the Interborough Rapid Transit Company can be gathered from a few statistics of the traffic conducted, as compared with trunk-line railroads. During the calendar year of 1922, the last year for which statistics of this kind are available, the entire revenue-passenger business on the steam railroads or trunk-line railroads of the country (Classes I, II and III) reporting to the Interstate Commerce Commission amounted to exactly 989,509,000 passengers, and it is estimated that the few small roads outside the jurisdiction of the commission would not be sufficient to make an aggregate of 1,000,000,000 passengers. During the same year, however, the twelve months ended Dec. 31, 1922, the number of passengers carried by the Interborough Rapid Transit Company was 1,001,730,481. This number was divided approximately two-thirds on the subway division and one-third on the elevated division. Yet this number was carried practically without accident. The figures of passengers carried by the Interborough for 1923 and 1924 are given in Table I.

THIS ARTICLE describes the nature and extent of the repair problem, the methods followed in carrying out repairs and the organization by which this work is conducted in the shops of the Interborough Rapid Transit Company of New York. Previous articles on the repair shops, inspection methods and inspection shops of this company appeared in the issues of May 3, 1924; Aug. 16, 1924, and Aug. 30, 1924.

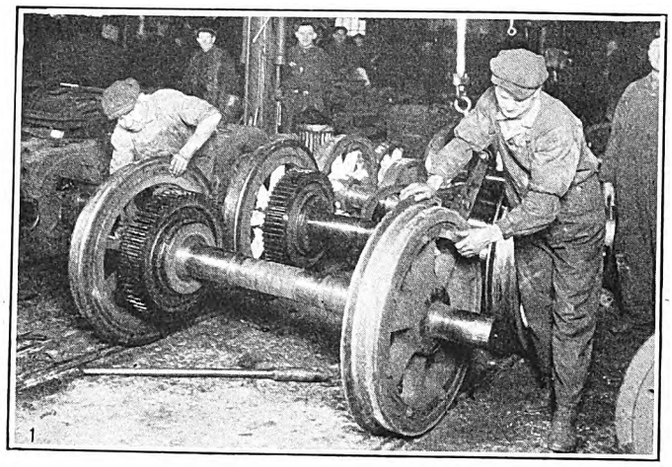
TABLE I—PASSENGERS CARRIED BY THE INTERBOROUGH RAPID TRANSIT COMPANY

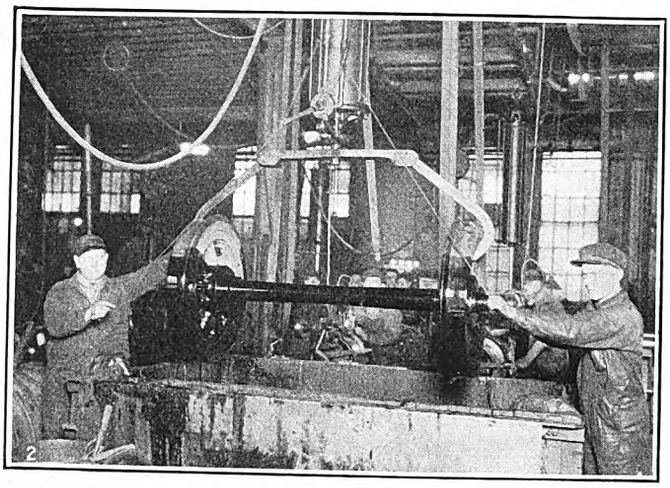
	1923	1924
Subway	693,069,053	729,029,664
Elevated	355,143,240	357,528,667
Total	1,048,212,293	1,086,558,331

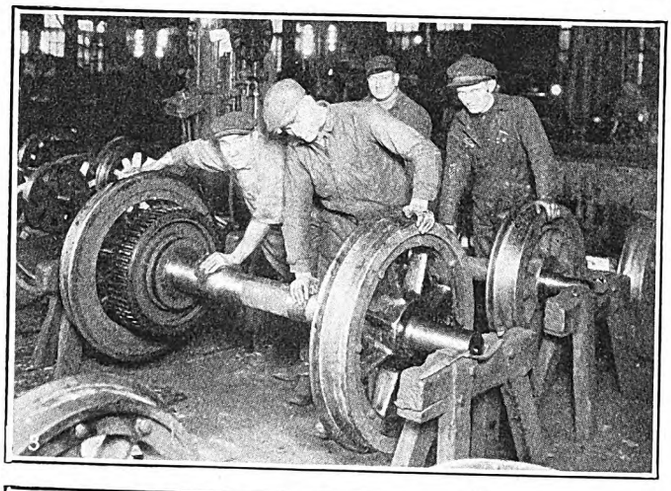
The extent of the operations of the Interborough Rapid Transit Company can be indicated in another way. Each month this company operates between 15,000,000 and 17,000,000 car-miles. This mileage is more than that which would be taken by the operation of a subway car 20 times around the circumference of the earth at the equator every day for a month.

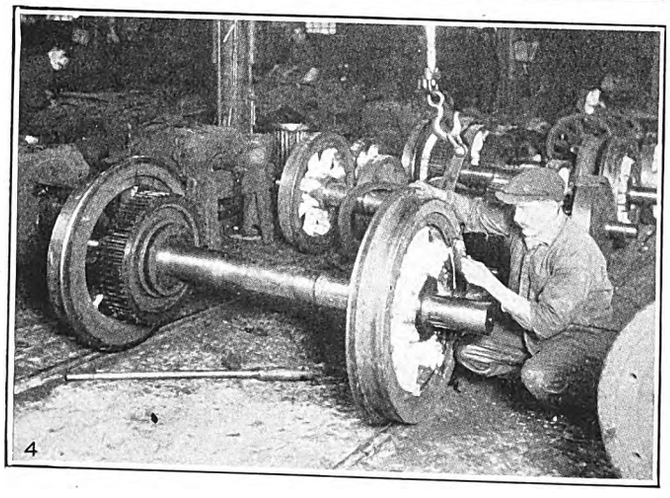
It is not only in number of passengers carried and car-miles run that the performance of the Interborough Rapid Transit lines is remarkable. The service conditions are probably the most severe in the world. Trains made up of steel cars, weighing between 38 and 40 tons each, have to be started, brought up to full speed and then braked to a stop, all day, at intervals of only about 1½ to 3 minutes. Frequently on the subway individual cars average more than 5,000 miles per month, and during this time they have to make from 12,000 to 15,000 starts and stops. Again, if a car develops a defect after it has been put in service in a train, it cannot easily be cut out and put on a siding or hauled on a branch track to the repair shop, as would be the case with a line operating on the surface. If it breaks down entirely it delays not only its own train but every

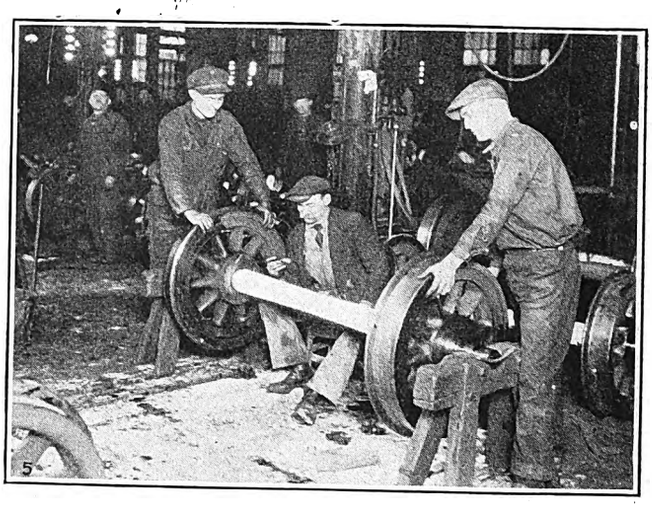
Digitized by Google











other train on the same track behind it and means a large loss of fares, as well as discomfort to the travelers. This demands that, in spite of the tremendously arduous railway conditions prevailing in subway operation, breakdowns from mechanical defects and pull-ins have to be kept practically to zero.

Finally, unlike most surface lines, rapid transit lines exist only where population density is high and where, in consequence, real estate is very expensive. This means that the repair shops and maintenance shops have to be designed to permit the smallest amount of space per car with which the maintenance department can get along. Added to all of these conditions which face the Interborough Rapid Transit Company, the city of New York, which is responsible for providing the necessary shop and inspection facilities under the dual contracts, is far behind in this part of its program. It is true that now, after long delay, the shop and inspection facilities of the company are being extended by the city, as described in the previous articles referred to, and an especially needed extension of the repair shops at 147th Street and Lenox Avenue for the subway division is now in course of construction. When this is completed, some time during this year, it will help the situation greatly.

In the meantime, of course, the company has not been able to wait for these new facilities and has had to conduct both inspection and repair work as best it could. In these circumstances, the low record of the company in delays per 1,000,000 car-miles from mechanical and electrical causes, as shown in the upper chart on page 444, is remarkable.

Careful records are kept of the number of cars shopped for different causes. The charts shown on page 444 are typical records of this kind.

Table II shows car-miles operated on the two divi-

The Five Illustrations on This Page Show the Methods of Inspecting Wheels by the Vibration Test and Magnifying Glass

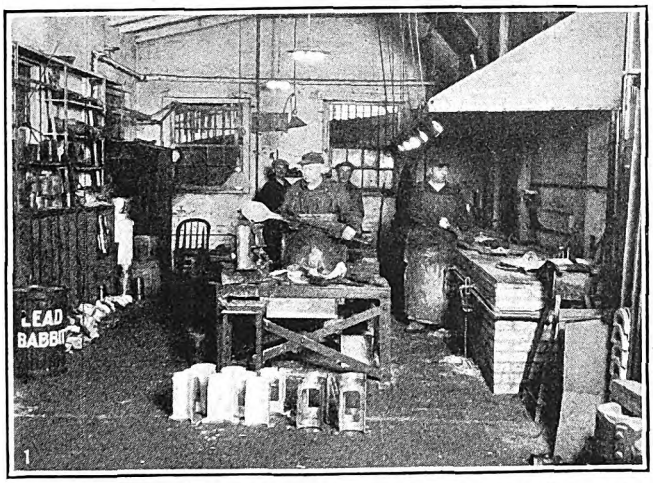
As explained in the text, a great deal of study has been given by the engineers of the Interborough Rapid Transit Company to methods of testing wheels, axles and pinions. The five accompanying views show the processes used when the wheels come into the repair shop. (1) The dirt is scraped and wiped off. The axle is then immersed in a lye tank for 30 or 35 minutes, and then thoroughly cleaned with waste. (2) It is then put in a hot bath of oil, and (3) then wiped clean and dry again. (4) The axle, wheel and spokes are then coated with whiting and the axle is vibrated with a hammer. (5) It is then carefully examined with a magnifying glass for evidence of detail fractures. Any crack is usually at the junction of the wheel and axle. Three of the views show a motor axle and two show a trailer axle. Both are treated in the same way.

Digitized by Google

sions for the 14 months ended with February, 1925. Table III gives the number of cars owned last fall, i.e., not including those on the recent order.

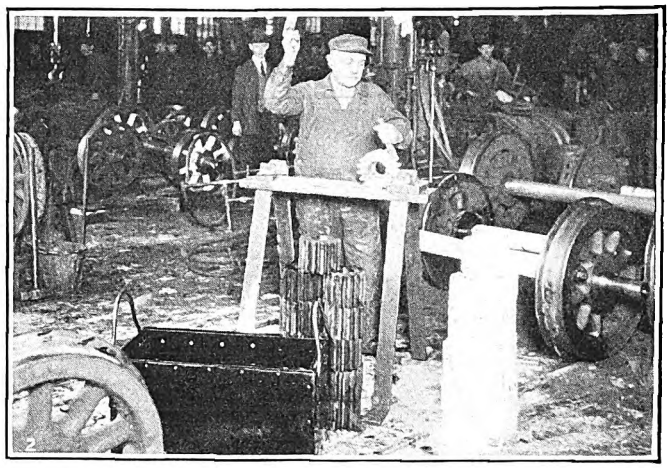
ORGANIZATION OF MECHANICAL DEPARTMENT

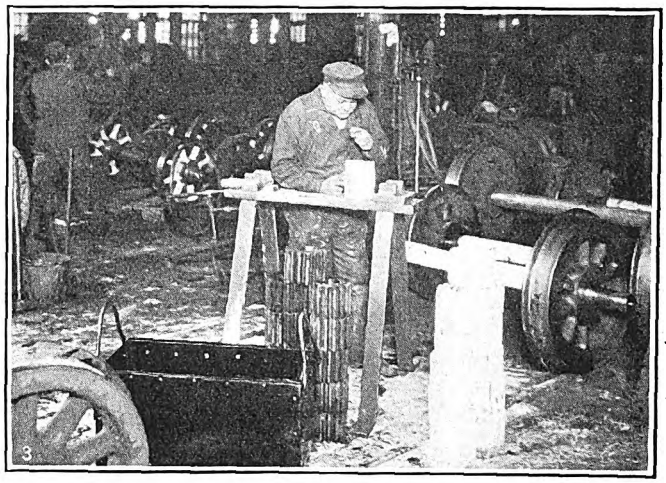
The car equipment department of the Interborough Rapid Transit Company is headed by a superintendent of car equipment, who is also assistant to the general manager. The fact that the head of the mechanical department is thus also in close official connection with the highest councils in the company shows the importance in which good maintenance is held on the Interborough and the authority which it is realized he should have. This official, James S. Doyle, has charge of all of inspection, maintenance, construction and engineering of rolling stock on both the elevated and subway divisions.

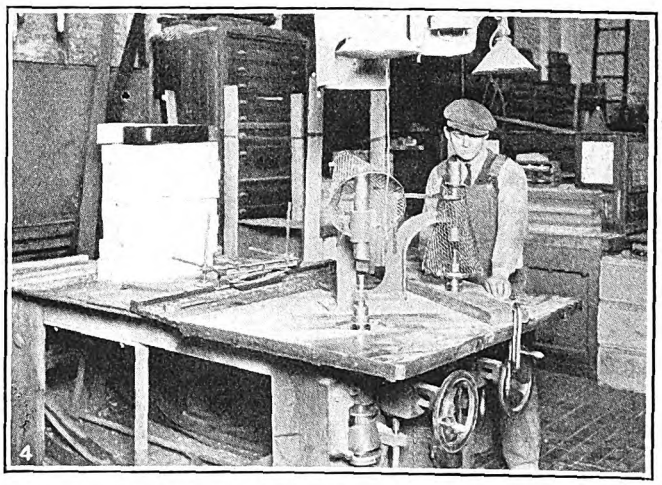


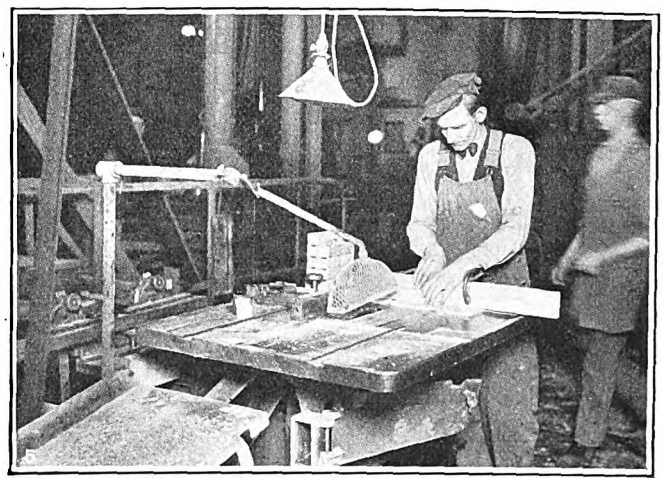
The company makes a distinct separation between its inspection work and its repair and overhaul work. The inspection is conducted in nine special inspection shops, located at different points in the system, as described in the previous articles mentioned. In these shops all cars are inspected on a mileage basis, the motor cars after every 1,000 miles and the trail cars after every 1,200 miles.

The repairs, except such light repairs as are carried on at the inspection sheds incident to inspection, are done at one of the two repair shops of the company. The subway rolling stock goes for all repairs except painting to the shops at 147th Street and Lenox Avenue, now being doubled in size. The cars for the elevated system are repaired at the shops belonging to the Manhattan Elevated Railway at 98th Street and Third Avenue. All painting of cars is also done at these shops. A considerable number of the executives connected with the maintenance department of the company have their









The Five Illustrations on This Page Show Babbitting, Pinion Testing and the Safety Features of Mill Practice

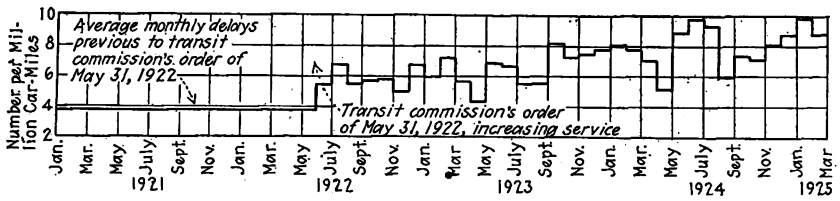
The first view shows the babbitting room at the 98th Street shops. The babbitt furnaces, the pyrometer and the racks for bearings of different sizes are at the right. There is still a larger babbitting room at the 147th Street shops. The next two views show the method of testing new motor pinions by the vibration method. It is very similar to the method used for testing wheels, as described on the opposite page. View 2 shows the blow being given to a pinion coated with whiting. Below are piles of coated and uncoated pinions and an oil bath tank. View 3 illustrates the examination of these pinions with the magnifying glass. Views 4 and 5 are from the wood mill in the 98th Street shops. The machine in View 4 is a variety molder and shaper. Note the mandrel which slips over the end of the shaft to hold it in place. Note also the safety guards over the revolving parts. These guards are so arranged that while they can be raised they cannot be removed from the machine. View 5 is of a circular saw and also shows a guard so arranged that it cannot be removed from the machine.

Digitized by Google

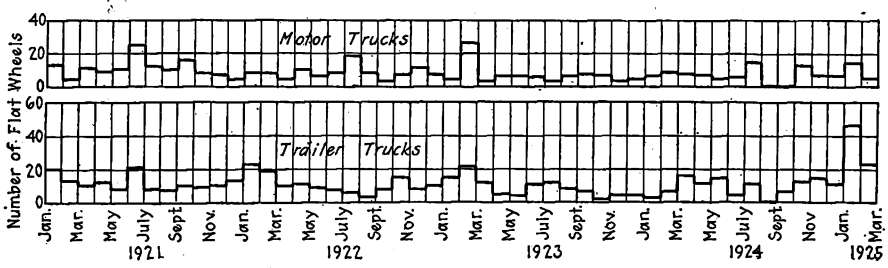
offices at the shops at 98th Street and Third Avenue, and here also is the office of the superintendent of car equipment.

At these shops each car on the system is thoroughly gone over at least once a year, at which time all necessary repairs are performed. In addition, the heavy repairs, which, because of their character, are such that they cannot be advantageously performed at the inspection and running repair shops, are also carried on in these shops.

The principal causes for which cars are sent from the road to the repair shop, except at overhauling times, are: Armature and field trouble, wheel turning, worn journals or truck repairs, heavy car-body repairs and painting.



Delays Due to Electrical and Mechanical Causes—Subway Division



Wheels Flat—Manhattan Division. The Upper Drawing Is for Motor Trucks, the Lower Drawing for Trailer Trucks

When a car comes into the repair shop, regardless of the nature of the trouble, a careful inspection is also made of the car body, including brake rigging, interior of body, platforms, roofs, sills, body bolsters, and control apparatus. If any defect is discovered the necessary repairs are made. In addition, a regular schedule is carried out with all cars.

Car Wiring Tests at Repair Shop

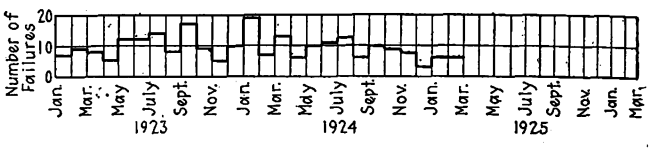
The control apparatus and car wiring are subject to the following inspection and tests as cars go through the shop.

The controllers are inspected, and if any worn fingers are found they are changed and new fingers are installed and adjusted. If any controller cylinders are found with worn or loose segments, they are removed and sent to the machine shop for repairs. The finger blocks and arc chutes are thoroughly cleaned and any necessary repairs are made. All mechanical parts such as shafts, pinions, gears and levers are repaired and readjusted, where this is needed.

All contactors are tested and inspected, and all worn or burnt contact tips, arc chutes, shunts, interlock fingers and worn mechanism base plates are replaced with new parts. All wire connections are gone over and tightened.

The reversers are tested, cleaned and oiled. All worn or burnt fingers or segment boards are replaced. All wire connections are tightened.

The line switches are tested, and all worn, burnt or broken tips, levers, arcing horns and arc chutes are



Road Failures Due to Grounded, Open and Short Circuited Train Line Jumper Wires

cleaned or replaced with new parts. Worn overload trip contacts and interlock fingers are replaced and adjusted. The operating magnet valves are overhauled and pin valve seats are ground on a six months basis.

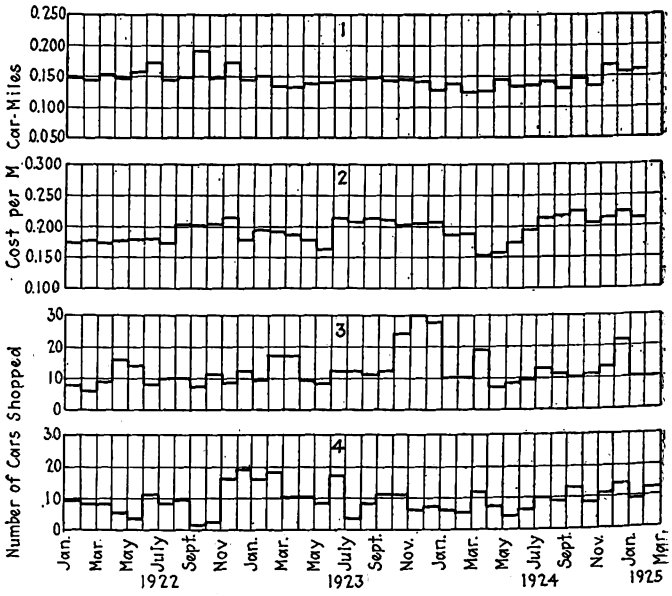
The rheostats are inspected for broken or fused grids and loose connections. At this time, broken or burnt insulators are replaced and the insulating collars are cleaned and shellacked.

The coupler sockets are inspected, particularly for loose or cracked insulation blocks and for loose or broken contact fingers and covers.

All switches and fuse base and connection boxes are inspected, particularly for loose parts, and all connections are tightened. All wires are examined for broken strands.

Before any car is allowed to leave the repair shop the electrical wiring on the car is given a high-tension test of 1,200 volts, for break-down of insulation, short and open circuits and grounds.

The truck trolleys and motor leads are inspected and removed on a time basis. The interval for the truck trolleys is every 18 months and that for the motor leads every 24 months. The flexible jumper connections between the cars, on which the reliability of the service depends to a large extent, are removed on a time basis of 18 months. The old jumper cable is scrapped and new cable is used so that the jumpers will be in 100 per cent condition.



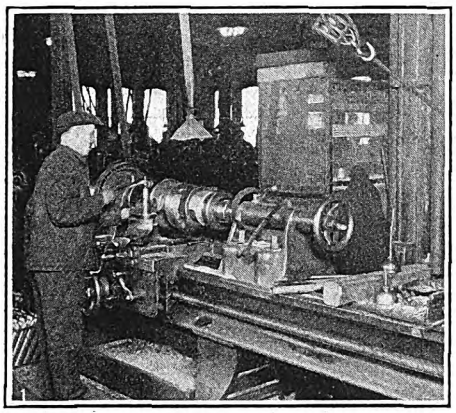
A Few Typical Charts of Maintenance Records

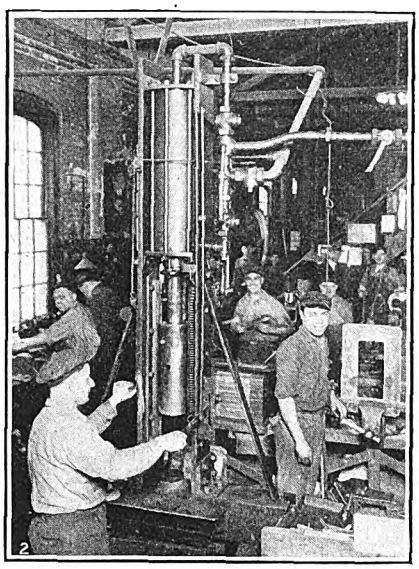
No. 1. Lubrication cost per thousand car-miles — Manhattan division.
No. 2. Lubrication cost per thousand car-miles — Subway division.
No. 3. Cars shopped for pinions and gears—Subway division.
No. 4. Cars shopped for car body defects—Subway division.

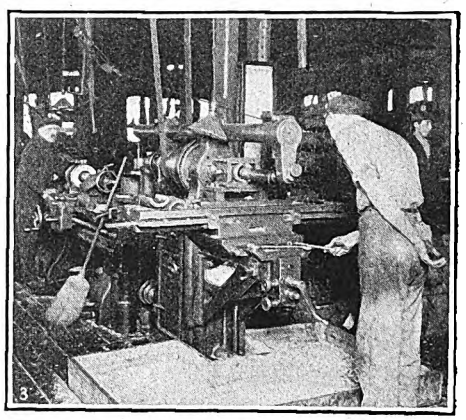
Digitized by Google

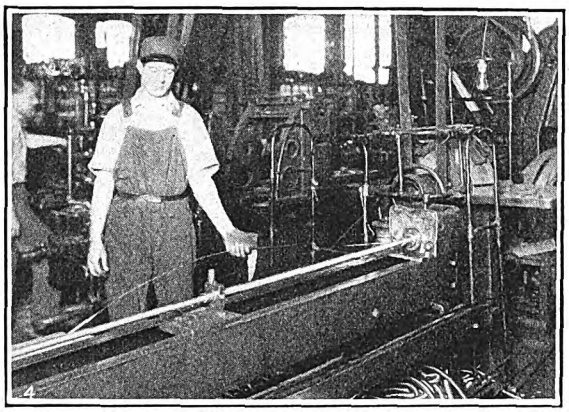
All wire used on the cars is made to the Interborough's specifications. These specifications are very rigid, calling for 30 per cent pure Para rubber. Wire is purchased by the company only from certain manufacturers who have been found able and willing to make wire that meets the company's specifications.

While the car bodies are going through the body repair shop, the trucks, brake rigging, air compressors, air brake equipment and trip devices are sent to a separate department where they are thoroughly inspected and the necessary repairs are made. All drawheads, pins and coupling links and also all pinions and gears are checked up for wear with a limit gage. Before a car is returned to service the air brakes, control and motor circuits are tested and the brakes are adjusted. At the same time, the car body is checked for height and side bearing clearance.









Four Interesting Machines in the Machine Shop at 98th Street and Third Avenue

Views 1 and 3 show the lathes used in turning axle brasses. The outside of a pair of journal brasses is being finished in View 1 and the inside in View 3. The two halves are held together by a band so they will make a perfect fit. The ring on the arbor of the boring tool in View 3 is a measuring gage. View 2 shows a pneumatic hammer for forming fiber disks for magnetic coils, washers, etc. This hammer was made from pick-up material in the shop. The fiber disks formed on this machine are first punched flat from strips. Then they are laid on a hot die and stamped to a dished form with this pneumatic hammer. This is a great saving in time over the old way of turning these disks on a lathe. A safety feature of this hammer is that the operator must use both hands on the machine while the hammer descends. The machine in View 4 is a device for winding brass wire into the form of spiral armor for motor and other leads. One great advantage of this machine is that it makes this wire armor of uniform size. It is also very rapid. The former method of making this armor was with a lathe with which 1,000 lb. of armor a week was a good record. This machine winds 1,000 lb. easily in a day.

Because of the high speed and the limited clearance of the cars with parts of the subway structure, good axles are even more of a necessity than on most electric railways. The company's specifications for axles are known among manufacturers to be very exacting. The original axles were annealed, but many years ago specifications were changed to call for higher-grade heat treatment such as is now used in the best automobile practice. Since the adoption of these specifications there has never been an axle failure under any of the Interborough cars. Although the use of this heat-treated material appears to be entirely safe, the company has always taken the extra precaution of having axles rigidly inspected at the mills before installation and subsequently tested periodically in service. The axles are tested at the shops on a 50,000-mile basis in the following manner:

The wheels and axles are removed from the trucks, and all rust and scale are removed from the axle. The axle is then immersed in a lye tank for 35 minutes. It is then thoroughly wiped clean with waste, after which it is put in a hot bath of oil at a temperature of 240 deg. F. for 35 minutes and again wiped clean and dry. The axle is then coated with whiting and alcohol. It is then vibrated and carefully examined with a magnifying glass for evidence of detail fractures. Views of these tests are given on page 442.

The same test of being cleaned and oiled, then coated with whiting and vibrated, is applied to the wheels and also to the swing hangers, equalizer bars, king pins, car-body brake rods, pinions and axle cap bolts on all trucks when they are passing through the repair shop.

All pinions are heat treated. In the vibration test given to them every tooth is vibrated and examined for defects. Axle cap bolt lock washers are of the type known as parallel washer, made of high-powered steel. They are scrapped every time bolts are removed.

Motor Maintenance

The company has a large variety of motors, as shown in Table IV. The controller equipments are also listed in Table IV.

As motors go through the shop all field coils and armatures are inspected and tested for defects. Those found in bad order are tagged with a "bad order" card. This card, which is 5½ x 7 in., carries an illustration of a field coil or armature, on which the position of the defect may be marked. The back of the card contains space for further remarks, as well as a duplicate illustration of the field coil or armature. Bad order tag cards for field coils are printed on white stock, those for interpole fields on blue stock and those for armatures on buff stock.

While the cars are in the shops all armatures are gaged and tested for lateral motion. The brush-holders are removed and the brush-holder insulators are cleaned.

At the same time the brush-holder tension is tested with a spring balance. The commutator and the armature as a whole is also inspected and given an electrical test.

Turning Rolled Steel Wheels

The rolled-steel wheel is used exclusively on subway division motor trucks. Previous to its development, less than 20 years ago, steel tires were used, but owing to the high rates of braking they were not satisfactory. The heat from the action of the brakes used would tend to loosen the tire and special means had to be adopted to correct this trouble. The development of the rolled-steel wheel was therefore very acceptable to the operators of the rapid transit lines in New York. The

Samples of Piecework Prices Used in Painting Manhattan Division Standard Cars

NOTE: Contracts include refinishing all work found unsatisfactory by foreman or inspector; preparation work; stacking and racking work; delivery of material to and from car and bench, etc.

Body Exterior—Motor or trail car, burn off enamel with burning machine, sand and putty, letterboards, side and end window posts, window stops, post battens, pier panels, window stools, aprons, sheathings, panels, battens, end body doors, end door posts and headers, door post battens, body corner posts and battens, bulkhead panels, hood bows, hood sheathing, and end stationary sash. Operations:

Burning, per car $11.66
Sanding, per car $2.54

Body Exterior—Motor or trail car. Enamel (orange color). Side and end window posts, window stops, post battens, pier panels, window stools, aprons, sheathings, panels, battens, end body doors, end door posts and battens, body corner posts and battens, end stationary sash. Operations:

Enameling, first coat, per car.... $1.55
Enameling, second coat, per car.. $2.07

Body Exterior—Motor or trail car. Enamel (black color). Letterboards, lower deck crown moldings, end door headers, bulkhead panels, hood bows, hood sheathing and battens. Operations:

Enameling, first coat, per car.... $0.86
Enameling, second coat, per car.. $0.95

Clear Story—Exterior motor or trail car. Enamel (black color). Upper deck sill and plate posts, panels, moldings and sash stops, carlin ends, roof sheathing at eaves, and hood sweep panels. Operations:

Enameling, first coat, per car.... $0.68

Body Exterior—Motor or trail car. Re-enameled type. Sand and putty, letterboards, side and end window posts, window stops, post battens, pier panels, window stools, aprons, sheathing, panels, battens, end body doors, end door posts, and headers, post battens, bulkhead panels, hood bows, hood sheathing, end stationary sash, upper body side and end sash. Operations:

Sanding, complete, per car..... $1.40
Puttying, complete, per car..... $0.33

Body Exterior—Motor or trail car. Re-enameled type. Enamel (orange color). Side and end window posts, window stops, post battens, pier panels, window stools, aprons, sheathing, panels, battens, end body doors, end door posts and battens, end stationary sash, upper body side and end sash. Operations:

Enameling. Apply first coat, per car $1.85
Enameling. Apply second coat, per car $2.20

Lettering, etc.—Motor or trail car. Exterior. Letter side panels or side sheathing in dark blue color, letterboards orange color, number side of car dark blue color, end door header and bulkhead panels in imitation gold, stencil cross-seat front rail in imitation gold; includes: layout, stripe and cut in. Operations:

Lettering. Paint words "Interborough" on letterboards, per car $1.10
Lettering. Paint words "Open Air Line" on side of car, per car.. $1.83
Numbering. Paint four figure car, 16 numbers on side of car, per car $0.84

Body Equipment—Exterior motor car. Clean and paint rheostat frames and hangers, contact boxes, fuse boxes, junction boxes, compressor and cradle, brake cylinder, air reservoirs, pipes, cleats, rods, clamps, asbestos, linings, truss rods, posts, needle beams and needle-beam truss rods, end caps and nuts. Operations:

Cleaning, per car $2.352
Painting, per car $2.898

Interior, Skinned Off Motor Car below advertisement signs. Remove varnish with remover and revarnish advertisement sign and window moldings, window cappings, pier panels, wainscotings, wire moldings at cross-seats, blind stops, cross and side seat framing and risers, end bulkhead partitions, end stationary sash, swing sash, switch boxes, cab partitions both sides, end doors, cab doors both sides, all wood trim not removed from car. Operations:

Removing varnish, bleach and sand, per car $15.00
Varnishing. Fill, shellac, putty and varnish first coat, per car $4.26
Varnishing. Sandpaper and varnish, second coat, per car..... $1.396

Interior, Complete — Revarnished motor car. Upper deck posts, casings and sash stops, panels, deck sill and plate facia and moldings, upper and lower deck headlining, edge moldings, strap poles, advertisement sign and window moldings, window cappings, upper body side and end sash, pier panels, wainscotings, wire molding between cross-seat, cross and side seat framing, and risers, end bulkhead partitions and bulkhead panels, end stationary sash, swing sash, switch boxes, cab partitions and bulkhead panels, end stationary sash, swing sash, switch boxes, cab partitions and head panels, both sides, blind stops, partings and casings, end doors, cab door both sides, and all wood trim not removed from car. Operations:

Shellacking. Sand, bleach, stain and shellac in part, per car.... $1.134
Varnish. Sand and varnish, per car $2.814

Stripping—Manhattan motor car, curtain or blind type. Strip complete as follows: Remove signal bells, bell and emergency cords, window guards and grab handles, end door locks complete with keepers, swing sash catches and keepers, cab, door locks, stile reinforcement plates, upper and lower sash, partings and frame casings, cab pocket, upper and lower drop sash, casings, partings, lifts, lock and lock stops, motorman arm rests; sash, body side upper and lower, partings, casings, lifts, locks and lock stops; blinds, partings and lifts; destination sign boxes and brackets, notice signs, fire extinguishers, emergency pipe cleats, side and cross-seat backs; stencil sash, partings and castings; place all hardware in boxes and bundle up wood trim. Strip complete including upper sash:

Motor car, 24 window curtain, per car $2.35

Trimming—Manhattan Motor Car curtain or blind type, when not equipped with Dahlstrom posts. Trim as follows: Apply window guards, signal bells, bell cord, anchors, hooks and eyebolts, emergency cords, anchors, hooks and eyebolts, end doors, casings, locks, lock keepers, chafing plates, anti-rattlers, rubber bumpers, cab doors, locks, lock keepers, seat rests, and lock stile brace plates, cab upper and lower sashes, lifts, locks, lock stops, casings and partings, cab seats, swing sash catches and keepers, upper and lower body sashes, blinds, curtains, sash and blind lifts, partings and casings, sash locks and stops, notice signs, cross and side seat backs, fire extinguisher box complete, destination sign box and sign blade brackets, includes: fit and drill all holes, replace all broken or missing parts found on inspection. Trim complete:

Motor curtain type, 24 window, per car $9.50

Air Brake and Brush-Holder Repairs Are Facilitated by Special Equipment
The left-hand view shows the testing department for motorman's operating air valves. The valves are tested as in regular service. At the right, a portion of the brush-holder repair department is shown

Interborough company was the first to co-operate with the manufacturers in the introduction of the rolled-steel type of wheel for heavy traction work. Since its introduction the company has carefully followed up all later developments and performances of this type of wheel in heavy traction service.

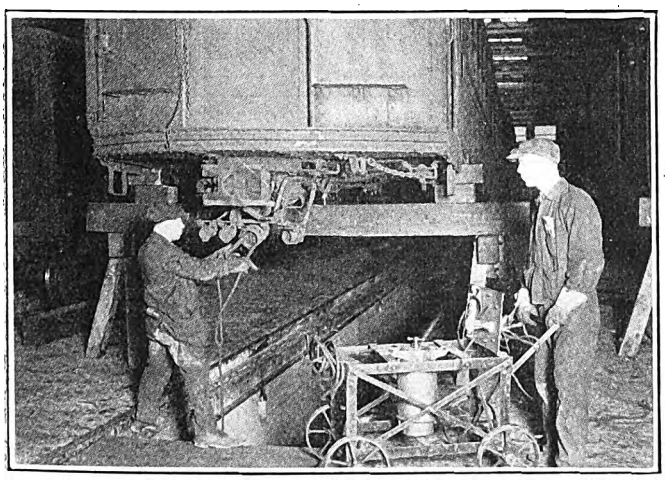
The method of turning wheels at the 147th Street shop was described in an article on page 443 of the issue of this paper for March 17, 1923, with some particulars of the piece-work system employed for practically all the repair and maintenance work of the company. The advantages of this system as a means of saving investment are perhaps no more prominently exhibited than in the work of turning wheels. Under the piece-work system the men have a strong incentive for speeding up, and the output of the lathes is correspondingly increased. The result of this is that at the 147th Street shop only three wheel lathes are required, each wheel lathe operated by one man turning out an average of 15 pairs of turned wheels per day.

Two of the charts reproduced on page 444 show the method of tabulating the number of cars shopped for wheels on the subway division and the number of flat wheels per month developed on the motor trucks and trailer trucks of the Manhattan division.

In one respect the repair situation of the company is complicated in that it has to care for the maintenance and repair of two entirely different kinds of cars, namely, wooden cars, as used on the Manhattan elevated division, and all-steel cars as used on the subway division. It is therefore in a position to be well acquainted with methods of maintenance and repair for both kinds of rolling stock and can offer to others the valuable experience it has gained in doing this work side by side with two distinct classes of equipment. While the same methods are followed in maintaining both the steel and wooden car bodies, the body repairs of each type require entirely different types of shop machinery. The steel cars are repaired at 147th Street and Lenox Avenue subway shop, which is equipped with the necessary iron-working machinery for making all classes of steel body repairs. All wooden cars are repaired at the 98th Street and Third Avenue shops, which have a full equipment of wood-working machinery.

Lubrication Practice

Owing to the exacting character of the service, special attention is given on both divisions of the Interborough Rapid Transit Company to proper and adequate lubrication. The methods employed represent an extended experience of the engineers of both the Inter-



Electrical Tests for Car Wiring and Armatures Detect Open Circuits, Short Circuits and Grounds
High-tension tests on car wiring are made at 3,000 volts a.c. The convenient portable transformer outfit shown in the view at the left is used. It can be operated from a 110-volt a.c. socket. The view at the right shows the method of telephone testing armature and commutator connections to show short circuits and grounds.

Equipment for Wheel Turning at the 147th Street Shops
These powerful lathes for turning steel wheels have been of enormous help in keeping the cars used in New York rapid transit service supplied with wheels

borough Rapid Transit Company and the Galena Signal Oil Company, which has a yearly contract with the railway company for the lubrication of car equipment at a guaranteed cost per 1,000 car-miles. A typical report showing the method of tabulating the amount and cost of lubrication is that reproduced in the accompanying table, which shows the lubricant chargeable to cost per 1,000 miles during March, 1924, for the subway division.

As will be seen, the averages for the different divisions vary considerably. This variation is due largely to differences in the type of equipment used. It will also be noticed that all costs are reduced to a basis of 1,000 car-miles.

Oiling of all moving parts is done at each car inspection, which is at intervals of 1,000 miles for motor cars and 1,200 miles for trail cars, but at the end of every tenth inspection the cars receive what is known as a general oiling. At this time, the waste is removed from the motor axles and journal boxes, which are then repacked. For this packing long-strand carpet wool waste is used.

Gears are lubricated with 4 lb. of gear grease every 10,000 miles, but for every 1,000 miles the pinion ends of the armature bearing are given 2 gills of oil and the commutator end bearing 1½ gills. All armature bearings are drained every time a motor car is brought into a shop. The oil is then carefully strained through several layers of cheese cloth and is then used again for lubricating journal bearings, while the refuse is retained for greasing drawbars, brake riggings, side bearings, sector bars, etc.

As already explained a great deal of attention is given to lubrication because of the hard service which the equipment has to perform and the knowledge that adequate lubrication is one of the greatest means of reducing maintenance.

To insure proper lubrication on the road, a representative of the Galena company pays a visit at least once a month to all depots and shops, taking up with the carhouse foremen their last lubrication report and inspecting the oil housings, tanks and filters with which the various shops and carhouses are provided.

To stimulate interest in better lubrication copies of

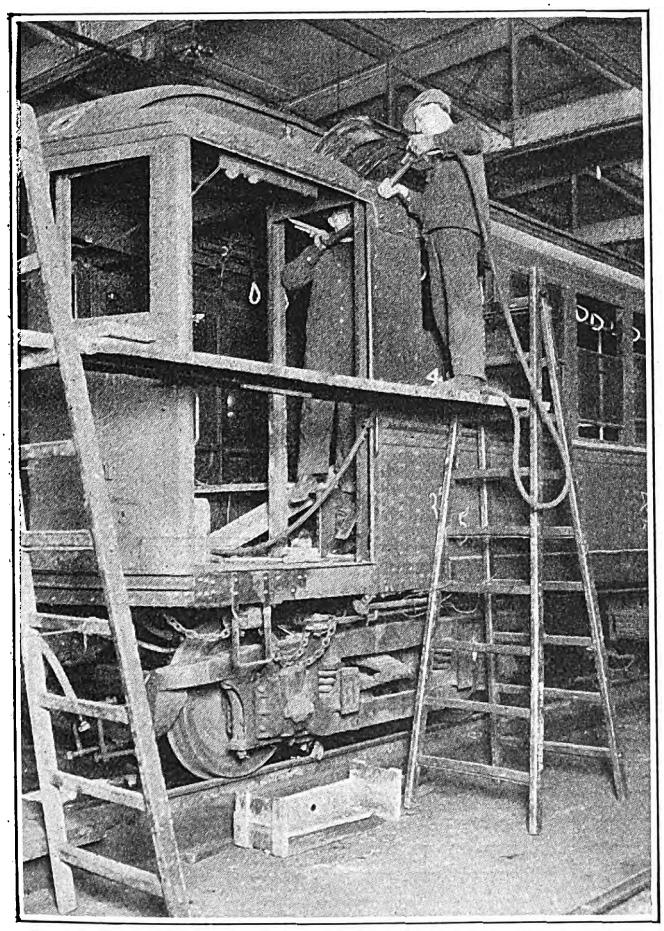
Packing Armature Bearings with New Oil-Saturated Wool Waste

the monthly reports of the lubrication expert to the superintendent of car equipment are sent to every division superintendent. At this time the superintendent of car equipment calls the attention of the division superintendents to any special points in the lubrication report which seem to call for consideration. Thus a record of an excessive amount of oil used is a reason for asking for an explanation of the conditions which brought about such a condition.

All general painting of cars is done at the 98th Street shop. Records are kept in the main office showing the date on which each car was last in the paint shop, the time when it should return to the shop if not called in earlier and the kind of painting called for.



Riveting a Roof Plate on a Car by a Pneumatic Riveter

The cars on the subway and elevated divisions are treated from a painting standpoint in an entirely different manner. The elevated cars, being very conspicuous from the street, are painted an orange color with black striping and considerable lettering. The use of so light a color is not considered necessary in the subway, so the cars on the subway division are painted a Pullman green with no lettering except the word "Interborough" on the letterboard, and the number of the car on each side at each end.

An important feature in the paint shop is the use of the piece-work system, which was adopted in 1905. Portions of the piece-work schedule for Manhattan cars are published on page 446. Other figures with typical blanks used in the shops of the company were published in the issue of this paper for March 17, 1923.

Performance Records Feature Tire Maintenance Practice

Los Angeles Motor Bus Company Is Making a Careful Study of Tire Mileage—High-Crowned Pavements Produce Uneven Wear

MAINTENANCE work on the buses of the Los Angeles Motor Bus Company, which is a subsidiary of the Los Angeles Railway and the Pacific Electric Railway, is done in a modern garage built of steel, brick and concrete. The offices of the company are on the second floor, while on the ground floor the buses are stored and repaired. In addition to storage space for 50 buses around the walls there are numerous inspection pits equipped with cranes for handling these heavy vehicles. Painting and the heaviest form of repair work are done at the railway shops.

No bus operates more than 200 miles per day. Schedule speed varies between 12 m.p.h. in the middle of the day and 7 m.p.h. in the rush hours. When a bus comes from the road it is gassed, oiled, and inspected. All lights are turned on to discover burned-out globes. Batteries and the airbrakes with which all are equipped are tested. Air in the tires is renewed every three days. Buses are greased every 500 miles and the oil changed every 1,000 miles, at which time they are taken into the pit for general inspection. After a mileage of 40,000 to 60,000 there is a general overhauling. This is practically on a yearly basis.

A record is kept of each individual tire. On every tire is burned a company number and a distinguishing letter. Thus a Moreland tire will never be used except on a Moreland bus, a Fageol except on a Fageol bus, etc. A tire numbered in the 4,000s is a 34-in. tire; one in the 5,000s a 35-in., etc.

When a tire is to be changed the mechanic fills out in duplicate a "Tire Change Blank," containing complete data. One copy he keeps; the other he sends to the storekeeper each day. Each wheel of a bus is numbered and the number of the wheel and the number of the tire must be put down on the record.

All of the data relative to tires are consolidated on permanent records which are instantly available. Any tire which has to be changed or repaired is first listed on a small file card called a "Tire Location Card." These data are then transferred to a larger filing card, which is the "Tire Record." As the mileage reading of the speedometer is taken and entered on the "Tire

Digitized by Google

Storage Space for 50 Vehicles Is Provided in the Garage of the Los Angeles Motor Bus Company as Well as Facilities for Maintenance

Record" card at each change and also the number of the wheel from which the tire was taken, the amount and kind of service given can be exactly determined.

There is a special reason for recording the number of the wheel from which a damaged or wornout tire has been removed. Because of high-crowned pavements, tires used on the Los Angeles buses wear unevenly. The inside right rear tire on a bus with double rear wheels receives the hardest wear. It is estimated that these wear only 60 per cent as long as the others do. This cannot be figured closely, however, because tires are constantly being changed around to equalize the wear.

It was found after considerable experimentation that the buses rode best and tires lasted longest when unequal air pressure was used to equalize the slant of the crowned streets. With 34x7 tires the outside right and inside left tires carry ordinarily 100 lb. of pressure. The inside right and the outside left carry 90 lb.

The buses, especially the double-deckers, are hard on tires. The double-deckers tend to roll from side to side after passing over an inequality in the paving. This motion rolls the edge of the flap nad cuts the tube. A special set of tires has been made up and is now being tested by the compan. They are 12-ply instead of 10-ply and the management hopes they will solve this phase of the tire problem.

As each bus finishes its day's run and comes into the garage it is dusted and swept and minor repairs are made. The buses are washed at stated intervals. Records of these details are also kept. Not more than 15 minutes a day is required for keeping these and the tire records up to the minute. If a bus gets in trouble on the road the crew reports in and a mechanic or a tow car, depending on the degree of seriousness, is sent out. There is a "Road Trouble Sheet" for reports on breakdowns and their causes, including accidents. A 24-hour "Divisional Accident Summary" is made out for the manager's office by the dispatcher. Every accident, no matter how trivial, is personally investigated by the assistant manager in charge of operations.

All parts required for repairs are drawn on requisition. For this purpose the company uses an Acme Perpetual Inventory Card System. Every six months there is a check of stock to adjust errors.

Maintenance of Armature Bearing and Housing Fits

For Efficient Operation and Long Life Sleeve Bearings Should Line Up Accurately with Armature Shafts—Bearings Loose in Housings or Housings Which Are Loose in Motor Frames Cause Misalignment, Rapid Wear and Large Oil Consumption

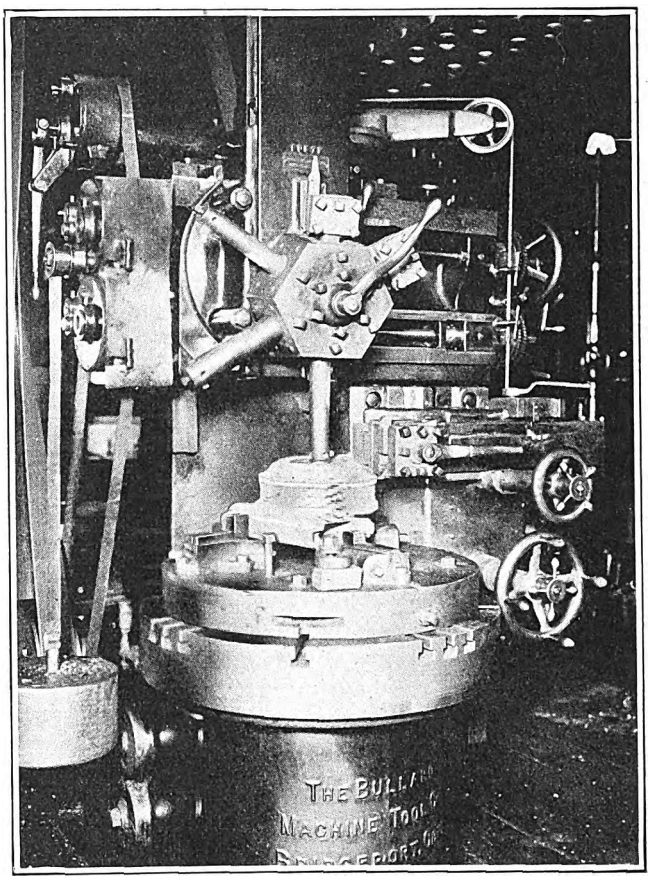
By E. F. Whitney
Renewal Parts Engineer Westinghouse Electric & Manufacturing Company

THE life obtained from armature bearings depends not only upon the lubrication and the elimination of dirt and water from the bearings but upon the alignment of the bearings, the running clearance for the shaft and the assembly of the bearings in the housing. Housings that are worn and are loose in the frame are liable to cause incorrect alignment of the armature bearings. This trouble can best be eliminated by renewing the housing or by welding and remachining the housing fit. Shimming should not be permitted. At best, it is but a temporary repair and is sure to cause trouble. Bearings which are shimmed to keep them tight in the housing will usually be out of alignment, and unless the shaft journal clearance is increased several thousandths of an inch it is quite probable that the armature shaft will bind in the bearings.

Particular attention should be given to fitting the bearings to the shaft after they have been pressed into the housings. Armature bearings which are easily driven into place will loosen in service and start excessive wear of the housing bore and bearing. Loose bearings and excess journal clearance all tend to increase the oil consumption and permit destructive vibration of the motor parts.

Motors of the older types usually require armature bearings bored undersize for use with worn shafts. In some instances bearings with the outer diameter oversize are necessary if the bearings are to fit tightly in the housings. Armature shaft journals will wear tapered and it is desirable to turn these journals down for use with the undersized bearings. If the wear at any section of the journal reduces the diameter as much as $\frac{3}{64}$ in. it is desirable to turn the shaft down and polish the journal so as to bring it to the nearest undersize for which bearings are available. Some operators have found it preferable to standardize the undersized shaft journals in steps of $\frac{3}{32}$ in. diameter. On many other properties standardization includes only such dimensions as $\frac{1}{16}$ in. and $\frac{1}{8}$ in. undersize, as this reduces the number of renewal bearings to be carried in stock.

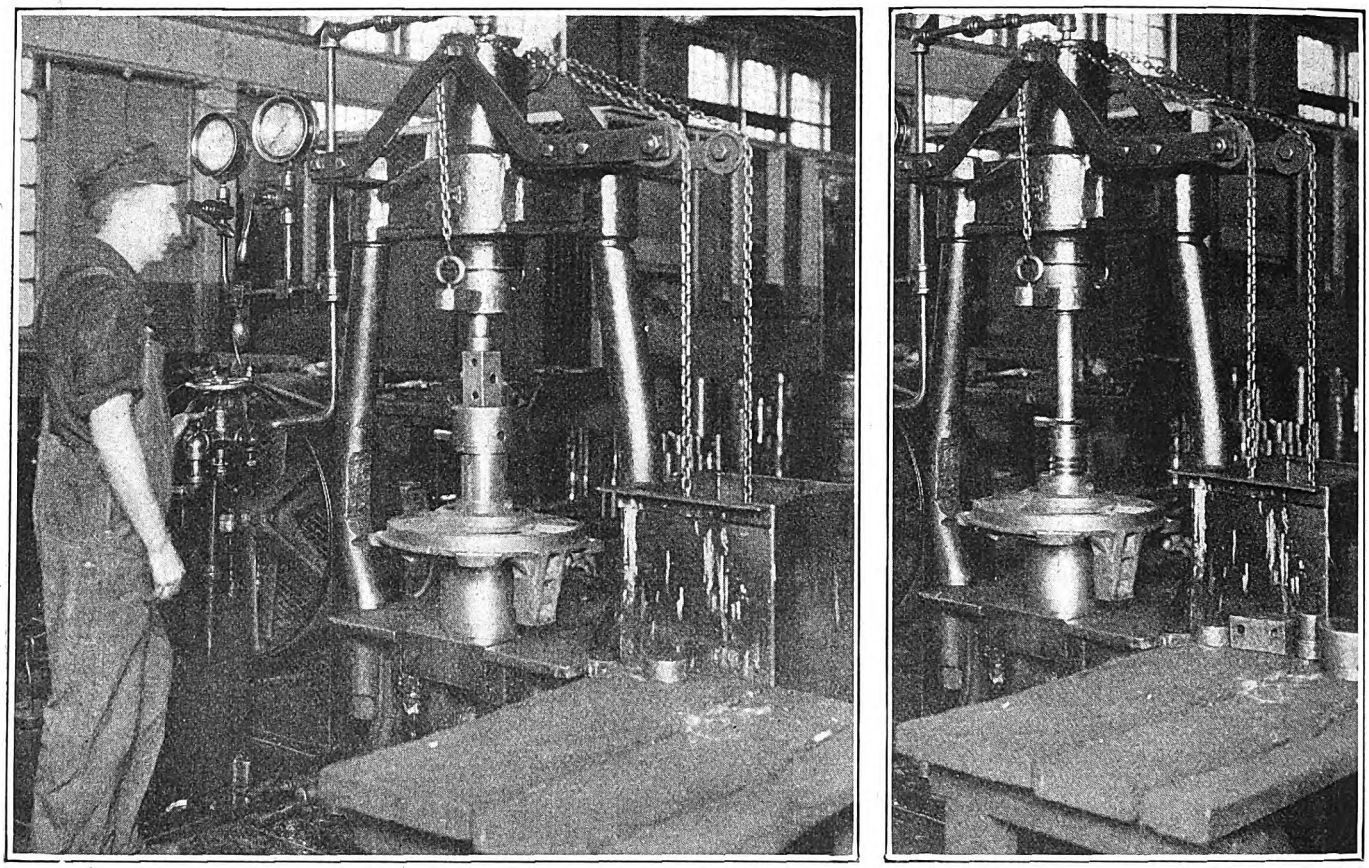
Many of the older types of motors were originally equipped with cast-iron or malleable-iron babbitted bearings. The babbitt lining in these bearings is so thick that the armature can drop down on the pole pieces in case a hot bearing occurs and the babbitt melts out. This usually results in the loss of an armature with considerable damage to the laminations. Babbitted bronze bearings for the newer type motors, as well as for the older types, are made with a thin babbitt lining. Then if a hot bearing develops the journal will be seated temporarily in the bronze shell, which will prevent the armature from striking the pole pieces. This feature of bronze babbitted bearings enables a crippled motor to operate in an emergency and makes possible the return of the car to the shop without excessive damage. Bronze shells can be tinned and rebabbitted more easily and satisfactorily than malleable iron or cast iron. This gives a certain assurance that longer bearing life will be obtained.



Armature Bearing Housing in Position for Boring in a Vertical Turret Lathe

The bore of the housing, or of the bearing seat in some of the older motors which do not use housings, may be worn so much as to require a bearing with a larger outside diameter than the standard bearing. If the housing bore can be welded satisfactorily so as to avoid distortion or imperfect alignment it may be remachined to standard size. Housings which are worn only three or four thousandths in the bore can be fitted with slightly oversize bearings. If the wear amounts to several thousandths, the housing should be rebored

Digitized by Google



At Left—Pressing Bearing into Housing with Bearing Press. At Right—The Same Press Is Used for Broaching the Bearing Surface

for an oversize bearing, built up by welding and remachined to standard size or a new housing should be obtained. Housings of light construction, unless they are of steel, should not be weakened by reboring more than $\frac{1}{16}$ in. diameter oversize. Heavy housings with thick hub sections can safely be rebored $\frac{1}{8}$ in. larger in diameter.

The reboring of the housing can be done best in a vertical turret lathe such as shown in an accompanying illustration. The housing must be centered from its outside rim and the axis of the boring bar must line up with the center line of the housing bore. The set-up for box frame motor housings can best be made by attaching a false jaw of soft steel to each of the four chuck jaws. These jaws are then bored and faced off on top to form supports for the rim of the housing similar to the housing seat of the motor frame. With the housing clamped in the lathe a light cut should be taken in the bore. Then it should be finished to exact size. Special attention should be given to make the bore smooth and within a variation of plus or minus 0.001 in., so that a lasting press fit of the housing may be obtained. The original keyway, if worn, should be welded before reboring and recut for the standard key after the housing has been rebored.

The outside diameter of the armature bearing should have a press fit allowance of plus 0.002 to 0.004 in. Its surface should be smooth and free of any ridges or tool marks. Large bearings may be given a coating of white lead on the outside, but with the smaller ones ordinary machine oil could be used when pressing the bearing into the housing.

A type of bearing press such as shown in one of the illustrations will give satisfactory results. The hydraulic type, operating with a plunger speed of 8 to 10 in. per minute, is more desirable than a faster hydraulic type of press or the air cylinder type. The bearing should be started into the housing by driving it with a flat plate, after which 3 to 5 tons pressure should be applied. With large bearings about 5 to 8 tons pressure will be required at the final instant.

Babbitted armature bearings after they have been pressed into the housing will be closed in so as slightly to reduce the bore. It is therefore necessary to broach the bearing to make it the desired size. A broach of the type shown is very satisfactory. The broach should have from six to nine annular teeth, ground to different diameters, varying by increments of 0.002 in. The maximum size of the broach should be from eight to fourteen thousandths larger than the shaft diameter, depending upon the journal size. One very desirable feature of broached bearings is the polished surface of the babbitt which the broach leaves as it cuts its way through the babbitted bore.

The table below shows the maximum and minimum running clearance for the journal for shafts of various sizes:

ALLOWABLE RUNNING CLEARANCE FOR JOURNAL BEARINGS, IN INCHES

Shaft Diameter	Clearance for Journal	
	Maximum	Minimum
2 to 3	0.008	0.006
3 to 4	0.010	0.007
4 to 5	0.014	0.008

With larger motors it is desirable to keep closer clearances and exact alignment. The armature bearings of such motors, after being pressed into the housings, should be finish-bored instead of being broached to size. If broaches are not available for the smaller bearings, then these bearings should be rebored after they are assembled in the housing, in order to obtain the required clearance. The set-up for this operation would

Digitized by Google

be the same as that made if the housings were to be rebored in the vertical turret lathe.

The sides of the waste window of the bearing should be rounded or beveled and oil grooves should be cut from the corners of the window to permit the lubrication of the flange end by the oil collected in the chamfer at the side of the waste window. The groove should be cut through to the face of the flange to lubricate the wiper face and the bearing flange.

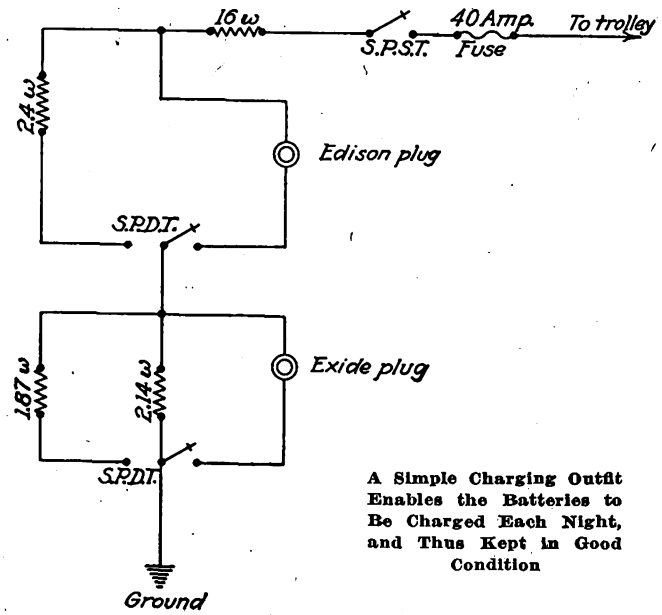
It is necessary in following out this bearing renewal procedure to have both the pinion end and commutator end housings accompany the armature to the winding room and bearing department where the shaft journals would be calipered and, if worn, turned to a standard undersize. The bearings would then be pressed into the housings and the bores either broached or machined in the vertical turret lathe to give a uniform bore concentric with the housing seat. The armature with its housings would then be returned to the assembly floor, where the complete motor would be assembled and tested before being put into service.

Storage Battery Trucks Save Time and Labor

Kansas City Railways Uses Two of These Trucks and Finds Them Valuable for Handling a Large Variety of Railway Parts and Materials

TWO storage battery trucks which have been used in the shops of the Kansas City Railways for some time have paid valuable returns in the form of savings in labor and time for handling the miscellaneous varieties of materials that must be moved about the shop. This equipment is used for handling such materials between the various shop departments, between the shop and the storeroom, and also for loading the supply cars that transport materials and parts to the various carhouses.

One of the trucks is of the fixed-platform type and the other has an elevating platform. The former is the older of the two. Since this has a larger platform than the other, it has been equipped with special racks for carrying such car parts as mounted wheels, motor cases, etc. Tiers of boxes containing finished parts going from the shop to the storeroom are readily handled on the elevating platform truck. This type is also found particularly handy for handling large boxes or containers filled with parts.



A Simple Charging Outfit Enables the Batteries to Be Charged Each Night, and Thus Kept in Good Condition

Charging equipment has been set up as shown in the accompanying diagram. This consists of a rheostat for regulating the rate of charge and instruments for measuring the current and voltage. It is the practice to test the batteries each evening. They are then plugged into the charging line, and the night watchman has instructions to take them off some time during the night, or whenever they are completely charged.

The trucks are manned by an operator and helper. These men replace a number of laborers who were formerly required for moving materials about the shop on hand trucks.

These Storage-Battery Trucks in the Shops of the Kansas City Railways Are Found Very Valuable for Moving Materials About the Shops

Standard Forms for Shop Reports

By Keeping Equipment Maintenance Records in a Uniform Manner, Electric Railways in the Texas District Are Able to Compare Performance Results and Costs with Each Other and Decide Where Improvements Are Needed

FOR many years the master mechanics of the various electric railways in the Texas district under the Stone & Webster management have made monthly and yearly reports of their departmental work. These reports for the mechanical department gave performance statistics of various kinds, such as wheel mileage, trolley shoe and wheel data, lubrication costs, and various other information. When first started, the master mechanic of each company would compile these data for his company in any form he saw fit, and in greater or less detail, according to his fancy. This method had the disadvantage that the information given was not comparable with the reports of the mechanical departments of other companies under Stone & Webster management in the Texas district, because the methods of computation in each case were different.

The master mechanic of the Northern Texas Traction Company wished to compare his performance with that of other mechanical departments on the same basis, so he prepared several standard forms of shop reports. These have now been adopted as standard by the other Stone & Webster properties in the Texas district. Beginning with Jan. 1, 1924, all mechanical department monthly and annual reports were made out on these forms. This has served to stimulate interest among the master mechanics, and extreme competition within certain limits has resulted.

There are 19 report forms used, which are listed as follows: (1) Car Changes; (2) Pairs of Car Wheels Changed; (3) Car Wheels Discarded; (4) Armature Changes; (5) Average Miles Between Armature Rewinds; (6) Car Painting Costs; (7) Car Overhauling Costs; (8) Car-Miles; (9) Lubrication; (10) Brake Shoe Cost per Thousand Car-Miles; (11) Trolley Wheel Cost per Thousand Car-Miles; (12) Trolley Slide Cost per Thousand Car-Miles; (13) Total Current Collection Equipment Cost per Thousand Car-Miles; (14) Maintenance Cost per Thousand Car-Miles; (15) Total Cost of Carhouse Operation; (16) Number of Cars Washed; (17) Number of Cars Inspected; (18) Wrecker Calls; (19) Labor Turnover.

These reports are arranged to give data in a uniform manner regarding performance, costs, etc., for the current year or month, together with similar figures for the corresponding period a year previous. This permits easy comparison with former records.

For the convenience of the various companies comprising the Texas district and also for local information of the individual companies, the various subdivisions of power accounts are divided into additional classifications from that contained in the standard classification. A special form is also used for operating expense accounts for the railway. This form is reproduced herewith.

1. *Car Changes.* The form for car changes is made out monthly and includes a list of the principal changes made, such as car body, fenders, glass out, trucks, hot journals, brakes, air equipment, motors, control equipment, trolleys, wiring, accidents, and service changes. Two columns are arranged to tabulate information for each of these items, one for the current month and the other for the corresponding month of the previous year. A summary is given at the bottom of the form which includes the total average miles, car changes for the mechanical department and other departments, and the average miles per change for the mechanical department and for other departments. This information is also tabulated to give comparison for the current and previous year.

2. *Pairs of Car Wheels Changed.* The report of car wheels changed is made out monthly for all divisions. On this form the various defects which cause wheels to be removed are listed in separate columns for each diameter of wheel used. Monthly totals are given for the current and corresponding month of the previous year. The various defects listed are skidded flat, worn flat, flanges, journals, worn-out wheels, manufacturing defects, miscellaneous. Totals are given for the current and previous year.

3. *Car Wheels Discarded.* The form for car wheels discarded contains seven columns with headings as follows: Type, size, number of wheels, total life mileage this year, average mileage this year, number of wheels last year, average mileage last year.

4. *Armature Changes.* Information regarding armature changes is made out monthly and includes side headings of open circuit, shorted coils, grounded, commutators, loose bands, broken shaft, pinions, sleeve bearings, ball bearings, melted babbitt, and miscellaneous. Totals are given for the current month and corresponding month of previous year, together with the average mileage per change.

5. *Average Miles Between Armature Rewinds.* Information regarding the average miles between armature rewinds is tabulated monthly on a form with the following headings: Class, number in service this year, number rewound this year, per cent rewound, average miles, number in service last year, number rewound last year, per cent rewound last year, and average miles last year.

6. *Cars Painted.* Information regarding cars painted is tabulated for two classes, so as to give the number and average cost. The information is tabulated for the current and previous years. The various types of cars are listed and are divided according to service into city or interurban. A summary at the bottom gives the total number of cars painted.

7. *Cars Overhauled.* The form for cars overhauled is quite similar to that for cars painted and divides them into two classes, with the number and average cost. The cars are also listed according to type and service.

8. *Car-Miles.* This information is tabulated under three headings for the current year and for the previous year, so as to give the number of cars owned, the average miles per car and total miles operated. Cars are classified according to type and number of motors, and summaries are given for total miles of two-man cars, convertible safety cars, all types of city cars, all types of interurban cars, and totals for each company and for the entire system.

9. *Lubrication.* This information is tabulated so as to give the gallons or pounds of lubricant used, the total cost and the cost per 1,000 car-miles. Classification is made by divisions, and the various kinds of lubricants listed include car oil, air compressor oil, cup grease, gear lubricant, and other lubricants. A summary at the bottom of the sheet gives the total cost of lubricants for all divisions; the cost of packing, waste, etc.; cost of labor for lubricating cars; total cost of lubricating, including both labor and material, and the total cost per 1,000 car-miles.

10. *Brakeshoe Costs per 1,000 Car-Miles.* Information regarding brakeshoe costs is tabulated monthly and gives amounts for the current year and for the previous year. This is arranged by divisions and includes the

Digitized by Google

total cost of shoes, total number of shoes, and the cost per 1,000 car-miles.

11. *Trolley Wheel Costs per* 1,000 *Car-Miles.* The information for trolley costs is tabulated in a manner quite similar to that of brakeshoe costs, and is divided into divisions with separate places for total cost of wheels, total number of wheels, average car-miles per wheel, and cost per 1,000 car-miles.

12. *Trolley Slide Costs per* 1,000 *Car-Miles.* The tabulation for trolley slide costs is also quite similar to that of 10 and 11 and is divided into divisions with headings for total cost of slides, total number of slides, average car-miles per slide, and cost per 1,000 car-miles.

13. *Total Current Collection Equipment Cost per* 1,000 *Car-Miles.* Information for the total cost of current collection equipment is tabulated for the various divisions and includes the total cost of collection equipment with the total cost per 1,000 car-miles.

14. *Maintenance Cost per* 1,000 *Car-Miles.* This information is tabulated

monthly and contains columns for total cost and cost per 1,000 car-miles for the current and previous year. The various types of cars are listed and divided into city and interurban classes. A summary is given for all cars.

15. *Total Cost of Carhouse Operation.* The cost of carhouse operation is arranged to show comparative figures for the current and previous year under the headings of cost of carhouse operation, cost per 1,000 car-miles, cost of inspecting cars, cost per 1,000 car-miles for inspection, cost of cleaning cars, cost per 1,000 car-miles for cleaning.

16. *Number of Cars Washed.* The information tabulated for the number of cars washed gives only the number of the city and interurban cars washed for the particular periods.

17. *Number of Cars Inspected.* Information regarding cars inspected is given for regular and light inspection and includes the number of city and interurban cars inspected in each class.

18. *Wrecker Calls.* Information regarding wrecker calls is tabulated for the current and previous year under the headings of fires, car failures, derailments, obstructions on track, collisions, and miscellaneous. Totals are given for corresponding periods each year.

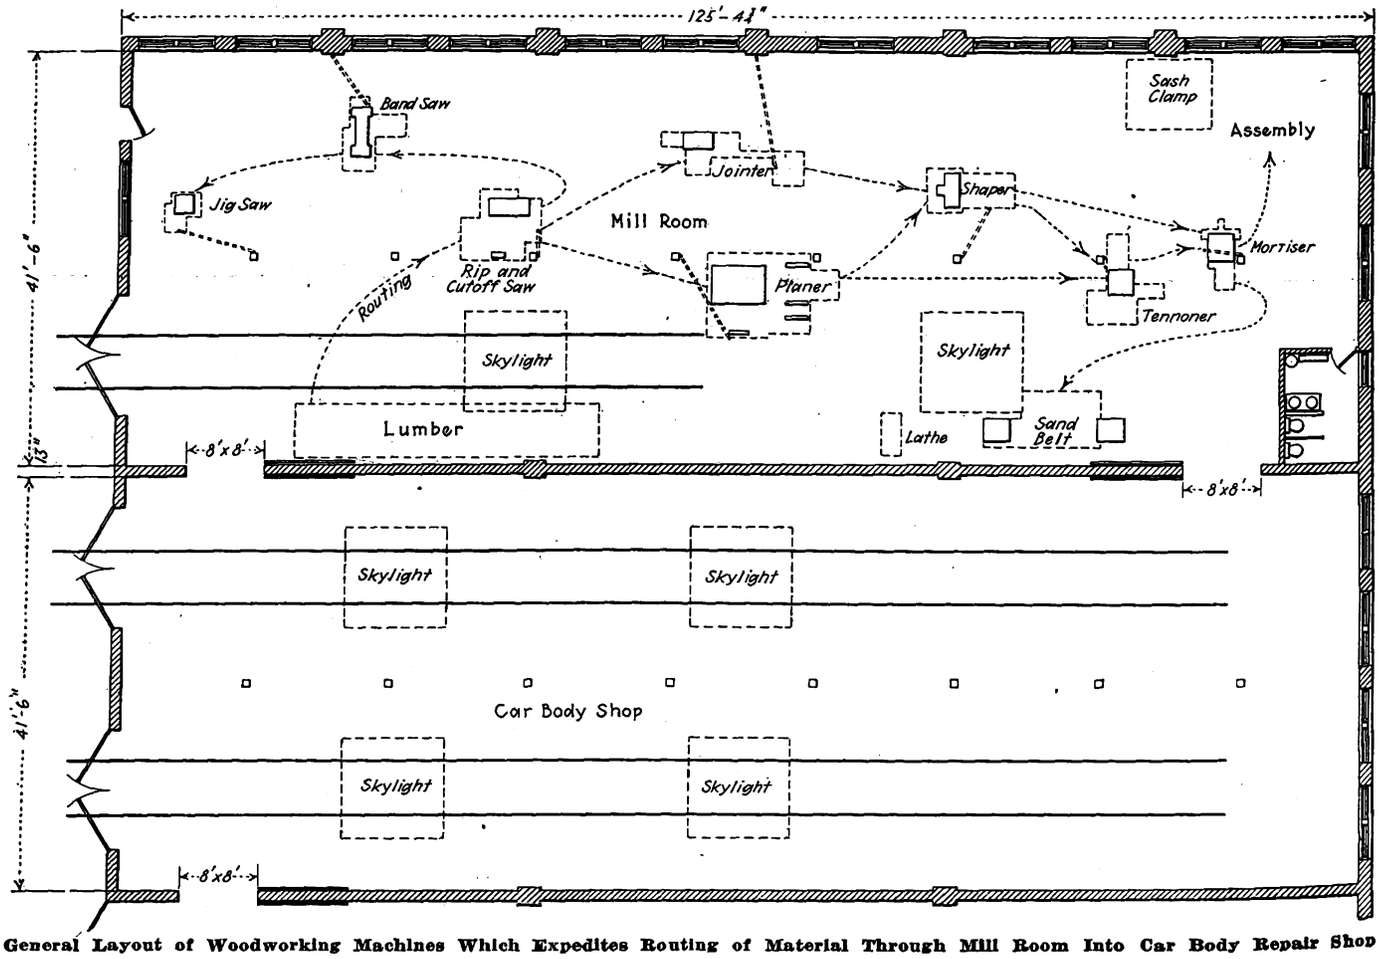
19. *Labor Turnover.* Information regarding labor turnover is tabulated under the headings of number of regular men hired, number of extra men who left service, number of regular men who left service, number of extra men hired, and number of regular men in service.

Carhouse Converted into a Shop

Ample Space Was Available and Individual Motor-Driven Tools Were Located to Facilitate Direct Routing of Work in Columbus, Ohio

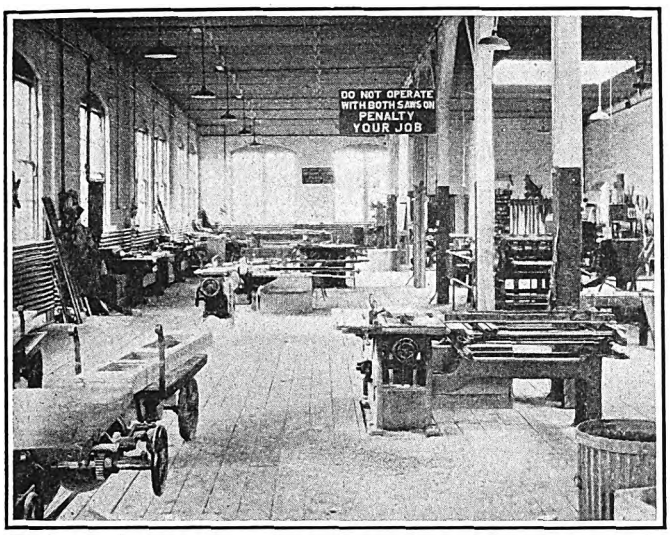
TWO sections of an old carhouse of the Columbus Railway, Power & Light Company were taken over recently by the shops department after the company disposed of its summer cars. Each section is 41 ft. 6 in. wide and 123 ft. 4¾ in. long. One is used as a mill room and the other as a car body repair shop. Tracks were left in the body repair section and a plank floor laid even with the top of the rails. The mill room section of the building has an outside side wall with eleven large windows in it. Skylights have been placed in the roof of both rooms. Two are located over each track in the car body repair shop and two are located in the mill room near the partition between the two sections. Combined with the white-painted walls and ceilings these make the room especially light and attractive during the daytime.

Artificial illumination is furnished in the mill room by three rows of 100-watt, 110-volt lamps in dome reflectors mounted about 12 ft. above the floor. This height and the spacing give uniform illumination on the floor without wasting light. In the car body repair shop a row of dome reflectors has been placed adjacent to the roof-supporting columns. In addition, rows of 150-watt lamps with scoop-shaped reflectors along two side walls throw the light against the car. Each lamp has an individual snap switch on a drop cord.

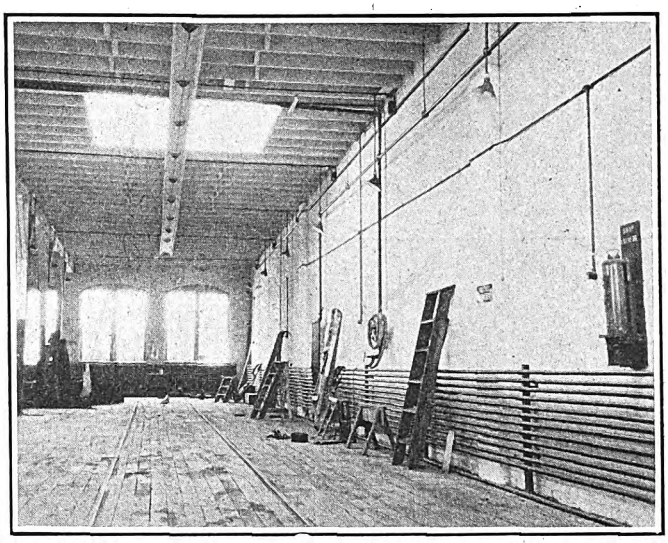


General Layout of Woodworking Machines Which Expedites Routing of Material Through Mill Room Into Car Body Repair Shop

Digitized by Google



New Mill Room of Columbus Railway, Power & Light Company Was Formerly Part of an Old Carhouse



Car Body Repair Room, Adjacent to the Mill Room, Is Large Enough to Accommodate Four Cars

Because generous floor space was available, the various wood-working machines have been spaced so that there is ample room around every one. As each machine is driven by an individual motor, it was possible so to place them that the best routing of material through the shop was obtained. A short length of track enters the mill room at one corner. The rough lumber is brought in on flat cars and placed between the track and the wall. On the other side of the track is located the combination rip and cut-off saw, while immediately in line with this is the planer and jointer. Following in line toward the rear of the room are the shaper, tenoner, mortiser and sanding machine. Specialized and curved work is taken care of by a band saw and a jig saw located at the front of the shop somewhat out of line with the other machines. Assembly of sashes and doors takes place in the rear corner of the room, where clamps, gluepot and assembly benches are provided. The finished product is taken through the doorway at the rear or front end of the shop into the car body repair shop, or on into the mill work storeroom.

All Motor Repairs Made at Shop

By R. S. Neal
Assistant Superintendent of Equipment
Kansas City Railways

For some time it has been the practice of the Kansas City Railways to make no motor repairs at the carhouses. Regardless of what the failure may be, the entire motor is removed from the truck and is sent to the shops.

It is felt that there is considerable advantage to be gained from this practice, as the shop is better qualified and equipped to take care of the various motor repair jobs than are the carhouse forces. More uniform results and a higher degree of workmanship in fitting armature and axle bearings and similar classes of work are obtained where this work is carried out by a comparatively small number of highly trained specialists under the direct supervision of the shop management. Armatures are handled to better advantage than in the carhouses and there is consequently less possibility of serious damage to this expensive equipment when it is being put into the motor case. Heretofore it was the practice to move armatures back and forth between the shop and the carhouses on a car specially equipped for this purpose. In spite of these precautions, however, there is no doubt that considerable damage was done in handling them.

Another important motor maintenance practice which has cut down the number of failures in service and has reduced repair costs is the elimination of field coil terminals. This, of course, has been largely made possible by concentrating all the motor repair work at the shop. The leads are brought out directly from the field coils and permanently joined together. This practice is being followed on GE-67, GE-70, GE-80, and West.-306 motors. On box-frame motors this form of installation is not entirely satisfactory, but it is planned to extend the practice to that type of construction when a special machine, now under consideration, for making the installation is completed. On the GE-57 type of motor it is at present almost impossible to handle several coils connected together on account of the excessive weight. At the present time, however, the brass field coil spools in these motors are being removed, and the coils are being made up similar to those on other types of equipment. It is expected that this construction will make it practicable to connect the coils together and eliminate the terminals.

A very important advantage is obtained from the practice of making all motor repairs at the shops, in the matter of field coil maintenance. When the motor work is done at carhouses, certain types of field coil defects are very difficult to detect. Unless some very serious defect develops, which shows up in flashing or burning of the armature, there is a strong tendency to allow motors to continue in service until serious damage occurs. When motors are sent in to the shop for routine bearing, gear and armature maintenance, a much more careful and thorough check of the condition of field coils is possible. The saving in this one item alone probably more than justifies the practice of sending the complete motors to the shop.

Investigation has shown that there is very little if any increased cost for labor and handling due to sending in the complete motors. This is particularly true of box-frame motors. The results of the practice in Kansas City have been so satisfactory from the standpoint of reducing failures in service that it is considered an important improvement.

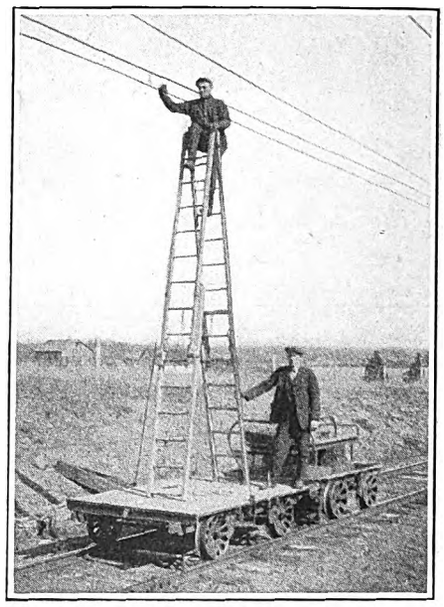
Keeping Down Line Maintenance Costs on a Small Interurban

A 1-Ton Ford Truck Equipped with Extension Ladders Is Used as a Line Wagon

On the New Haven & Shore Line Railway a Few Skilled Men Divide Their Time Between Repair Work on the Overhead Structure and on the Rolling Stock and Track — A Gasoline-Propelled Line Car Is Used —Catenary Construction Reduces Maintenance Expense



Trouble Hunting on Private Right-of-Way Is Done with a Gasoline-Propelled Rail Car and Trailer

DURING the year and eight months since service was resumed on the New Haven & Shore Line Railway, Guilford, Conn., careful attention has been given by William Walker, general manager, to every means of reducing operating expense. This has resulted in keeping down the cost to an average of 20.03 cents per car-mile in 1924. Of this, 2.27 cents was for maintenance of way and structures, including overhead lines. It is estimated that only about one-third of the latter amount, or somewhat less than 1 cent per car-mile, is chargeable to maintenance of the overhead construction. A total of less than $1,000 has been spent for this purpose during the entire period since the railway was reorganized in 1923.

A detailed account of the way in which the reorganization was accomplished was published in ELECTRIC RAILWAY JOURNAL for Sept. 6, 1924, page 343. Certain changes which were made in the methods and equipment used for power generation and distribution have had an important influence in reducing the cost of operation.

ORIGINAL DESIGN WAS FOR 1,200 VOLTS

The road was originally built in 1910 to operate at 1,200 volts, d.c., Power was generated by 25-cycle, three-phase Curtis turbines at the company's own station at Saybrook, the eastern terminus of the line. At this point there was also a substation equipped with three General Electric 600-volt, 200-kw. rotary converters. Two of these were operated in series to furnish power at 1,200 volts. The third machine was a spare. Later a fourth was added, which made it possible to operate two sets when desired.

At Guilford, 18 miles from Saybrook and 16 miles from the western terminus of the line at New Haven, a second substation was located. Equipment similar to that at Saybrook was used. Between these places there was a high-tension transmission line and from Guilford to Foxon Park, on the outskirts of New Haven, there was a 500,000-circ.mil feeder line.

Overhead construction was of the three-point catenary type, designed by the General Electric Company and the Sperry Engineering Company. The latter company was also the builder of the line, including tracks, overhead structures, buildings, etc. Present low maintenance costs are made possible largely by the quality of the original construction. A seven-strand steel messenger wire was used with No. 000 grooved copper trolley wire. These were suspended from bracket arms on wood poles spaced 150 ft. apart. All the smaller parts used in the overhead structure were sherardized instead of being galvanized. The latter process was used only for such pieces as bracket arms, which were too large for sherardizing treatment. The material so treated has stood up well during the intervening years despite the corrosive effect of the salt air which is always present along the shore of Long Island Sound.

Originally cars weighing nearly 60,000 lb. were operated by four 600-volt motors connected two in series. In the city of New Haven the Shore Line cars operated over the tracks of the Connecticut Company, where the trolley voltage was only 600. In the beginning this was done without changing the motor connections so that they ran at half speed, resulting in extremely slow operation. Commutating switches were installed at a later date to permit operating the motors in parallel.

In 1919 all service on this railway was suspended, as told in the article already referred to. This condition continued until the summer of 1923, when,

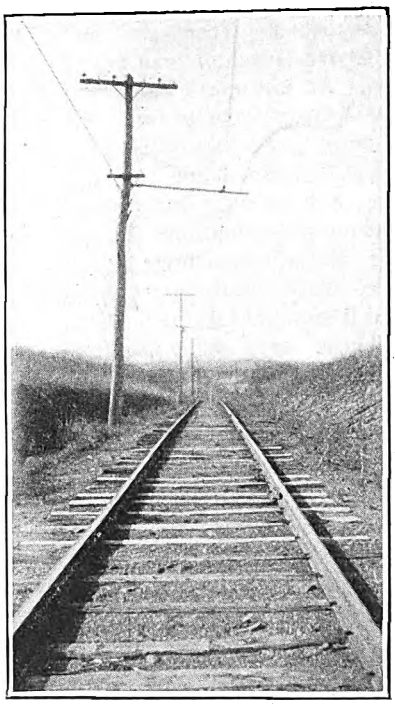
Center—The High-Tension Line Is Brought Into the Guilford Substation as Shown Here. An Automatic Oil Switch Has Been Installed at This Location



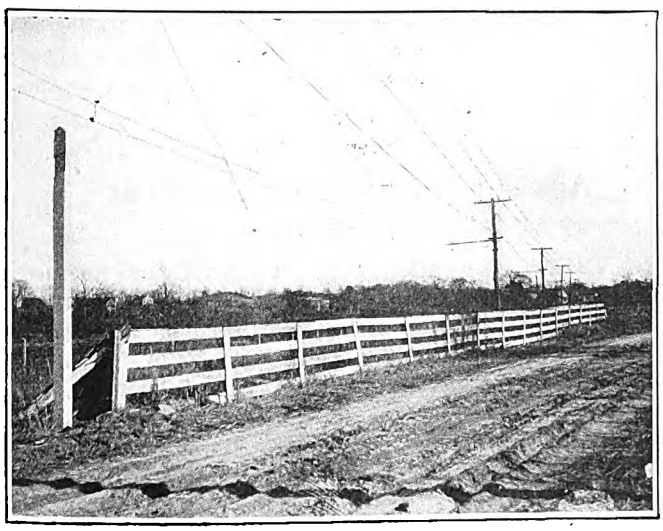
At Right—Messenger and Trolley Wires Are Suspended from Bracket Arms. The Transmission Line Is Carried on Cross-Arms at the Top of the Poles

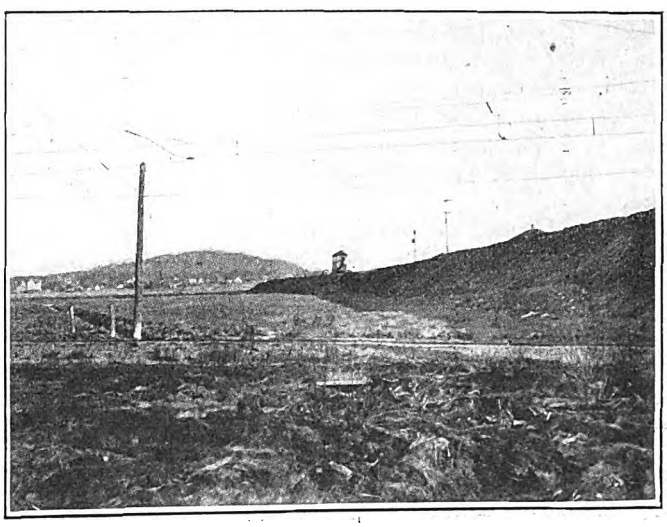
despite many handicaps and discouragements, a reorganization was effected under the auspices of F. E. Kington & Company, bankers of New Haven. Twenty months ago service was resumed after an interruption lasting almost four years.

Changes for 600-Volt Power Supply

At this time extensive changes were made in the rolling stock and methods of power distribution. It was decided to operate at 600 volts instead of 1,200 volts. New substations were built at Totoket, half way between Guilford and New Haven, and at Grove Beach, 6 miles from the eastern end of the line. These were equipped with two rotary converters each, taken from the Saybrook substation, which was discontinued. After four years of idleness these machines were put back in service after being subjected to only a short drying out process. This was all that was needed, however, and little trouble has been experienced with them.

It was arranged to purchase power from the Connecticut Company at New Haven instead of generating it at Saybrook. Connection is made at a point about three-quarters of a mile beyond the beginning of the Shore Line tracks. An 11,000-volt, three-phase, 25-cycle transmission line is connected through a set of fuses and an automatic oil cut-out switch to a recording wattmeter. From there it goes through a second set of fuses to the transmission circuits of the Shore Line Railway. An interesting feature of this installation is that the oil switch can be reset from the Connecticut Company's power house, 3 miles away. Otherwise it would be necessary for a man to make the long trip from Guilford to reset it. The arrangement of the equipment is shown in an accompanying illustration.





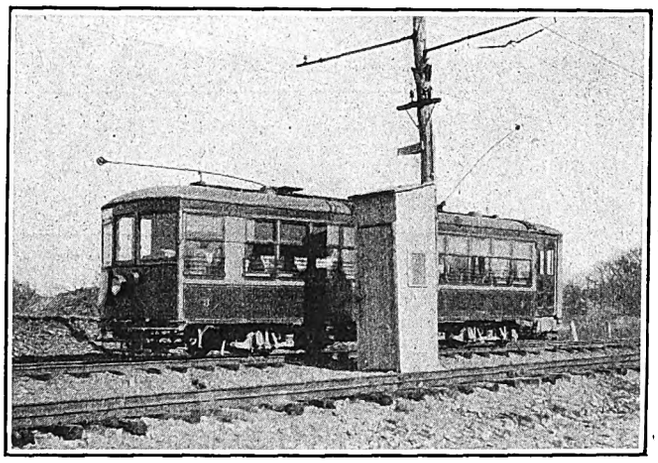
This Three-Point Catenary Construction Has Been a Factor in Keeping Down Line Maintenance Cost. On Curves Wood Strain Insulators Are Used in the Manner Shown

Digitized by Google

A new transmission line was built from New Haven to Guilford. From that point to the new substation at Grove Beach it was possible to make use of the old line. An automatic oil switch has been installed inside the Guilford substation. This is set lower than the one at New Haven, so that the former will trip out first in case of overload and perhaps save the latter from tripping out at all. Its present location inside the substation is convenient for resetting. Formerly protection was afforded only by fuses mounted outdoors on a pole. Altogether, approximately 24 miles of 11,000-volt line is now maintained by the railway.

These arrangements for power distribution have worked out entirely satisfactorily. Last summer, when traffic was at its height, the railway was operating four regular passenger cars, two or sometimes three extra passenger cars, five stone cars and a work car. Despite these heavy demands no trouble has been experienced with low voltage. During the winter it is possible to shut down the Totoket substation.

In addition to the transmission lines, the railway



A Typical Telephone Station on the Shore Line Railway. All Train Movements Are Regulated by Telephone. No Signals Are Used

has 2 miles of private telephone lines and 20 instruments. All train dispatching is done by telephone. Special train movements are arranged by the dispatcher when necessary. There are no signals.

Except for the changes mentioned in the foregoing paragraphs, the overhead construction is the same today as when the railway was originally built. The messenger wire, braces and pull-offs are in good condition. Wood strain insulators used on curves have stood up well. The copper trolley is somewhat worn in places, but not to an extent that seriously affects its usefulness. It is planned in the future to use clinch ears at certain locations where the groove is now rather badly worn.

The good condition of the trolley wire is the more remarkable because the old cars for a time were equipped with cast-iron trolley wheels. These were found to be so injurious to the copper trolley wire, however, that their use was eventually discontinued. The present cars are equipped with More-Jones type VK 6-in. copper trolley wheels. These have been found to have an average life of 4,210 miles. Whenever conditions require it sleet cutters of a type made by the Connecticut Company are used. This has been necessary but a few times during the past two years.

Catenary construction has been a factor in keeping the cost of line maintenance low. There is no quick change from a comparatively slack wire midway between poles to a rigid section directly under the bracket arm as with direct suspension. Cars are operated at speeds of 35 to 40 m.p.h. on private right-of-way and the wire has shown no sign of excessive wear. Few breaks have occurred and there has been no indication of crystallization.

The maintenance personnel of the Shore Line Railway has varied duties. Two men are regularly engaged on track repairs, greasing curves, oiling switches, etc. Two other men divide their time between maintaining the overhead lines and substations, inspecting and overhauling cars, and bonding, repairing bridges, etc. Two days each week are ordinarily devoted to each of these three occupations. On Sunday the four regular men are off and a fifth serves as all-around emergency man. The men are paid well and like the variety in their work. As a "Jack-of-all-trades" a man earns higher wages than would be paid to the ordinary six-day-per-week railway repair man.

Considerable rail bonding has been done recently by the company. Although the original line was adequately bonded throughout, many bonds were stolen during the four years when the road was not in operation. It has been necessary, therefore, to devote special attention to installing bonds. This is done by electric arc welding.

Some work has had to be done also on the replacement of wood poles. Approximately 15 new poles have been installed during the past eighteen months. For this purpose untreated chestnut poles are used and have been found to be entirely satisfactory.

On account of having considerable trackage in paved streets in addition to the open track on private right-of-way the company has both a line wagon and a line car. The former is a one-ton Ford truck, on the back of which have been mounted two extension ladders, joined together at their upper ends and hinged to the floor. Removable ¼-in. bolts are used as hinge pins. This arrangement makes it possible to take the ladders off the truck without difficulty.

For work on private right-of-way a Fairmont gasoline-propelled rail car and trailer are used. The same ladders which are mounted on the Ford truck can be mounted on the trailer by attaching them to a duplicate set of hinges. This light vehicle can negotiate the rather steep hills at a good speed and has proved of great value. Gasoline propulsion is an advantage when hunting trouble with the trolley dead. The trailer is so light that it can be easily lifted off the rails to allow a regular car to pass and can then be replaced by the two men in the line maintenance crew.

Advisory Council for Accident Prevention

ACCIDENT prevention work on the Chicago Surface Lines, described in the ELECTRIC RAILWAY JOURNAL for Feb. 21, page 313, has been carried on through a general advisory council headed by V. T. Noonan, supervisor of accident prevention. Other members of the council are as follows; H. H. Adams, superintendent of shops and equipment; C. H. Evenson, superintendent of transportation; H. B. Fleming, chief engineer; F. M. Hamilton, supervisor of purchases and stores; A. J. Klatte, assistant electrical engineer; F. L. Kriete, general attorney, and E. L. Kuntzner, secretary.

Interurban Railway Puts Way Maintenance on a Competitive Basis

Inspection of Track and Roadway Made on the T. H., I. & E. Lines as a Basis of Awarding Prizes for Careful Maintenance Also Furnishes Useful Information for Budget Making

By D. H. Walker
Assistant Engineer Terre Haute, Indianapolis & Eastern Traction Company

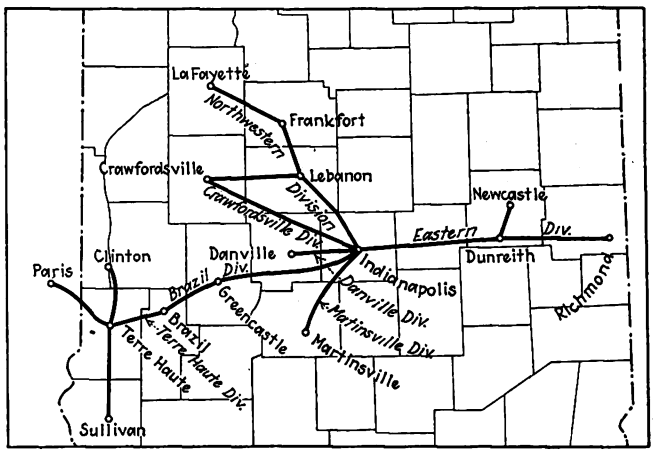
AN INSPECTION of track and roadway for the purpose of awarding prizes to the various divisions and sections having the best track after completion of the year's work was made by the Terre Haute, Indianapolis & Eastern Traction Company in December, 1924. In the spring the chief engineer had told the division supervisors that prizes would be awarded by the company to those having the best sections at the end of the year. The matter was then forgotten for a while but later the question arose as to the basis on which the prizes should be awarded. It was decided to make an inspection trip over all divisions and to give the prizes to those sections and divisions which had achieved the best results as shown by this inspection.

In addition to being a basis for awarding prizes the trip was expected to accomplish other results. Expenditures on the track for the past year had been made in accordance with a budget prepared at the beginning of the year. A new budget for 1925 was at that time in course of preparation and it was felt that an inspection of the entire system would help to give a clear impression of what had been accomplished and would show which sections would require the greatest expenditures for the coming year.

Moreover, it was thought that each supervisor would benefit by an inspection of the entire system. Supervisors of the various divisions had been busy with their own work and had had no opportunity to inspect the work of the other divisions. Meetings had been held twice each month with the roadmaster and the work outlined to all alike. Visible evidence of how the other man had carried out these instructions was deemed advisable. That this inspection would help to stimulate competition by showing the man with poor track that he had much to do to bring his work up to the standard was another point in favor of the plan. Such an inspection would also instill pride in the man with good track and encourage him to maintain his high standards.

As every man takes more interest in his own work when he finds that others are interested in it too, it was thought that the morale of the track department would be improved by including the general superintendent and other officials of the company among those making the trip. The superintendent of distribution found that the inspection would afford him a good opportunity of making a careful study of the overhead lines and he, therefore, joined the party. Besides those already mentioned the inspection party included the purchasing agent, the chief engineer, four superintendents of divisions, four supervisors of roadway, the roadmaster and assistant roadmaster, two assistant engineers, and the foreman of bridges and buildings. For part of the trip the chief dispatcher and master mechanic accompanied the others.

Three days were occupied by the inspection. A special car was used and each run was made either as the second section of a limited train or as an extra. The car used was well suited for inspection purposes, being of the observation type as shown in the accompanying illustration, with ample room at the front end for those making the inspection to get a good view of the track.



The Terre Haute, Indianapolis & Eastern Traction System Is Operated in Seven Divisions

The lines of the Terre Haute, Indianapolis & Eastern Traction Company radiate from Indianapolis as a center, as shown on the accompanying map. The Brazil and Danville lines constitute a division under one supervisor. The Crawfordsville and Martinsville lines make up another division. The Northwestern division includes the lines from Indianapolis to Lafayette and from Lebanon to Crawfordsville. The Eastern division embraces the track from Indianapolis to Richmond and the branch from Dunreith to Newcastle. By considering these four groupings the number of sections were about equal in all divisions. It was necessary to "back track" somewhat in making the inspection, but this offered the inspectors an additional chance to recheck any features in doubt on the first examination. Approximately one day was given to each division.

For the purpose of rating the sections, grades were marked by the inspectors on four groups of subjects. Each group was assigned a specified number of points under the three markings of Good, Indifferent, and Poor. The card shown on the following page is a sample of those prepared by the inspectors on each division.

	AVERAGE					

Form Used by Inspectors in Grading the Various Track Sections

Fences and drainage were the principal items in the first group. Special attention was paid to alignment and condition of posts and gates, cleanliness of side ditches, freedom of culverts from obstruction, and condition of the embankment. Surface, line, ballast and joints were included in the second group. Inspectors were asked to note the alignment of track, both tangent and curve, riding quality at entrance to curves, ballast line at shoulder just outside edge of the tie and at the toe of the slope, condition of weeds, and the riding quality of joints.

The third group included sidings, switch stands and lamps. Attention was paid to cleanliness of side tracks, fit of switches, whether switches were properly oiled and had head rods in the correct position, whether switch lamps were plumb, clean and burning and whether the light was in focus with the bull's eye. Farm and road crossings, right-of-way, and station grounds constituted the fourth group. Attention was paid to whether planks were properly renewed and box crossings filled, whether the surface of the roadway at crossings was properly filled around the track joints, whether the shoulder of the bank was weed grown, and the general cleanliness of the ground around stations and shelter houses.

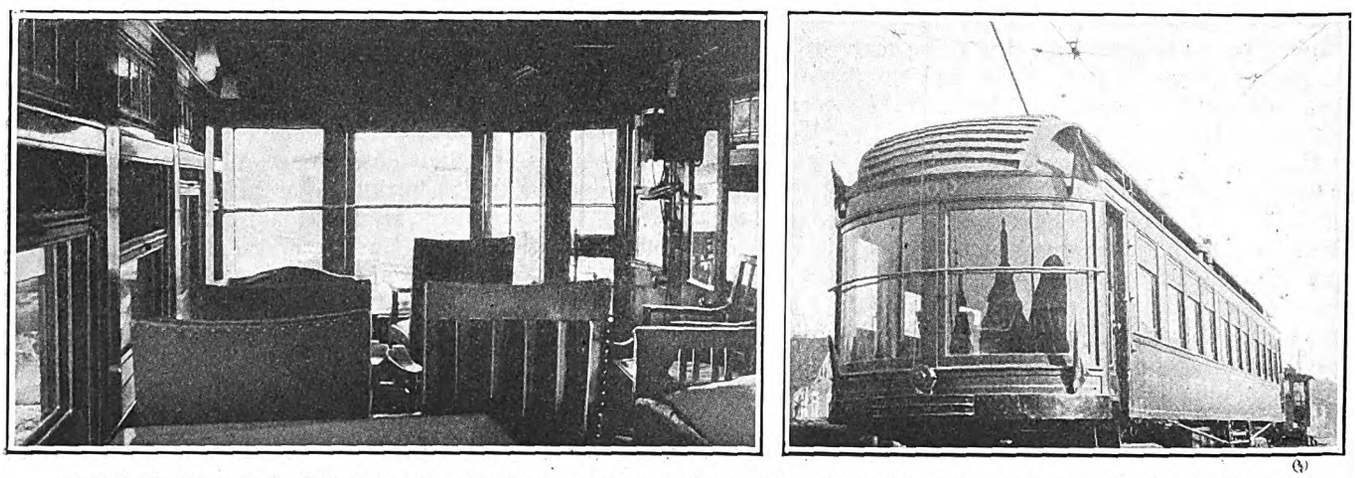
Since so many points were considered in each group, the grading was done by two men. The purchasing agent, the superintendent of distribution, a division superintendent and an assistant engineer took the four groups with one of the supervisors assisting each man. The foreman of bridges and buildings acted as alternate and substituted on each division for the supervisor whose territory was being covered.

In the final grading of divisions and sections consideration was given by the office, after all inspectors' reports were in, to the amount of money spent on each division during the year. The committee markings were averaged for all groups. Then track expenditures per mile for labor and material were figured for each division and the average for all divisions. The percentage of each division, as compared to the average, was used in revising the markings as follows:

	Per Cent of Average Expenditure	Committee Markings	Revised Markings
Eastern and Newcastle Branch	198.2	76.43	38.56
Northwestern and Crawfordsville Branch	72.3	73.50	101.66
Crawfordsville and Martinsville	48.6	73.81	151.81-1st
Brazil and Danville	62.3	75.36	119.82-2nd

Prizes of $25 and $15 were awarded on this revised basis to the two supervisors. Section prizes of $15, $10 and $5 were awarded to each division in accordance with the committee markings. Vouchers with the following inscription: "First (etc.) prize for meritorious work on your section during the summer of 1924," were sent to the winners the day before Christmas.

Some changes in the method of marking have been decided upon for the next inspection. Henceforth, four classifications will be used, Good, Fair, Indifferent and Poor. Values given the group markings will also be changed somewhat. It was found that with the values used the difference between good track and bad track could be more than counterbalanced by fences and drainage. The ideal way, the railway believes, would be to have as inspectors men not connected with the company but who are familiar with track and roadway work. Then grading could be on an absolutely fair basis with no prejudice because of any knowledge of actual conditions and reasons why one division should be better than another. Such results could then be revised more fairly in accordance with expenditures.



At Left, the Rear End of the Inspection Car Is Arranged for Observation. At Right, a Good View of the Track Ahead Can Be Obtained Through the Windows at the Front of the Car

Double-Head Welder Cuts Wheel Maintenance in Detroit

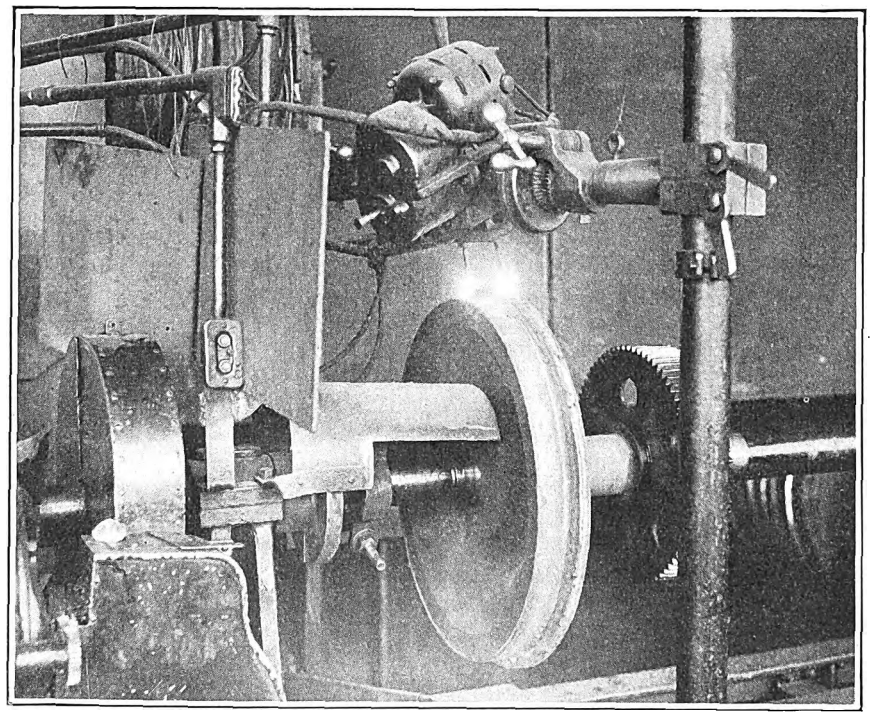
By A. C. Colby
Superintendent of Equipment, Department of Street Railways, Detroit

Time of Welding Wheels Reduced Almost Half by Addition of Second Head on Automatic Welder — Special Grinder Increases Mileage by Reducing Amount of Metal Removed

ROLLED steel wheels used by the Department of Street Railways in Detroit are welded and ground when the flanges become worn, with a view toward obtaining maximum wearing life. This is accomplished by reducing to a minimum the amount of metal that must be removed from the treads of the wheels to true up their contours after they have become worn in service.

The practice of welding flanges, either with automatic or hand equipment, has been adopted by many properties. Results with automatic equipment have been reported uniformly satisfactory, but some difficulty has been experienced with hand welding. When only a comparatively small number of wheels are to be welded, however, some properties are using the hand method with apparent success.

One feature of the Detroit practice is the use of a double-head welding machine to speed up the rate of welding. This lays two beads of metal on the wheel flange simultaneously instead of one bead per revolution, as in the case of a single-head machine. It was found to be a comparatively simple matter to add the second welding head to a single-head machine, thereby almost doubling its capacity. The cost of welding any particular wheel depends of course on its condition, but for a given wheel, the double-head machine reduces by almost half the time formerly taken with the single welding head.



A Second Head Has Been Added to the Automatic Welder
Two beads of metal are deposited simultaneously and the total time required is reduced almost half. Note the guard to protect the journal from particles of metal.

Welded Wheels Are Trued by Grinding

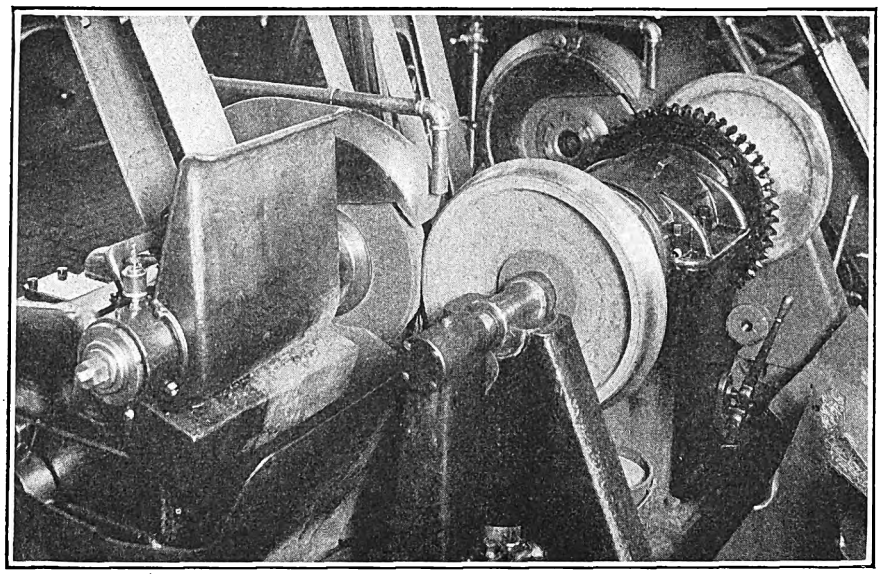
After welding, the contour of the wheel is trued up by grinding the tread and flange instead of turning. This results in the removal of a minimum amount of material from the wheel. Consequently, a considerable saving in the amount of metal removed from the wheel is made as compared with the customary practice of turning the wheels either with or without flange welding. To make grinding a success, however, the wheels must be attended to before they become worn beyond a certain stage. If one of the flanges is permitted to wear excessively thick, grinding is no longer satisfactory or economical, and it is better to turn the wheels to restore their contour.

The A. E. R. E. A. standard limit-of-wear gage is used by the Department of Street Railways for determining when wheels should be taken out for attention. If they are removed promptly after reaching the limit shown by this gage, the flange and tread are usually found to be in condition which permits them to be repaired by welding and grinding.

An accompanying illustration shows the welding machine in operation. This is the standard type of General Electric Company automatic equipment, and the arrangement of the two welding heads is clearly shown. No difficulty has been experienced in feeding the welding rod from each head so that the material is deposited uniformly on the wheel.

The grinding machine is shown in a second illustration. This was built by the Norton Company, Worcester, Mass. The grinding wheels are shaped so as to finish the flange and tread simultaneously. The accompanying sketch shows the shape of the grinding wheel. When these wheels become worn, they are returned to the manufacturer for redressing. After the throat and flange are finished, there is a sharp corner left at the back of the flange which must be ground off. Some

Digitized by Google



This Grinder Was Built Specially for Truing Up Wheels After Welding

saving in time has been made by cutting this corner off with an acetylene torch, and then finishing with the grinder.

Subsequent to the installation of the grinder by the Department of Street Railways, a similar machine was installed in the River Rouge plant of the Ford Motor Company and is used for grinding locomotive wheel tires.

Costs of Welding and Grinding

Comparative figures compiled for the month of October, 1924, show the costs of welding and grinding wheels. During that month a total of 485 labor hours were required for welding 250 wheels, of which approximately half had a nominal diameter of 34 in., and the other half 26 in. On both welding and grinding work, one man handles the machine. The rate of pay is 80 cents per hour. In the case of welding, the average time per pair of wheels was 1.94 hours, which makes the labor cost without overhead $1.55. This is an average figure for both the 34-in. and 26-in. diameter wheels.

There were 200 pairs of wheels ground during this month in 246 labor hours, or at the rate of 1.23 hours per pair of wheels. The labor cost for grinding was consequently 98 cents per pair. In addition to labor, there must be added the cost of welding material and power. These costs have been established as follows:

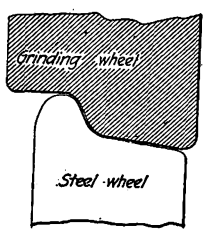
Cost of Welding Wire	
34-in. wheel	$0.51
26-in. wheel	.39
Average	$0.45
Cost of Electric Energy	
34-in. wheel, 23.1 kw.-hr. at 2.7 cents	$0.62
26-in. wheel, 16.5 kw.-hr. at 2.7 cents	.45
Average	$0.54

The total average costs without overhead are therefore as follows:

Welding labor	$1.55
Grinding labor	.98
Welding wire	.45
Energy	.54
Total	$3.52

This shows little saving, if any, over the cost of turning, using a modern type of lathe, with proper handling facilities and only one man. But it is in the increased life of the wheel that the greatest advantage comes from welding and grinding. The practice followed in Detroit has not been in effect long enough to permit the accumulation of comparative mileage figures, but an estimate can be made of the results to be expected. In addition, while the time of the welding operator is charged entirely against the wheel work in the figures above, he is available for miscellaneous welding jobs during the period that the automatic machine is in operation.

The standard flange in Detroit is 1 in. thick and $\frac{3}{4}$ in. high. On the basis of the A. E. R. E. A. standard limit-of-wear gage for this flange, it is necessary to remove approximately $\frac{7}{16}$ in. thickness of metal from the tread to restore the flange to its normal contour by turning, after it has reached the point indicated by the gage. Assuming that this occurs twice during the life of the wheel before it is scrapped, the wheels would have three periods of wear from the time they are first put into service until completely worn out. Starting with a tread thickness of $2\frac{1}{2}$ in. when new, and assuming that the wheels would be scrapped when the thickness is reduced to $\frac{1}{2}$ in., this would leave about 2 in. of effective metal in the tread. But of this amount, two turnings, each $\frac{7}{16}$ in. thick, are removed during the life of the wheel, to true up the contour of the tread and flange. Consequently, a total of $\frac{7}{8}$ in. of this metal finds its way into the shop scrap pile, and only about $1\frac{1}{8}$ in. of metal is actually worn off in service.



The Grinding Wheel Is Shaped so as to Finish Both Tread and Flange at Once

Assuming an average wheel life of 100,000 miles, this is obtained from the $1\frac{1}{8}$ in. of metal left to be actually worn off in service. This gives a mileage of slightly more than 11,000 for each $\frac{1}{8}$ in. of wear. If flanges are welded and ground, very little metal is taken off the tread to true up the wheel. Consequently a large part of the $\frac{7}{8}$ in. of metal which was formerly turned off is available for actual wear in service, and the wheel mileage may be reasonably expected to be increased in the same proportions as for the average mileage obtained. With 11,000 miles obtained for each $\frac{1}{8}$ in. of wear this would increase the mileage by 77,000 and would therefore add more than 75 per cent to the wheel life.

Mileage Is Increased

In addition to the saving made in the amount of metal taken off to true up the wheel, the practice of welding and grinding increases the mileage in another way. It is well known that when a wheel is turned the cut must be taken deep enough to remove the hard surface which has been rolled on the tread by contact with the rail. The practice of welding and grinding does not require the removal of this hard material and the life of the wheel is therefore increased beyond the amount that is indicated by the actual thickness of metal saved.

In the Suburbs a Portion of the Track Is in a Reserved Strip in the Center of the Street

Special Organization Handles Track Maintenance Work

United Railways & Electric Company of Baltimore Has Separate Forces for Maintaining and Rebuilding Track — Efficiency Is Promoted by Keeping Men Continuously Employed on Same Kind of Work—Maintenance Is Done on a Monthly Budget Plan

TO IMPROVE the efficiency of the men engaged in maintaining its track, the United Railways & Electric Company of Baltimore has developed separate organizations for doing this work and for rebuilding track. Replacements that are charged to capital or depreciation accounts are done by the reconstruction forces under the direction of the principal assistant engineer. All other track repairs are done by the maintenance of way forces under the roadmaster. Supervision over both organizations is exercised by the chief engineer. This arrangement is not inflexible, however. Men from the maintenance forces are engaged in reconstruction work from time to time and vice versa, but under normal conditions the two organizations function separately.

For maintenance of way purposes the system has been divided into four districts. The city of Baltimore is approximately square, and there is roughly the same amount of trackage in each of the four quarters. The east and west dividing line follows the general direction of Centre Street, while Charles Street is the north and south line separating the maintenance of way districts. Each district is further subdivided into a division and a section. The division comprises all the paved track in the district, while the seltion takes in all the open track. How nearly equal in mileage the various divisions and sections are is shown in the following table:

MILEAGE OF DIVISIONS AND SECTIONS

District	Paved Track	Open Track	Total
1. Northwest	56.07	46.59	102.66
2. Northeast	58.47	44.37	102.84
3. Southeast	50.75	45.20	95.95
4. Southwest	77.43	36.94	114.37
Total	242.72	173.10	415.82

A division foreman is in charge of all the work done on track in paved street in each district, and a section foreman looks after the open track. These eight foremen report to the roadmaster. As the work done in paved streets is more extensive and more complicated than that done on private right-of-way the position of division foreman is considered the more responsible and is ordinarily held by an older and more experienced man. Under the division and section foremen are gang foremen to direct the individual jobs.

The total maintenance-of-way force varies from about 300 to 400 men. Of these 30 are bridge carpenters, 30 are curve greasers, and 20 are track shopmen. There are also a few men engaged in miscellaneous occupations such as inspecting electric switches, renewing hard centers, etc. Trackwork usually can be done during 10 months of the year, but during the other 2 months the men are kept busy on emergency rail replacements, joint repairs, or snow fighting.

Maintenance work is done on a monthly budget basis, and the number of men varies somewhat according to the allowable expenditure for the month. In summer, or when particularly large undertakings require it, the force is increased. The men are hired by the gang foremen subject to the approval of the roadmaster. They must also pass examination by the company's doctor before they are allowed to go to work.

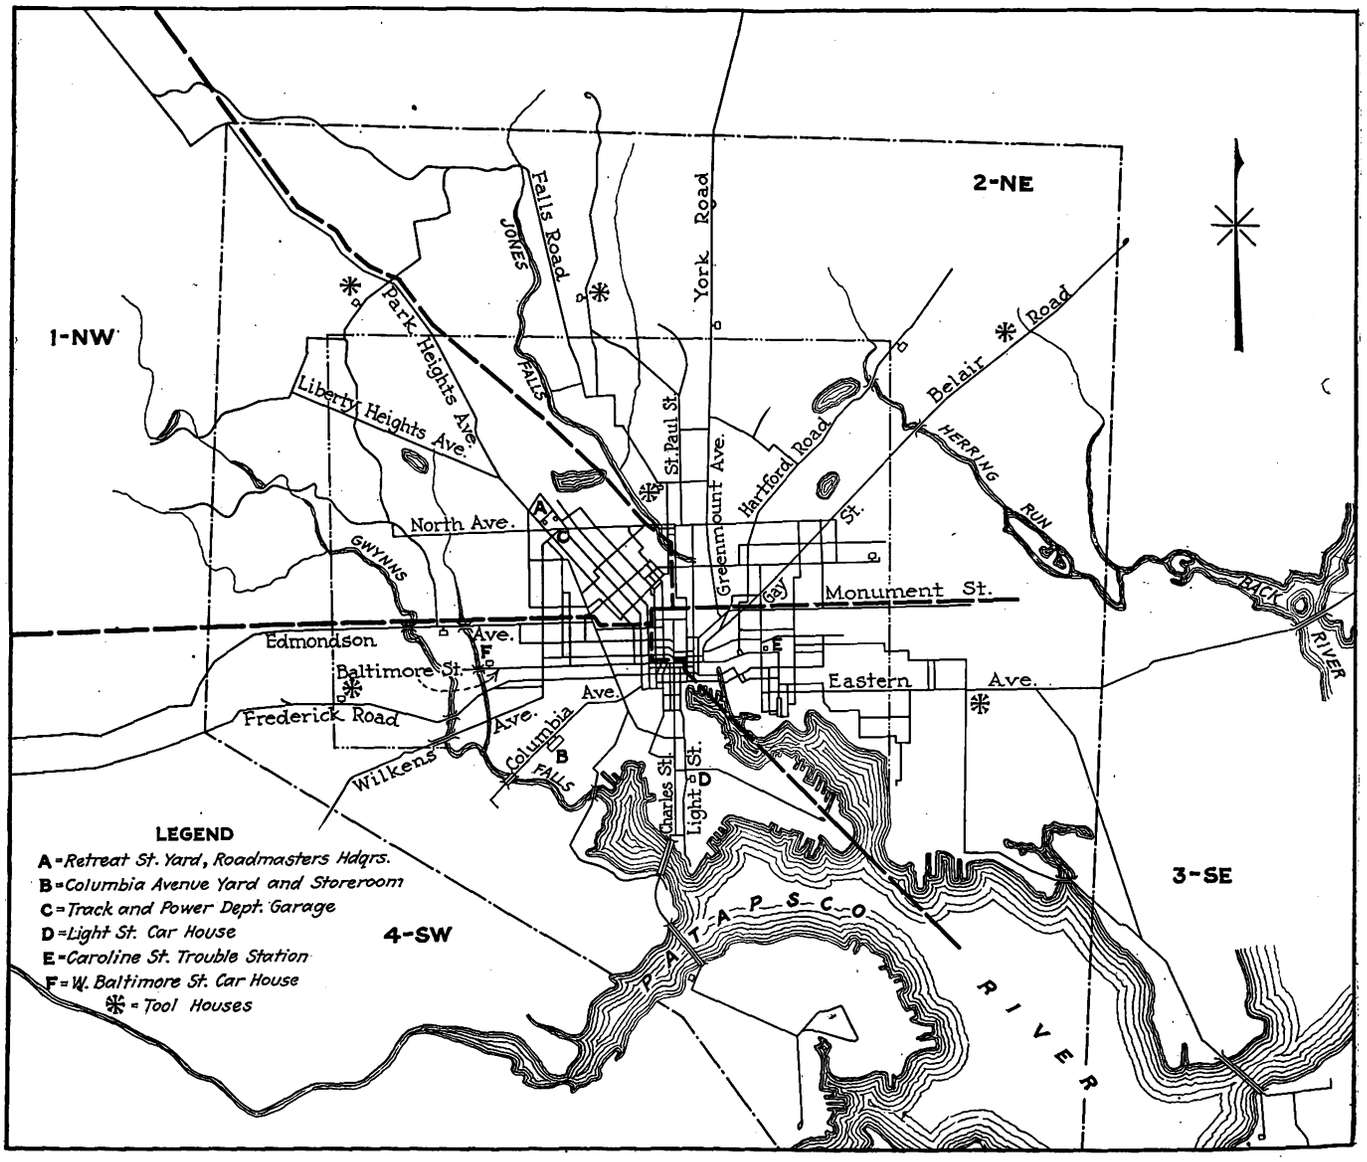
For track in paved streets the railway is now using A.E.R.E.A. standard 7-in. grooved girder rail, on wood ties, spaced on about 2-ft. centers. Six inches of stone ballast is machine tamped under the ties. Joints are installed by the electric seam-weld process. Where the remainder of the street is paved with asphalt, which is widely used in Baltimore, two rows of granite block liners are placed on each side of the rail. When granite block paving is used over the entire street the railway omits the liners alongside the rail.

Some track has been built using T-rail and nose block, but this is not thought to be very satisfactory.

Digitized by Google

No economy has been effected by using such a method because the saving in the cost of rail is counterbalanced by the greater expense of the blocks.

Joints on all tracks in paved streets, with the exception of those in special work, are welded. The company has been using welded joints for many years, beginning with cast welds, later using electric bar welds, riveted joints with thermit welded bases and finally electric seam welds. Little trouble has been experienced with cupped joints except in track that is very old. When cups first appear they are ground out.



For Maintenance-of-Way Purposes the System of the United Railways & Electric Company of Baltimore Is Divided Into Four Districts with Approximately the Same Track Mileage in Each

As the age of the track increases and the cups become deeper they are built up with an electric arc welder and then ground smooth. Comparatively few joints, however, need to be treated in this manner because, as a general rule, by the time such a condition develops the track is practically worn out and ready for reconstruction.

Where track has worn until there remains only about 2 or 3 years of useful life, the rail begins to fail by breaking. This may be either at or near the joint or frequently remote from it. In such a case the defective part is cut out and a worn piece of rail of the same section installed. Ordinarily this piece of rail is at least 12 ft. long as it is felt that rails of shorter length are apt to work loose. In making repairs of this character bolted joints are generally used because the expense of welding would not be justified for the short time that the track is to remain. Moreover, where rail is worn to such an extent it is difficult to make a satisfactory job of welding. Having granite block liners along the rail makes it possible to cut out defective pieces of rail and install new pieces without disturbing the asphalt.

A careful record is kept of the exact time when paving is opened up and when it is closed again. It has been found that damaged claims for injuries incurred by people falling into the excavation have sometimes been presented long after a job was completed, so that these records have been helpful in furnishing details concerning the work in such cases. When the paving is opened up at night kerosene torches are placed down in the hole along the rail. These burn all night and illuminate the track area without interfering in any way with the passage of cars.

In the outlying sections of the city some of the track is in a reserved strip in the center of the street. At the time the railway lines in the suburbs were first built they were located alongside unpaved roads. When the city grew and these streets were improved it was

Digitized by Google

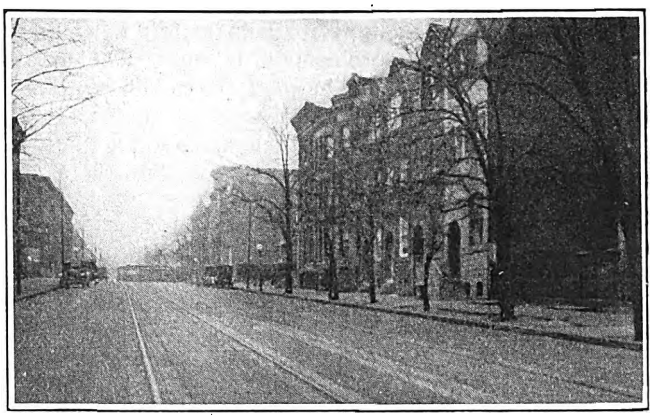
desired to have the tracks in the center. The company agreed to this change in location, provided that a strip was reserved for its use.

The width of the reserved strip varies somewhat with the width of the street, the minimum being 23 ft. and the maximum 26 ft. Wood ties and 85-lb. standard T-rail with bolted joints is the standard type of construction used. Its appearance is shown in an accompanying illustration. The overhead construction is carried on concrete poles, and concrete curbs separate the reserved strip from the vehicular roadways. No grass is planted in the reservation. In some locations hedges have been planted along the outer edges, but this practice is not favored by the railway. Experience has shown that there is a greater tendency for litter to accumulate in track planted in that way, and the appearance is marred rather then enhanced by the hedges. Maintenance work on track in the reserved strip is under direction of the section foremen.

Welded track, of course, needs no bonding, but through special work and the open T-rail track, copper bonds are used. They are welded in place by the acetylene torch method. In addition to bonding the joints through special work heavy copper cables are used for bonding around the entire job so that the return circuit is not dependent upon the special work.

Transportation of materials for the maintenance of way department is furnished by 11 White trucks and such work cars as may be needed. Each division has a 2-ton truck and each section a ¾-ton truck. In addition to these there is a 2-ton truck to carry the equipment used in renewing frog inserts, and another for repair work on drains and culverts. A ¾-ton truck is employed during the day to take care of electric switches. At 5:30 p.m. this truck reports to the roadmaster's office, and is kept there during the night to answer emergency calls.

All trucks are equipped with service recorders. Charts from these instruments are filed in the office of the roadmaster and from them it is possible to determine whether the trucks are being used to best advantage, that is, how much of the time they are in motion and how much time is spent waiting. The railway believes that these devices have saved their cost several times over.

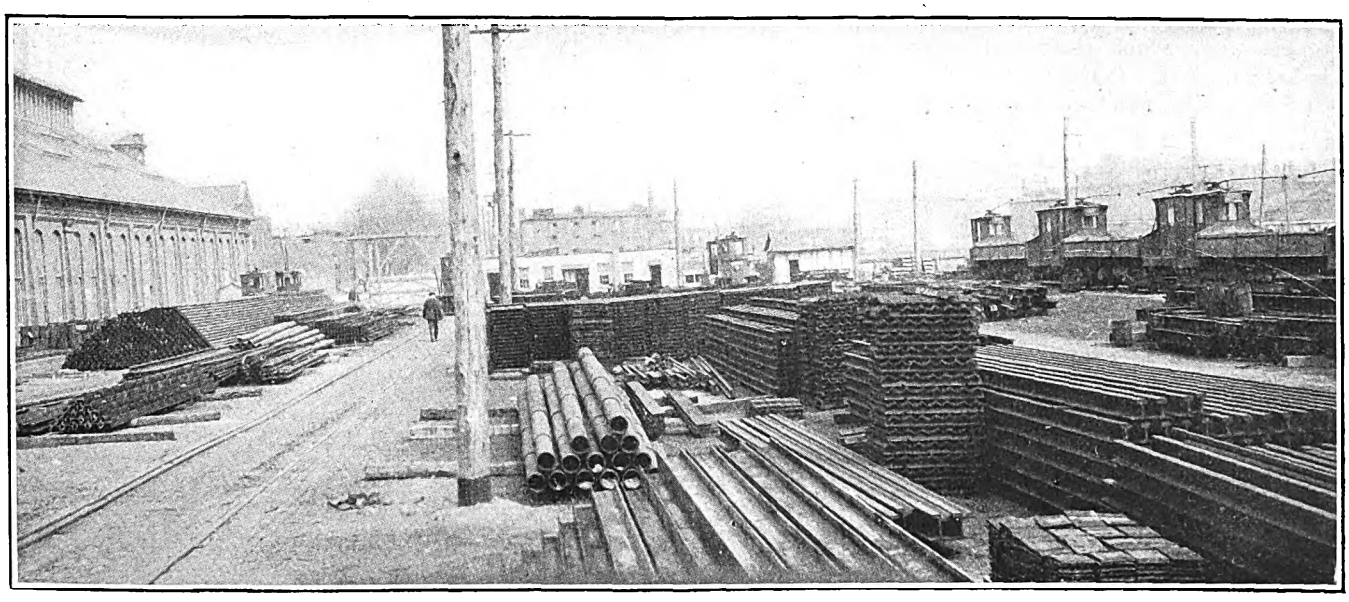


Two Rows of Granite Block Liners Along Each Rail Facilitate the Making of Minor Repairs

Each division and section has two sets of edge tools. One set is kept in a conveniently located tool house, and the other set, newly sharpened, is kept at the general track maintenance headquarters. Small tool houses, 10 ft. x 15 ft., have been built of corrugated iron and placed at spots readily accessible for the work on the outlying lines. Tools are transported back and forth between these locations and the yard by motor truck to reduce to a minimum the carrying of tools on passenger cars. For work in the center of the city the tools are carried and kept in the 2-ton divisional trucks.

Material for track maintenance work is transported by these motor trucks when the quantity required is small. Large lots and heavy materials are carried on work cars. These are under the direction of the superintendent of work cars, who has his office at the general storage yard. Crews to operate work cars and men to handle heavy material at the storage yard are under the jurisdiction of the track department, even though the material itself is controlled by the storekeeper until requisitioned. Comfortable quarters and recreational facilities have been provided for the yard men.

Although their territory spreads over more than 400 miles of track the division and section foremen keep in close touch with maintenance headquarters. Wherever he may be, each man telephones in to the roadmaster's office at 9 a.m., 11 a.m., 1 p.m. and 3 p.m. At 4 o'clock these eight foremen, together with the



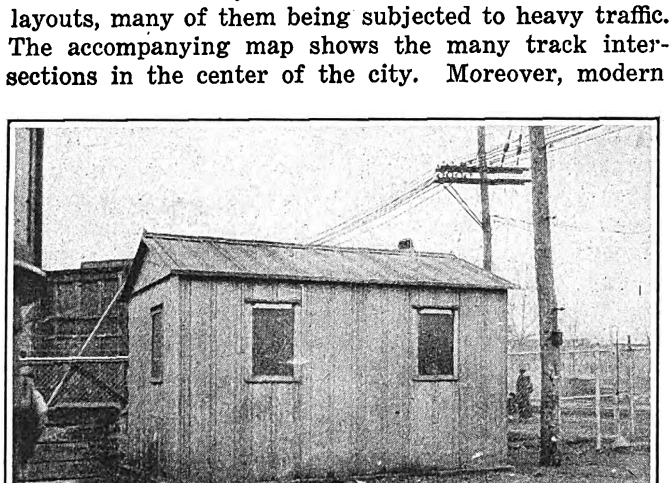
Good Housekeeping Is Emphasized at the Main Columbia Avenue Storage Yard

Digitized by Google

roadmaster and assistant roadmaster, sit down in the office and discuss the problems of the day. The quantity of material that will be needed the following day on each division and section is reported by the foreman in charge. Arrangements are then made for securing it from the storekeeper and transporting it to the desired location.

At this time the roadmaster calls attention to any reports that have been received concerning defective track or paving. All employees are encouraged to make report of anything of that kind that they find. Very often the maintenance department is already aware of the defect, but the co-operation of the trainmen has been found helpful in many cases. A special effort is made to repair as quickly as possible any defect reported in this way.

A serious maintenance-of-way problem is presented by the large amount of special trackwork in Baltimore. The United Railways & Electric Company has 826 such layouts, many of them being subjected to heavy traffic. The accompanying map shows the many track intersections in the center of the city. Moreover, modern



Tool Houses of This Type Have Been Erected in Convenient Locations to Save Carrying Maintenance Tools Long Distances

rolling stock will not clear on some of the old curves and the railway is installing clearance curves as fast as it is practicable to do so.

One gang which reports directly to the roadmaster is known as the "hard center" gang. It is engaged in tightening up, resetting and renewing frog inserts. A truck has been provided, as mentioned in a foregoing paragraph, to haul tools and materials for this work. Worn special work is built up by welding with an Indianapolis welder and grinder.

It has been found that where steel wheels are operated over manganese switch tongues there is a tendency for the sharp edges of the tongue to bite into the comparatively soft steel of the wheels, thus causing them to climb. The company's specifications require that the edges of new tongues shall be rounded off, but the tendency is for them to wear sharp again. A special gang of two or three men is employed to keep switches in good order and as the tongues develop sharp edges they are rounded off by grinding or hammering.

At the track yard the company has its own special-work manufacturing plant. This is a well-equipped shop capable of turning out any work that may be needed. Advantages claimed for this practice are that the work can be done at somewhat less cost than to buy it outside, and that it can be done much quicker. This reduces the number of parts that it is necessary to carry in stock. Hard center frogs can be made in 48 hours and built-up frogs in 10 hours, if necessary.

Overhead Railway with Chain Hoists Serves the Special Work Shop and Yard

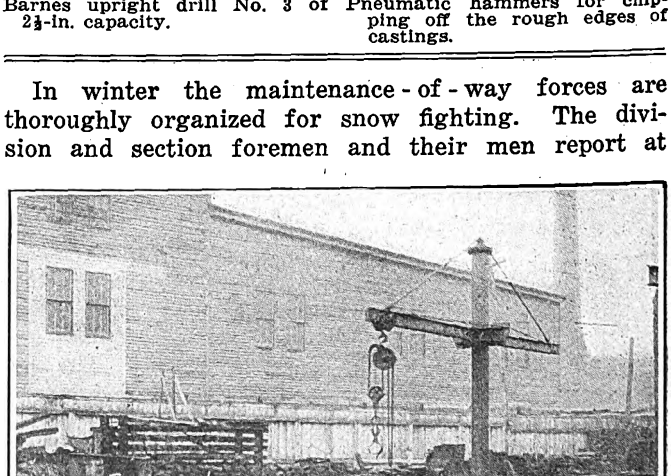
This plant supplies only a part of the railway's special work requirements. It is operated continuously throughout the year with a force of from 15 to 20 men. When the demand exceeds the capacity of the plant special work is purchased outside. No attempt is made to increase the output by employing additional men.

Compromise and ordinary joint plates are made at this shop. Rails are cut to whatever length needed for a particular job, and any necessary bolt holes are drilled. Maintenance tools are resharpened.

The machinery used for this work includes one each of the following:

- Hilles & Jones No. 4 rail bender capable of handling any sized rail.
- Hilles & Jones No. 3 punch and shears, which will punch a 2-in. hole in 1¼-in. steel.
- Highley cold-cut saw No. 20.
- Highley circular saw sharpener.
- Barnes upright drill No. 3 of 2¼-in. capacity.
- Detrick & Harvey open-side frog and switch planer, which makes a 15-ft. cut.
- Detrick & Harvey bolt cutter.
- Norton No. 7 emery grinder.
- Pennsylvania air compressor.
- Three Springfield swing grinders.
- Pneumatic hammers for chipping off the rough edges of castings.

In winter the maintenance-of-way forces are thoroughly organized for snow fighting. The division and section foremen and their men report at



An Upright Crane with a Chain Hoist at the End of a Horizontal Arm Is Used for Loading Materials in the Special Work Yard

Digitized by Google

what are called "storm quarters," in most cases operating carhouses. These locations are shown on the accompanying map. The curve greasers are put to work cleaning switches in the center of the city when the snow reaches a depth of 1 in. The rest of the switches are handled by division and section foremen with 67 of their men. When snow reaches a depth of 3 in. the supervisor of reconstruction reports to the roadmaster's office with his own force of approximately 100 men. With this organization to back up the transportation department, the lines have all been kept open except under extremely bad storm conditions.

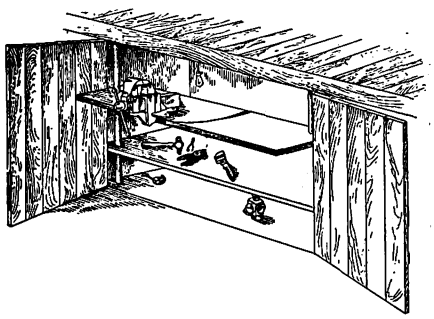
Special efforts are made by the maintenance department in summer to improve the appearance of the grounds surrounding carhouses and terminals. Much work has been done in planting grass and bushes in such locations and the appearance has been greatly improved.

Pit Tool Boxes Reduce Time of Bus Repairs

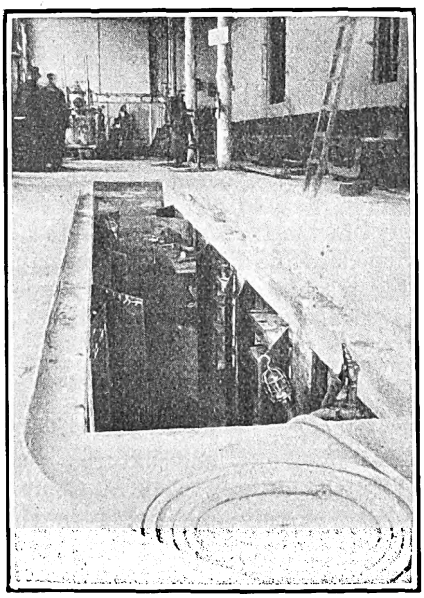
Cabinets in Sides of Pit Developed by Des Moines City Railway Contain Tools, Spare Parts and Supplies Required for Bus Maintenance

TO REDUCE lost time and save many extra steps taken between the pit and work bench in the routine maintenance of bus equipment, the Des Moines City Railway constructed the completely equipped inspection and maintenance pit shown in the accompanying illustration. This pit is provided with storage cabinets for tools, supplies and spare parts, a folding work bench and vise, and other facilities for doing work under the bus chassis.

A location was selected at one side of the car repair shop, where a convenient driveway is available for moving buses in and out of the shop. Practically all bus inspection and repair work is done here. This includes inspection and care of batteries and tires, changing of lubricating oil, etc.



By Means of a Folding Bench Equipped with a 4-In. Machinist's Vise Minor Repairs Can Be Made Without Leaving the Pit



In the Des Moines City Railway Shops the Repair and Inspection Pit Is Completely Equipped with Tools, Spare Parts and Supplies

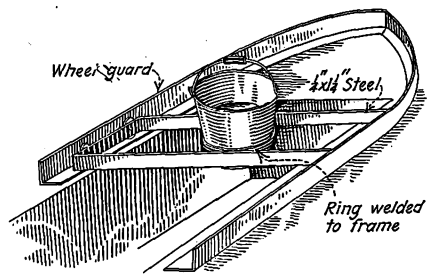
The length of the pit is 24 ft. 6 in. at the bottom, and 29 ft. at the top. It is 3 ft. 2 in. wide. At one end the depth is 4 ft. 6 in. and at the other end is 4 ft. 4 in., thus providing for drainage. Five storage cabinets 4 ft. wide and 2 ft. deep are formed in the concrete walls on each side of the pit. They are closed by swinging steel doors.

To form a guide for the bus wheels a 6-in. x 4-in. angle extends around the front and sides of the pit. The horizontal leg of this angle is turned toward the pit. This not only serves for fastening the frame in place, but also forms a secure reinforcement near the edge of the floor to support a jack at any point around a bus. The horizontal leg on the pit guard also serves as a track for the bucket carrier shown in another illustration.

Included among the tools and supplies stored in the cabinets are hand tools, special tools and extra parts that are most frequently needed. In one cabinet, a folding bench is arranged so that it can be swung out into a convenient position when needed and can be folded back out of the way when not in use. This bench carries a 4-in. machinist's vise which is suitable for supporting parts while adjustments or minor repairs are being made.

Tire chains, distilled water and battery acid, a large grease gun, a supply of transmission and engine oil and a vulcanizing outfit for making tire repairs are all conveniently stored in the pit. A CP-27 car compressor supplies air at 125 lb. pressure. The air hose is long enough to reach to the extreme end of the pit. Spare tires and tubes, extra battery parts and a battery tester are also included in the pit equipment. Battery charging wires are arranged so that when a bus is going to be out of service for some time, they can be connected to the bus battery without removing this from the vehicle. At one end of the pit an ordinary 12-in. electric fan is mounted so that this "pit workshop" can be kept free of fumes and provided with circulating air in warm weather.

A bucket carrier previously mentioned has proved to be an additional convenience. Ordinarily, when a bus is standing over a pit it is convenient for a workman to get at the drain plug for changing either transmission, differential or crankcase oil, but it is difficult to provide a suitable support for a pail which will not be in the way of a workman moving about the pit. The pail carrier consists of a light rectangular frame made of ¼-in. x 1¼-in. steel with a ring of the same material welded in the center. The frame is mounted on four rollers inside the wheel guard at the sides of the pit, thus permitting the carrier to be moved easily to any desired location under the bus. With the bucket supported as shown, the pit can be kept clean, and there is no obstacle to interfere with the workman when he is doing other tasks while waiting for the oil to drain out.



A Bucket Can Be Supported Close Under the Engine or Transmission When Draining Oil by This Apparatus

This convenient pit and its equipment were developed by A. J. Clements, mechanic in charge of bus maintenance, under the direction of C. R. McMahon, master mechanic.

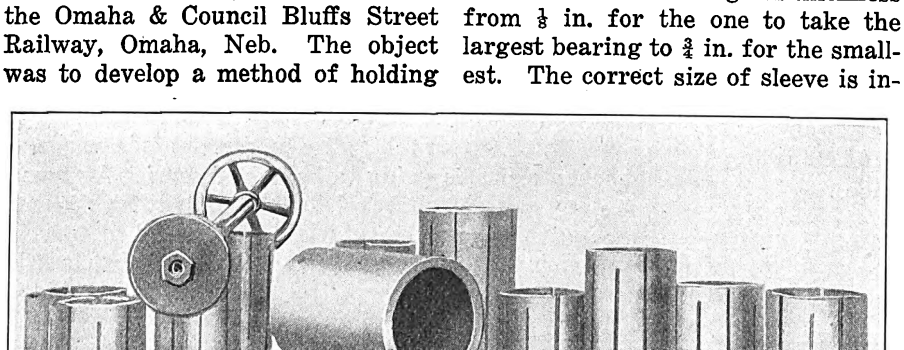
Equipment Maintenance Notes

Self-Centering Chuck for Armature Bearings

BY T. E. WOOD
Master Mechanic Omaha & Council Bluffs Street Railway

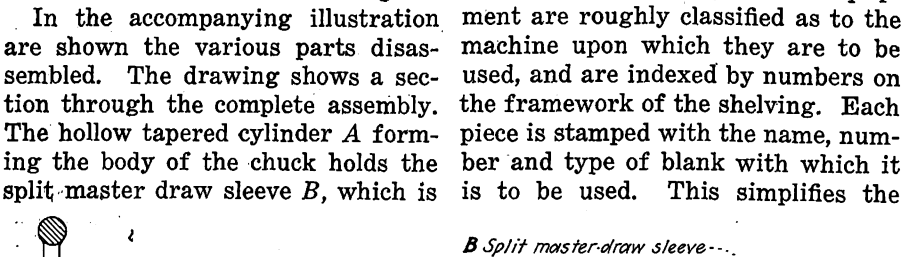
A SELF-CENTERING chuck for holding armature bearings while they are being machined has been designed and built in the shops of the Omaha & Council Bluffs Street Railway, Omaha, Neb. The object was to develop a method of holding the bearings securely in place in the lathe, while at the same time making it possible to center them accurately and quickly, so as to reduce the cost of doing this work.



Parts of Self-Centering Armature Chuck of Omaha & Council Bluffs Street Railway. The Split Sleeves Shown Accommodate Bearings of Various Outside Diameters

The principal parts of the chuck consist of a hollow tapered cylinder which is threaded on the lathe live spindle like an ordinary chuck, a split master draw sleeve, a rod extending through the lathe live spindle, and a set of split sleeves to accommodate different sizes of bearings.

In the accompanying illustration are shown the various parts disassembled. The drawing shows a section through the complete assembly. The hollow tapered cylinder *A* forming the body of the chuck holds the split master draw sleeve *B*, which is pulled tight by the hand wheel *D* acting through the rod *C*, the other end of which is threaded into the closed end of the cylinder at *E*. This compresses the sleeve as it is drawn into the taper. Each draw sleeve has ten longitudinal ⅛-in. slots equally spaced, and running alternately to within ½ in. of alternate ends. The sleeves range in thickness from ⅛ in. for the one to take the largest bearing to ¾ in. for the smallest. The correct size of sleeve is inserted in the tapered cylinder to accommodate the diameter of bearing being machined. Both the cylinder and the sleeves are of cast iron.



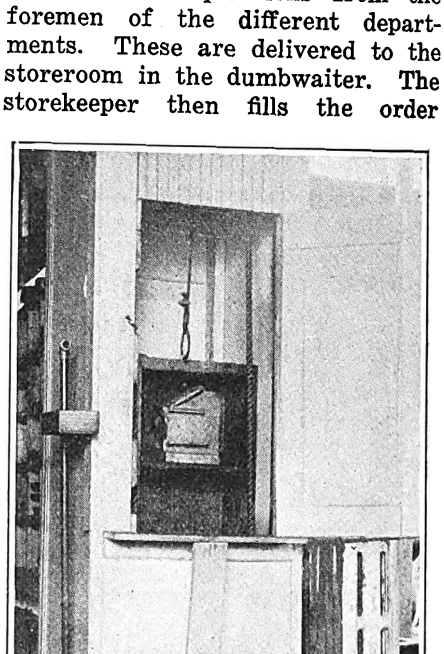
A Longitudinal Section Through the Assembled Chuck. The Bore of the Outside Cylinder Is Tapered so that the Split Sleeve Is Compressed as It Is Drawn Up into the Cylinders. The Rod C Extends Through the Lathe Live Spindle

Jigs and Dies Stored Systematically

ALL jigs, dies and fixtures used in the railway shop at Columbus are stored on shelving in the toolroom adjacent to the machine shop. The various pieces of equipment are roughly classified as to the machine upon which they are to be used, and are indexed by numbers on the framework of the shelving. Each piece is stamped with the name, number and type of blank with which it is to be used. This simplifies the task of finding a particular fixture, and makes it possible to send a machinist's helper to the toolroom.

Dumbwaiter Saves Time of Shopmen

THE storeroom for small maintenance parts used by the Eighth Avenue Railroad, New York City, at its 155th Street shop is on the second floor of the shop building. Ordinarily this is served by two stairways. Trouble caused the shopmen, and the resultant loss of time, from climbing the stairs has been overcome by C. P. Westlake, supervisor of equipment, through the installation of a dumbwaiter. The men obtain requisitions from the foremen of the different departments. These are delivered to the storeroom in the dumbwaiter. The storekeeper then fills the order quickly and lowers the dumbwaiter with the parts required. Movable shelves are provided to accommodate different sizes and varieties of material.



A Dumbwaiter Is Used by the Eighth Avenue Railroad for Quick Communication Between Storeroom and Maintenance Shop

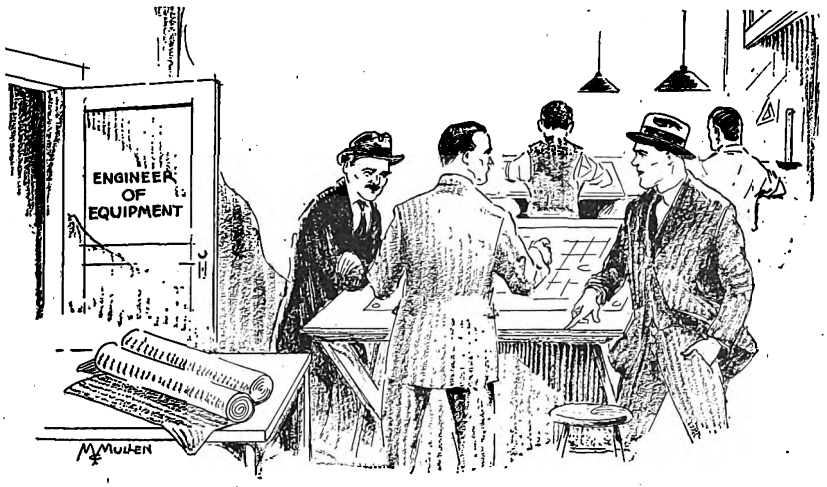
Dick Visits a Large Property

And Finds One of His Ideas in Practice



DICK PRESCOTT, engineer, and Steve White, carpenter foreman of the Consolidated Railway & Light Company, after completing their inspection at Centerville, arrived in Rushburg the following morning. As this was the largest city to be visited on their trip Dick felt that here, if anywhere, they would find concrete suggestions regarding the organization of an equipment engineering department.

Much to their delight, the engineer of equipment accompanied them on their trip through the shop. They lost no time in getting started.

As they entered the drafting room Dick brought up a subject in which he was particularly interested.

"What are you doing to standardize the various parts and fittings used on your different series of cars?"

"That's a very live topic with us," was the reply, "We started in about 2 years ago to see what we could do along that line and after we really understood what we were driving at, began to make pretty good headway."

"How do you go at it?" asked Dick.

"Come over here and I can give you quickly a rough idea of our method."

They moved over to a near-by table. He picked up a blueprint booklet and continued: "Now this set of prints makes up what we call a bill of material for a car. You'll notice that these forms contain a list of all the equipment on a given type of car, including detailed information that will assist in making out requisitions for the proper parts. Then we go on here (continuing to turn the pages) to a list of various castings, forgings and miscellaneous items with sketches of all these special parts. You'll notice pattern numbers for all castings are included. We have complete drawings of each of these patterns."

"That's very interesting," remarked Dick. "Now how do you apply this information?"

"Well, it's simply a process of elimination, once you have all the data in this form. By making very slight changes in design sometimes we are able to substitute one standard piece for several different varieties formerly in use."

"I follow you there, all right, but it looks like you'd still have to keep on ordering parts for the various cars in service, to have them all uniform in each car. Otherwise you'd have to scrap a lot of perfectly good material that is already on hand."

"That's true only to a certain extent. For instance, let's take this item of hand straps. We found that there were about 10 different types and lengths in our various groups of cars; in fact, just about as many different straps as there are types of cars. The store-room had to carry each type in stock for replacements, and at the same time the carhouses had to have some of each on hand. That meant that we were continually ordering small quantities of 10 different straps."

"When we studied this a little, we found that all our cars could be fitted with just two compromise types of straps. Then we made this sketch showing these two types, and a list of the cars in which each strap is to be used."

"What do you do when you have a car come in with one of the old straps broken?"

"I was just coming to that; it illustrates the principle of our entire practice. As soon as we had decided to use this new strap an engineering department instruction sheet was sent out to everyone interested, including storerooms, purchasing department and carhouses. Orders for replacement straps are limited to the new standard. When a car comes in with a broken strap, all those in that car are replaced with new ones. The old straps are put into stock and are used for replacements while they last. Then another car is stripped and the new standard is put in. So that way the process of substitution continues gradually, but all purchase orders are limited to the new standard part."

"That's fine," said Dick. "Will you let me have one of these blank bills of material forms?"

"Sure, help yourself. If you get into this subject, let me know if I can help you any further. Now if you'll come over this way we can see how it works out in the storeroom."

Car Maintenance Costs Reduced Since Last

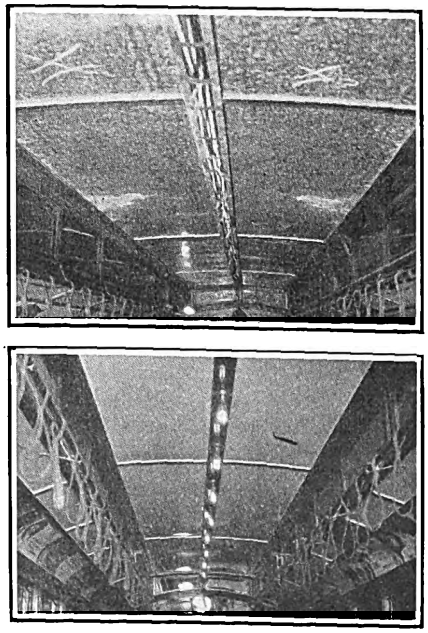
FIGURES compiled by the Electric Railway Association of Equipment Men, Southern Properties, showing the comparative cost of car maintenance in January, 1925, and the same month a year ago, indicate a reduction of nearly 1 cent per car-mile. Six companies reported lower costs in January of this year and three had greater costs. The average was 24 cents per mile as against 24.98 cents. Figures for individual railways are given in the accompanying table.

MAINTENANCE COSTS PER 1,000 CAR MILES

	Jan., 1924	Jan., 1925
Memphis	20.49	19.72
Little Rock	23.30	20.22
Atlanta	19.37	22.41
New Orleans	22.27	22.85
Knoxville	26.87	23.05
Dallas (Texas Elect.)	25.39	25.04
Dallas	30.42	25.09
Birmingham	23.10	26.60
Chattanooga	31.82	31.07
Mobile	26.80	....
Average	24.98	24.00

Galvanized-Iron Sheets Used for Headlining

WHENEVER the headlining in cars operated by the New York & Harlem Railroad, New York, N. Y., requires replacing, No. 20 gage galvanized-iron sheets are used. For the average size car each sheet that is used is 24 in. x 96 in. Artificial lighting is by a row of lamps down



Above, Ceiling of Car with Galvanized-Iron Headlining in Place. Below, Ceiling Completely Finished with Lamps in Place.

Digitized by Google

the center of the car. The wires for the lighting circuits are inclosed in a trough and the bases for the lamps are mounted directly on the cover for this trough. Galvanized iron is used for the headlining as it has been found that it gives additional protection against deterioration.

Before the sheets are placed in position they are given a coat of Pratt & Lambert red primer on the upper side, and when they are in place the lower side is painted by a coat of red primer followed by a coat of Pratt & Lambert white enamel. This gives a smooth white surface which is a good reflector for the lighting. The accompanying illustrations show the galvanized-iron headlining in place and after it has been finished.

Cheap Concrete Setting for Poles

Old Paving Stones, Broken Concrete and Brick with Cement Grout Give Good Results in San Francisco

BY S. L. FOSTER
Chief Electrician Market Street Railway, San Francisco

UPON looking over an impressive list of 80 booklets relative to the various uses of portland cement recently, I was surprised to find no mention of the unusual use the Market Street Railway of San Francisco has made of cement in constructing the monolithic setting of its many thousands of steel and concrete poles for the past 23 years.

When a steel pole is set, it is raised or hoisted into the center of the hole dug in the ground. While it is held by pike—or fork—in the exact position desired, most companies pour and tamp concrete around the pole, this concrete being prepared manually or mechanically of the classical ingredients, namely, water, cement, sand and crushed rock or gravel and transported more or less from the point of mixing to the hole.

METHOD DISCOVERED ACCIDENTALLY

Owing to the non-arrival promptly of the crushed rock on a certain piece of pole setting work in 1902, the foreman of a gang doing this work on the Market Street Railway adopted an innovation that has since become our standard practice. From a near-by pile of rejected basalt or granite paving blocks he selected clean ones and packed the space tightly with these blocks between the pole and the sides of the hole. Then he mixed "grout"—cement, sand and water—in a large wheelbarrow at the edge of the hole and pouring it into the hole filled the interstices between the paving blocks, pole and sides of the hole with this "grout."

From that day to this no more premixed concrete has ever been used in our steel pole settings. Many of these settings have later been purposely demolished for various reasons, and invariably the exterior surface of the steel pole has been found perfectly preserved from corrosion and the cementing bond between paving blocks entirely satisfactory.

The proportions used in this "grout" has been one sack of cement to three sacks of sand and enough water to make it flow readily into the voids. No tamping is or could be done with this unfortunately but necessarily thin "soup." I know of no other electric railway company following our method of steel pole setting.

This method is as satisfactory as any other in furnishing the two objects of such a setting, namely, (1) providing a monolith about the lower part of the pole to present a broad surface over which to distribute the pressures against the soil produced by the leverages from the various strains applied to the top of the pole in railway work, and (2) inhibiting corrosion of the underground exterior surface of the steel pole.

It is economical of labor, as the throwing in of the paving blocks is simplicity itself while the stirring up of the "grout" in the wheelbarrow is done far more expeditiously than would be the case with the usual concrete mixture on a platform or in a concrete mixer. It is done exactly at the mouth of the hole, and the mixture is delivered into the hole the instant the proper consistency has been attained without any setting, any haulage cost, any tamping, any waste of cement or sand or any subsequent cleaning up of the street being required.

It is economical of material, as these old paving blocks, as used in San Francisco where blocks are continually being replaced by smoother paving, cost nothing beyond haulage and often are at hand when new track and pole construction are being carried on simultaneously. In other cases, instead of old paving blocks pieces of the excavated concrete base under bituminous paving, as removed by the track men to make room for ties and rails, have been used to fill the pole hole. This method saves not only the cost of the crushed rock but also the hauling cost of the crushed rock to the poles and the hauling costs of the condemned paving blocks or surplus concrete pavement base away from the street. After the great fire of 1906 bricks from the ruins were used with equally good results.

There is a still further advantage to this method of pole setting. As soon as the space between the pole and the sides of the hole has been packed full of the paving blocks or pieces of concrete pavement base, the pole is so firmly wedged in that the supporting pikes can be removed and usually the wire strains, if any, can be at once applied to the top of the pole. The pole is now practically set as far as resistance to the normal strains is concerned. The addition of the cement grout is really more to preserve the surface of the steel from corrosion than to provide rigidity for the setting, but this consideration should not lead one to use a cheap grout for the purpose. Poles have been found badly rusted where the proportion of cement had been abnormally reduced in the concrete used.

LABOR AND MATERIAL REDUCED

In brief, this San Francisco method improves the efficiency of steel pole setting in three essential features. It reduces the labor cost and the material cost, and it eliminates the former delay imposed on the linemen to permit the concrete to harden where the usual small-sized crushed rock is used instead of large paving blocks. Thus it expedites the work very materially.

As soon as the pole settings are grouted the span wires can be put up preparatory to stringing the trolley wire.

It is also found much easier to cut the pole setting off the pole with pneumatic chisels when paving blocks are used in the setting than when smaller pieces of stone are used.

Another favorable feature of this class of work in San Francisco by the ocean is that in the majority of holes clean sand is found entirely suitable for use with the cement. Thus the only transportation required for the concrete pole settings is that of cement and tools.

Cleaning Armature Cores by Sand Blast

IN THE shops of the Department of Street Railways, Detroit, Mich., a sand-blast method is used for cleaning armature cores and commutators before rewinding. This method takes but half an hour to clean an average size armature as against half a day previously required for a man to scrape, file and

Cleaning a Railway Armature by Sand Blast Previous to Rewinding

pick it clean. The sand blast is directed against the parts by means of a nozzle attached to a flexible hose, with an air supply and valve convenient to the operator for regulation. A suction hood takes the dirt and refuse from the armature out of the shop.

Causes for Lubrication Failure

RECOMMENDATIONS for packing bearings, together with causes for failure of lubrication in service, are given in a discussion of lubrication practices recommended for electric cars, which appears in the January issue of *Lubrication*, a publication of the Texas Oil Company. Armature bearings must be carefully machined and fitted on all surfaces. It is essential that they receive a sufficient and continuous supply of satisfactory lubricant and that they be packed and fitted in such a manner as to exclude dirt and water. Assuming that a high grade oil and proper waste saturation are used, the principal causes of apparent lubrication failure are enumerated as follows:

1. Shifting of the bearings in the housing, caused by the shearing of dowels or keys. This prevents the window in the bearing from registering with the window in the waste well, thereby shutting off the oil feed.

2. Distorted bearings which are caused by a fit too tight in the bearing housing. To guard against this, the overhauler should be sure that the armature can be turned by hand after assembling.

3. Loose or stretched housing bolts in motors of the split-frame type cause a bad fit between the bearing and the housing and permit the oil to escape outside the bearing. Shims for the purpose of taking up wear have the same effect. Their use should be avoided.

4. Improper alignment in reboring housings and bearings often causes tight fits and leads to failure. End play should be checked and particular attention given to keeping water out of the lubrication chambers, as this washes out the oil and causes glazing of the waste.

Experience has shown that within economical limits the wear is approximately inversely proportional to the quantity of oil applied. Dirt and water can be kept out of the bearings by proper maintenance of the dust caps and waste box covers.

Axle bearing wear is not generally considered so harmful as armature bearing wear, but it is the cause of many troubles. Excessive axle bearing clearances cause shocks and unnecessary strains in the motor frame, and on the axle cap and axle cap bolts. A change in the center to center clearances between the axle and the armature shaft causes the gears to spread beyond the normal pitch line and causes excessive wear of pinions and gears, due to a rubbing contact rather than rolling. Uneven wear of two axle bearings should not be tolerated.

Pull-Ins Reduced in Dallas

FOR the first time since the active campaign was started by the Dallas Railway to reduce pull-ins the number in one month was less than 100, the record for February showing but 91. Of these, 61 were chargeable to the shops and 30 to the transportation department.

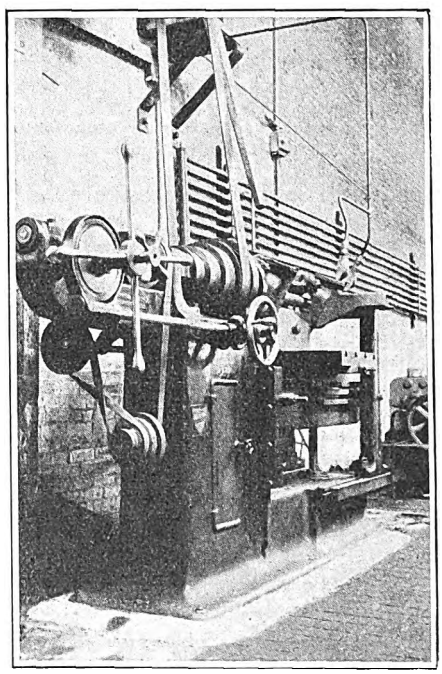
Mechanical pull-ins were: For fields, 31, armatures 10, brake rigging 9, air brakes and contactors 6 each, field jumpers 4, controllers 3, gearing, trolleys, brushes and holders 2 each, and for armature bands, bearings, motor leads, cables, circuit breakers, bells, seats, gates and journal boxes, 1 each. There were 5 unclassified.

Transportation pull-ins were: For accidents 14, unclassified 7, derailments and broken glass 3 each, found O. K. 2 and split switch 1.

Reconditioning Motors to Increase Bearing Mileage

RECENTLY the Eastern Massachusetts Street Railway made the first replacements of axle bearings on a group of small motors placed in service during the latter part of 1923. The average mileage per axle bearing was 125,000. In contrast to this the average life of axle bearings on several older type motors with shells more or less worn was found to be approximately 25,000 miles. In the case of the older motors, bearings had to be removed before they were fully worn on account of breakage, oblong dowel-pin holes, resulting from the loose condition of the bearings in the motor shell.

This convinced the company that in order to secure maximum bearing life the motors must be in first-class condition mechanically. As a result of a study of the subject a program of reconditioning motors by rebor-



Motors Are Rebored on This Machine in the Chelsea Shop of the Eastern Massachusetts Street Railway

ing is now under way at the company's Chelsea shops. It is expected by this procedure to triple the life of certain types of bearings.

One distinct advantage obtained by increasing the life of bearings is the fact that all bearing renewals can be made at the shops when cars are brought in for general overhauling, and thus eliminate the necessity of making replacements at the carhouses. One of the boring mills equipped with a special jig for re-

Digitized by Google

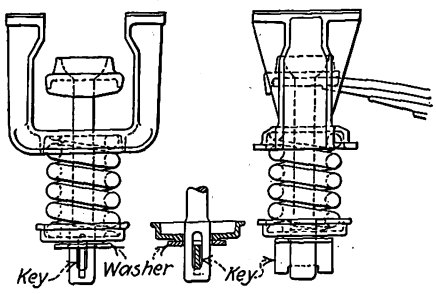
boring GE-247 motors is shown in the accompanying illustration.

In the case of this type motor the axle bearings were found to be too thin for satisfactory service. The diameter of the bearing is now being increased ⅛ in. with an allowance of 0.003 in. for clamping fit in the motor shells. To insure proper alignment each motor is fitted with a standard set of new armature frame heads before being placed in the jig. The motors are bored to provide interchangeability of the axle caps as heretofore. Direct labor cost of reboring the axle fits is $2.50 per motor, the work being done at the time the motors are overhauled.

New Equipment Available

Improved Swing Link

THE J. G. Brill Company, Philadelphia, Pa., calls attention to a new type of half-ball swing link that it has designed for suspending Birney safety car bodies from the



Changed Type of Swing Link for Safety Car Trucks

end quarter-elliptic springs of Brill 78-M and 79-E trucks.

This link forging is of the plain type and, instead of the threaded end with nut under the coil spring seat, a slot and key are used. This eliminates any difficulty which might occur from the nut rusting practically solid on the threaded link.

Limit Switch for Motor-Operated Shop Doors

A LIMIT switch has been designed by the General Electric Company, Schenectady, N. Y., for use with motor-operated doors and ventilator-opening equipment such as is used in many electric railway shops. The switch operates on the traveling nut principle, opening a circuit in either direction of travel, the distance of travel being regulated by means of an adjusting screw permitting calibration of from two to twelve turns.

Damage to the switch resulting from overtravel of the motor is prevented by allowing the traveling nut to leave the worm at the extreme ends, in which position further turning of the worm has no effect on the nut. When the direction of rotation of this worm is changed the nut is automatically re-engaged by means of a compression spring.

The switch is completely inclosed and the cover is held in place by four thumbscrews. Knockout holes are provided on the side for conduit wiring. The coupling is cup-shaped and slotted to engage a pin on the operating mechanism.

Due to the slow break of the contacts, the switch has been limited to 230 volts direct current, but can be used on 550 volts alternating current. The current-breaking capacity of the tip is limited to the current taken by the coil of a 75-amp. contactor on alternating current and an 80-amp. contactor on direct current.

Welding Flux Gives Strong Ductile Weld

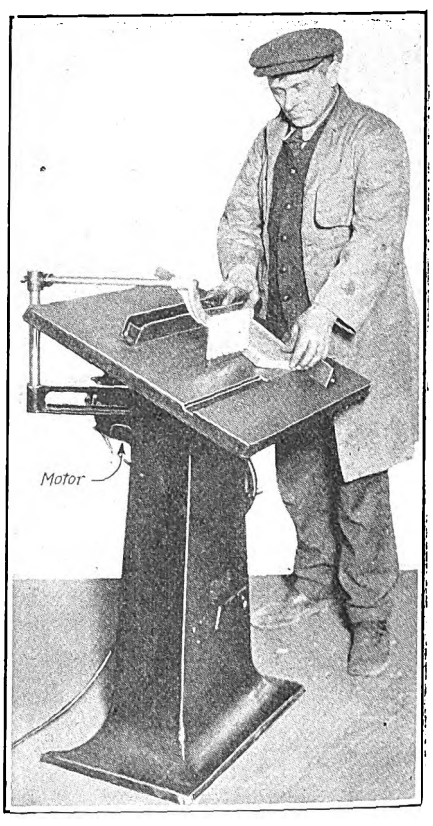
A WELDING flux known under the trade name of Welfex has been brought out by the Chemical Treatment Company, New York, N. Y. The manufacturer claims that this flux possesses several properties desirable for effecting a strong, soft and ductile weld which can be machined, faced or drilled without chatter or change of speed. The flux is intended primarily for gas welding. When using it, one end of the welding rod is heated by the torch flame and when brought to a cherry red is dipped in the flux, which fuses and forms a coating over the rod. The heat of the torch then causes the flux to flow from the rod to the weld. The end of the rod and the welding area should be kept well covered with this coating of slag.

It is stated that the slag which is produced not only protects but absorbs the impurities from the exposed surface of the hot metal, and that it also prevents serious changes of silicon or carbon content in the metal. Welfex is a desulphurizer, the affinity of its slag for sulphur being greater than that of the fused or molten metal.

Where welding is done on heavy pieces, additional flux should be added directly to the surface of the weld. With this method, care should be exercised to have the flux form a fluid slag of sufficient quantity to float over and completely cover the metal under fusion. This is essential, as the important service rendered by a fluxing slag is to dissolve metallic oxides and shield the molten metal from oxidation.

Universal Saw with Gear Drive

A UNIVERSAL saw, motor-driven through helical gears, is being marketed by R. L. Barker & Company, Chicago, Ill. The gears, which are exceptionally wide, are operated in oil. Ball bearings are used throughout. The driving equipment and the saw can be moved up



Universal Saw with Motor Drive

and down by turning a large hand wheel at the side of the machine. A heavy metal pedestal eliminates vibration and a guard for the saw is of efficient design. The table is 23 in. x 28 in. x 34 in. high and a saw 8 in. in diameter is used to provide a depth of cut of 2⅜ in. A ½-hp. motor is used for driving. The saw will cut wood, metals, bakelite and other compositions.

Association News & Discussions

Steam Railroad Engineers Hold Annual Convention in Chicago

American Railway Engineering Association and Signal Section Discuss Many Committee Reports of Interest to Electric Railway Men—National Railway Appliance Association Stages Annual Exhibit

SUBSTANTIAL progress in the study and solution of various railway engineering problems was evidenced throughout the annual meeting of the American Railway Engineering Association, held in Chicago, March 10 to 13. Attendance equaled the high record figure of last year, and the dinner on Wednesday evening taxed the capacity of the Congress Hotel Gold Room. The largest display of railway engineering material and appliances ever assembled was staged during the period of the convention by 176 members of the National Railway Appliance Association.

President Ray Urges Greater Co-operation and Increased Committee Activity

In his annual address to the association, President George J. Ray, chief engineer Delaware, Lackawanna & Western Railroad, attributed much of the progress made by the association to conscientious and enthusiastic committee work. Speaking of the present status of the railway industry, he said that although the total business handled by the railroads in 1924 was not quite up to that of the peak year of 1923, the month of October, 1924, showed a greater tonnage handled than in any preceding month in the history of American railroads.

"This vast tonnage," he said, "was handled without any material shortage of cars or power in any part of the country. At the present time the railroads are passing through one of the most interesting stages of their existence. During the past year we have seen some of the first moves toward consolidation under the transportation act of 1920.

"We will have to help build up some of these new combinations to a point where they are capable of handling the business and to maintain them in an economical manner and safe condition. We will be called upon to adjust the usual construction and maintenance programs to fit the new requirements and conditions."

Referring to the problems of maintenance, he urged that budgets be based on the requirements of the traffic and operating conditions over a period of years; so that maintenance programs would not fluctuate with short periodic changes in volume of traffic. Mr. Ray summarized this by saying, "There should be a reasonable maintenance standard for every individual property. This standard should be based upon the general earning capacity and also upon the kind and class of traffic handled. With this standard correctly fixed, slight fluctuations in the business should not materially alter the yearly program of maintenance work."

On the subject of automatic train control he urged that railway construction, maintenance and operating men co-operate in studying and analyzing the various types of control that have been installed on several trunk lines during the past year in compliance with orders of the Interstate Commerce Commission. He also advocated that the railroads of the country take the initiative in collecting data to be used as the basis of eliminating unnecessary grade crossings.

At the meeting on Wednesday J. M. R. Fairbairn, chief engineer Canadian Pacific Railroad, was elected president for the ensuing year. Various committee reports presented during the session contain information of interest to electric railway engineers. These include the following:

Committee Reports of Interest to Electric Railways

Electricity.—The subjects covered were water power, electrolysis, transmission lines and the joint use of poles. Revisions were made in the specifications for the construction of overhead electric supply lines. Specifications were prepared covering the maintenance of transmission lines and the joint use of poles. These are designed for the guidance of forces engaged in maintaining railroad electric supply lines located on railroad property. Standard practices to be followed when wooden pole lines are used for both electric power transmission and distribution circuits, and for signal and communication circuits, are also compiled.

Ballast.— Specifications for stone ballast were presented with a recommendation that they be substituted for the present specifications in the manual. It was recommended that the design of the 15-tine ballast fork adopted in 1924 be withdrawn from the manual because this fork cannot be produced commercially. Investigation showed that the railroads do not favor different sizes of stone for different characters of traffic. It was also concluded that there is no particular advantage in smaller sized ballast from the standpoint of collecting dirt. Consequently it was decided to make ¾ in. the minimum and 2½ in. the maximum sizes for ballast. It was also concluded that rock meeting the requirements for weight, toughness, soundness, wear and cementing qualities would necessarily be satisfactory in strength, absorption and solubility, and these last-named tests were, therefore, omitted from the proposed specifications. No definite rules were offered on the subject of ballasting by contract, but the committee submitted as information a typical form of contract and specification which has been used successfully by one road.

Masonry.—Last year's unfinished report on the principles of design of plain and reinforced concrete for use in railway structures was completed. It was submitted with the recommendation that it be included in the manual. The report called attention to the lack of reliable information as to embankment pressures on culverts under deep fills and the committee therefore limited its study to vertical loads. Rules for the inspection of masonry structures were also included in the report.

Economics of Railway Location.—A progress report included methods of estimating speed, time and fuel consumption on lines to be constructed or revised. An outline of the computations for the speed curve method was given, together with a modification of this method, especially adapted to computing the values of rise and fall. It was pointed out in the report that speed should be differentiated as between that based on running time between stops and the speed based on the elapsed time between terminals. In view of the many variable contributing conditions, no definite method was given for estimating delays, except that of studying past performance under similar physical operating and traffic conditions.

Buildings.—The committee recommended that the specifications for concrete roofing tile, display roofing tile, electric light wiring, hot air heating, hot blast heating, architectural terra cotta and concrete architectural stone, as presented in the 1923 report, be approved for publication in the manual. The conclusions of the committee relative to floors for freight houses and location and design of passenger stations were submitted for inclusion in the manual. Data covering the ventilation of railway buildings were also presented as information.

Stresses in Railroad Tracks.—This committee submitted a progress report based on four years of study in co-operation with the American Society of Civil Engineers. The report gave further data on stresses in tracks produced by the action of steam and electric locomotives. It also included the

Digitized by Google

first scientific study of the effects upon rail and upon track maintenance, resulting from the canting of rails inward. A general discussion was given of tests conducted on the Chicago, Milwaukee & St. Paul Railway.

Co-operation with Universities.—Stimulation of a greater interest and appreciation of the value of technically trained men in railway organizations was the purpose of this committee. Its further object was to secure a more general application of laboratory and other university research facilities to the solution of railway problems, and at the same time to stimulate a greater interest among engineering students in transportation as a future vocation. A progress report was submitted carrying on further the work done in previous years.

Economics of Railway Operation.—The report of this committee included an analysis of the effective speed upon the cost of transportation. It also presented further data on methods for increasing the traffic capacity of a railroad, and an analysis of costs as applied to starting and stopping trains.

Roadway.—Information reports were submitted on corrugated metal culverts, methods of handling the problems resulting from slides and water pockets, and methods of keeping down dust on road crossings and platforms as well as on tracks.

It was pointed out that when the roadbed shoulder is built up with clay or other impervious material, a pocket which holds water is formed under the track. It was recommended that cinders or some other porous material should be used to build up the roadbed shoulder instead of clay or other like material. When it becomes necessary to use impervious material, the committee stated that suitable cross-drains should be placed to prevent water pockets.

Spraying with crude oil was found to be the most general method used for the elimination of dust. It was also found, however, that several railroads have discontinued this practice. In some cases oiling of the roadbed was unsatisfactory for a number of different reasons. It seemed to be the general opinion that oiling of the roadbed is advisable in sandy desert regions where the rainfall is very light, but that the results are much less satisfactory in districts having a nominal amount of rainfall. There seemed to be a general agreement that station and freight yard driveways can be oiled to advantage and that the same is true of highways at crossings or points adjacent to railroad tracks.

Wood Preservation.—The committee on wood preservation reported under six heads. This included revision of the manual, service test records on ties and fence posts, treatment with a mixture of creosote and petroleum, treatment with a mixture of chloride of zinc and petroleum, marine oiling research and the effect of preservatives on the inflammability of wood.

Owing to the increased use of treated timber and the decreased quantities of creosote which are available, the question of the suitability of mixtures or combinations with other preservatives was considered particularly pertinent. The report continues the study of this subject from last year. For inclusion in the manual specifications were submitted covering thermometers used in creosote distillation and also a method for the analysis of zinc chloride.

During the past year a process was developed at the Mellon Institute of Industrial Research, Pittsburgh, Pa., by means of which zinc chloride and petroleum is injected into the timber in the form of an emulsion composed of zinc chloride solution of 15 to 40 per cent strength and a mixture of heavy asphaltic base petroleum thinned to the density desired. The results obtained from the zinc chloride petroleum treated ties indicated that the addition of the petroleum to zinc chloride will, under most conditions, add to the life as compared with zinc chloride treatment only. The report stated that experimental work along this line carried out during the past year has been very encouraging.

Shop and Locomotive Terminals.—Among several subjects studied by this committee was included the general layout and design of car shops. This was treated from the standpoint of steam equipment conditions, but allowance for the differences in clearance required would permit these recommendations to be readily compared with electric railway practice.

Signals and Interlocking.—The report of the committee on signals and interlocking contained voluminous information on automatic train control and signals for highway crossing protection. In treating automatic train control, the committee outlined six important phases of the subject but confined itself this year to a detailed report on but two of these, namely, (1) the purpose of train control and historical data; (2) the extent to which wayside signals may be omitted in train-controlled territory.

The several sections into which the complete report will be divided are as follows:

The purpose of train control and historical data.

Definitions.

The effect of train control on train operation.

The comparative control furnished by various types of train-stop and train-control devices.

The effect on signal systems of installing train control.

Extent to which wayside signals may be omitted in train-controlled territory.

Iron and Steel Structures.—A number of revisions of the manual dealing with the general specifications for steel railway bridges were prepared. Certain portions of the manual, nullified by the adoption of the general specifications for the erection of steel railway bridges, are to be removed. In addition, the report includes rules for the field inspection of existing bridges, a statement relative to the status of the specifications for steel highway bridges now before a conference committee of the American Railway Association, the American Society of Civil Engineers, and the Association of Highway Officers.

Uniform General Contract Form.—A form of option for the purchase of land and a form of agreement for the joint use of passenger station facilities were presented by the committee. There were also included in the report for information and discussion forms of agreement for the purchase of electrical energy, for the joint use of freight station facilities and for joint pole lines. The committee reported on the result of the joint conference on standard construction contracts to which its chairman was a delegate.

Yards and Terminals.—This year the committee has carried forward its detailed studies of the relation between passenger station facilities and business handled, to include an analysis of the problem of handling commuter traffic as contrasted with through traffic. In addition, a detailed report was submitted on the handling of freight, dealing particularly with the economics of various types of freight houses and involving both operating and investment charges. Curves were presented in the report showing the comparative investment per ton for outbound and inbound houses.

Ties.—Further study of substitute ties was covered by a section of the report dealing with the principal causes of failure of substitute ties and methods whereby these might be overcome. Suggested designs were submitted with the recommendation that interested roads build and test these types under different track conditions. Foreign woods for tie purposes were discussed and conclusions were submitted for inclusion in the manual. A specification for tie plugs was also prepared.

Economics of Railway Labor.—A discussion of standard methods for performing maintenance-of-way work and of methods of programming this work were included in the report. The first portion of this discussion deals with the establishment of standard schedules as units of performances for the purpose of securing the most effective organization of the maintenance forces. Such necessary factors as budgets, equalization of expenses, division programming and the relation of these factors to the economical application of labor are discussed in the second portion of the report.

Records and Accounts.—The work started last year on cost-keeping methods and statistical records for the purpose of securing unit costs was discussed in the report. Three different classifications were presented as a basis for separating the cost figures. These included studies of maintenance costs from the I.C.C. primary accounts, from sub-primary accounts and from special studies. The committee concluded that cost keeping and statistical records are practical and result in economies, by facilitating the control of expenditures.

Signs, Fences and Crossings.—This committee prepared definitions of bituminous materials and specifications for bituminous crossings, for approval and publication in the manual. It submitted a progress report on the elimination of highway grade crossings and also compiled information outlining the methods followed by the various states in apportioning the cost of highway improvements adjacent and parallel to railroad rights-of-way.

Digitized by Google

Tracks.—An amended table of temperature expansions for laying rails, which gives values for 39-ft. and 45-ft. rail, was presented for revision of the manual. Detailed plans of certain types of crossings, compromise joints and compromise rail were submitted for adoption. The committee recommended the practice of canting rail inward at the rate of 1 in 20. Figures were prepared showing the comparative cost of resawing, rerolling and building up rail ends by the oxy-acetylene process. Data on track construction in city streets were included.

Rail.—This committee presented new specifications for rail in which the non-essential features heretofore causing dissension between rail manufacturers and railways have been eliminated. It also submitted a progress report for track bolts, and suggested a method of compiling statistics based on a traffic density factor.

Wooden Bridges.—A record of progress on the study of the useful strength of new, old and treated timber in railway trestles, and a critical examination of the present series of stresses when applied to timber under railway load conditions, were contained in the report. There was also a classification of the uses of timber and lumber under A.R.A. specifications. Attention was directed to the standardization program developed by the timber industry, resulting in the American Lumber Standard Recommendation No. 16 of the U. S. Department of Commerce. The committee also reported on the relative merits of open and ballasted deck timber trestles.

Central Electric Railway Association Master Mechanics Organize

New Association Will Be Affiliated With C. E. R. A.—Purpose Is to Consider Methods of Improving Equipment Maintenance Practice and to Work Toward Greater Uniformity as a Means of Expediting Interchange

EQUIPMENT men in the territory covered by the Central Electric Railway Association met at Lima, Ohio, on March 12 and organized the Central Electric Railway Master Mechanics' Association. This is the result of a movement started shortly after the last annual meeting of the C. E. R. A., at which time some of the equipment men felt that they would derive greater benefit from meetings devoted entirely to equipment subjects than from the procedure as followed in the Engineering Council. Approximately 30 equipment men attended this first formal meeting of the new association, and a special committee appointed by the executive committee of the C. E. R. A. sat in during part of the session, to outline the views of the executive committee relative to the new organization.

Need for Master Mechanics' Organization Outlined

T. H. Nicholl, superintendent of motive power Union Traction Company of Indiana, who presided as temporary chairman, opened the meeting by stating the need for some more closely knit organization of equipment men than had been offered by the engineering council. The object of this movement, according to Mr. Nicholl, was to make possible an intensive study of mutual equipment problems, to raise the standard of equipment maintenance on the member roads in the territory, and to expedite the interchange of equipment through greater uniformity of practice.

He pointed out that the best results from the standpoint of improvement in practice could be accomplished through the medium of an exclusively mechanical men's organization, rather than through the existing engineering council. This was held to be due primarily to two reasons; first, the saving in time resulting from confining the discussions to equipment subjects entirely, and second the simplified organization that would result from the elimination of the geographical subdivisions into which the engineering council was divided.

G. R. Green, general superintendent Chicago, South Bend & Northern Indiana Railway, made an impassioned appeal for a full recognition of the importance of the master mechanics' duties on electric railways in general and particularly those engaged in the interchange of equipment. He maintained that methods of improving the service to shippers should receive the utmost consideration by all departments of the various roads in the territory. He held that this would mean increased freight business, particularly in the C. E. R. A. district, and consequently considered it of vital importance to the very life of the industry.

Mr. Green spoke highly of the past work of the Engineering Council. From the equipment man's viewpoint, however, he said that the concrete results accomplished had been limited, due to the short time available for the consideration of track and overhead line subjects along with those of the mechanical department. Through a master mechanics' association the mechanical men had felt that they would have more time available to work out their specific problems. He maintained that the master mechanics are in position to make substantial savings in costs through comparison of practices and interchange of ideas for improvement. He suggested that by holding meetings at various points in the territory at least a part of the time available could be used to visit the shops of member companies, thus better to compare practices and take advantage of new methods and ideas.

The same line of thinking was expressed by E. B. Gunn, superintendent of equipment and transportation Western Ohio Traction Company, who had undertaken the work of sending out notices for this meeting. He said that it was the intention to make these strictly business meetings, and that attendance by representatives of manufacturers would be limited to those in position to assist directly in the work of the association. He added that it would be the practice to discourage entertainment of any kind, so that the time available for meetings could be used to the greatest possible advantage.

According to all three speakers, it was the desire and intention of the master mechanics to maintain a close affiliation with the C. E. R. A. They explained that the meeting in progress had been called for the purpose of working out a concrete plan which would then be submitted to the executive committee of the C. E. R. A. for approval before going ahead.

G. K. Jeffries, general superintendent Terre Haute, Indianapolis & Eastern Traction Company, representing the executive committee, said that it was inclined to commend the master mechanics for the initiative and enthusiasm which had led them to go ahead with plans for a better way of doing their work. He felt sure the executive committee would approve the proposed form of organization, affiliated with the C. E. R. A.

Brief addresses were also made by F. D. Carpenter, president Western Ohio Railway; M. Ackerman, general manager and purchasing agent Cincinnati & Dayton Traction Company, and K. A. Simmon, representing M. B. Lambert, Westinghouse Electric & Manufacturing Company. Some of these speakers expressed the thought that the interests of all concerned would be served best by making the master mechanics' organization one section of an engineering group which would include the maintenance of way and

RULES FOR INSPECTION OF INTERCHANGE EQUIPMENT

Wheels

A. Tread thickness measured 1 in. from edge of rim shall not be less than ¾ in.
B. No wheels must have over ⅛ in. hollow tread.
C. Flanges not less than 1⅛ in. thick.
D. Treads not to be over 3⅞ in. wide or under 3 in. at any point.
E. Must not have chipped flanges more than ⅞ in. wide by 1½ in. long.
F. Steel wheels must not have a flat spot over 2 in. long and cast-iron wheels must not have a flat spot over 1 in. long.
G. Wheels must not be less than 54 in. inside measurement at gage line.

Couplers

A. Knuckles must not be over 5¾ in. from face to contour of coupler.
B. Locking device must come within 2 in. of knuckles.
C. Minimum height 31½ in., maximum 34½ in. under any condition of loading.
D. Anchor must not be loose and no anchor bolts missing.
E. No cracks or defects on knuckles or drawbars or anchors.

Trucks

A. Side bearings to have at least ⅛ in. clearance under load.
B. Center bearings must be O. K. and well lubricated.

Brakes

A. Not over 8 in. piston travel under load.
B. Heads, beams, pins, rods, hangers, etc., must be in good repair.
C. Hand brake must be efficient and in good repair.

U. S. Safety Appliances Standard

A. All cars must be properly equipped with United States Safety Appliance Standards.

Digitized by Google

power distribution men. The equipment men, however, felt that the others should take the initiative on their own account in forming themselves into similar groups.

A constitution which had been prepared by a special committee was read and adopted, and was then turned over to the secretary for submission to the C. E. R. A. executive committee. This provides for three grades of membership, namely, active, associate and honorary. Membership in the first grade, the only one permitted to vote and hold office, is limited to those in active charge of the maintenance of equipment on member roads of the C. E. R. A., and their principal assistants. Not more than two persons from any one property can hold active membership. Associate membership is open to mechanical department foremen, inspectors, etc. Honorary members are to be elected by the executive committee.

Rules for the inspection of interchange equipment were taken up, discussed in detail and adopted. These rules are published on page 477. An evening session was devoted to a detailed discussion of a code of rules governing the condition and repairs to freight cars for the interchange of traffic. This was designed as a guide for the adjustment of questions arising between car owner and handling road.

A special committee was appointed to prepare a schedule of uniform charges for the repair of equipment on foreign roads. Standing committees on standardization and on subjects were also appointed.

The following officers were elected to hold office until the next regular meeting: T. H. Nicholl, president; P. V. C. See, vice-president; L. E. Earlywine, secretary and treasurer; E. B. Gunn, F. J. Foote, Fred Heckler and J. W. Osborne, members of the executive committee.

The next meeting will be held at Fort Wayne, Ind., on April 9.

American Association News

Power Transmission and Distribution

THE midyear meeting of the power transmission and distribution committee was held in Chicago on March 9 and 10 with the following members present: Charles H. Jones, chairman; J. Walter Allen, J. C. Damon representing W. H. Bassett, M. W. Cooke, S. M. Day, J. H. Drew, D. D. Ewing, Charles Gilman, H. W. Griffin, C. L. Hancock, C. J. Hixson, W. E. Huber, Adrian Hughes, Jr., John Leisenring, F. McVittie H. S. Murphy, C. P. Nachod, J. F. Neild, W. J. Quinn, W. Schaake, A. Schlesinger, J. M. Waldron, F. J. White.

The Monday sessions were devoted exclusively to meetings of sub-committees. Considerable progress was made at these meetings in the compilation, preparation and discussion of reports on the various subjects assigned to them. The general meeting of the committee was held on Tuesday. In order to conserve the time it was decided to proceed with the business of receiving progress reports of the various sub-committees.

Mr. Waldron, chairman of the sub-committee on revision of signal sections of the manual, reported progress on the standardization of aspects for signaling.

For the sub-committee on concrete pole design Mr. McVittie, chairman, reported that three meetings had been held and a tentative report had been prepared which contemplates leaving out a considerable portion of the text matter in the present manual section. This committee has decided to conduct a series of tests on poles now in general use and will include the results of these tests in its final report.

It was planned to conduct all of these tests on octagonal poles, but Mr. Hughes kindly offered to conduct a similar series of tests on square poles. The same general rules and calculations that apply to octagonal poles also apply to the hexagonal and round poles and with the addition of the data accumulated from the square poles the report of this year's committee will undoubtedly be very complete on this subject. It was the opinion of the committee that the time was not ripe for the development of an A. E. S. C. standard as the concrete pole was largely in the development stages.

Mr. Murphy reported that a meeting of the sub-committee on trolley wire wear and specifications had been held in New York a few days previous with the corresponding sub-committee of the American Society for Testing Materials. A definite agreement was reached on the hard drawn trolley wire specifications. The specifications as prepared by the secretaries of the two organizations were modified to a small extent by the addition of paragraphs pertaining to the reeling of wire and the modification of the paragraph referring to the twist test. Mr. Jones stated that with approval of both associations these changes bring the A.E.R.E.A. specifications for hard drawn trolley wire into complete conformity with the A. S. T. M. specifications.

At the meeting in New York of the sub-committee of the two associations considerable progress was made in the development of a high strength trolley wire specification. It was agreed to set up two different strength specifications, one to be referred to as high strength bronze wire and the other to be referred to as medium strength bronze wire.

It was impossible to come to any agreement with the A. S. T. M. on the twist test for a high strength wire. After considerable discussion on this subject it was the opinion that unless the A. S. T. M. saw fit to alter the stand its sub-committee has taken a high strength specification should be developed by the power transmission and distribution committee.

Mr. Murphy stated that very little progress was being made on the question of current collecting devices, on which subject a corresponding committee of the equipment committee was also working. He also stated that some additional data had been gathered on the subject of trolley wire wear and it would be compiled in time for the inclusion of the report of the committee in June.

Mr. Neild submitted a definite report on temporary connections to trolley wire, which recommended the use of two devices, one of which had to be removed in order to permit a trolley car to pass, while the other one could be left on the wire while cars passed underneath it. This report was accepted for final submission to the committee in June.

Mr. McVittie stated that considerable discussion had taken place regarding specifications for trackless trolley overhead construction and that the committee now had before it a tentative set of specifications which outlines general construction details. Since comparatively few installations of trackless trolley were being made the committee did not feel that a very extensive and comprehensive set of specifications was required at this time.

Mr. Allen reported that the committee on return circuits had arrived at certain conclusions as to the number of bonds, types of bonding and place of attachment to the rail and that a report was in process.

Mr. Jones stated in the present specification for direct suspension overhead construction, which has been adopted by the A. E. S. C. as a tentative American standard, are a great many construction details which apply also to catenary suspension. It was his opinion that while it should be desirable to consolidate the specifications for both types of construction in the one specification it was not advisable to do that at this time. Mr. Jones suggested that it would be better to prepare a separate specification for catenary overhead and include in it those portions of direct suspension specification that were applicable. Such a specification will be ready for final discussion of this committee prior to the June meeting.

Since the organization meeting of the committee in December the executive committee has assigned the subject of radio interference for investigation. After some discussion a sub-committee consisting of W. J. Quinn and J. F. Neild was appointed.

As a result of a discussion on protcetive coatings for iron and steel it was agreed that the manufacturer representatives present, who were interested in galvanizing work, would gather together information relative to the various tests which might be used in determining the quality of galvanizing.

On March 5 and 6 a meeting of the A. E. S. C. sectional committee was held in New York on revision of parts two and four of the National Safety Code. The association was represented at this meeting by C. R. Harte, R. W. Eaton and M. B. Rosevear.

The News of the Industry

Franchise Progress in Kansas City

New Grant Which Will Provide for Bus Service Ready to Go Before Council

At the meeting on March 9 of the committee of the Council of Kansas City, Mo., which has before it the ordinance to establish conditions under which the Kansas City Railways is to be allowed to operate buses in auxiliary service, a further delay of one week was arranged before the final draft of the ordinance is placed before the entire Council for a vote. It is six months since the railway first applied for permission to run buses in service auxiliary to the railway.

At the outset receivers for the railway were several weeks in coming to any agreement with the Council in regard to the life of the franchise. Time limits running all the way from three to twenty years were discussed before a franchise to run for three years was finally agreed upon. City officials contended that inasmuch as the average life of a bus is approximately five years, a trial period not to exceed five years should be allowed. The railway receivers argued against the short-term investment involved in a temporary franchise.

Once the time limit on the franchise had been arranged and announcement made of the routes tentatively established for the nine services, but further delays were experienced because disagreements arose anent the proposed routings. Loading zones were asked for at the Union Station, but they were protested by the Kansas City Terminal Railway, which controls the station, and by the attorneys for the Yellow Cab & Baggage Company. An express line to and from the Country Club districts is planned and has been much discussed and argued against by Aldermen and citizens from various other sections of the city, particularly on the score of the 25-cent fare which is presumably to be charged for this service.

Even now, with only a few minor points in the ordinance to be settled and the bill passed and signed, it is probable that the first of April will have gone before the Kansas City Railways may be free to carry out plans, purchase buses and start the proposed service.

A period of two weeks is required to put an ordinance through the Council in the event no objections or arguments are raised. After that has been done the receivers will be obliged to present the plans to Judge Kimbrough Stone, referee, for his consideration and approval or rejection. If all the remaining obstacles are quickly surmounted, regular service by bus may be in operation in Kansas City, Mo., some time in May or June, it is said.

The railway is operating a regular service with six buses in Kansas City, Kan., carrying traffic in the outlying district of Argentine to the present terminal of intercity car service over the viaduct.

Transit Survey of Cleveland Proposed

Cleveland and its suburbs are seeking to co-operate with a view to treating the transportation problem in the metropolitan area of Cuyahoga County as a whole. With this thought in mind, a transportation committee for the metropolitan area of the county has just been named, with Alfred R. Horr, vice-president of the Cleveland Trust Company, as chairman.

Mr. Horr has just returned to Cleveland from New York, where for ten years he was vice-president of the Equitable Life Assurance Society. He has been a director of the Third Avenue Railway, the Coney Island & Brooklyn Railway and the Brooklyn City Railroad. Mr. Horr says that his committee will attempt to solve the transportation problems of Greater Cleveland, which includes the suburbs, instead of Cleveland alone. To do this, it may be necessary to amend the Tayler service-at-cost franchise under which the Cleveland Railway is run.

Serving with Mr. Horr on the committee are the Mayors of Lakewood and Cleveland Heights, one of the East Cleveland city commissioners and two Cleveland Councilmen.

Buses Regulated in Indiana

Motor Carriers There Placed Under Commission Regulation—Certificates of Convenience and Necessity Provided—Permits to Operate Transferable

BUSSES and trucks operated for hire in Indiana have been brought under the jurisdiction of the Public Service Commission. The bill to that effect has been signed by the Governor. The measure is a compromise. Traction interests arrayed themselves behind the so-called Moorehead bill as best designed to accomplish the degree of responsibility that they thought ought to be assured by the proposed legislation. The bus interests, as two years ago, protested on the ground of the alleged severity of that measure, saying that strangulation would result under the imposition of the Moorehead bill as presented originally. They introduced a bill of their own which called for regulation by the State Highway Department.

The new law is to supplement the public utilities law, which gives the commission power to adopt rules and regulations to govern applications for certificates of public convenience and necessity. The original bill required that all bus and truck operators should be compelled to obtain certificates of convenience and necessity from the commission and required the commission to give "consideration to the service rendered in the territory by steam and electric railroads and other motor vehicles." The words "steam and electric railroads" were stricken out of the bill by the House, making it within the power of the Public Service Commission to consider only the existing motor lines in the territory in determining whether or not an applicant is entitled to a certificate for operation.

The Senate amended the Moorehead bill so that all bus and truck companies in operation over fixed schedules 90 days prior to the taking effect of the act would be entitled automatically to certificates of convenience and necessity. Bonds which will guarantee the payment of damages if caused by any vehicle through careless operation must, however, be filed with the commission before the certificate may be granted. By an amendment made in the House these bonds may be taken out in mutual associations or reciprocal exchanges, but they are to be subject to the approval of the commission.

PERMITS TO OPERATE ARE TRANSFERABLE

By another amendment made in the House the certificates granted by the commission may be sold, bequeathed or transferred just as is any other property. It has been pointed out that after all existing motor transportation companies have received certificates it is reasonable to assume that few occasions would ever arise by which a bus company would come before the commission with an application for a certificate, since the rights can be bought and sold.

Where bus companies already are in operation in cities or towns continuous thereto under contract the Board of Works or Common Council may continue to supervise, control and contract for such service and determine when, if at all public convenience and necessity, require that competing service shall be established. The determina-

Digitized by Google

tion of any such board or Council may, however, be appealed for review to the Circuit or Superior Court of the county within 20 days. The penalty for violation of any of the provisions of the law is a fine of $10 to $100 for each offense, each day constituting a separate offense. The commission also may cause any certificate to be revoked. Each section of the law is independent of the other.

The original bill was introduced by Senator Robert L. Moorehead, Marion, Republican. It was based on the recommendations of the Bus Regulation Survey Commission, which worked under A. M. Glossbrener, Indianapolis, at the instance of the State Chamber of Commerce. The Indiana Highways and Motor Association, led by Samuel E. Hadden, secretary, and Robert I. Marsh, attorney, fought for the amendment to the bill along with other motor bus owners and the associations representing the motor carriers.

Conference Proposed on Conditions in Buffalo

Herbert G. Tulley, president of the International Railway, Buffalo, N. Y., continues to ignore the insidious threats and charges made by the politicians. He has, however, informed the City Council that the railway will not commit itself to any paving or track reconstruction. He says that the criticism of the railway is having a serious effect on the ability of the management to raise funds for necessary improvements.

The Chamber of Commerce has asked the Public Service Commission to investigate service conditions so that "necessary steps can be taken to compel the company to give such additional service as may be required." As a result William R. Pooley of the Public Service Commission says a survey will be made by the commission to determine the adequacy of the service in Buffalo. The commission also has called a conference to be attended by the municipal authorities, President Tulley of the International and Thomas E. Mitten, Philadelphia, of Mitten Management, Inc. It is to be held March 25 in Buffalo.

Mayor Schwab continues his threat to declare a transportation emergency in Buffalo so as to enable him to permit the return of the jitneys in an effort to force the company to operate more cars. The railway says this plan will only tend to reduce the company's revenues and force a fare higher than 8 cents, the rate authorized by the commission.

An appeal from the 8-cent fare is being considered by the City Council. Dr. Milo R. Maltbie, the city's utility expert, has made a report on traction facilities in Buffalo, but his findings have not been made public. It is reported, however, that Dr. Maltbie has recommended that no appeal be taken from the 8-cent fare decision of the board because of the fear that a review by the commission might result in a fare still higher than that now in effect. Some members of the commission are said to feel that the fare was based on a valuation of the company's property in Buffalo that was too low.

Jitneys Regulated in Terre Haute

Protest of Merchants Results in Ruling Autos Off Street Car Streets—Ordinance Provisions Summarized

Objection by merchants along Wabash Avenue, the main street in Terre Haute, Ind., to jitneys has resulted in the City Council passing an ordinance which prohibits jitneys from parking longer than 5 minutes on a street in the congested district and from receiving or discharging passengers on any street upon which an electric railway operates.

The protest was against the great amount of parking space occupied by jitneys operating on six lines, four of which paralleled street car lines. More than two blocks of curbing was used by the jitneys, barring customers' automobiles.

Immediately upon enforcement of the traffic ordinance the Terre Haute division of the Terre Haute, Indianapolis & Eastern Traction Company entered four large buses in competition with the jitneys which were operating. On all lines but one the jitneys were ordinary sedans or California-topped automobiles. The railway buses are front-entrance type, one-man operated, with pay-enter cash fare boxes. Transfers are issued from cars to the company buses and vice versa.

The new traffic ordinance, of which only one of twenty-six sections applied to jitneys, had been in effect about a month when G. O. Nicolai, manager of the Terre Haute division, announced on March 12 that additional buses had been ordered by his company. At that time the company's two bus lines were being operated on 15-minute schedules. Mr. Nicolai declined to say whether a new line was to be started or a closer schedule instituted on the present service.

Jitney Men Seek Aid of Court

Following is the section of the traffic ordinance regulating the jitneys:

(Passenger-Carrying Vehicles — Other than Street and Interurban Cars—No person, firm or corporation operating any jitney, city bus or interurban bus for hire shall receive or discharge any passengers upon any street, avenue or roadway at any point thereon upon which there is located any street car tracks or track, upon and over which street or interurban cars are regularly operated.

No street car, interurban car or vehicle for hire shall remain standing on any street within the congested district for the purpose of receiving or discharging passengers for a period exceeding 5 minutes at any one time.

Provided that none of the provisions of this section shall apply to any taxicab, or owner or operator thereof, when such taxicab is operated only upon a specific call by telephone or otherwise under a specific contract for hire, from a public or private garage or station maintained for the purpose of receiving such calls, and the destination of which taxicab is wholly under the direction of a passenger or passengers transported therein and the route of which is over any street or streets available for travel thereto; nor any vehicle, nor the owner or operator thereof, when such vehicle is operated by a hotel owner in the conveyance of guests between such hotel and any railroad or interurban station.

Immediately upon passage of the ordinance the operators of the jitneys sought and obtained a restraining order against the city to prevent enforcement of the measure until a hearing was had on a petition for an injunction. In the Vigo County Superior Court No. 2 the injunction was denied. The court held that a City Council had the right to determine how each street was used.

Indiana Interurban Reduces Fare as Experiment

The Indianapolis & Cincinnati Traction Company, Indianapolis, Ind., has decided to reduce fares for a month as an experiment. In the past the rate has been 3 cents a mile. The new rate will be 2 cents for 30 days, but only on round trip tickets. One-way tickets will sell for the old rate.

The company had been making Sunday excursion fare concessions for some time. These have proved so beneficial in creating new business that it was decided to extend the reduction to week days to see whether the results would be proportionately as great. The company hopes to appeal to the public to make more general use of the railway and is directing attention to the advantages which are offered by the new rates.

Although the move by the company is entirely independent on its part, it is said that other interurbans of Indiana are awaiting with interest a report on the outcome of the reduced tariff test to see whether earnings are increased without any undue increase in operating expenses.

Financial Backers of New Missouri Road Not Disclosed

George R. Collins, Kansas City, who said he was general manager for Lee Dunlap, principal promoter of the proposed St. Louis-Kansas City Short Line Railroad, testified on March 6 that he was first approached on the subject of an interurban line between the two principal Missouri cities by George Harrison, vice-president of the New England Bank, Kansas City. Mr. Harrison told him that his father, a banker at Glasgow, Mo., was promoting the road and had invested $35,000 for preliminary work, but that he wanted help. This talk took place nearly 10 years ago. The project was permitted to slumber during the war, but Mr. Harrison and his associates recently interested a syndicate in the proposed road.

Charles Miller, counsel for the Chicago & Alton, sought to obtain the names of the members of this syndicate, but Mr. Collins declined to furnish them. Finally, on advice of L. C. Boyle, attorney for the promoters, he furnished the names of the officers of the new line. They are: E. W. Lawhorn, St. Joseph, president; Lee Dunlap, second vice-president; W. H. White, St. Joseph; W. R. Cawthorn, Columbia; Dr. H. K. Gibbins, Fayette, and State Senator Walter Brownlee, Brookfield, directors.

Mr. Collins stated that the new road, a 238-mile system, will be 40 miles shorter than the Wabash, the shortest steam road between St. Louis and Kansas City. It will serve nineteen towns now without railroad facilities. It will be equipped with electricity.

Hearing on Subway Relief

Commission Engineer Holds Lengthening of Local Platform Easiest to Increase Subway Capacity

An extended hearing was given to the subject of the lengthening of the platforms of local stations by the Interborough Rapid Transit Company on March 16 by the New York Transit Commission. In general, opinion seemed to favor the plan from the transportation standpoint as the quickest and easiest way of increasing the subway capacity, though the company declared that it should not be obliged to pay the expense of this lengthening.

Daniel L. Turner, consulting engineer of the commission, specified that the present platforms at the local stations were of various lengths, but that 81 platforms would have to be extended at 48 stations, aggregating 2.2 miles, to permit operation of ten-car local trains. This would add about 380 additional cars during the rush hours and would increase the capacity of the subway from 25 to 33 per cent. His observations indicated that in making a trip two-thirds of the passengers use at least two trains, one express and one local, and that one-third of the passengers use three trains, one express and two locals. The cost of reconstruction of the platforms was estimated by him at $12,000,000, and the cost of the 382 additional cars, of which 70 per cent would be motor cars and 30 per cent trail cars, would be $10,425,000. Additional power and other equipment would add $6,196,000, thus making a total of $28,621,000.

President Hedley for the company admitted the change would increase the capacity of the subway, but pointed out that the proposed plan would unbalance the relation between local and express traffic, which, with ten-car express trains, would call for about eight cars on locals. A ten-car train is about the limit for normal operation. The possibility of adding one or more cars to the local trains, properly marking them and opening them up only at the express stops, was also considered.

Chairman McAneny outlined the possibility of the city advancing all of the funds required to make the platform extensions. While under the present contracts the company is required to pay half of the construction cost of additions and betterments that are just and reasonable, this proposed payment would be entirely for city property, the city could finance the borrowing for considerably less than it would be possible for the company to do, and as the city would have to reimburse the company eventually for this expenditure, it would be the gainer by doing the work itself. Further discussion was postponed until a later hearing.

COMPANY WILL CONTEST

At a hearing by the commission on March 19, the company, through its counsel, Mr. Quackenbush, declared it would contest in the courts any attempt to assess on it a part of the cost of extending the platforms, on the ground that these lengthenings were not in the contemplation of the parties to contract No. 3 when it was signed, nor at the time of its readjustment in 1918, nor when the whole matter was again under consideration in 1922. He further stated that the company could raise these large funds now, if at all, only under such conditions as to make the attempt improvident.

Official Comment at Chicago

Heads of Railways Enlighten Stockholders on the Proposed Purchase by the City

Two of the annual reports just issued by the railways at Chicago have brought expressions regarding the Chicago city program from three of the leading transportation men of the city. One came from Henry A. Blair, president of the Chicago Surface Lines and of the Chicago Railways. It is Mr. Blair's only personally penned viewpoint on the city plan. He said in part:

> While fully satisfied of the sincerity of the Mayor's efforts to work out a plan which will deal fairly with all concerned and which will attract to local transportation properties the large amount of new money essential to enlargements commensurate with the city's growth, nevertheless the undersigned has not been able to concur in the view that the proposed certificates can be rendered thus attractive to new investors. Accordingly, as an alternative in case it should be found that the proposed certificates are not marketable the undersigned has submitted for the consideration of the local transportation committee of the City Council a plan whereby the necessary additional money would be obtainable and whereby the enlarged system would be operated at cost (including a fair return to capital) under franchise which the city might terminate at any time upon paying to the investors the amount of their investment.
>
> The Mayor's plan contemplates enlargements and extensions which will require the expenditure of several hundred million dollars in addition to making provision for the investment in existing transportation properties, so that the question of the marketability of the proposed certificates is fundamental to such plan.

Mr. Blair comments on the fact that the security holders of the Chicago Railways are already engaged in complicated law suits over their respective right to dividends and to participate in the election of directors. The significance of this lies in the fact that there is no provision on the city's plan to pay anything at all to some of the security holders and a part of the litigants are among these.

He says:

> It is regrettable that the litigation should have been interjected into a situation so complicated and critical as that presented by the expiration of the present franchises and the maturity of all the company's bonds on Feb. 1, 1927; especially in view of the well-known fact that any plan—no matter by whom proposed—which contemplates sale, lease, consolidation or merger of the company's properties cannot be consummated, under the participation certificate agreement "unless and until the holders of a majority in amount of the total number of the equal parts represented by all of the four series of participation certificates shall consent thereto" in the manner provided in the agreement of Aug. 1, 1907, under which the four series of participation certificates were issued.

Mr. Blair had already approved much of the physical plan of the proposed consolidated system and declared that the co-ordination it proposed was an economic necessity.

Similar approval is given the physical plan by Leonard A. Busby, president of the Chicago City Railway, who devotes nearly 2,000 words in his annual report to a description of the ordinance. His analysis coincides with that given editorially by the ELECTRIC RAILWAY JOURNAL of March 7. He says:

> The proposed ordinance is often referred to as a municipal ownership and operation proposition. In substance it is neither municipal ownership nor operation. As a matter of fact the city will not contribute a single dollar toward the purchase of these properties. While the legal titles will be vested in the city, the beneficial ownership of the properties will rest in the holders of the public utilities certificates until these are paid, either through earnings of the properties or funds provided by the city.

Samuel Insull, head of the Chicago Rapid Transit Company, the elevated lines, warmly indorsed the project in his annual report, not, he explained, that he abates his mistrust of municipal ownership and operation a whit but because it is the closest approach yet made to offer the city an ideal transportation system. He said he would accept the "Schwartz certificates" which the city will offer in payment.

Toledo Board Wants Action

Prompt action of some kind on a plan to give Toledo, Ohio, better railway service and enable a fare reduction is expected as a result of the dispatch of a letter to the City Council on March 16 by the street railway board of control. The board expresses the belief that "after four years of operation of this franchise ordinance Toledo is not served by adequate, comprehensive and unified means of service." In conclusion the board says:

> We therefore respectfully recommend that you promptly give thorough consideration to a comprehensive study of the transportation problem and that you promptly invite from the Community Traction Company a proposal for remedying the transportation situation:
>
> 1. As to the immediate improvement of service.
> 2. As to the discharge of accrued financial obligations to the city.
> 3. As to the prompt repair of pavements and the rebuilding of defective tracks and for the providing of a crosstown service and such improvements to and extensions of the system as shall adequately serve the community's needs.
> 4. As to the immediate lowering of the rate of fare.
>
> We respectfully urge prompt consideration of this matter by your honorable body.

Back of the action the City Council holds in its hands the home-rule power over buses and has before it two or three plans for city-wide systems which would compete directly with the traction lines.

Officials of the Community Traction Company have already laid before the Council a plan to reduce expenses by the elimination of bus competition, make further use of one-man cars, adopt the skip-stop and carry out other minor economy features.

Bill to Abolish Utah Utilities Commission Killed

A bill providing for the repeal of the state law creating the Public Utilities Commission of Utah was recently killed by unanimous vote of the members of the House at the legislative session now being held in that State. The measure was known as House Bill No. 32. It was referred to the committee on public utilities and reported out of that committee with the recommendation that the enacting clause be stricken. On motion this report was unanimously adopted.

Buses in Cleveland by June 15

Buses will probably be operated in Cleveland, Ohio, by the Cleveland Railway, starting about the middle of June, now that Gov. A. Victor Donahey has signed the Collister-Krueger bill giving municipalities control over their local transportation. This bill becomes a law on June 15. It was designed to permit the Cleveland Railway to operate buses. In addition to giving home rule to municipalities in motor bus transportation, the new measure also provides for local control by "contiguous municipalities."

John J. Stanley, president of the Cleveland Railway, has announced that plans of the company call for operation of buses over fourteen routes in the city of Cleveland, and that to carry out this plan between 80 and 90 buses will be required. Sixty per cent of these buses will be single-deck vehicles designed to be used as feeders to the railway system. The other buses will be double-deck. They will be used over two routes, paralleling main lines of the railway. One of these routes will be along Clifton Boulevard through Edgewater Park, from the Public Square to Rocky River, paralleling the Clifton Boulevard line, and the other will be along Prospect and Carnegie Avenues from the Public Square to the Heights section. Railway officials say that if the bus line paralleling the Clifton Boulevard line is as successful as they anticipate, no street cars may be operated during the non-rush hours over the Clifton Boulevard line.

The problem of financing the investment in buses is still bothering the railway officials, inasmuch as the service-at-cost grant in Cleveland provides that no new stock may be issued except at par. The present market quotation of the railway stock is around 92. Councilman Sanders, former city street railway commissioner, has suggested that the company be permitted a special allowance of 3 cents a car-mile for the purpose of buying buses. This idea has met with favor in railway circles. If this is done, the amount expended for buses in Cleveland would not become a capital investment. Councilman Peter Witt, also a former street railway commissioner, has suggested that the city issue $250,000 in bonds, buy the buses itself and lease them to the railway.

Franchise Negotiations at Oakland Unproductive

Inability of the city of Oakland, Cal., and the Key System Transit Company to agree on terms has made it impossible for the proposed new franchise to be voted on at the spring election. The company some time ago made a request for an indeterminate franchise. Leon Gray, City Attorney, in behalf of the municipality offered a 50-year franchise. President C. O. G. Miller of the railways stated that only under an indeterminate franchise can the interests of investors be properly protected.

Mayor John L. Davie and Commissioner Frank Colbourn oppose the 50-year franchise. The Mayor says it is "too long a time." Commissioner Colbourn advised the City Council to "go slow in granting 50-year franchises."

In rejecting the terms of the 50-year franchise Mr. Miller said substantially:

> While we are prepared to join in his earnest effort to simplify and make possible the adoption of charter amendments which will protect the public interest and permit the owners of the present franchises to surrender their franchises for resettlement franchises, there are some provisions in the proposed amendments which, if not modified, will make it impossible for us to do so.
>
> We owe the public the best possible service, but in order to discharge that duty it is essential to the security of the investors that they be protected by franchises containing proper franchise provisions. The franchise situation of the company is bad, but not desperate. Some of our present franchises have only a short time to run, but they are reasonably workable in their present shape. Others are too short in their terms to permit permanent refinancing. The engineers now making a survey of the traffic needs of Oakland have intimated that it will not be possible for them to accomplish their purpose without new franchises for additional lines; that such franchises cannot be provided under existing charter provisions, and that the charter must be amended. The company desires such provisions so it can comply with the purpose of the survey. It will be readily appreciated, however, that this company cannot surrender its existing franchises and accept new franchises so burdened with restrictions and unreasonable obligations as to impair its usefulness to the public. To adopt such amendments would not better the situation but would delay the possibility of carrying out the recommendations of the board of engineers.

As a substitute for the 50-year franchise the company has submitted its own proposal to the effect that the City Council shall grant indeterminate franchises to expire only when the city is ready to take over the railway and "pay a reasonable price" for it.

Articulated Service Is Begun in Atlanta

Buses were placed in service on Sunday morning, March 8, by the Georgia Railway & Power Company through the Ansley Park and Morningside Drive section and also the Sylvan Hills section, in accordance with requirements recently imposed by the Mayor and General Council. This service is to be continued until the permanent coach service can be established through this and other territory asked on behalf of a corporation to be owned by the Georgia Railway & Power Company.

For this temporary bus service the company is using the buses formerly owned by the Crosstown Express and operated through this territory. The company explains that they are not to be taken as indicative of the type of coach which the company will use on its permanent coach routes. The company will make a thorough investigation of coaches and select modern coaches of the most approved and attractive type for this service. The necessity for starting the bus lines immediately compelled the use of the buses at hand.

The fare for a ride on the buses for any distance or for any ride on the combination use of these buses and the railway system of Atlanta will be 10 cents per person per ride. A passenger boarding one of the buses on an inbound trip will pay 10 cents. Passengers desiring to transfer to the railway system will, upon request being made at the time of the payment of the fare, be issued a bus-street railway exchange ticket, which, upon presentation on the first connecting railway car at the point of transfer or exchange, will insure the same rights as the railway fare.

A temporary order, preventing enforcement of the city ordinance designed to end jitney operation in Atlanta, was granted in Superior Court on March 6 by Judge George L. Bell upon petition of bus owners and operators of 110 cars. The ordinance to abolish the jitneys was designed to be effective at midnight on March 8.

The petition asked the court to declare the ordinance null and void on the ground that it was unreasonable and discriminatory and that it violated the state and federal Constitutions. It termed the anti-jitney ordinance a "legislative and propaganda scheme to put the jitney out of business, not a law to regulate but to prohibit." It added:

> The ordinance is a result of a political and propaganda campaign of the Georgia Railway & Power Company to stifle competition; but now the company has gone into the jitney business itself, obtaining under this ordinance a monopoly.

Argument on the matter was begun before the court on March 14, but the presentation of the case was not completed that day and adjournment was taken until March 16.

Breaking Ground for New York's New Subway

Mayor Hylan broke ground on March 14 for two sections of the city's new subway system. The ceremonies were held in the public square at Hancock Park, 123d Street and St. Nicholas Avenue. The Mayor's speech was sent out by radio from the municipal broadcasting station.

Following the speechmaking, the Mayor, with a silver pick and spade, broke ground in Hancock Park, under which the new line will be built. This part of the line, known as Route No. 78, Section 3-A, extends under St. Nicholas Avenue from 122d to 133d Street. The contractor is the Rosoff Engineering Company.

The other section for which ground was broken immediately following the Hancock Park ceremonies is Route No. 78, Section No. 3, extending from Eighth Avenue and 111th Street to St. Nicholas Avenue and 122d Street.

The value of the two contracts in the aggregate is $9,500,000.

The city's new subway system extends from 193d Street and Fort Washington Avenue, down Fort Washington Avenue to 173d Street to Broadway to St. Nicholas Avenue to 122d Street to 8th Avenue into Central Park West, skirting Columbus Circle, down Eighth Avenue to 53d Street, where a branch will turn east through 53d Street under the East River to the Union Station in Queens.

From 53d Street another leg of the line will go down Sixth Avenue running parallel with the Eighth Avenue line. The Sixth and the Eighth Avenue lines will converge at Greenwich Avenue and Eighth Street, thence down the Sixth Avenue extension to Canal Street, thence down Church Street to either Fulton or Wall Street, thence under the East River to Brooklyn.

Digitized by Google

From the Union Station in Queens a branch will extend to Jamaica and another branch will go through Long Island City, Greenpoint, Williamsburg and into central Brooklyn and downtown to meet the tunnel from the lower end of Manhattan, thus making one complete circuitous route connecting Manhattan, Queens and Brooklyn.

The Manhattan routes of the city's new system were adopted by the Board of Estimate last December. The Central Park West-Washington Heights sections of the west side line have already been validated and approved.

It is explained that the routes and general plan for the Manhattan portions of the new subway system are presented first for the reason that the physical difficulties of subway rapid transit construction are greatest in Manhattan and because all lines from other boroughs will pass through the new Manhattan trunk lines.

Another Operator Hides Behind Interstate Commerce Provision

Harrison B. Freeman, receiver of the Hartford & Springfield Street Railway, Warehouse Point, Conn., has filed a damage suit for $5,000 against the Interstate Bus Corporation. The bill alleges illegal competition.

Mr. Freeman stated that a company made up of bondholders of the railway invested $50,000 in buses for the transportation of passengers between Hartford, Conn., and Springfield, Mass., under franchises and the statutes regulating motor vehicles. He complains that the Interstate company started operating buses over the same line on Jan. 21, 1925, without license or registration.

The Interstate company contends that it is not subject to the control of state bodies, but to the Interstate Commerce Commission on the grounds that it is doing an interstate business.

Agreement Up in Rochester

A draft of the proposed agreement between the Amalgamated employees of the Rochester lines of the New York State Railways and the company was to be submitted to the membership in Rochester at a meeting on March 20. The provisions of the pact have not been revealed, but a demand for one day of rest in seven is assured and a plea for an advance over the present 55 cents an hour rate has been intimated. The present contract with the railways will expire on May 1. The Rochester union acts in conjunction with the employees in Utica and Syracuse and on the interurban lines.

Service-at-Cost Measure in Missouri

A bill authorizing cities of more than 100,000 population to adopt a "service-at-cost" plan has been introduced in the Legislature of Missouri at the request of counsel for the reorganization committee of the Kansas City Railways. The bill merely is an enabling act to permit Kansas City and St. Louis to adopt the plan in co-operation with the common carriers subject to approval of the State Public Service Commission.

She Stoops to Inspect

A housewife of East St. Louis, Ill., who has been seen on the cars of the East St. Louis & Suburban Railway so often during the past six weeks was not merely wasting her time by gadding about. She had a task to perform and she did it well, as twenty-four motormen and conductors of the railway will attest who have been commended for their personal appearance and the cleanliness of their cars and rewarded with prizes of $5 each and a day off with pay as recognition of their worthiness as reported by the housewife in question. The woman was acting as inspector general for the railway in its third annual clean-up campaign for cars and car crews. She surveyed necks and steps, collars and floors, fingernails and car seats. On the basis of her reports to W. H. Sawyer, president of the company, 46 men received the maximum reward, while more than 100 others received a $5 bonus.

First Weekly Pass in Maine —Bus Plans

The York Utilities Company, Kennebunk, Me., plans to use the weekly pass starting on March 29. The company proposes to sell the pass, good for bearer, in specified 10-cent zones at $1.25 for the first pass with a rebate of 25 cents if the pass is turned in when the next succeeding week's ticket is purchased. This will be the first installation of its kind in Maine.

Data on the company's activity in the bus field contained in the item published in the issue of the ELECTRIC RAILWAY JOURNAL for March 14 were incomplete and in at least one respect inaccurate. The company states that the new bus service will be given not only to Kennebunkport but will include the discontinued Cape Porpoise branch, so that no part of the territory served by the present line will go unserved. In addition, the new bus line and another new bus line will serve five additional towns. The York Utilities Company, which operates in Sanford, Kennebunk, Kennebunkport and Biddeford, is not in receiver's hands and never has been.

Rice Safety Award Won by Beaver Valley

The Beaver Valley Traction Company, New Brighton, Pa., was presented with the Cecil G. Rice safety award in Pittsburgh on March 2, at the annual safety banquet of the Western Pennsylvania Division of the National Safety Council. Some of the results follow, showing the decrease of various items last year with the average of the previous three years:

	Average of Years 1921–1922–1923	Year 1924	Decrease, Per Cent
Fatal accident	None	None	...
Permanent disability accidents	None	None	...
Accidents causing more than 10 days' disability.	11	4	175
Total number of accidents	51	24	47
Total hours lost	5,051	1,568	233

These accidents are personal injury accidents among employees. The street car accidents are on the decrease, too, but with the inspiration of the Cecil G. Rice award the company says that the effort should be made to reduce further the accidents on the street and thereby add more glory as a result of individual efforts.

The Duquesne Light Company, the Pittsburgh Railways, and the Equitable Gas Company were among the ten companies showing the greatest decrease in personal injury accidents.

Intensive Merchandising Campaign by Kansas Road

Officers of the Union Traction Company, with lines from Nowata, Okla., through Coffeyville, Independence and Cherryvale to Parsons, Kan., are to fight fire with fire. If buses give travelers better service, so will the interurban. If trucks running on Montgomery County hard-surfaced roads offer better service to express and other shipments, so will the Union Traction. In line with the new policy the company is broadcasting the word of special care and speed for express with two deliveries daily to any town on the lines. Special facilities are offered the regular shipper in the way of accommodations.

In the passenger department, the inroads of the motor cars were ignored for years. Traffic fell off and the road cut the schedule from the original hourly one to an hour and a half. Later it was cut again.

Late in December came the resolution to offer service in competition with motor cars and hard roads. An order was placed for six new one-man modern type cars for the interurban lines. When they are put into service, possibly by April 1, the old schedule will be abandoned and cars returned to the hourly schedule.

The electric railway between Independence and Coffeyville was built and placed in service in 1907.

New Bus Proposals Called in New York

The Board of Estimate of New York City on March 13, following the recommendation of John H. Delaney, chairman of the Board of Transportation, voted to scrap the 80 applications filed by corporations and individuals for franchises to operate buses on the city streets. The board, at the same time, invited those who seek such privileges to submit new applications not later than April 9. In extending this invitation the board also submitted a questionnaire, prepared by Mr. Delaney, which it suggested all applicants for franchises should answer.

The 80 applicants whose initial proposals must be recast include those corporations and individuals who have submitted proposals to the Board of Transportation or the Board of Estimate since July 1 of last year. They were reviewed in a general way in the bus report filed last month by the Board of Transportation and in which Commissioner Delaney and his associates suggested a city-wide system of about fifty-eight routes. These were finally approved by the Board of Estimate.

23 Miles of Subway Routes Approved in New York

The Board of Transportation of New York City adopted additional subway routes on March 20 totaling 22.90 miles, the construction cost of which is estimated at $186,046,000. The routes are located in Manhattan, Brooklyn and Bronx, include subaqueous tunnels and are additions to the administration's independent subway construction program which was announced last December by John H. Delaney at a meeting of the Board of Estimate.

Approves Bus Operation Within City

The New York State Railways won another round in its battle for the right to operate buses over the Ridge Road from the suburban town of Greece into the city when the Rochester, N. Y., Common Council recently approved the petition of the Rochester Railways Coordinated Bus Lines, subsidiary of the New York State Railways, for operation within the city. The railway has received the requisite permission from the Town Board of Greece and its plea is pending before the board of Parma. If granted there, the matter will go to the State Service Commission. Buckley Brothers, as related previously in the ELECTRIC RAILWAY JOURNAL, now operate a bus line over the route covered by the traction company's petition. James J. Dadd, secretary of the New York State Auto Bus Association, has announced the intention of the independent owners to carry the fight to Albany in their efforts to prevent the railway winning a franchise.

In the previous reference in the JOURNAL to the bus activities of the New York State Railways it was made to appear that they were to extend to Schenectady. The stock of the Schenectady Railway is owned jointly by the Delaware & Hudson Company and the New York State Railways, the latter being controlled by the New York Central Railroad, but is separately operated. The Schenectady Railway is prepared to enter the bus field, but it will do so through a subsidiary under the direct control of that company.

News Notes

Will Fight Ouster Ruling.—Jitney owners of Huntsville, Ala., are preparing to protest the ruling of the Alabama Public Service Commission, which recently issued an order preventing them from operating between Huntsville and outlying mill suburbs in competition with the electric railway of the Alabama Power Company.

Interurban Passengers Pay Same Amount.—The Public Service Commission has approved new rates of the Rochester, Lockport & Buffalo Railroad for local passenger fares. Fares are so adjusted that interurban passengers will pay the same amount within the city of Lockport, N. Y., as would be charged for a local ride within the city limits. A new regulation provides that an excess fare of 10 cents will be charged on all cash fares over 16 cents. When excess fare is charged the cash fare receipt issued by the conductor will so indicate and such excess fare will be refunded upon presentation of receipt, within 90 days from date of issue, to any authorized ticket agent or at the office of the treasurer.

Employees Inspect Shops.—About 100 employees of the rolling stock and shops department of the Boston Elevated Railway, Boston, Mass., divided in groups of four, recently were taken on an inspection trip to the Albany Street shops of the company. They were escorted by a guide through the drafting room, truck and wheel shop, brass foundry, armature shop, compressor room and other shops. They were met by the respective foremen, who explained the methods used in overhauling and repair work and described the uses of the various machines and equipment. Exhibits were placed throughout the shops for inspection and attracted much attention.

Will Confer on Fare Reduction.—Representatives of the City Council of Glendale, Cal., the Chamber of Commerce and the Pacific Electric Railway will confer with the State Railroad Commission in an effort to find a basis for reducing fares between Glendale and Los Angeles. This decision was reached at a recent special meeting of the Council. If possible, a ninety-day or six-month trial will be given the 10-cent flat rate plan, to see if it will earn a sufficient revenue for the company to warrant adoption as a permanent rate. At present the one-way rate between Glendale and Los Angeles is 23 cents, while 38 cents is charged for a round trip. The rate between Los Angeles and Hollywood is 10 cents each way.

Developing the Service Instinct.—Another company pamphlet made its première on March 16 under the title of "Service." This single sheet, published by the United Railways & Electric Company, Baltimore, Md., is "to encourage helpfulness and co-operation in transportation." The first edition promised that "service" would be the theme of every paragraph and sentence. It gave inclusive and enlightening answers to the question "What is service in Baltimore with street cars and buses?"

Increased Fare or Tax Reduction Needed.—Either the fare must be increased or the taxes assessed against the United Railways, St. Louis, Mo., reduced if the company is to be operated as a going concern, Rolla Wells, receiver for the system, asserts in the current issue of the "United Railways Bulletin," the company's official publication. The gross revenues for the company in 1924 showed a decrease of $1,003,000 compared with 1923, while for the first two months of this year operating income showed a decided falling off compared with the first two months of 1924. Receiver Wells concludes that the car riders will have to make up this deficit by paying higher fares or by interesting themselves in seeing that the tax burden of the company is lightened. In addition to paying high taxes the company is also compelled to meet competition from buses, private automobiles and service cars.

Foreign News

Ventilation in Paris Subways to Be Improved.—Complaints of impure air in the subways of Paris, France, have become so numerous and pressing that the Prefect of the Seine has ordered measures taken at once to improve conditions. Disinfection methods have been proposed, but it has been decided that better ventilation and not disinfection is what is needed. The installation of motor-driven fans at four different points is expected to give the desired improvement in ventilation on the Metropolitan system.

Tramways Profit, Buses Lose, in Hull.—An actual net profit of £27,500 will be shown on the tramways operation of the Hull Corporation Tramways, Hull, England, at the end of the financial year, March 31, 1925, according to the report presented before the Hull Corporation tramways committee late in January. This estimate takes into account the loss on bus operation, which is estimated at £5,475. The city engineer was given a contract for reconstruction of part of the Heddon Road track at a cost of £20,951, and his estimate for work on the Holderness Road track was also accepted.

Reports on Electrification in Belgium.—The commission appointed some time ago to inquire into and report on the practicability of electrifying the railroad between Matadi and Leo, in the Belgian Congo, has now presented its report, which is entirely in favor of the project. It is recommended, however, that a commencement should be made with the first 60 miles of the line, between Matadi and Sognololo, which has the most severe grades on the system.

Brazilian Electric Railway Proposed.—A project for the construction of an electric railway from Caracol to Espirito Santo do Puihal, in the State of Minas Geraes, Brazil, is under way.

New Cars for Manchester.—The Manchester Corporation Tramways, Manchester, England, expects to put 70 new vestibule bogie tramcars into service during the first half of 1925. The electrical equipment will be furnished by the British Thomson-Houston Company. The ordinary output of about 25 cars a year from the Town Council's own works will be continued. This additional equipment is required to handle increased traffic. The tramway was extended 8½ miles in 1924, and another 8 miles is soon to be put in operation.

Pre-War Fares in Sunderland.—The Sunderland tramways committee, Sunderland, England, has decided to return to pre-war fares. The 1½d. fare is reduced to 1d., and ½d. is taken off all the higher fares. It is estimated that on the basis of the present traffic this will mean a reduction in revenue of more than £20,000 a year.

Barcelona Subway to be Built.—Three miles of the track of the Sarria electric railroad, leading to the terminal in Barcelona, is to be made into a subway.

Financial and Corporate

Comment on D. U. R. Situation

Politics and Absent Ownership Held Responsible for Receivership—Bus Had Rather Late Start

Bankers in intimate touch with the finances of the Detroit United Railway, Detroit, Mich., believe that with proper capital changes the road cannot help but work out its difficulties. This is the opinion expressed by the Detroit correspondent of the *Wall Street Journal* in a special dispatch in the issue of that paper for March 16. This writer says the receivership of Detroit United is the result of adding quickly changing transportation conditions to an already incongruous mixture of politics and absentee ownership. He says the statement sent to stockholders is subject to criticism in one respect; instead of slack Detroit business being responsible for the Detroit United Railway receivership, the trouble is due more to the road's inability quickly to avail itself of the kind of facilities now in demand.

SLOW START ON THE NEW PROGRAM

The author of the article proceeds to explain:

> About a year ago the Detroit United began to buy up bus lines and also to install its own buses parallel to its electric lines where riders showed a preference for motor transportation. Commendable work has been done toward building up a system of motor lines both feeding and supplementing the electrics. But it was a late start. Few large American cities depend so largely on individual motor transportation as Detroit. Where 10 years ago the city expanded along the interurban lines and provided electric traffic, the bus and private automobile have made it possible to develop suburban real estate which has no rail service of any kind.

It is further pointed out that since the sale of the city lines to the city of Detroit two years ago the Detroit United, except for a limited amount of freight, has been strictly an interurban and commuters' service. There has been no big city line earning bulk to cushion against.

Whether or not the analysis of the financial writer is correct, the opinions expressed represent the point of view of a man who is generally well informed. He says the receivership is viewed in banking circles as serving a good end in that it will permit a rearrangement of finances and probably new capital acquisitions which will insure carrying out the bus program, the possibilities of which, in an area of 100 square miles having about 1,300,000 population without steam commuter service of any kind, are hardly sounded. On this matter of commuter service the article says:

> There is not a single commuter train out of Detroit on any steam railroad. Even the Michigan Central, with an unused downtown train shed and a string of logical commuter towns toward Ann Arbor, has done nothing to develop suburban business and refuses to install commuter service or give commuter rates.

Many Problems Before London Underground

Traffic Being Lost to Buses—Competition Hurtful—Lord Ashfield Says It Is Absurd to Build Underground Lines and Operate Them at Half Load with Traffic Diverted to Surface Transport

THE gross traffic receipts of the so-called Underground Group, London, England, which comprises the Metropolitan District Railway, the London Electric Railway, the City & South London Railway, the Central London Railway and the London General Omnibus Company, Ltd., for 1924 amount to £12,770,000, an increase of £650,000, or 5 per cent. This percentage increase falls short of the percentage increase in the number of passengers, because the average receipt per passenger in 1924 is slightly less than it was in the previous year, the reduction occurring wholly on the omnibuses. This is due to the bad weather of the summer week-ends. Between April 1 and Oct. 30, out of 30 week-ends not more than a dozen enjoyed sunny, cheerful weather, and the long-distance pleasure traffic was curtailed in consequence. It is also due in small part to minor adjustments in the fares charged.

The aggregate operating expenses are £10,820,000, and these are increased by £897,000 over the previous year. As a result the net receipts are £247,000 less than they were a year ago. Lord Ashfield, chairman of the companies, ascribes this to be the starting point of the unfortunate record of the year.

In order to carry the traffic 196,000,000 of miles were worked, an increase of 20,000,000 over the preceding year, or 11 per cent. Of these miles 137,000,000 were worked by the omnibuses, an increase of 18,500,000, or 16 per cent over the previous year. The remaining 59,000,000 were worked by the cars of the railways, an increase of 1,500,000, mainly required for the service of the newly opened Edgware extension. Thus while traffic receipts increased by 5 per cent the work performed to carry the traffic increased by 11 per cent.

The total number of passengers carried averaged almost 4,500,000 daily, and amounted for the year to 1,457,000,

COMPARATIVE STATEMENT OF THE OPERATING RESULTS OF THE LONDON UNDERGROUND GROUP YEAR 1924, COMPARED WITH 1923

MISCELLANEOUS STATISTICS OF LONDON UNDERGROUND GROUP YEAR 1924, COMPARED WITH 1923

	Total Railways		London General Omnibus Company Limited		Total	
	1924	Increase +	1924	Increase +	1924	Increase +
Passengers carried:						
Ordinary	205,881,127	*774,418*	1,158,411,377	+118,475,655	1,364,292,504	+117,701,237

an increase over the previous year of 111,000,000, or 8 per cent, and an increase of 285,000,000, or 24 per cent, over the year 1920, which represented the highest point in the artificial post-war prosperity. Never before has this group of companies carried so many passengers. The whole of the increase in the traffic has fallen to the share of the buses, with the result that more than 7,000,000 further passengers gained by the omnibuses have been lost to the railways. Lord Ashfield explains, however, that despite the loss by the railways it has not enabled any reduction in train service to be effected or any other economies to be made. As he has put it, the loss falls wholly upon the net receipts, and reduces the balance available for distribution in dividend upon the capital. What the buses have gained has been more than offset by the expense incidental to working a larger fleet of buses, so that here again the net receipts are less. For these reasons the common fund, after meeting all the calls properly made upon it, was £819,724, or £182,258 less than it was in the year 1923.

Competition Unfortunate

To Lord Ashfield it certainly is foolish to have provided underground railways to deal with congested traffic and then to permit them to be operated with half loads while other means of transport intervene to rob them of their traffic and retain it on the streets, not only restoring the congestion but making it more dangerous and tedious in the process.

Since Jan. 1, 1919, up to Dec. 31, 1924, the Underground group has spent on extensions and improvements, on new buses and garages, in one way or another £15,600,000, and is committed to a further expenditure of £5,350,000 to complete construction upon which the companies have already embarked. Until this expenditure becomes self-supporting by attracting additional traffic to the system as a whole Lord Ashfield says the management cannot possibly venture upon any fresh schemes of expenditures. The forward policy must, therefore, unless some change in the situation takes place, become a conservative policy. Although the management is being pressed to extend the Underground system and build new tube railways to all these projects it must turn a deaf ear. Not that many of them are not desirable and needful, but, as Lord Ashfield explains, "if London hopes to secure the execution of these projects, it can only be as part of a considered scheme of transport facilities, in which the various means of transport are co-ordinated, so that each takes only its proper share and in which the present unchecked and destructive competition is brought within reasonable and fitting limits."

As Lord Ashfield sees it the root of the company's present troubles is competition. There are 500 independent buses being run in London. The first of these buses appeared in 1922. At the close of 1922 there were 13; at the close of 1923 there were 194; at the close of 1924 there were 499. The owners consist of eight companies or groups of persons, owning from 44, the maximum, down to 12, the minimum number, and after that of numerous individual proprietors, of whom no fewer than 105 are the owners of one bus.

Lord Ashfield says that from the point of view of London traffic, and not alone from any selfish point of view, this incursion of individual omnibus proprietors should never have been permitted. As he sees it, it is a misfortune both to London and to the proprietors themselves that will require much tact and discrimination to clear up. One of the questions he suggests for answer is how a co-ordinated system of routes and services is to be secured out of a group of omnibuses owned by no less than 186 separate companies or persons. He was constrained to say:

> Does London want an orderly, efficient, economical system of transport? Then London must see to it that such measure of regulation and control is secured as will enable such a system to be maintained and developed.
>
> The London General Omnibus Company has entered into agreements with the associated tramways for the pooling of the traffic carried over the roads worked in common with them, and for the sharing of this traffic equitably between them in proportion to the services rendered. It was then possible for the tramways to look with less anxiety upon, say, the great development of routes to Wembley this last year, because they knew that out of the omnibus company's takings they might be able to claim some share if their own share were inadequate or unjust. The public needs were fully met, and the tramway company was not unfairly prejudiced. We have found, as those who are concerned with the administration of the London traffic act will find, that the only solution of this traffic problem is some means by which the warring separate interests may be resolved into a common interest, by which the many managements, with divergent aims, may be consolidated into a common management.

Lord Ashfield says he regards the London traffic act of 1924 to constitute the most important event of the past year and a landmark in the London traffic problem. All the talk and inquiry of a score of years is now focused in this act. The act itself provides little in the way of control, but it sets up machinery which can be used for control. This power rests in the Minister of Transport, acting largely under the advice of a committee composed of representatives of the various authorities in and adjacent to London, and of representatives of the police and central government. In conclusion Lord Ashfield said:

> The London traffic act of 1924 is, as I have said, a first step, but the first step is always the hard step. I fear the end of our troubles is not yet in sight, and many vexed questions must be resolved before we are in smooth waters, but I have confidence in those now intrusted with the responsibility for London traffic, and I feel sure that, given good will and breadth of view, good must come out of this act, for now that a start has been made we must march toward some goal, even though it is not exactly the goal at which I should aim myself.

New Holding Company Announces Financing

The National Electric Power Company, New York, is the new company formed to take over the control of the Cumberland County Power & Light Company, serving Portland, Me., and vicinity, and the Northwestern Public Service Company. It will own approximately 97½ per cent of the common stock of the Cumberland County company, which operates the Portland Railroad, and all the common stock of the Northwestern Public Service, which serves a wide area in South Dakota.

The Maine property was recently acquired by Albert Emanuel & Company, New York, who in the last year and a half have also acquired many small properties in the zone of the Northwestern Public Service Company.

In connection with the work of carrying out the details of the plan an issue of $3,750,000 of National Electric Power Company 20-year 6 per cent secured gold bonds was offered on March 16 by A. C. Allyn & Company. This is the first financing for the new holding company. It is to be followed, it was learned, by an offering shortly of $1,500,000 of 7 per cent cumulative preferred stock of the par value of $100 a share. In addition there is to be an issue of 10,000 shares of 7 per cent non-cumulative preferred, $100 par value, but this issue will not be publicly offered.

The properties now held by the

Digitized by Google

Emanuel interests in the area served by the Northwestern Public Service Company, including ten small companies taken over within the last several weeks, represent about 60 per cent of the total power generation facilities of South Dakota. They extend in a chain from Aberdeen, in the northern part of the State, to Yankton, in the extreme south, on the Missouri River.

The offering of the $1,500,000 of cumulative preferred shares of the National Electric Power Company will also be made by A. C. Allyn & Company.

Regular Dividend Declared at Boston

The usual quarterly dividend of 1½ per cent has been declared by the Boston Elevated Railway, Boston, Mass., payable on April 1 to stockholders of record of March 17. In the issue of the ELECTRIC RAILWAY JOURNAL for March 7, page 390, it was made to appear that the quarterly dividend had been reduced to 1¼ per cent. This was an error. The directors do not declare dividends at Boston. They are declared by the trustees, and Chapter 159 of the special acts of 1918 under which the trustees were appointed provides that the dividends on the common stock shall after 1922 be at the rate of 6 per cent per annum.

$933,277 Surplus for Market Street Railway, San Francisco

The gross revenue of the Market Street Railway, San Francisco, Cal., for the year ended Dec. 31, 1924, shows a small increase over the preceding year. For the first 6 months there was a substantial increase in gross, but this was partially offset by a decrease in the last 6 months, particularly during Presidential election.

Generally speaking, there were no important changes in service or in operating costs except some slight increases in maintenance charges and general expenses and in the item of expense for conducting transportation, due to a small increase in the rate of wages paid platform men and others effective May 1, 1923. In consequence the wages for the first 4 months of 1924 were approximately 5 per cent higher than for the corresponding months of 1923. On the other hand the slight increases in general expenses were partially offset by a decrease in the rate charged the company for electric power.

There is no deferred maintenance at the present time. In addition to the regular maintenance work, 28,000 ft. of single track was reconstructed and more than 300,000 square feet of asphalt and brick pavement was constructed or reconstructed in addition to the 450,000 square feet of paving which was laid in connection with ordinary repairs.

As soon as the subway along the Embarcadero at the foot of Market Street is open for traffic the company expects to effect material improvement in the service on lower Market Street, as practically all vehicular traffic along the Embarcadero will be diverted from the surface to this subway.

Notwithstanding the great increase in automobile traffic, there has been no material increase in the number of accidents or expenditures for claims. Accidents involving fatalities were fewer than ever before in the history of the company or its predecessor. The company attributes this to the training system for trainmen started several years ago, a development which it is expected will unquestionably continue to reduce both the labor turnover and the number of accidents.

On Dec. 31, 1924, the only outstanding funded debt of the company consisted of $13,000,000 of 7 per cent first mortgage bonds, of which $125,000 were reacquired during the year and placed in the sinking fund.

Charles N. Black, president of the company, says no material progress has been made in the negotiations for the purchase of the company's property by the city of San Francisco, although the committee has held several meetings and the matter is still under discussion.

STATEMENT OF INCOME AND PROFIT AND LOSS OF THE MARKET STREET RAILWAY, SAN FRANCISCO, FOR THE YEAR ENDED DEC. 31, 1924

Operating Revenue:		
Passenger	$9,789,153

Taxes (railway only)	6.26
Operating expense and taxes	77.68
Operating income	22.32
Non-operating income	0.37
Gross income	22.69
Deductions from income	8.76
Net income	13.93

$7,000,000 Montreal Issue Offered

A syndicate headed by Aldred & Company, New York, is offering $7,000,000 of the newly created Montreal Tramways general mortgage issue. The bonds bear interest at the rate of 5 per cent and, at the price of 88 and interest, at which they are offered, yield the investor 5.85 per cent. The bonds are secured by a general mortgage covering the entire property of the company and also other properties which may be acquired in the future. They mature on April 1, 1955.

The total authorized amount of the issue is $100,000,000, but for the present only $17,826,500 will be issued. This last amount is being used by the company to remove all of its perpetual debentures from the market and to replace them with the new bonds.

The new issue has one senior security—the first mortgage bonds, which are limited to an amount not exceeding $25,000,000. Of this issue $21,351,000 are issued. These bonds are due in 1941 and when these fall due the present issue will be a first charge on all the assets of the company.

Of the total present issue of $17,826,500, only $7,000,000 are being offered to the public, these representing the debentures held by Montreal Tramways & Power Company. The financing is being done in connection with the readjustment of the financial affairs of the company, referred to in the ELECTRIC RAILWAY JOURNAL for March 7, page 387.

New Holding Company for Southwest Utilities

The Electric Power & Light Corporation has been organized for the purpose of vesting in it the assets of the Utah Securities Corporation and certain equities in the other utilities which have been acquired by the Electric Bond & Share Company from time to time in the past. Included in the assets of the Utah Securities Corporation is all the common stock of the Utah Power & Light Company, as well as the common stocks and certain other securities owned by the Electric Bond & Share Company, New Orleans Public Service, Inc., the Dallas Power & Light Company, the Dallas Railway, the Texas Interurban Railway and the Power Securities Corporation, the latter company owning the common stock and certain other securities of the Idaho Power Company.

The companies to be included under the new arrangement furnish public

Digitized by Google

utility service in 253 communities, of which 245 are supplied with electric power and light service. Among the principal cities served are New Orleans, Dallas, Salt Lake City, Ogden, Durango and Montrose, Colo., and Boise, Pocatello and Idaho Falls, Idaho. The total population served is estimated at 1,179,000. More than 300,000 consumers are served and of these more than 234,500 are supplied with electric power and light.

Under this plan holders of Utah Securities Corporation capital stock will receive $10 per share in cash and four shares of the Electric Power & Light Corporation for each share of Utah Securities. A special meeting of Utah Securities stockholders has been called for April 2 to approve the plan.

Income Bond Payment Declared

Official announcement is made of the decision of the Quebec Power Company directors to pay the interest on the 5 per cent income bonds of the Quebec Railway, Light, Heat & Power Company, Quebec, Que. In commenting on this action the *Canadian Financial Post* says it means that the company has been whipped into such shape that in addition to earning the interest on the consolidated 5 per cent bonds it can show the income bond interest earned as well, and leave a creditable showing on the capital stock. Quebec Power owns 90 per cent of the income bonds, or about $3,000,000, par value. The starting of interest payments on these bonds will mean an income of more than $150,000 a year to Quebec Power. The opinion of the *Post* is that this would seem to assure to the common shareholders of the latter company an increase in the dividend rate this year.

Baltimore Railway Absorbs Competitor

The United Railways & Electric Company, Baltimore, Md., recently absorbed its largest bus competitor, the East Fayette Street bus line. This step is in accordance with the established policy of the company, which believes that the entire transportation system of the city should be under one management.

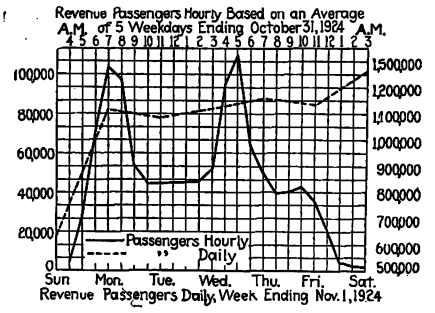
The East Fayette Street bus line operates 21 vehicles, each seating from 30 to 35 passengers, over a route also served throughout its length by the street cars. It is estimated that approximately 10,000 persons a day are being carried on a 5-minute base headway with 2½-minute service during the rush hours. The company came into existence in 1922, when several independent bus owners merged and bought a number of large, well-equipped, modern buses.

The United Railways & Electric Company will take over the buses at midnight on March 31. For the present it is planned to continue operation along the same route with the same schedules and at the present rate of fare. This is now 7 cents on the buses as against 7½ cents on the cars. The railway plans to have its accountants make an immediate study of the operation of the bus line to determine accurately its revenues and expenses.

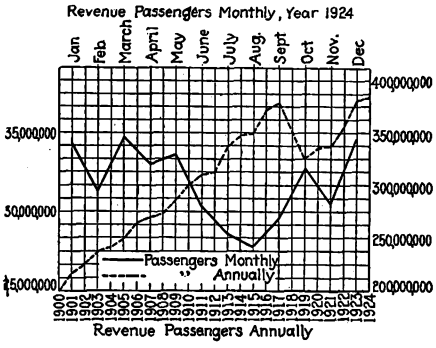
Impressive Presentation of Traffic Fluctuations at Boston

Traffic on the lines of the Boston Elevated Railway, Boston, Mass., varies from the normal base traffic of 45,106 revenue passengers per hour to 115,197 revenue passengers in the evening rush hour, an increase of 155.4 per cent, and then gradually falls off until it reaches its minimum in the early morning (night car) service, preparatory to again starting the upward climb to the morning rush hour peak.

During the days of the week there is a fluctuation no less significant. From Monday to Friday the daily traffic approximates an average of 1,109,861,



Traffic Fluctuations by Day and Hour at Boston



Passenger Revenue Variations at Boston

rising to 1,216,132 on Saturdays and falling to 630,755 on Sundays, an increase over the normal of 9.57 per cent on Saturday and a decrease from the normal of 43.17 per cent on Sunday.

In the variations from month to month during the period of a year the swing is from August, the low point at 27,640,267 revenue passengers, to December and March, the high points at 34,366,600 revenue passengers, or an increase of 24.33 per cent.

Over a long period of years the curve starting in 1900 at 203,521,121 revenue passengers constantly increased to 1917 when it reached 381,017,338 revenue passengers, then passed through a period of recession, and again increased until 1924 when it reached a new high record of 382,888,848 revenue passengers.

Whereas the load from year to year over a long period is slowly on the upward trend, the great fluctuations are by the hour, day and week. These the company is explaining for the benefit of its employees are the factors which make operation difficult, are little known by the car riding public and are not generally appreciated by those actually engaged in the transportation service.

$8,975,000 Philadelphia Issue Offered

Public offering was made on March 14 by Dillon, Read & Company, New York, of a new issue of $8,975,000 of 6 per cent gold bonds of the Philadelphia Rapid Transit Company, Philadelphia, Pa., due March 1, 1962, at 99 and interest to yield more than 6.06 per cent. The sale will furnish proceeds for taking up short term securities totaling $6,750,000 and for other corporate purposes.

Figures made available in connection with the new offering showed that in 14 years under the management of Thomas E. Mitten and of W. C. Dunbar, now president, the company earned a surplus of $16,896,967, of which $11,244,385 was paid out in dividends and $5,652,582 has been put back into the property.

The new bonds are a direct obligation of the company and principal, sinking fund absorptions and interest payments are additionally secured by a direct mortgage on all the property of the Market Street Elevated Passenger Railway by the pledge of the entire outstanding capital stock and lease until the year 2000 of the Market Street Elevated and by guarantee through indorsement of the Union Traction Company of Philadelphia. Reproduction cost of the mortgage property is put at not less than $45,000,000. The company leases and operates 695 miles of track. Its new bonds are callable at 105.

Portland, Me., System Suffers Loss in 1924

The Portland Railroad, Portland, Me., earned during 1924 only about 40 per cent of the guaranteed 5 per cent dividend upon the railroad stock. The deficit for the year was approximately $60,000. This fact was disclosed in the annual report of the board of directors of the Cumberland County Power & Light Company, which controls the railway in Portland and South Portland. The report states that the continued increase in the use of automobiles leaves little prospect for an immediate improvement in railway conditions and intimates that a larger deficit for 1925 is to be expected. The Cumberland property promises to do everything possible to hold this deficit within bounds, but states it is confronted with a decreasing revenue without corre-

INCOME STATEMENT OF PORTLAND RAILROAD

For Years Ended Dec. 31

	1924	1923

sponding decrease in expenses. The accompanying table shows the income account for the Portland Railroad for the years 1924 and 1923.

Willoughby Company Lowers Deficit

A comparison of operation for 1924 and 1923 of the Cleveland, Painesville & Eastern Railroad, Willoughby, Ohio, is shown in the accompanying statement. The company operates 39 miles of track. During the year 1924, according to the 29th annual report, total expenditures for additions and improvements chargeable to capital account were $30,964. The total amount of bonds outstanding on Dec. 31, 1924, was $1,631,000.

†Deficit.

Increase in Philadelphia Dividend Made Effective

The Philadelphia Rapid Transit Company, Philadelphia, Pa., has declared a quarterly dividend at a rate placing the stock on an 8 per cent basis, as had been promised by the management, the increase of 2 per cent in the annual amount paid being on account of accumulated dividends under the 1907 contract wtih the city. The dividend is payable on April 30 to stock of record April 15.

Will Assume Debts.—In a supplemental order the California Railroad Commission has authorized the Sacramento Northern Railway specifically to assume the debts and outstanding obligations of the Sacramento Northern Railroad, which under prior order of the commission it was authorized to acquire. The order also allows the Sacramento Northern Railway to issue at not less than par $1,000,000 of common stock, and to assume the payment of outstanding bonds of the Sacramento Northern Railroad.

Manager for Receivers Appointed.—Minot J. Hill, general manager of the Trenton, Bristol & Philadelphia Street Railway, Bristol, Pa., has been named manager for the receivers of the Frankford, Tacony & Holmesburg Street Railway, Philadelphia.

Stone & Webster Year Book.—Stone & Webster, Inc., Boston, Mass., have issued the 1925 edition of the booklet in which they present data covering the operations of the properties with which they are identified.

Deficit in Napa.—A deficit of $7,878 was suffered by the San Francisco, Napa & Calistoga Railway, Napa, Cal., in 1924. The gross receipts were $279,416, operating expenses were $186,069, interest on funded debt $59,730, rents paid for leases of road $14,494, taxes $22,838, improvements $2,600 and miscellaneous deductions $1,563.

Seeks to Abandon Line.—The Wisconsin Public Service Corporation has applied to the Railroad Commission to abandon and tear up its tracks on its unprofitable Huron Street line in De Pere, Wis. The line is included in the city's new paving program, with the company's share of the cost estimated at $30,000, covering new rails, steel ties and pavement.

Seeks to Abandon Rather than Repave.—The Illinois Power & Light Company has petitioned the State Commerce Commission for permission to abandon service on the New Street line in Champaign, Ill. The street is to be repaved and, rather than face that assessment, the corporation will give up its tracks. It has proposed to the Council to operate buses over the route.

No Par Stock for Federal Light.—The directors of the Federal Light & Traction Company, New York, have voted to recommend to stockholders at a special meeting to be held April 28 that the common stock be split five shares for one of the present; also that the par value of the shares be changed from no par to $15, and that the par value of the preferred be reduced from $100 to no par.

Will Purchase Carhouse for City Use.—The City Council of Selma, Ala., recently adopted a resolution to purchase the carhouse of the Selma Electric Railway, which went out of business some months ago. The purchase price is $20,000, from which a deduction of $3,000 will be made for a piece of land which will be turned over to the railway. The city will use the building for a fire station and city stables.

Surplus Falls Off.—The gross earnings of the Lake Shore Electric Railway System, Cleveland, Ohio, for the year ended Dec. 31, 1924, were $2,780,953 compared with $2,774,481 for the year ended Dec. 31, 1923. Operation and taxes showed an increase, being $2,176,952 in 1923 and $2,268,642 in 1924. The surplus after the consideration of interest decreased from $172,461 for the year ended Dec. 31, 1923, to $92,199 for the year ended Dec. 31, 1924.

Merger Bill Passed by Senate.—The United States Senate has passed without debate the bill providing for a voluntary merger of the electric railways of the District of Columbia. This was accomplished by the adoption of an amendment, to meet the views of an objector to the terms of the measure as originally drawn, by which the approval of Congress will be necessary to effect consummation of any merger that may be arranged. The bill then went to the House, where, despite the congestion, it was said there was a chance of passage before adjournment on March 16.

Terminal Sold.—Negotiations have been concluded for the sale of the Auroro, Plainfield & Joliet Railroad's terminal at Van Buren and Joliet Streets, Joliet, Ill., to the Illinois Traction System for $47,500. Halsey, Stuart & Company, representing holders of the electric line's bonds, consented to the sale. The traction company has announced that it will remodel the building for its offices and use the structure as a bus line terminal. The traction system has also paid a paving assessment of $17,000 against the electric line.

Wants to Abandon Branch Line.—The Toledo, Fostoria & Findlay Railway will ask for permission to abandon its branch line between Bowling Green and Pemberville, Ohio, according to an announcement by officials of the company. City officials at Bowling Green asked about an improvement to be made along the line and the company immediately took action to give up the operation of that section, which has suffered greatly from competition of private automobiles. The city will not oppose abandonment of the line.

Receiver Appointed for South Bend Road.—Charles Currie has been appointed receiver of the Chicago, Lake Shore & South Bend Railway, Michigan City, Ind., by Judge Robert C. Baltzell in Federal court. His bond, set at $25,000, was provided. The petition for a receiver was filed several days ago by the Cleveland Trust Company, which sought to foreclose a mortgage on the property and equipment of the defendant. The company operates lines in and between Hammond, South Bend, East Chicago and Michigan City. The proposed plan for the reorganization of the property was outlined in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 7, and subsequent events were referred to in the issue of March 7.

Authorized to Issue $2,141,000 in Notes.—The Department of Public Utilities has granted permission to the Boston Elevated Railway, Boston, Mass., to issue $2,141,000 of notes or bonds, payable in not more than 30 years, to bear a maximum interest of 6 per cent. Proceeds to the amount of $1,200,000 will be applied to the payment and cost of additions to the South Boston power station, $500,000 toward the repair shops at Everett, Mass., $200,000 will be used at the Forest Hills yards and shops and $241,000 will go toward miscellaneous construction work. The bonds are callable on any interest date at 105 after 10 years.

Wants to Abandon a Line in City.—The Jamestown Street Railway, Jamestown, N. Y., has petitioned the Public Service Commission for permission to abandon the Willard Street line in the city of Jamestown. A. N. Broadhead, president of the traction company, says the line has not paid operating expenses for some years. The company also has asked the State Utilities Board for permission to abandon the Chautauqua traction line between Mayville and Westfield. The company also is planning to remove the tracks of the Chautauqua Lake Railroad from Mayville to Chautauqua. The line has been under lease to the Pennsylvania Railroad, which has indicated its intention of giving up the lease.

Personal Items

Army Colonel to Help Build New York's Municipal Subways

Col. John R. Slattery, Corps of Engineers, U. S. A., has been appointed to the post of deputy chief engineer of the New York Transit Commission. Colonel Slattery will be the principal assistant to Chief Engineer Robert Ridgway in the advancement of New York City's new subway program.

Chairman Delaney of the commission wrote to Secretary Weeks of the War Department last February, requesting that leave of absence be granted Colonel Slattery, so that he might accept this position without forfeiting his army status and prerogatives between then and the date of his retirement next year. Colonel Slattery also made a personal appeal to the same effect. Secretary Weeks declined to grant their petition, explaining that it was contrary to good army policy to grant leaves of absence to army officers to permit them to enter upon municipal employ unless they were already eligible for retirement. Colonel Slattery then determined to resign his commission and accept the tender of the new post.

The new appointee has been in the service of his country since June 16, 1896, when he entered the United States Military Academy at West Point. He was graduated in 1900 and was assigned immediately to the Engineer Corps. During the World War he served in the A. E. F. as a Brigadier-General on the staff of Gen. John J. Pershing. In 1918 and 1919 he was attached to the Seventh Army Corps. Following his recovery from pneumonia in 1920, he served as army engineer in the Columbia River improvement below Vancouver. He has been particularly identified with subaqueous construction for the government. He is a native of Ohio and is reputed to be among the most expert of army engineers.

Ira E. Guthrie Resigns from Interstate Company

Ira E. Guthrie has resigned as secretary-treasurer and member of the board of directors of the Interstate Public Service Company, Indianapolis, Ind. Mr. Guthrie will leave soon after April 1 for Florida, where he will become associated in an official capacity with the Hollywood Land & Water Company, which is building the city of Hollywood-by-the-Sea, Fla.

Mr. Guthrie has been secretary and treasurer of the Interstate since shortly after its organization in 1912. At that time the only property of the company was 62 miles of electric railway between Indianapolis and Seymour. He has witnessed the company's growth until its resources are now in excess of $35,000,000. He was born near Columbus, Ind., and had most of his early business training and experience there. After teaching school for two years he was employed by industrial and banking interests in Columbus until 1903, when he became auditor of the Indianapolis, Columbus & Southern Traction Company, which built one of the first interurbans into Indianapolis. After it was extended to Seymour that road was leased to the Interstate in 1912 for a period of 999 years. Mr. Guthrie was prompted to leave Indiana in the belief that the change of residence to Florida would benefit his wife's health.

George R. Green General Superintendent at South Bend

George R. Green has been made general superintendent of the Chicago, South Bend & Northern Indiana Railway, Michigan City, Ind., and its affiliated lines, the Southern Michigan Railway and the Railway Transit Company, a bus-operating organization.

G. R. Green

This promotion is still another instance of a general superintendent drawn from the ranks of the mechanical forces. In Mr. Green's case it is literally from the ranks, for 24 years ago, at the age of 14, he started in the railway business as an armature winder's helper with the Detroit United Railway. He remained with that property for 18 years, except for three years between 1909 and 1912, during which time he was master mechanic of the Saginaw & Flint Railway.

Advancement was by small steps, but initiative, persistence and hard work, combined with an interest in the problems of his company outside his immediate duties, were bound to receive recognition. He finally rose to the position of general foreman of interurban equipment with the Detroit United.

In July, 1920, Mr. Green went to South Bend as superintendent of equipment. When it appeared that railway service might be supplemented with buses, he was selected to study bus operations in other cities. When the new service was decided upon he was placed in charge of starting and operating the buses. Next followed his appointment to be general superintendent of the rail lines and the buses.

George MacLeod Has Had Broad Career

George MacLeod is the new vice-president and general manager of the Buffalo & Erie Railway Company. The property is one of the new companies which grew out of the reorganization of the old Buffalo & Lake Erie Traction Company.

Mr. MacLeod's experience has been very broad. He has served in the steam railroad line, the electric railway field and has been prominently identified with bridge companies.

Following his graduation from Cornell University in the civil engineering class of 1890, Mr. MacLeod undertook the work of resident engineer of the Louisville & Nashville Railroad. Following this assignment he was superintendent for 7 years of the Kentucky-Indiana Bridge Company and Louisville, Kentucky & New Albany, Ind., belt lines. Later he was named receiver for the New Albany Street Railway, New Albany, Ind. In 1901 he relinquished the managership of the Kentucky & Indiana Bridge Company and the Louisville-New Albany Belt Lines to accept the post of general manager of the Lousville & Albany Railroad. Then in 1906 he became the chief engineer of the Kentucky Traction & Terminal Company, Lexington. Here he remained in a similar capacity until the fall of 1924, when he took on the duties of vice-president and general manager of the Buffalo & Erie Railway Company, with office in Fredonia, N. Y.

O. W. Brain and W. H. Myers, Australian Officials, Promoted

O. W. Brain was recently appointed assistant railway commissioner for the New South Wales Government Tramways, Sydney, Australia. W. H. Myers was appointed chief electrical engineer, succeeding Mr. Brain.

Mr. Brain joined the Crompton Electric Company following an early experience in England and Tasmania. He left that service in July, 1896, to enter the railway as chief assistant to the late P. B. Elwell. When Mr. Elwell was incapacitated through ill health, Mr. Bain was asked to take charge of the branch. This Mr. Brain did, and since Mr. Elwell's death in 1899 the organization in its present form has been built up under his administration.

W. H. Myers, his successor, who held the position of chief assistant electrical engineer of railways, was the first graduate of the Sydney University to obtain the degree of bachelor of electrical and mechanical engineering. Right after graduation he joined the engineering firm of Noyes Brothers in Melbourne, and remained with that firm until the end of 1904, when he received an appointment in the New South Wales Railway department to take charge, under Mr. Brain, of the electrical installations of the new railway station then under construction in Sydney. In 1906, he was appointed assistant electrical engineer and in 1921 chief assistant electrical engineer.

Digitized by Google

Charles F. Terrell was recently made general superintendent of light and power of the El Paso Electric Railway Company, El Paso, Tex. In this capacity he succeeds J. F. McLaughlin, transferred to Baton Rouge. Mr. Terrell has been with the Stone & Webster organization for the past 20 years and at Birmingham for the past two years.

Crawford Burris, formerly general foreman in the mechanical department of the Chicago, South Bend & Northern Indiana Railway, Michigan City, Ind., has been appointed master mechanic. Mr. Burris started with the company at South Bend in 1908 and has advanced step by step in the mechanical department since that time.

Robert E. Cornwell, purchasing agent of the Chicago, South Bend & Northern Indiana Railway and the Southern Michigan Railway, Michigan City, Ind., has been appointed assistant superintendent of equipment in addition to his present duties. This expansion in responsibility is due to the promotion of George R. Green to the position of general superintendent. In 1903 Mr. Cornwell started with the Indiana Railway as a city street car conductor, later advancing to timekeeper during construction of the Southern Michigan Railway. Following this he became ticket agent and then storekeeper. He held this last position for 14 years, and five years ago was again promoted, this time to become purchasing agent.

Obituary

James Nicoll Dick, chief engineer of power houses of the Montreal Tramways, Montreal, Que., died recently in Montreal. Mr. Dick had just completed a quarter century's service with the company. He was in his sixty-fifth year.

John J. Fahey, claim agent of the Scranton Railway, Scranton, Pa., died on Feb. 16. Mr. Fahey entered the employ of the Scranton Railway in 1906 as claim agent. In 1920 he was appointed chief claim agent, succeeding Stephen Dyer. Some time prior to his association with the company Mr. Fahey was sheriff of Lackawanna County.

Artemas Ward, pioneer in many forms of modern advertising, who introduced the subway and elevated newsstands and vending machines into New York, died recently. In the old days the news business was carried on almost entirely at the entrances to the rapid transit stations, but it was Mr. Ward's idea that after patrons had reached the rapid transit station they usually had several seconds and sometimes minutes in which purchases could be made. Acting on this theory, he went into the elevated and subway news-stand business.

Edward Wickham, treasurer of the Omaha & Council Bluffs Railway & Bridge Company, controlled by the Omaha & Council Bluffs Street Railway, Council Bluffs, Iowa, and president of the Citizens' Gas & Electric Company, is dead. Mr. Wickham was prominently identified with business and civic affairs in Omaha and Council Bluffs.

Improvements in Prospect in Fort Wayne

Approximately $1,300,000 will be spent by the Indiana Service Corporation, Fort Wayne, Ind., in the next year on improvements and construction work in Fort Wayne and vicinity. According to tentative plans outlined by President Feustel, a new car repair shop and machine and carpenter shops will be erected and some of the city lines will be double tracked. In addition to the heavy expenditures in the Spy Run north side plan and shops the company officials announce that new storage and rip tracks and freight house facilities will be built in the south side property recently purchased by the company. Mr. Feustel said the company also was considering the purchase of rolling stock equipment.

Republic Truck Receivership Lifted

The Security Trust Company, Detroit, Mich., has closed its receivership of the Republic Truck Company, Alma, Mich. The second and final payment of 6.0844 per cent to priority creditors and .97107 per cent to general unsubordinated creditors has been made. On July 30, 1924, priority creditors received about 88 per cent and general unsubordinated creditors 14 per cent. Nothing has been paid to subordinated creditors on their claim of $3,486,953, as by agreement their dividends have been added to those of the priority creditors.

Payments by receiver on unsecured claims of $4,861,741, including the $3,486,953 claim of subordinated creditors, total $727,686. A further small distribution of about $30,000 may be made if the government allows a tax refund of that amount. This is not expected.

The Security Trust Company was appointed receiver for Republic Truck Company Sept. 28, 1922, operating the plant for several months and in May, 1923, selling the property to a committee of first mortgage gold noteholders representing about 85 per cent of the $2,500,000 issue.

Many Bus Types Represented at Boston Show

The Boston Automobile Show, held March 7 to 14, maintained its reputation and repeated last year's accomplishment as the most important of the automobile shows in point of view of bus interest displayed. Sixteen-bus chassis or complete vehicles were on view. Parlor car types lead with six, but there were five street car or pay-enter bodies, four sedans and one bare chassis. The vehicles were designated as intended for use in school, tour or

ELECTRIC RAILWAY MATERIAL PRICES—MARCH 17, 1925

Metals—New York

Copper, electrolytic, cents per lb.	14.25
Lead, cents per lb.	9.00
Nickel, cents per lb.	31.00
Zinc, cents per lb.	7.62
Tin, Straits, cents per lb.	53.00
Aluminum, 98 to 99 per cent, cents per lb.	27.00
Babbitt metal, warehouse, cents per lb.:	
Fair grade	60.00
Commercial	28.00

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.325
Somerset mine run, Boston	2.125
Pittsburgh mine run, Pittsburgh	1.825
Franklin, Ill., screenings, Chicago	2.125
Central, Ill., screenings, Chicago	1.90
Kansas screenings, Kansas City	2.625

Track Materials—Pittsburgh

Standard Bessemer steel rails, gross ton	$43.00
Standard open hearth rails, gross ton	43.00
Railroad spikes, drive, Pittsburgh base, cents per lb.	3.05
Tie plates (flat type), cents per lb.	2.425
Angle bars cents per lb.	2.75
Rail bolts and nuts, Pittsburgh base, cents, lb.	4.075
Steel bars, cents per lb.	2.10
Ties, white oak, Chicago, 6 in. x 8 in. x 8½ ft.	$1.60

Hardware—Pittsburgh

Wire nails, base per keg	2.90
Sheet iron (28 gage), cents per lb.	3.40
Sheet iron, galvanized (28 gage), cents per lb.	4.60
Galvanized barbed wire, cents per lb.	3.55
Galvanized wire, ordinary, cents per lb.	2.60

Waste—New York

Waste, wool, cents per lb.	16
Waste, cotton (100 lb. bale), cents per lb.:	
White	13–19
Colored	10–15

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), per gal.	$1.11
White lead (100 lb. keg), cents per lb.	0.1625
Turpentine (bbl. lots), per gal.	0.945
Car window glass, (single strength), first three brackets, A quality, discount*	84.0%
Car window glass, (single strength), first three brackets, B quality, discount*	86.0%
Car window glass, (double strength) all sizes, A quality, discount*	85.0%
Putty, 100 lb. tins, cents per lb.	4–6

* Prices f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb.	16.75
Rubber-covered wire, No. 14, per 1,000 ft.	$6.75
Weatherproof wire base, cents per lb.	19.00

Paving Materials

Paving stone, granite, 4x8x4, f.o.b. Chicago, dressed, per sq.yd.	....
Common, per sq.yd.	....
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.82
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3½x8½x3 N.Y., per 1000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.85
Cement, Chicago consumers' net prices, without bags	2.20
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., N. Y.	1.25

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.625
Light copper, cents per lb.	9.75
Heavy brass, cents per lb.	7.00
Zinc, old scrap, cents per lb.	4.375
Lead, cents per lb. (heavy)	7.00
Steel car axles, Chicago, net ton	$16.75
Cast iron car wheels, Chicago, gross ton	17.25
Rails (short), Chicago, gross ton	19.25
Rails, (relaying), Chicago, gross ton	25.50
Machine turnings, Chicago, gross ton	10.75

sightseeing, electric railway and steam railroad service, as well as for bus-operating company service.

In the parlor car class were the following: Two Pierce-Arrows with Farnham-Nelson bodies, one Pierce-Arrow with Cutter body, one International Harvester and one International Motor (Mack), each with Lang body, and a White with the new Brown body, described as an "interurban parlor coach." The sedan types were exhibited by the Garford, Reo, Graham and Stewart New England representatives. These were all of the medium-sized type carrying from 15 to 18 passengers. Pay-enter or street-car type bodies were shown in the International (Mack) spaces by the Brown Body Company and by the Reo representative. The Mack contribution was a new 29-passenger body, both chassis and body being built by that company. Reo had a 21-passenger type with bodies by the Boston Body Company and the Fitzjohn Company. A source of continuous attention was the Mack Great coach, a six-wheel experimental job, which was shown last October during the American Electric Railway Association exhibit at Atlantic City.

Rolling Stock

Madison Railways, Madison, Wis., has purchased for June delivery six new safety cars of the latest design and construction at a cost of $48,000. The company has also purchased six buses at a cost of $54,000.

Cleveland Railway, Cleveland, Ohio, will probably be in the market for buses in accordance with its intention to run 80 or 90 of these vehicles by June 15. The plan of the company is referred to elsewhere in this issue.

City of Detroit Department of Street Railways, Detroit, Mich., has announced specifications on the 100 additional Peter Witt cars it is going to purchase. The details follow:

Number of cars ordered	100
Name of road	City of Detroit, Department of Street Railways
Type of car	Peter Witt
Seating capacity	52
Total weight	37,000 lb.
Bolster centers, length	23 ft. 9 in.
Length over all	48 ft. 5¼ in.
Truck wheelbase	5 ft. 3½ in.
Width over all	8 ft. 4 7/16 in.
Height, rail to trolley base	10 ft. 9¾ in.
Body	Steel
Headlining	3-star Agasote, 1/16 in.
Roof	Arch
Air brakes	Straight
Axles	5-in.
Bumpers	Elliot type
Car signal system	Faraday buzzer
Control	K 35-H
Curtain material	Pantasote
Designation signs	Hunter
Door operating mechanism	National pneumatic
Hand brakes	Peacock staffless
Headlights	HDB-96
Journal boxes	Symington
Motors	Four 35-hp., 600-volt
Finish	Enamel
Sanders	Osgood-Bradley sand traps
Seating material	Rattan
Step treads	Kass
Trolley base	O B form 1
Wheels	26-in. steel

Guelph, Ont.—Five cars bought from the Guelph Radial Railway for operation on the Ontario Hydro-Electric Railways, Toronto and York District, Scarboro Division, have been overhauled, three by the Ottawa Car Manufacturing Company and two by the Toronto Transportation Commission. They have been equipped with Westinghouse 306-CV-4 motors and Canadian Car & Foundry Company trucks.

St. Catharines, Ont. — Underframes have been laid down at the Niagara, St. Catharines & Toronto Railway shops, St. Catharines, Ont., for two 60-ft. interurban cars, one for the Niagara, St. Catharines & Toronto Railway and the other for the Canadian National Electric Railways, Toronto Suburban District. They will be similar to the car built at the same shops for the Toronto Suburban.

Track and Line

Madison Railways, Madison, Wis., has ordered and will receive next month 120 tons of rails at a cost of $7,500. These rails will be used to double track Atwood Avenue from Division Street to Fair Oaks Avenue.

New York & Queens County Railway, New York, N. Y., is planning to double track its line between Flushing and Jamaica. For this purpose the company expects to use rails taken from its present lines between Corona and the Woodside carhouse and between St. Michaels Cemetery and Riker Avenue in Long Island City. Application is to be made to the Queens County Supreme Court for permission to abandon service on the lines from which the rail will be taken.

Montreal Tramways, Montreal, Que., ordered recently 50,000 ties and has asked tenders for 30,000 more. It has also asked prices for 2,000 tons of 115-lb., No. 508, Lorain section girder rail; 1,000 tons 85-lb. T-rail, No. 1, C. P. R. section; 3,000,000 lb. spikes; 200,000 tie plates, shoulder type; 11,000 standard tie rods; 30,000 lb. track bolts; 35,000 ft. of bonding cable; 100,000 tons broken stone; 20,000 tons sand and 100,000 bags cement.

Pittsburgh Railways, Pittsburgh, Pa., seeks in an ordinance the right to lay single car tracks on Diamond Street west of Grant Street, additional tracks on Diamond and Ross Streets and connecting curves and switches at various locations. The Council by unanimous action affirmed the ordinance, which will mean probable route changes.

Birmingham Electric Company, Birmingham, Ala., has been requested by a number of citizens of Fairfield to build a railway from Fairfield through several recent additions into Central Park. Such a line would save about 20 minutes time between Fairfield and Birmingham.

Chicago, North Shore & Milwaukee Railroad, Chicago, Ill., has taken another step to improve its right-of-way in Milwaukee, Wis. Considerable property has been purchased at Madison and Grove Streets. Residences on this line will be torn down to permit the removal of two curves at First Avenue and Madison Street, followed by another at Grove and Madison Streets. The tracks now in use will also be torn up, to be replaced by rails which will cross diagonally from Scott Street and First Avenue to Madison Street and Grove Street, eliminating the curves entirely. The improvement work will start shortly so that it will be completed by the middle of the summer. The improvement will cost $100,000. The Common Council must approve the plan.

Stockton Electric Railroad, Stockton, Cal., will commence work about April 1 on the extension of the Main Street line from its present terminal at Wilson Way 1 mile easterly to the city limits.

Capital Traction Company, Washington, D. C., plans to rebuild its tracks on M Street from 29th to 32d Street at a cost of $100,000. Work will start the end of March. The work will be done at the same time the District is widening and repaving the thoroughfare.

Power Houses, Shops and Buildings

Montreal Tramways, Montreal, Que., has ordered two 500-kw. rotary converters, with transformers, from the Canadian Westinghouse Company, and a switchboard for it from the General Electric Company for the St. Laurant substation, and two 1,000-kw. rotary converters, with transformers and switchboard, from the Canadian General Electric Company, for Hochelaga power house, and two 2,000-kw. rotary converters, with transformers and switchboard, from the Canadian General Electric Company, for its Mount Royal Avenue substation.

New York City, N. Y.—The Board of Transportation fixed April 2 for the receipt of bids for the construction of the inspection sheds of the Westchester and the Wakefield yards of the Pelham Bay Park and the White Plains Avenue branches of the Interborough subway in the Bronx.

New Advertising Literature

General Electric Company, Schenectady, N. Y., has issued "G. E. Welding Electrodes," a 16-page illustrated booklet describing the characteristics and applications of the three types of General Electric electrode, designated as types A, B and C. Brief instructions are included covering the use of each type.

Bridgeport Brass Company, Bridgeport, Conn., has issued data book No. 16, containing prices and weights of sheet brass, brass rod, wire, condenser tubes and seamless brass and copper tubes. Copies may be obtained gratis on application to the Bridgeport Brass Company.

Martindale Electric Company, Cleveland, Ohio, has issued catalog No. 6, entitled "Motor Maintenance Equipment." This shows apparatus for slotting commutators and cleaning lamination slots, and tools for grinding commutators.

National Paving Brick Manufacturers' Association, Cleveland, Ohio has issued three pamphlets on vitrified brick pavements. They are "Brick Roads Outlast the Bonds," "Brick Pavements, City Streets, County Highways" and "Making Brick Pavement." The material is available to those interested.

MORRIS BUCK, *Managing Editor*

Volume 65 New York, Saturday, March 28, 1925 *Number* 13

Oklahoma City Has Only Itself to Blame

OFFICERS of the Oklahoma Railway, Oklahoma City, Okla., talked themselves hoarse in the past in an effort to prevent the calamity that threatened the railway. City officials and others were deaf to their pleas. Even the retail merchants opposed the reasonable parking provisions suggested by the company. Warnings meant nothing to them. The traction man who spoke in his own behalf could be seeking but one thing—to feather his own nest. Finally the inevitable happened. The railway went into the hands of receivers. The bondholders were for demanding their pound of flesh. As is very often the case, they favored summary action by immediate abandonment of unprofitable lines. That gave the people something to think about. Calamity had come home to them.

The receiver held the bondholders off until he could arrange for a report on the property from an outside source. This has now been made by George H. Clifford, manager of the Northern Texas Traction Company, Fort Worth, which won the Coffin award last year. The summary of his recommendations, printed elsewhere in this issue, speaks for itself. The ideas are excellent, but for many of them the company had pleaded without avail. The receiver has already been authorized to spend $100,000 for improvements. If he is permitted by the court to carry out Mr. Clifford's recommendations in full he will spend $202,500. The spending of this sum, however, is presaged on the assumption that the city will act to curtail practices distinctly unfair to the company. Mr. Clifford has left the city to itself to think things over.

Oklahoma City can be as well served with transportation as is Fort Worth. It will not be, however, unless it takes the lessons of recent months and the recommendations made in the expert's report seriously to heart. It needs to change its attitude. And it needs to do it quickly.

Some Editorial Writers Lose Sense of Proportion

BALAAM, perverse as he was and difficult to convince, made no bid for notoriety. Not so men who write poppycock for pay. The supposition is that any bid for notoriety is better than no bid at all and should be permitted to go unchallenged. Perhaps the worst offenses against reason are committed by papers like the Detroit *Free Press* that repeat the statement, referred to elsewhere in this issue at greater length: "That the trolley car as a means of transportation is already out of date is perfectly obvious." How do they reach that conclusion? Surely not by analysis which has any association with the dull process of reasoning. The statement does everything but square with the facts. But what are facts to the paper with a hammer out for the railways? Would the *Free Press* allow the statement to go uncontroverted that the newspaper is already out of date as a means of dissemination of information on account of the radio?

Says this writer of editorial balderdash: "We are convinced that if the main arteries . . . could be cleared of their tracks and an adequate number of buses substituted for the present trolley cars, the public would be more satisfactorily served." Really! Note the expression "an adequate number of buses"! It seems too bad to have to trample on sacerdotal folly.

The bus has its place, to be sure, but its place is not where this writer and many others like him suppose it is. This can be proved by a little mental arithmetic. Pity is needed for the man who is not even cognizant of developments in his own city under his own eyes that contradict what he says. According to him, the city bought junk when it took over the city lines of Detroit. If it did, which is a question, then the men in Detroit who are responsible for handling the city's large investments are merely seeking to perpetuate the system by pouring millions of dollars into a property for which the junk was an outward evidence. If the instance of editorial thinking displayed at Detroit were an isolated one, it might be allowed to pass unnoticed. There are too many wizards with words victims of the bus bacillus of pathogenic propensity. That is the trouble. Optimism with respect to the bus is a delightful thing where it is not the result of ignorance.

Intensive Development Needed to Restore Detroit United Earnings

MORE than 600 miles of interurban railway passed under the jurisdiction of the court in the recent receivership action against the Detroit United Railway. Naturally the event provoked considerable discussion in financial circles. Now that it has happened, it is easy enough to say that the receivership was unavoidable. Figures tell the story. The net income in 1924 after depreciation, etc., was $152,384, as compared with $512,751 in 1923. These and other statistics included in the annual report, an abstract of which is published in this week's issue, are all points to ponder. They are significant, but they are not staggering. The receiver is optimistic of the future, and the bankers who handle the company's securities while concerned with the outcome are not distressed at the course events have taken.

Long before he died, Mr. Stevenson had laid down a comprehensive program for the development of the property. In this he had the consent of the bankers. It is, of course, unfortunate that greater progress has not been made toward the fulfillment of this program, but it was economically sound under the changed conditions of the property and it would seem that as soon

Digitized by Google

as the impediments natural to the receivership have been removed the plans will be proceeded with aggressively. It will be recalled that there has been no default in the payment of bond interest or in meeting sinking fund requirements.

The controversy with the city over the purchase of the local lines in several years removed now, but it was not without its effect in the present instance in that it tended to dissipate the energy of the management by requiring it to direct its endeavors along unproductive lines. It was the duty of the management to protect the investment represented by the company's railway lines in the city, but it could hardly carry on successfully at the same time two dissimilar processes. Technically, the management has shown ability, but need exists for the development of greater merchandising sense. The tools for this work are all largely available. The physical equipment of track and line is good, there are many new cars, some fine auto coaches and good terminals. Much of the road is over a private right-of-way. Lack of diversity of industry is an inherent economic drawback to the territory in which the company operates, but there need be no great cause for concern even over this. There recently have been some rate readjustments in favor of the company. Others are required.

Developing New Sources of Revenue

ONE interurban electric railway operating out of a large mid-Western city has several important lines that for years have handled a good passenger business. Within recent times this traffic has fallen off due to conditions of competition, both from private automobiles and from buses, that are familiar to many. The same heavy cars have been used for nearly 20 years. Headways have not been changed materially. In fact, nothing has been done to make the public believe that there can be anything new in the way of its interurban service.

Another line reaching the same city stands in marked contrast. Even though it does not pass through territory that is so well built up, nor which has the same possibilities as the former system, this road in the past few years has been engaged in a program of modernization that has permeated into every department. When it became apparent that competition might affect passenger revenues adversely, new light-weight cars were bought. These were of a modern design and painted a distinctive color, so that it was not possible to confuse them with the old cars. Schedules were tightened up by eliminating delays as far as practicable. Limited and other special services were started.

Not content with improving its passenger service, this same road investigated carefully the possibilities of handling freight and express. Under the direction of a competent traffic manager with steam railroad experience, numerous plans were developed and put into practice for securing carload and less-than-carload business. So successful has this been that today the railway's track is taxed to its capacity.

The next move that is contemplated is the installation of buses for local business so as to relieve the track for high-speed limited service and also for freight. It is claimed that this will permit a still further increase in the revenues of the railway and give it a wider field of usefulness.

Nothing could illustrate more clearly than this comparison the differences that often exist between managements and their methods. Even though the electric railway industry is today in an excellent financial condition there are properties which are not going ahead, not moving along with other developments in the industrial field, not even holding their own, but are drifting. While such a policy of stagnation may get by for a time, sooner or later it will lead to failure. It is well for each management to take stock and see if the property is among the leaders, and if not, how it can be placed with them.

Chambers of Commerce Constructive Aids to Better Transportation Conditions

THE placing in nomination of Philip H. Gadsden of Philadelphia to succeed himself as a director of the Chamber of Commerce of the United States is encouraging to those who consider transportation one of the important matters before the national chamber. Since Mr. Gadsden has been a director of the chamber, he has been most active in endeavoring to secure through it a broad answer to the most acute transportation questions now before the country. This is instanced particularly by the five committees appointed by the chamber about two years ago to study all the principal phases of the transportation problem. Mr. Gadsden was a member of the committee on "Relation of Highways and Motor Transport to Other Transportation Agencies" and of the sub-committee on "Taxation," and the reports of these committees, published in November, 1923, did much to develop the idea of the co-ordination of agencies, which today is accepted as desirable. Other important aid given by him to transportation matters outside of offices which he has held with the American Electric Railway Association have been as chairman of the National Committee on Public Utility Conditions during the war and as a member of the Federal Electric Railways Commission. Though much progress has been made during the last few years in settling electric railway and allied local transportation problems, much remains still to be done, and a great deal of it can best be undertaken on a national basis. The interest taken by the Department of Commerce in highway traffic and safety is symptomatic of this. With Mr. Gadsden re-elected a director of the national chamber its continued interest in transportation matters is assured.

This occasion should not pass without a plea to railway managers to take an active interest in their local chambers of commerce and boards of trade. These organizations are unique among civic bodies in that they represent primarily the active business man of the community. Hence their members are apt to be well representative of those who will look upon local transportation from a business standpoint and to realize the close relation which good transportation has with business prosperity. They are therefore not only likely to be sympathetic with any improvement in local transportation, but their positions on such matters should carry great weight. In other words, they are the natural allies of the local railway company if they understand its problems, and any railway manager who neglects this opportunity for assistance from his local chamber is not doing all he should for his company and the industry.

Financing Rapid Transit Facilities

Special Assessment Against Benefited Property Is Advocated as an Equitable Method Under Modern Conditions of Financing Rapid Transit Construction — Examples Are Cited to Show that the Unearned Increase in Property Values Is Sufficient to Pay a Large Part of the Cost of Rapid Transit Facilities

*By C. E. Smith**
Consulting Engineer, St. Louis, Mo.

THE construction of transit facilities needed to meet the traffic requirements of a large and rapidly growing city calls for the investment of money at an ever-increasing rate, and the financing of this capital outlay and the return thereon form the nub of the transit problem of today. This conclusion was recently reached by the special rapid transit committee of the St. Louis Board of Aldermen which was engaged in a study of the possibilities for rapid transit in that city.

The immense sums of money required for rapid transit construction and the unwillingness of the public to grant franchises to private companies for a sufficiently long period to justify the investment of private capital for such purposes have led to the investment of public funds for that purpose during the last 30 years.

Although all of the original elevated railroads in New York City, Chicago, Boston and Philadelphia, and also the Market Street subway in Philadelphia and the Cambridge subway of the Boston Elevated were built with private funds, the expenditures made by public utility companies for this purpose were small compared with present-day costs of rapid transit construction. Consequently the practice of carrying out subsequent construction with public funds has been followed quite generally, and has become the adopted policy. This is also the announced policy of a number of other cities, including Chicago, Detroit, St. Louis and Los Angeles.

Several Ways of Financing Public Construction

Public funds may be used for rapid transit construction under one or more of the following plans:

1. By the sale of bonds, the fares being made high enough to pay interest and sinking fund charges in addition to all other costs of operation.
2. By the sale of bonds, the interest and sinking fund to be paid out of general funds of the city, and collected from the taxpayers in the general tax rate.
3. By assessing part or all of the construction cost against specially benefited property.

The first method has been rigidly adhered to in Boston, where part of the subways were built with public funds and leased to an operating company at a rental consisting of interest and sinking fund on the bonds and the cost of maintenance. Partly by reason of the carrying charges of the rapid transit facilities, (part of which had been paid for by public funds and part by private funds), partly by reason of the duplication of surface and rapid transit service, partly from automobile competition but principally to the increased level of operating costs, the issue was squarely presented there as to whether the subway rentals would be waived and collected from the taxpayers in order to hold fares down, or whether the fare would be raised to a point high enough to carry all of the increased costs and continue the payment of the subway rentals. The matter was decided in favor of the latter method. Fares were raised to 10 cents except for short rides in suburban districts which now cost 6 cents, making the average fare about 9 cents. This has been sufficient to pay the entire cost of service, including the subway rentals.

Fixed Charges from Taxes in New York

Assessment of subway rentals against the taxpayer has come about from force of circumstances in New York City. There, under the original lease (contract No. 1), the same arrangement was put in effect as at Boston. The first subway, including some elevated line, was built by the city and leased to the operating companies at a rental covering interest and sinking fund on the bonds, and maintenance. For several years after that arrangement went into effect, the 5-cent fare was adequate to pay all costs of operation, including the rapid transit rentals, but with rising costs it became necessary either to raise the fare above 5 cents, or for the city to give up the subway rentals which the operating companies could not pay out of a 5-cent fare. Contract No. 2 for a short extension was on the same basis.†

The companies sought to increase the fare, but the city successfully resisted these efforts, by reason of the peculiar contractual relations between the companies and the city, and for several years has not received rentals on the greater part of the rapid transit facilities. It has continued to receive rentals for the first group of rapid transit facilities that cost the city approximately $65,000,000, but has not for several years received rentals for the second group of rapid transit facilities that cost the city approximately $250,000,000. The result has been that the city has charged the taxpayer approximately $70,000,000 for interest and sinking fund charges on rapid transit bonds, in order to help keep the fare down.

In Philadelphia, public funds have been used for the

*The author is consulting engineer for the city of St. Louis, and the conclusions presented here were included in a progress report of a special committee of the St. Louis Board of Aldermen which has been studying rapid transit facilities for that city.

†The city's investment under contracts Nos. 1 and 2 was about $60,000,000, on which the leasing company (the Interborough Rapid Transit Company) pays 5 per cent for interest and 1 per cent for sinking fund.

In March, 1913, the so-called "dual" contracts or contracts Nos. 3 and 4 were made with the two companies in New York for extensions to the existing rapid transit systems. The terms of these contracts were quite different from those of contracts 1 and 2. Briefly, these contracts provided that the operating revenues should be devoted, first, to the payment of rent, taxes, operating expenses, maintenance and depreciation, then to the payment of 6 per cent for interest and sinking fund on the investment of the companies under these contracts, plus a certain agreed amount, based on the average annual income previously earned from the operation of their privately owned lines. If any surplus then remained it was to be devoted first to the payment of interest and sinking fund on the investment of the city, plus certain sums to correspond to those paid to the companies over and above the fixed charges on their new capital. Any further profit was to be divided. The earnings have never been sufficient after operating expenses, etc., to meet the companies' deductions, which have priority over the return on the city's investments.—EDITOR.

Digitized by Google

construction of an elevated railroad, and are now being used for a comprehensive subway system. No part of the city subway system has been completed or placed in operation. An elevated railroad 6½ miles long built by the city has been leased to the operating company for a rental of 1 per cent the first year, 2 per cent the second year, 3 per cent the third year, 4 per cent the fourth year and 5 per cent the fifth year and thereafter. The interest and sinking fund on city bonds amount to more than 5 per cent. The difference between the amount the city has to pay and the amount it will receive from the operating company will be collected by general taxation and paid out of the city's general funds.

Assessing Cost on Benefited Property

The third method of assessing the cost of rapid transit construction by benefit assessments against specially benefited property has not yet been adopted to any considerable extent, although innumerable municipal improvement projects for the purpose of improving transportation have been carried out, and the cost has been paid by assessments against specially benefited property.

Notable among these is the Twin Peaks tunnel in San Francisco. Here a considerable settlement in a valley southwest of the city was separated from the city proper by a mountain about 1,000 ft. high, making access very difficult. A benefit district was formed, consisting of lands on both sides of the mountain, and a subway for street cars only, with two intermediate subway stations, was built through the mountain, length 2½ miles, cost $4,000,000, which was paid for by the Twin Peaks Tunnel Assessment District. The city street railway department spent $250,000 for construction of tracks and electrical equipment and provided cars.

According to City Engineer M. M. O'Shaughnessy, there were 4,813 acres in the assessment district, 4,153 acres on the side beyond the mountain, and 660 acres on the city side along Market Street. Distribution of the assessment was about $3,400,000 for the larger area, and $600,000 for the smaller area. It was paid in ten yearly installments, with deferred payments carrying 7 per cent interest. The work is all done now and the tunnel is paid for and everybody is happy.

The original rapid transit act of New York City (chapter 4 of the laws of 1891) was not specific in outlining the method by which the city could finance rapid transit facilities. Section 37 of that act was amended in 1911, to permit raising the cost of rapid transit facilities by benefit assessments against specially benefited property. Because in the beginning the 5-cent fare for the tremendous volume of traffic was sufficient to pay interest and sinking fund on rapid transit construction, little attention was given to this authorized method of financing by benefit assessments. With the increase in costs, the failure of the operating companies to pay the rapid transit rentals, and the necessity for the city to raise the interest and sinking fund by general taxation, the method of financing by benefit assessment has again come to the front.

The City Club of New York made a detail examination and analysis of the benefits that have resulted there as the result of rapid transit construction. It was found that as soon as the rapid transit program was announced and construction was begun, property along the rapid transit routes increased considerably in value. In some places where it was learned that stations would be located there was speculation in real estate and values increased rapidly. The increase has continued during the operation of the rapid transit routes.

In the borough of the Bronx the increase in land values along a rapid transit line 3.8 miles long was studied. For a strip 1 mile wide, one-half on each side of the rapid transit route, the value of the land before the route was announced amounted to $33,000,000. Seven years later, after the rapid transit facilities were in operation, the same land was valued at $78,000,000, an increase of 133 per cent. During that period the normal increase of land not adjoining the rapid transit route was 40 per cent. The remaining 93 per cent, about $30,000,000, of increase was undoubtedly due to the rapid transit facilities. As the length of this line was 3.8 miles, the increase in land values due to rapid transit over and above the normal increase in the same period amounted to more than $8,000,000 per mile of the rapid transit line. This portion of 3.8 miles was partly subway and partly elevated construction.

Another study was made by the City Club of a route in Manhattan Borough above 125th Street, length 4.4 miles, practically all subway. The total value of land for a strip 1 mile wide along this line was about $47,000,000 before the rapid transit line was announced. Seven years later, when the line was in operation, the land was valued at $116,000,000, an increase of nearly $70,000,000, or nearly 150 per cent. The normal increase of adjoining land in that vicinity was about 43 per cent. The extra increase due to rapid transit, in excess of the normal increase, amounted to more than 100 per cent, nearly $50,000,000, which, spread over the 4.4 miles of route, indicated an increase due to rapid transit alone of more than $11,000,000 per mile of rapid transit route.

On both these lines the increase in land values has continued at a more rapid rate than other lands not served by rapid transit routes.

Merchants to Pay Benefit Assessments

This subject has also been brought sharply to the front by the proposal of merchants along Sixth Avenue, New York, to have the city purchase the elevated railroad there, take it down, and install rapid transit subway; the merchants to pay benefit assessments equal to 10 per cent of the value of their properties. Roughly, this offer amounts to approximately one-half the cost of the improvement. It is thought that by taking more property into a benefit district the property assessments could be made to equal the entire cost.

In Detroit, constitutional debt limitations made it necessary for the city officials to direct their attention to other means of financing rapid transit facilities. The conclusion was reached that the entire cost of construction of the fixed improvements consisting of subways and elevated lines should be assessed against specially benefited property, and that the rolling equipment, the tracks, the electrification, substations, etc., should be provided by the operating company. This method of financing was submitted to the voters in an election during September, 1924, and was approved by a vote of nearly four to one.

There is no doubt whatever that rapid transit increases the value of property located convenient to rapid transit routes, and there seems no good reason in equity why the owner of such property and the recipient of such benefits should not pay toward the cost of the rapid transit facilities some part of his

Digitized by Google

unearned increment in value. The benefit is considerably greater at the entrances and exits of rapid transit stations than at points a greater distance away, but increased property values can be detected more than ½ mile away from the stations. The increase in property values amounts to more around stations in congested districts, where tremendous numbers of people pass, than at outlying stations where the people are fewer. Particularly is this true of downtown department stores, office buildings, hotels, theaters and other such institutions that have direct connections with rapid transit stations.

The conclusion that was reached in Detroit that the cost of construction of the fixed improvements should be paid for by benefit assessments against specially benefited property, and the cost of electrification, the tracks and the cars should be provided by the operating company and supported by the fare paid, seems a reasonable division of the cost, and we are ready to recommend that division for serious consideration at St. Louis.

At first thought it might appear that by this method private property owners would be providing facilities for the enjoyment of public utility companies. This is not true, as the public utility companies would not be permitted to charge anything for the use of the rapid transit facilities, nor would the car rider be compelled to contribute through his fares to the cost; the fares would carry only the maintenance of the facilities. The principle of furnishing rapid transit facilities for rapidly and safely moving the population of a large city is not essentially different from that of furnishing streets. Street widening and street openings are largely paid for by benefit assessments against specially benefited property, and the users of the streets are not charged anything for their use except the cost of their upkeep.

The problem is not essentially different when facilities are provided for a certain kind of traffic, such as electric car traffic. It is fully established that cities have the right to restrict the use of certain streets and boulevards to certain types and kinds of vehicles, and to control the traffic in any street and otherwise to exercise their police power for the general welfare. Essentially the only difference between a rapid transit route and a surface street, on either of which tracks may be laid and cars operated, is that the rapid transit route is usually at another level than the usual street surface, but that merely indicates that present-day traffic problems require us to think beyond the two dimensions of width and length, and consider now the third dimension—height.

The Michigan Boulevard Link Bridge and the South Water Street improvement under way in Chicago are good illustrations of this. There Michigan Avenue has been double-decked and South Water Street is about to be double-decked. The cost of the double level for the handling of traffic, restricted against truck traffic on the upper level and practically devoted to truck traffic on the lower level, is being paid for partly by the city direct and partly by benefit assessments against specially benefited property.

Highways have been provided at the expense of the public from the very earliest days. In some instances where the public did not provide enough of them, toll roads were provided by private capital, but practically all toll roads have been absorbed by the public. Until the day of the railroad, all the traveling public was ever called upon to furnish was the conveyance and the means of locomotion. This principle held even when omnibuses and stage coaches were operated, but with the advent of the street railways, requiring rails, the cable railway requiring underground construction, and the electric railway requiring tracks and trolley wires, the companies engaged in that service were not required to provide their own streets, but merely to pay for the construction in them made necessary by their operation, and to provide their moving equipment.

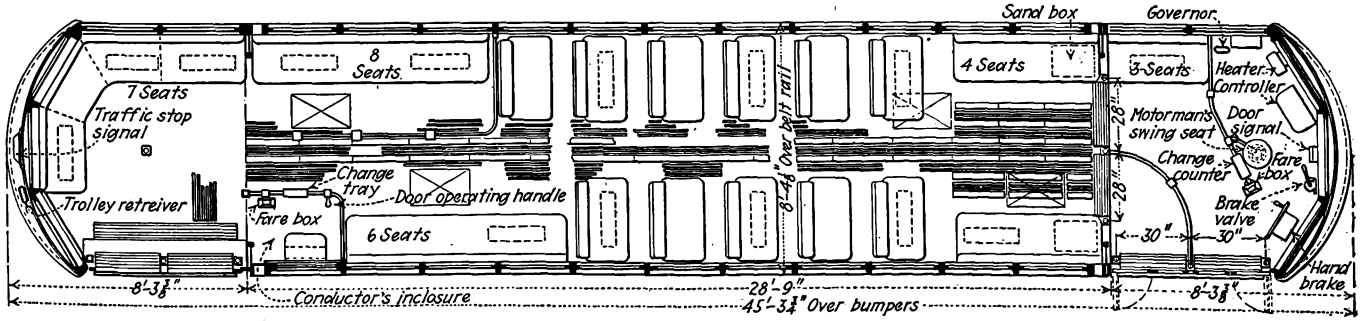
Similarly it would seem logical, now that the public cannot be transported satisfactorily on streets furnished by the public, for the public in its own interest to provide another roadway level separate from present levels, on which the operating company would provide such tracks, electrical equipment and cars as would be necessary for handling the traffic. Of course, facilities provided from benefit assessments against specially benefited property should be just as free for use as the streets, and no additional charge should be included in the fare for the use of such facilities.

"Near-Side" Cars Operated in Ottawa

New One-Man, Two-Man Cars of the Ottawa Electric Railway Are Arranged for Front-Entrance and Pay-Leave Operation—Red Light on Front Dasher Gives Warning When Car Is About to Start

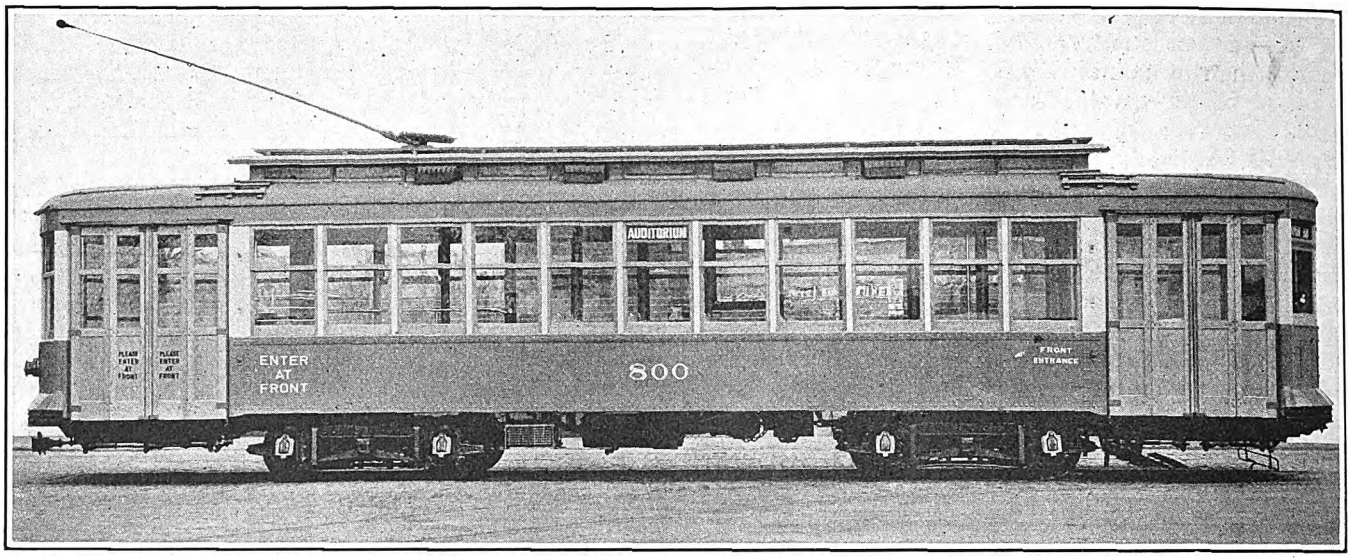
WITH the introduction of 20 new double-truck, front-entrance motor cars by the railway, the near-side stop has been adopted in Ottawa, Ont. The new cars are of the single-end type and may be operated by either one man or two men. Passengers enter at the front and leave at the rear. With two-man operation the pay-as-you-leave plan of fare collection is used, while fares are collected pay-enter with one-man operation.

With two-man operation the conductor's position is just to the front of the rear doors. Aluminum railings,



Floor Plan of Double-Truck, Single-End Motor Car for Ottawa Electric Railway

Digitized by Google



These Cars Are Arranged for Front-Entrance, Rear-Exit Operation

foot rest and a change tray are provided, together with a transfer and supply box below the tray.

Car bodies are of all steel construction, with monitor type roof. They have a length over all of 45 ft. 3¾ in., a seating capacity of 52 and weigh completely equipped, but without load, 38,750 lb. The front end of the cars has longitudinal seats for 11 passengers. Ten cross-seats are provided in the center of the car, and the rear has longitudinal seats which continue around the rear vestibule end. The rear vestibule floor is on the same level as the car body floor. One step is provided just inside the doors. The front platform is lower than the car body floor and there is a single step at what would nominally be the bulkhead.

Seats are upholstered in rattan and the car interior is finished in cherry with Panelite headlining. In order to distinguish the new cars from the old, they are painted red, while the older equipment of this company in painted green.

Doors are interlocked electrically with the car control. Signal equipment includes a light in front of the motorman's position and red and green signal lights at the rear. A new feature will be an arrangement by which the motorman's signal light shows forward through a red lens, to warn people in front of the car that it is about to start. This light is thus located just above the front window sill.

The cars were built by the Ottawa Car Manufacturing Company and the trucks were supplied by the Canadian Car & Foundry Company. Additional details of the car dimensions and equipment were published in the ELECTRIC RAILWAY JOURNAL for May 17, 1924.

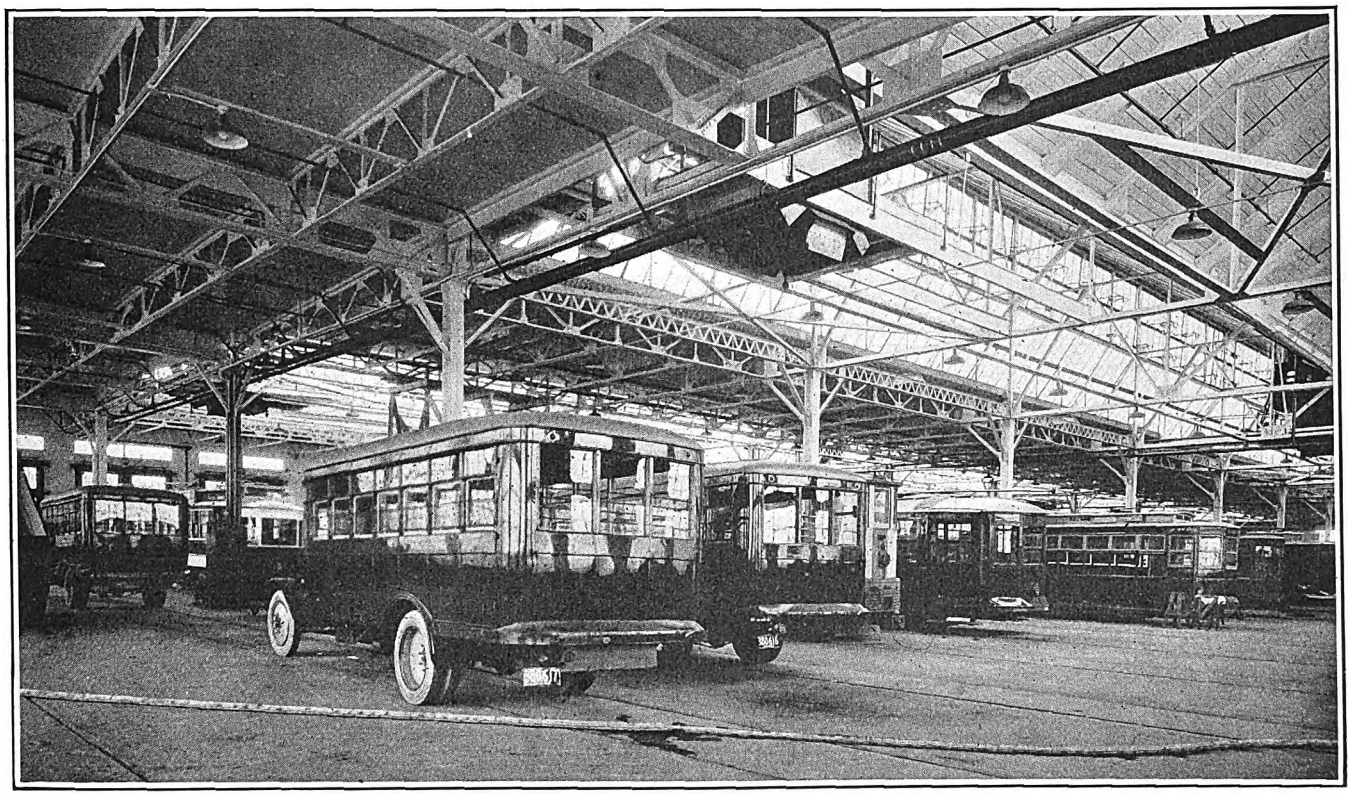
Ring Feeds from Outside Wood Mill and Paint Shop Provide Flexible Electric Service at Boston Elevated Shops—Careful Study of Shop Lighting Preceded Installation—Well-Developed Sprinkler and Hose Service System Used with Alert and Trained Squads



Lighting Arrangement in Paint Shop

THE electrical distribution system of the new Everett shops of the Boston Elevated Railway has been planned particularly so as to provide for continuity of service and to keep the working areas of the shops unhampered by the wiring system.

The main substation, where the incoming lines enter, is at one side of the paint shop, as shown in the illustrations. From this point four cables are run in a tunnel to the near side of the paint shop, whence the circuits branch to the ends to serve the wood mill and dry kiln. These four cables are each No. 000 and lead-covered. One power service cable is run from the tunnel outlet at the paint shop around the south side of the paint shop and wood mill and thence along the west side of the latter and into a safety-front switchboard near the wood mill stockroom (shown on page 873, issue of Nov. 22, 1924). The other power cable passes around the north side of the shops and terminates at the dead-front board just mentioned. In case either cable fails the other will care for the local power load.

All power service is handled at 550 volts, while the lighting current is stepped down to 110/220 volts through transformers located in the paint shop basement, outside the paint shop and wood mill walls on reinforced-concrete platforms a few inches above the ground level, and in the basement of the dry kiln. These transformers are fed by the 550-volt cables. The secondary circuits are carried from the transformers to main switch panels, from which local lighting distribution cabinets are fed.

One lighting service cable runs around the north side of the shops to the southwest corner of the wood mill. Another is carried around the south end of the paint shop to the dry kiln. Taps from the lighting cables are also carried into the paint shop to serve local lighting transformers mounted in the basement. The three phases are balanced as evenly as possible.

Taps from the power cables are run to a switchboard in the east central portion of the paint shop, from which the local feeds are run to the motors in the paint stock room, to elevator motors controlled by Condit remote-operated switches, to skylight motors and to all fuses of paint stock room motors. These latter are outside the stock room for increased fire protection. The solid neutral has been installed in all lighting service and distributing panel boxes. All service switches for lighting are Westinghouse-Krantz fused, two-pole, safety-inclosed auto-lock units, and power switches are three-pole units of the same make. For

lighting, feeder panels are two-wire Westinghouse-Krantz safety auto-lock control panels mounted in steel service boxes, with two-wire branch circuits equipped with fuse and switch.

Before the lighting installation was made, Jackson & Moreland, engineers, Boston, made a study of illumination in six electric railway shops in the East and Middle West and worked out the local requirements at Everett on the basis of a comprehensive analysis of the problems of the Boston company. The accompanying table gives the foot-candle intensities decided upon and realized in the Everett shops, perhaps the most difficult determination being the intensities desirable and practicable on the sides of car bodies standing in the paint and repair shops.

Yards

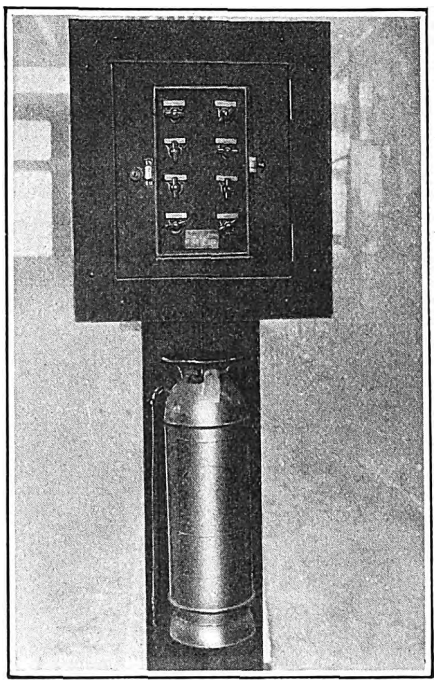
Locations	Foot-Candles*	Locations	Foot-Candles*
General yard	0.03 to 0.07	About buildings	0.05 to 0.08

*The working plane for all foot-candle measurements for interior lighting was taken at 2 ft. 6 in. above the floor and for yard lighting at 1 ft.

†The main floor units are so placed and selected that the intensity of illumination on the sides of car bodies for painting and repairs varies from an average of 12-ft.-candles at the car eaves to 2-ft. candles at the bottom of the body.

In general the paint shop and wood mill interiors are lighted by 500-watt Mazda C lamps, spaced 16 ft. x 20 ft. apart and equipped with Mogul sockets and 20-in. Westinghouse RLM reflectors. The lamps, between each pair of tracks, are in general three per circuit, mounted on roof trusses at a height of 20 ft. above the floor, and are controlled from switch cabinets located on the columns and in some cases on adjacent walls. Inside lighting for car painting is furnished by the car lighting units or by portables with heavy-duty cords attached. Pits in the wood mill are equipped with plug outlets for portable lamps. Supplementary angle lights are installed on the shop walls and a widespread use of 100-watt lamps is made on the wood mill balcony. Including yard lamps, 1,002 lamps are now in service at Everett, and 458 base plugs are provided on the walls and columns, all wiring being in rigid conduit.

The yard lighting is by 500-watt lamps, mounted some 20 ft. above ground on poles or wall brackets, as the case demands, and these lamps are divided into two groups of circuits controlled from the interior of the paint shop and wood mill and supplied from local transformers in these buildings or immediately outside.



Lighting Switch Cabinet with Fire Extinguisher Underneath

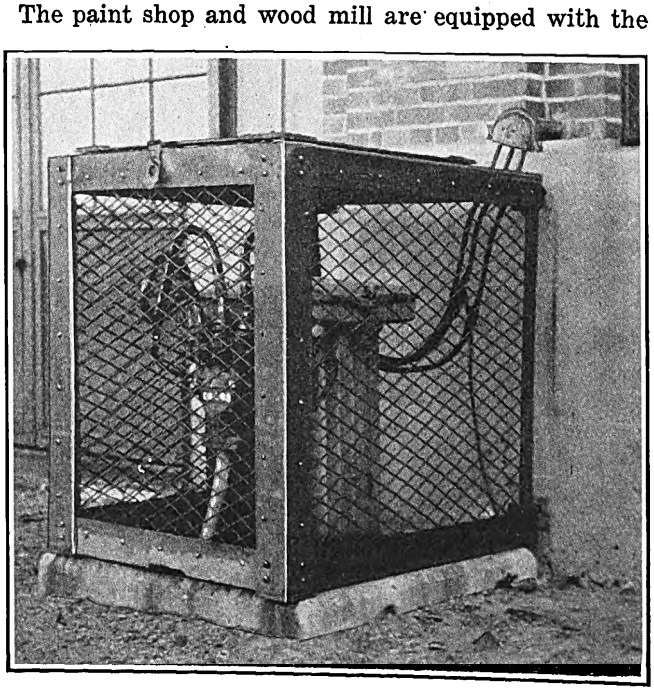
The Westinghouse-Cutter type CI "Luxsolite" fixture is used with 20-in. reflector and 8½-in. skirted refractor.

The lumber storage building is illuminated by two 50-watt lamps per compartment, on both the ground floor and balcony sections. An additional row of lamps is placed under each walkway. In the central light shaft of this building three 300-watt lamps are mounted at the top of the opening under the trusses. All lamps used in this building are heavily guarded against mechanical injury. Snap switches at entrances of the compartments on each level control the interior lamps.

In the dry kiln there are twelve 75-watt lamps mounted 12 ft. above the floor and provided with guarded reflectors. These lamps are wired in two circuits through concealed conduit. They are controlled from a distribution cabinet outside the drying room. In general the kiln room lamps are spaced on 8-ft. 5-in. x 10-ft. 6-in. centers. In the paint stockroom 150-watt lamps spaced on 10-ft. centers are standard.

In each of the two larger buildings a watchman's circuit of twenty 300-watt lamps is provided, controlled from special cabinets on the floor. The total connected lighting load of the buildings at present aggregates 250 kw.

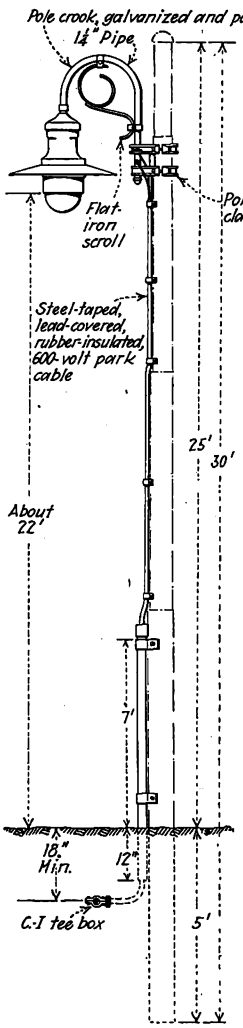
The paint shop and wood mill are equipped with the



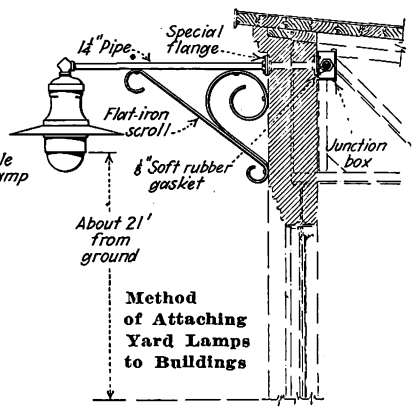
Lighting Transformer with Screening and Concrete Base at Entrance to Wood Mill

Digitized by Google

wet-pipe system of sprinkler protection, 966 heads being installed in the former and 956 in the latter. The lumber storage building and dry kiln are piped for the dry-pipe system, with 68 and 70 heads respectively. An 8-in. city fire service main completely surrounds the shops. This main connects at the north and south ends of the property with a 24-in., 55-lb. street main on the Broadway side. A cross connection from the gate-house on Chemical Lane to the northeast end of the paint shop completes the 8-in. loop around the buildings. Six-inch branch pipes lead at intervals into the buildings from the looped main, and the usual system of alarm valves is provided at the standpipe connections within the building. The alarm valves are equipped with annunciator connections to indicate the section where an opening occurs, as is usual practice. A five-drop annunciator is located on the side of the balcony in the wood mill and a similar four-drop annunciator is mounted on the side of the paint shop balcony.



Type of Lamp Post Used in Yard Lighting

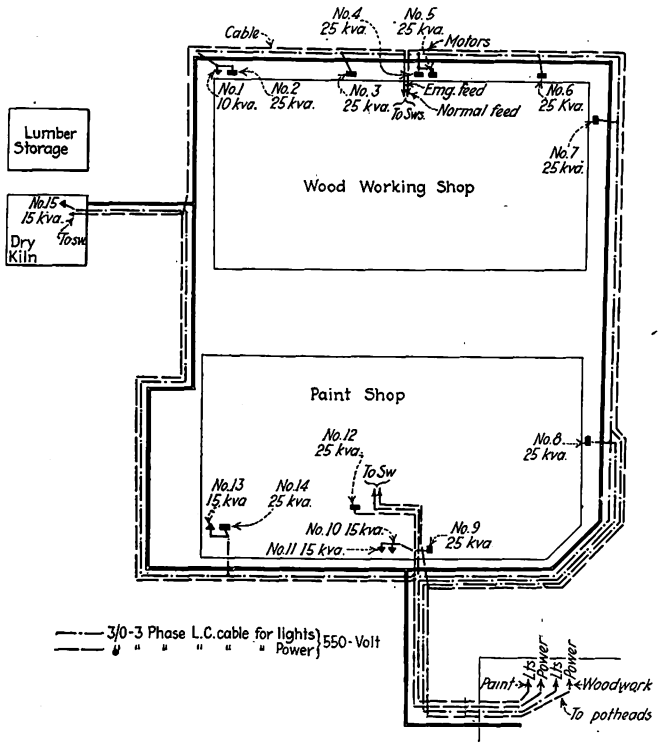


Method of Attaching Yard Lamps to Buildings

Standpipe Valves Outside of Shop Are Protected from Mechanical Injury

On the site of the paint shop was formerly located a 400,000-gal. fuel oil tank which straddled the south end wall of the paint shop. As the underwriters required the plant to have an auxiliary water supply it was decided to utilize this tank for the purpose. This was done by removing the top, which was of flat plate construction, lowering the grades of the sidewalks and partitions and installing concrete construction to carry tracks in the building and yard. Two 12-in. suction pipe lines from this tank run into the boiler house, where a 1,000-gal. per minute, single-stage, centrifugal, combined motor and steam-turbine driven fire pump is installed. This pump will deliver water at 125 lb. per square inch and will be augmented by another pump which will use one of the two foregoing suction lines from the tank when the shops are extended. The tank is filled either from a hydrant connection in the yard or from the standpipe system in the shops, as desired. Four hose outlets are installed on the outside of the boiler house and throughout the yard are twelve hose houses, four on the north side of the wood mill, one on the north side of the paint shop and the rest in the southerly end of the yard in the vicinity of the car storage tracks and lumber storage.

On the roofs of the wood mill and paint shop are warmed inclosures carrying hose outlets with long-handled valves which are operated from outside. The hose runs are coiled on portable frames which can be quickly pulled out of the house over rollers and dropped upon the flat roof section for convenience in serving the different portions of the roof. Another convenience which is designed to prevent rotting out the hose piping in the standpipes inside the buildings is the use of a small ball valve with drip pipe outlet upon the floor at the standpipe. The ball closes the drip valve outlet when more than nominal pressure is applied, but permits the escape of leaking water when the pressure is insufficient to lift the ball off its seat. All alarm valves and standpipe risers are equipped with 6-in. insulating joints. The sprinkler system was installed by C. H. Cronan, Boston.



Light and Power Cable Runs from Substation to Shops

Fourteen squads of six men each are organized for fire fighting in the paint shop and the same number in the woodworking building. Four similar squads also care for yard fire fighting. In general the squads each are headed by a chief under whom are two hosemen, one nozzle man and two valvemen. Fifteen Gamewell fire alarm boxes with auxiliary whistle signal and connections with the Malden fire alarm signal system are in service in the shops and yard. There is also a special city box at the gate house. The shops are provided

Digitized by Google

with a Western Electric interior communicating telephone system. H. G. Noble is superintendent of the Everett shops and John Lindall superintendent of rolling stock and shops. Acknowledgments are due to A. J. Blackburn, architect of the maintenance department, and J. Walter Allen, electrical engineer of the company, for assistance in the preparation of this serial.

The substation and boiler house is large enough to meet the ultimate needs of the shops, and as new buildings are erected and equipped, the addition of another boiler battery, a frequency converter, a third high-tension cable and further switching, feeder and control equipment can readily be made. The electrical distribution system of the paint shop, wood mill and lumber buildings typifies that to be installed in the future metal-working shops. The future fire protection system is based upon extending the present connections with the city mains, pumping installation and piping on the property.

Selling the Philadelphia Stock Issue

LEAFLETS and car cards were used to advertise the issue of $3,000,000 or 7 per cent preferred stock of the Philadelphia Rapid Transit Company, recently sold to car riders. The result, as mentioned in the news columns of this paper on March 7, was that the issue was oversubscribed within less than a week from Feb. 22, when the stock was offered. Individual subscriptions were limited to ten shares and were accepted only from residents of the city. Altogether the company received applications from approximately 14,000 persons, representing more than 300 different occupations.

Applicants for stock were allowed to hand their subscriptions to any P. R. T. conductor or subway-elevated cashier on blanks distributed on the cars and in the stations. No cash payment was received. Instead, the company agreed to notify the subscriber when he should begin payment and he then might pay at the rate of $1 per share per week, or in full. No interest was charged for deferred payment.

The form of application blank is shown in the accompanying illustration. It was a part of a six-page folder of "Service Talks." The car cards and dash posters carried such statements as: "Invest in a Growing Concern, Buy P. R. T. Preferred Stock," "One Dollar Will Start You to Ownership in P. R. T.—*Service Talks* Tells How." The cards were changed after a three-day display, and each set with a different color. In a radio talk on Feb. 28, J. M. Shaw of the company announced that 30,000 subscriptions had been received for more than the entire issue. This fact was also carried on car cards, shown in the cars on March 1.

PHILADELPHIA RAPID TRANSIT COMPANY
Securities Department
1620 Spruce Street, Philadelphia.

I hereby make application to purchase _____ shares, when authorized, of 7% Cumulative Preferred Stock of Philadelphia Rapid Transit Co. at $50 per share, par value, for which I will pay as stated in Service Talks 85. (Mark cross at 1 or 2 as selected, viz: ☒)

(Not more than 10)

☐ 1. When notified, I shall begin payment of $1 per share per week to any P. R. T conductor or subway-elevated cashier

or

☐ 2. When notified, I shall pay $_____ in full and receive _____ shares.

(Print or write plainly)
Applicant's Name _____
Applicant's Occupation _____
Street and No. _____
City and State _____

I certify that the above applicant is a P R. T. car-rider:

Employe's Name _____ Badge No. _____

NOTE—Hand this card to any P. R. T. conductor or subway-elevated cashier, who will sign and turn it in to the company

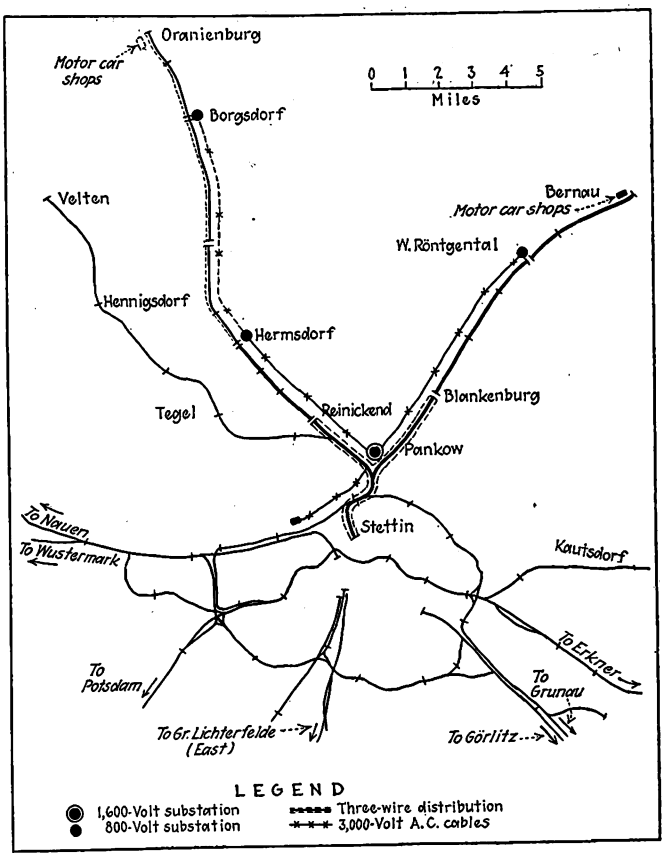
Berlin Suburban Electrification Put in Operation

Three-Wire Distribution Is Used for Busiest Section of 800-Volt Third-Rail Division—Train Units Are Made Up of a Motor Car and Two Trail Cars

THE first electrified section of the Berlin suburban lines, between the Stettin station (in northern Berlin) and Hermsdorf, was put in operation on Aug. 1 1924. The extension to Oranienburg will be in operation some time this year, to be followed by electrification of another branch from the same terminal to Tegel, Henningsdorf and Velten, according to Public Works Commissioner Gebauer, writing in *Verkehrstechnik*.



The Distribution of Electrical Energy to the New Berlin Suburban Electrification Is Partly at 800 Volts and Partly on the 800-1,600 Volt, Three-Wire System

Power for propulsion is delivered at 800 volts direct current. This was determined largely by the lower cost of d.c. motor cars. However, a third rail was chosen for conducting the energy owing to the likelihood that high-voltage alternating-current will eventually be used over the same tracks for trunk-line operation.

Energy is transmitted from the Berlin Electricity Works plant at Moabit at 30,000 volts, 50 cycles to the chief substation at Pankow, whence it is transmitted to the other substations shown on the map. Distribution from Pankow is on the three-wire principle, the third rail for one direction being served at 800 volts plus and the other at 800 volts minus. The running rails serve as neutrals. This balanced system was chosen to keep down electrolysis and reduce power losses.

The other sections use two-wire distribution because the loads come too infrequently to attempt balancing;

Digitized by Google

and as they run through the outer districts, less elaborate precautions against electrolysis suffice.

The electrification plans figure a maximum train density of six per hour each way on the Bernau division and eight per hour on the Oranienburg division. Train weight empty was taken at 270 metric tons and train capacity as 1,500 passengers. The speed on the outer sections, based on a rate of acceleration of 0.3 meter per second per second, is 70 km. per hour (43.4 m.p.h.) maximum and 40 km. per hour (24.8 m.p.h.) average schedule on the basis of 1,900 m. (6,232 ft.) spacing between stations. This schedule is about 30 per cent faster than was used formerly with steam.

The substations contain the following equipment:

Station	Rotary Converters Number	Rotary Converters Capacity, Kw.	Rotary Converters Manufacturer	Total Station Capacity, Kw.
Pankow	3	2,000	Bergmann	6,000
Hermsdorf	3	1,500	A. E. G.	4,500
Röntgental	3	1,000	Brown-Boveri	3,000
Borgsdorf	3	1,500	Pöge	4,500

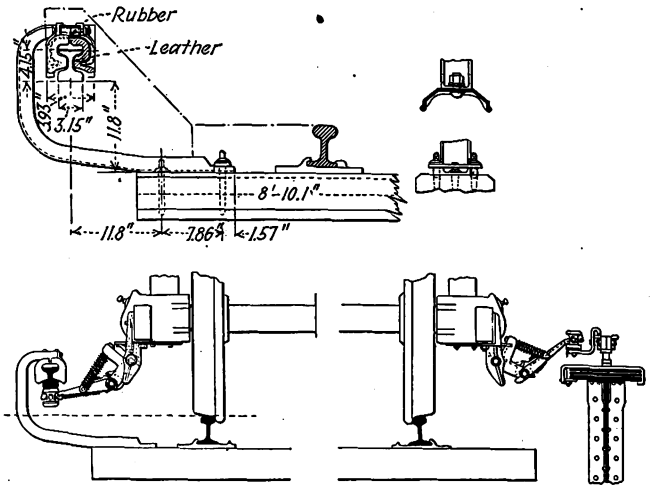
The under-contact third rail is used as a measure of safety. Because of the limited clearances the conductor is of the special type shown. Its weight is 40 kg. per meter (approximately 80 lb. per yard), its height only 105 mm. (4.15 in.) and its cross-section 5,100 sq.mm. A soft Krupp steel is used with high conductivity. Its resistance is 8.9 times that of copper. The construction permits additional conductivity to be obtained by adding strap aluminum or copper to the base of the rail.

The third-rail insulators have leather inserts between rail and insulator and insulator and cap for their mechanical protection; also rubber at the junction of the insulators to prevent the intrusion of water. These insulators are installed at intervals of 15 m. (49 ft.), the length of a third-rail section.

For the return circuit, the running rails have been fitted either with welded terminal flexible bonds or different kinds of galvanized contacts. Copper cross-bonds are installed at intervals of 150 m. (492 ft.).

Station lengths and limitations in loading and unloading time fixed the train length as 140 m. (459 ft.). Hence the chief improvements as regards capacity and speed of passenger interchange came through the adoption of sliding in place of swinging doors and a better arrangement of compartments.

For test purposes orders were placed for five different trial trains of like over-all dimensions and electrical equipment. Each train has halves about 70 m. (230 ft.) long. Each half train has four motors, two on each end truck. Since a weight of 17 metric tons per axle was required for most efficient motor use, the motor car had to be 20 m. long. This left 30 m. for the trailing portion. As that length was considered too great for a



An Under-Running Third Rail of Special Design Supplies the Electrical Power. The Shoes Are Also Adaptable to Over-Running Contact

body on standard four-wheel trucks and not enough for two cars on such trucks it was determined to use three two-axle 10 m. (32 ft. 9 in.) trailers to each motor car.

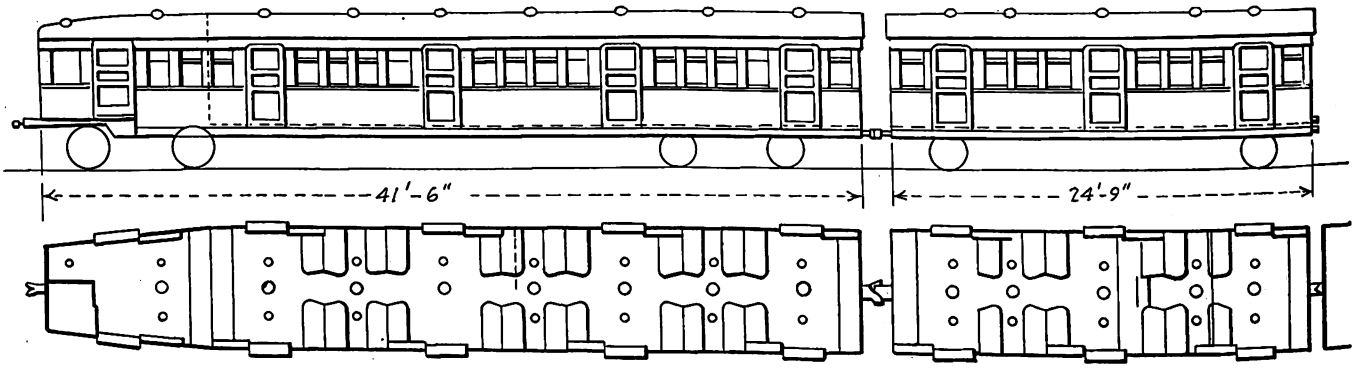
The use of 850-mm. (33-in.) wheels enables the passengers to step directly from the station platform 760 mm. (30 in.) high into the cars, except that 1,000-mm. (39-in. wheels) are necessary at the motor-truck ends. However, the portions over the trucks are used only for motorman's and baggage compartments.

The cars have steel frames with welded side sheathing, but the roof and interior are of wood.

Following trial of these trains, choice was made of the design shown in the accompanying plan. The motor car is 20 m. long, has five doors per side and seats 66 passengers. The trailer is 10 m. long, has three doors per side and seats 36 passengers. A complete train made up of these units seats 474, but has a carrying capacity of approximately 1,500. The weight of a motor car is 45 tons empty, of which the electrical equipment is 13.5 tons. The weight of a trailer is 15 tons.

It is intended, however, to go to four-motor cars later in connection with two trailers of greater length, so that the train make-up will have greater uniformity and there will be less gap between station platform and car body on curves than is now necessary with the extra long cars.

The present two-motor cars are fitted with two field-control motors rated at 230 hp. each at 630 r.p.m. on an hourly basis and 132 hp. each on continuous running. A gear and pinion drive is used on each side. Ball bearings have been definitely adopted for the armatures. while ball-bearing axle journals are on trial.



Train Units Are Made Up of Two Parts, Each of Which Consists of a Motor Car and Two Trailers

Precast Concrete Paving

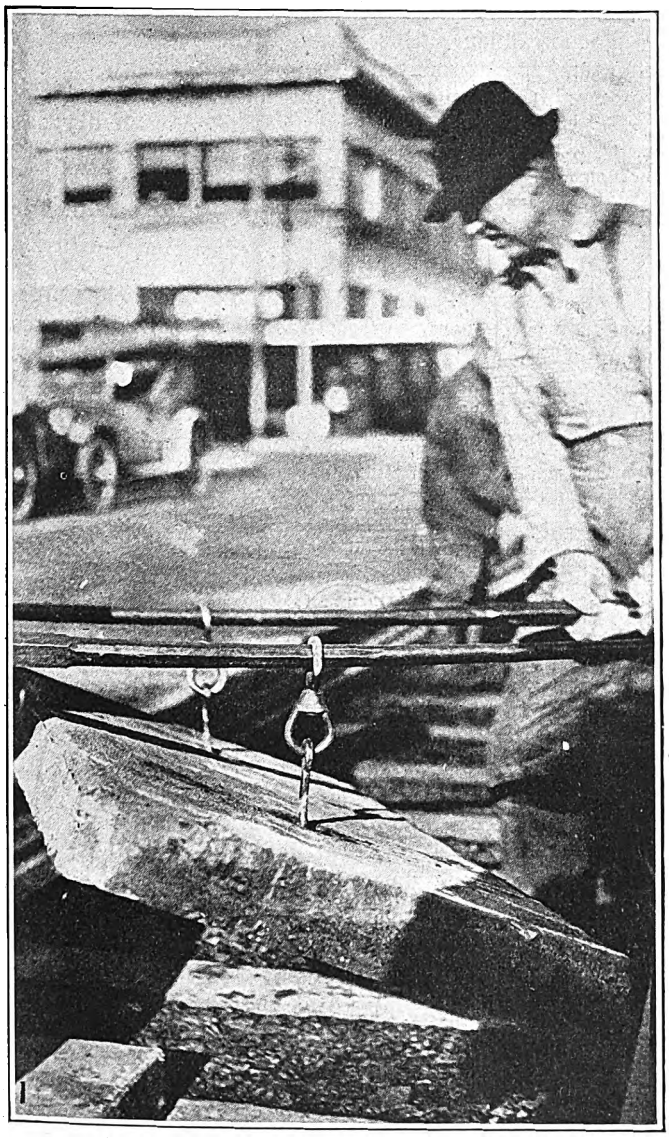
Reinforced Slabs Used by the Willapa Electric Company Permit Rapid Construction Without Interruption to Traffic—Paving Maintenance Costs Are Less —Noise of Operation Has Been Reduced

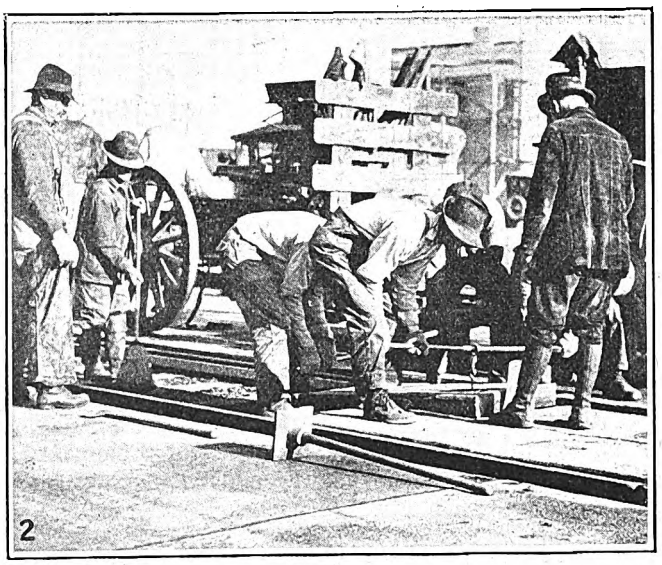
A METHOD of track construction using precast slabs of reinforced concrete for paving between and alongside the rails was tried recently by the Willapa Electric Company, Raymond, Wash. This experiment was made because the railway anticipated serious settlement on the streets where the paving was to be installed. It was thought that during the period of settlement paving of this type would be preferable to monolithic concrete. The new pavement has proved so satisfactory in this location that it is now planned to extend its use to other places.

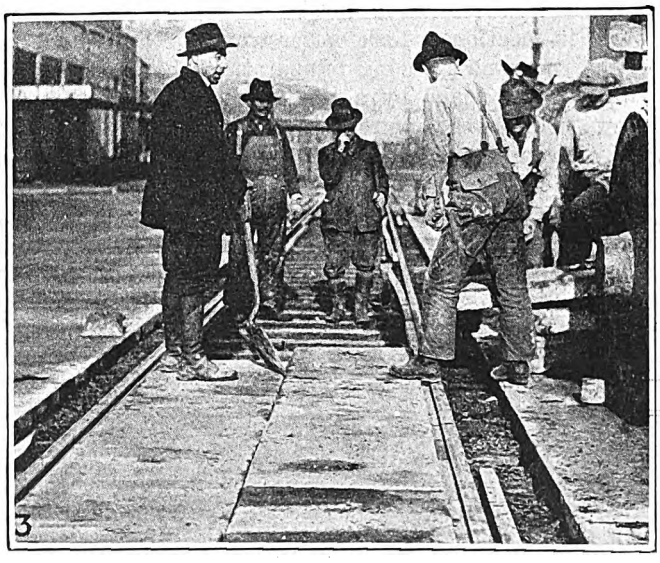
That portion of the city where the precast paving has been installed is built on tideflats adjacent to Willapa Harbor. Formerly these tideflats were badly cut up by deep tidal sloughs, and streets and sidewalks were constructed originally on pile trestles. Third Street, where the slabs were used, was constructed for over a block across a slough varying in depth from 10 to 35 ft.

These tideflats in the business section of the city were filled by a suction dredge, which at the same time deepened and widened the channel in the harbor and river. Material pumped from the bottom of the river varied from fine silt to rather coarse gravel, and during the filling process the heavier material was deposited near the end of the discharge pipe. When it was proposed to pave the street it was realized that with such a spotted fill, varying irregularly in depth, there certainly would be considerable settlement.

All piling under the old wooden streets and side-







Repaving the Track Area in Raymond, Wash., by Using Precast Slabs of Reinforced Concrete

No. 2. Blocks are easily placed and no interruption to railway traffic occurs when this type of paving is used.

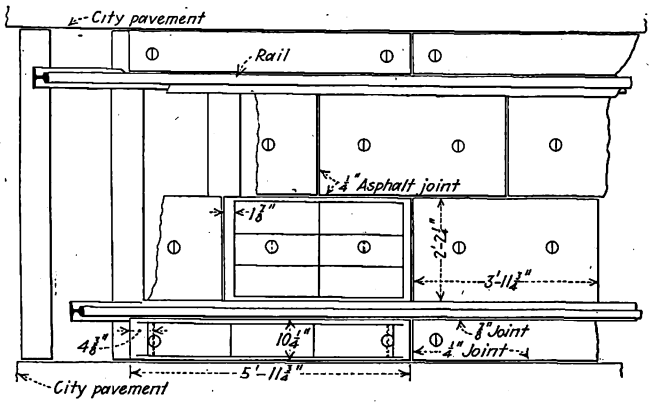
No. 3. Square wooden fillers are used alongside the rail to make a flangeway for car operation.

Digitized by Google

walks was cut off at a depth of 3 ft. below the elevation of the subgrade for the pavement, and sufficient additional material was brought in to care for what settlement had taken place during the period of about 18 months between the time the fill was completed and the paving work commenced. The city constructed an 8-in. concrete pavement on each side of the street and left a 7-ft. slot in the center for the track. Rails were not laid until after the city's paving had been completed. Under the edge of the pavement on each side of the track space an inverted curb was built.

The railway felt that it would be injudicious to construct any rigid type of track on a subgrade of this kind. With this in mind the precast slab pavement was developed. A design furnished by the Portland Cement Association was somewhat modified by the railway's engineers and was amended again in certain respects to incorporate suggestions made by engineers of the State Highway Department.

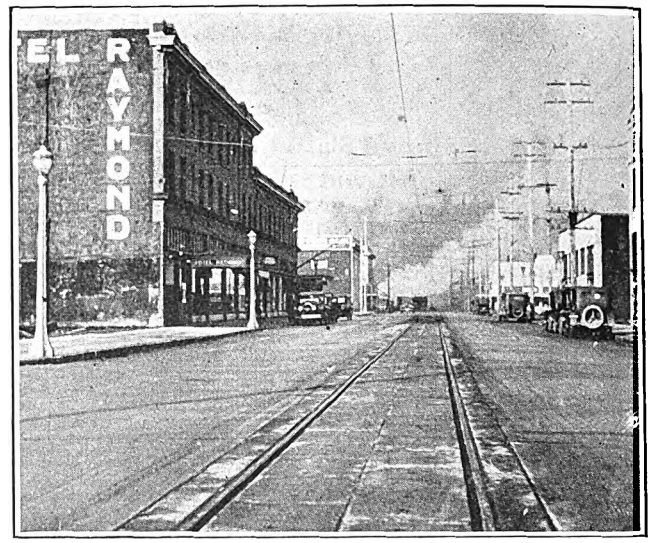
In constructing the track the subgrade in the 7-ft. space was lowered sufficiently to provide for a layer of crushed rock ballast underneath the 6-in. x 8-in. x 6-ft. 10-in. fir ties and 60-lb. A.S.C.E. rails which were used. After the track was surfaced fine crushed



Arrangement of Slabs Along and Between Rails

rock was filled in between the ties and brought to a level with the tops of the ties and rammed in place. This was done on the theory that if the ties settled under the weight of the traffic, the slabs would get added support from the rock between the ties. This practice, however, would not be recommended to be followed in locations where water would be apt to collect in the rock and freezing temperatures be encountered.

Slabs were made by a local concrete products company. They were poured on a wooden platform with partitions arranged to provide the proper sizes. Two rows of slabs each 22¼ in. wide and 4¼ in. thick were laid between the rails with joints staggered, while one slab 10¼ in. wide was laid on the outside of each rail. The slabs used between the rails are 3 ft. 11¾ in. long



Appearance of the Pavement Made of Precast Concrete Slabs Used in Raymond

and those on the outside of the rails are 5 ft. 11¾ in. Use of these lengths gave a little leeway in making joints as ties were spaced on 24-in. centers and kept the slabs from "creeping ahead" when they were being laid.

Wooden filler strips were placed against the web on each side of the rail, the inner one being of sufficient width to provide a suitable flangeway. Joints between the slabs were partially filled with dry sand and then poured with hot "D" grade asphalt. The narrow slabs outside the rails were notched to allow space for the spike heads and were set far enough back from the rail to allow space for angle bars and gas-welded bonds on the rail head.

Two lifting rings were arranged in each slab as shown in the accompanying drawings. Crowbars passed through these rings furnished an easy method of lifting and placing the slabs. Moreover it was possible to lay the entire pavement without interruption to traffic. Its construction is such that maintenance is very easy and inexpensive. An additional advantage which the railway finds in this design is a reduction in the noise of operation.

How Utilities Can Gain Greater Public Confidence

Better Service and More Frankness Are Urged at Joint Convention of Illinois Utilities Associations—Railway Men Discuss Many Operating and Maintenance Subjects

SPEAKING before the annual joint convention of the Illinois Gas, Electric and Electric Railway Associations, held in Chicago on March 18 and 19, Martin J. Insull, president Middle West Utilities Company; William A. Baehr, vice-president Illinois Power & Light Company, and John F. Gilchrist, vice-president Commonwealth Edison Company, emphasized the need for utility management founded on the broadest interpretation of the terms service, frankness, fair dealing and individual responsibility. The spirit manifested by these executives permeated all the proceedings and was voiced by speakers in the various sectional meetings. Nearly a thousand delegates and guests manifested an unusual interest in the program, and at the dinner on Wednesday evening the facilities of the Sherman Hotel were taxed to the limit by the unusually large attendance.

Status of "Big Business"

"Many speak of big business," said Mr. Insull, "but few understand it." He pointed out that the early promotional period of expansion from individual craftmanship to modern industrial efficiency, made possible by large concentrations of capital and engineering talent, had been accompanied by abuses and lax business principles. Today modern business is still laboring under the burden of popular prejudice and suspicion born in that early period. This prejudice can be obliterated only by the utmost frankness and fair dealing. Whenever the public finally understands the principles on which modern big business is conducted its attitude will be fair. He held that business must deserve public confidence before it can be gained, and pointed out that the modern business conception of service is most highly developed in the utility industry. Recognition by the public of this fact, he maintained, will wipe out popular suspicion engendered by the monopolistic nature of the utility business.

This same thought was voiced by Mr. Baehr, who called attention to the increasing responsibility which, under present-day conditions, rests upon each individual employee.

This individual responsibility, he said, increases as the process of concentration into large groups of properties continues. Unless the individuals in the industry recognize the importance of their function as humanizing agents in their contacts with the public the friendship and confidence so necessary to success cannot be acquired. Mr. Gilchrist advocated caution and vision. He warned against the dangers of going ahead too fast in power development at high construction prices when capital seems easy to get. On the subject of public relations work, he said that this phase of the utility man's business must not be lost sight of in the stress caused by increasing complexity of the technical problems that arise.

Railway Sessions Reflect Modern Thinking

In the railway section meetings, held during the afternoons of the two-day session, a modernized point of view stood out, not only in the discussion of general management subjects, but it was reflected also in a widened conception of individual responsibility on the part of those charged with maintenance duties. In the treatment of the many subjects discussed the relation of each department's work to the general objective of making friends for the utility and building a better and at the same time a more profitable service was constantly emphasized.

D. W. Snyder, Jr., vice-president Illinois Traction System, discussed the subject of merchandising electric railway transportation. He divided this subject into three phases, namely, methods of holding present passenger business, steps to be taken for regaining business lost in the past, and then measures for building up new business.

Vicious Circle of Economy

"First of all," he said, "it is necessary for each road to set its own house in order if it expects to hold its present business. He then pointed out that when the advent of the automobile had been followed by shrinking railway passenger business, this condition had been met with operating economies and curtailed service, which simply tended to drive more business to the automobile and the bus. Instead of building up gross revenue by giving improved service and then utilizing active and intensive modern selling methods, the vicious circle of economy had been continued, until the condition brought about by deferred maintenance threatened to put many lines out of business entirely.

There must be a service to sell, Mr. Snyder insisted. Clean, attractive cars, courteous employees and service that fits the transportation requirements of the community represent the railway man's stock of goods, and no amount of intensive selling will be productive of permanent returns unless the goods are right first. He said that more business had been driven from electric railways by bad public relations than by any other one cause.

A concrete example was cited of the experience of the Illinois Traction System following the introduction of modern merchandising methods. A faster and improved service was installed on the main division of that road, which resulted in an immediate increase in gross revenue of $11,600 for a three weeks period. In studying the subject of increasing passenger business, he said his property had found that if it could increase the number of passengers carried on each trip by only two, the operations would show splendid dividends. In this connection, he maintained that few electric railways have more than scratched the surface of the possibilities for merchandising their service.

A similar point of view was taken by J. F. Egolf, general manager Aurora, Elgin & Fox River Electric Company. He said that co-operation between the company and its employees was of utmost importance in attempting to merchandise electric railway service. This merchandising, in the last analysis, is done by the employees, according to Mr. Egolf, and if it is to be done successfully, they must first be put into the proper frame of mind regarding their relations with their company and the patrons of the line. This necessary spirit, he said, grows from confidence in the company and its management. He added that nothing could fully take the place of personal contact in winning this confidence.

Four Kinds of Advertising

John J. Moran, commercial manager Chicago Rapid Transit Company, discussed the importance of various forms of advertising in selling electric railway service. Such advertising, he said, takes four general forms, each of which requires distinct treatment. These he divided into advertising of the community itself, selling the service of the company to the housewife and business man, building employee spirit and morale, and safety advertising. He showed many interesting examples of the use of posters, executed with a high degree of artistic skill, and said that these frequently find their way into schools, clubs and other places where ordinary forms of advertising would not be permitted. In addition, he showed many examples of newspaper copy, prepared for the various specific purposes previously outlined.

Other Ways of Building Business

Other phases of electric railway business building were discussed by repre-

Digitized by Google

sentative men of the state. A paper was presented by J. R. Blackhall, general manager Chicago and Joliet Electric Railway, outlining the effects of automotive competition on that property. He pointed out, however, that the trend of traffic has recently taken an upward turn. Indications are that the cost of operating a private automobile will rise, and this should increase the use of electric railways.

G. A. Mills, vice-president and general manager Kewanee Public Service Company, outlined the experiences of one of the smallest railway properties in the state in putting its business on a profitable basis. This property has been rehabiliated after having ceased operations for fourteen months, during which period transportation was furnished by buses. When the railway was put back into service track layouts were revised, existing track was rebuilt and a 10-cent cash fare with eight tokens for 50 cents was put into effect. In addition, a $1 weekly pass was sold. In this town of 20,000 population approximately 500 passes are in use and about 20,000 tokens are in circulation. Good public relations have followed the re-establishment of the railway service, according to Mr. Mills. He attributed the difficulties of the previous company primarily to misunderstanding with the community.

Results accomplished through the installation of modern light-weight, one-man interurban cars on the Illinois Valley Division of the Illinois Traction System were described by F. E. Fisher, general manager of that division. He said that when these cars were first received the trainmen had objected to their use, but that determination on the part of the management to improve the service has finally demonstrated that they were entirely practicable. Seventeen of these cars which have been in operation since last August are now showing that this form of equipment results in increased total riding and at the same time makes large savings in expense, so that net earnings are considerably higher than with the old equipment.

Mr. Fisher described a form of bus competition which is still felt to some extent in his territory, and which, he said, seems to be beyond the pale of regulatory control. The bus driver, under this plan, puts himself within the classification of a contractor's agent, by arranging to haul certain individuals in the morning and at night between their homes and work, without engaging in a general passenger transportation business that subjects him to regulatory commission control. He said that the improved type of equipment and service offered by the railway was successful in making inroads on even this form of competition.

Status of Buses and Railways

The general subject of buses in their relation to electric railways was further discussed by W. H. Sawyer, president East St. Louis & Suburban Railway; B. W. Arnold, manager motor coach department Chicago, North Shore & Milwaukee Railroad, and M. L. Harry, division manager Illinois Power & Light Corporation, Decatur, Ill. Mr. Sawyer explained that the relations between bus manufacturers and electric railways have undergone a decided and definite change since the beginning of this form of competition. He said that at first the bus was the outgrowth of the jitney, and in this early stage the bus man didn't care particularly about his relation with the railways and openly said so. This situation was followed by an increasing recognition of the importance of the electric railway as a future operator of buses and a period of active discussion of the various phases of the relations between the automotive industry and the railways. During the last few months, according to Mr. Sawyer, the situation has entered a new phase. He called attention to the resolutions adopted by the American Electric Railway Association at the recent Midyear Meeting in Washington, and also to the statements made there by Mr. Dahl, speaking for the National Automobile Chamber of Commerce.

Mr. Sawyer said that the electric railways and the automotive industry have come to an understanding regarding the general principles upon which their relations should be founded, and urged that electric railway operators assume that the bus manufacturers would in general adhere to the spirit of this understanding. He implied that although individual manufacturers may in some cases fail to adhere to the code advocated and adopted by their own organization, such incidents may be expected to disappear rapidly as the value of full and whole-hearted co-operation becomes increasingly evident.

Mr. Arnold described his early attitude toward buses, when he first experienced the effect of unrestricted competition, and outlined some of the mistakes made by the railways in coping with this new competition. He said that buses as feeders to electric railways have three functions to perform: To serve the territory adjacent to the rail line; to add revenue to the rail line by directly feeding passengers to it; to help give a complete transportation service in a given community so as to improve the relations between the electric railway and the public. He urged that careful surveys be made before starting bus service in new territory, and then advocated that this service, when installed, be made as complete and frequent as possible in order to win the support of the people in the community. He decried the tactics of some high pressure truck salesmen in painting over-optimistic pictures of the possibilities of bus operation, and said that as a result of these tactics many bus lines have been installed in locations where they cannot be successful.

Conditions under which a combined bus and railway service was installed in Decatur, Ill., were described by Mr. Harry. He said that in this city of 50,000 people there is only about 15 miles of street railway track, and that consequently several parts of the community were not properly provided with transportation. As a result of this condition the growth of independent bus operation had been welcomed by the community, and this operation soon reached a scale which required serious consideration by the railway management. The railway finally purchased all the bus lines, substituted fifteen new buses for the old ones that had been in service, and with the co-operation of the city administration, instituted a joint service of railway and bus lines, with universal transfers. Buses are now operated over 10.5 miles of route.

Various phases of electric railway maintenance were presented in papers by J. I. Catherman, engineer maintenance of way Illinois Traction System; F. V. Skelley, superintendent Tri-City Railway, Rock Island, Ill., and T. H. Shaughnessy, assistant superintendent of shops and equipment Chicago Surface Lines. These papers are abstracted elsewhere in this issue.

At the conclusion of the meeting on Thursday, the following officers were unanimously elected for the coming year: President, J. F. Egolf; first vice-president, C. G. Handshy; second vice-president, G. W. Welsh; secretary-treasurer, R. V. Prather. G. A. Richardson, Arthur D. Mackie, R. C. Roderick and D. W. Snyder, Jr., were elected members of the executive committee.

Safety as a Means of Reducing Insurance Costs*

By Charles B. Scott
Bureau of Safety, Chicago, Ill.

THERE is a very definite relationship between the two terms "safety" and "insurance" which is not well understood nor appreciated by the public generally. Many of the insured interpret their insurance to mean, literally, a system by which they may be relieved from losses in excess of premiums paid by them.

Insurance companies are really trustees or custodians of certain funds collected in the form of premiums. If you carry insurance, then eventually you must pay your losses plus the expense of administering the insurance fund plus a reasonable return to insurance company stockholders. You, as an insured, may be faced with a catastrophe when others insured with you will take on their proportion of burden and relieve you of having to bear it all at once, but if you live long enough and continue your insurance, you will pay back year by year until you yourself have paid all your loss.

There is only one possible way by which you can reduce your insurance costs, and that one way is by reducing your losses. There is only one way by which you can reduce your losses. You cannot do it by paying someone else to carry your risks; you cannot do it by having a lot of others in your line of business pay your losses and theirs; you can do it only by removing your hazards and improving your risks—by creating the "state or condition of being safe and free from danger and risk." which is safety, the literal definition of Safety.

The electric railway business is one in which the most diligent and closest economy is obviously necessary. My purpose is to try to tell you how you can save some of the money you are

*Abstract of paper read before Electric Railway Section of Joint Convention Illinois Utilities Associations, Chicago, March 18-19, 1925.

Digitized by Google

paying out of your income for insurance costs and accident and fire claims. Most of you buy fire insurance, and your premiums amount to a considerable sum. Your rates on carhouses and rolling stock are high because your loss records on carhouses and rolling stock are bad. Your loss records are worse than they should be—there is a reason for it, and the reason is you are not constantly using earnest efforts to guard such property from fire loss. Not because you do not know how to protect your property, but because you do not ceaselessly follow up the things you know should be done.

There are two very important factors in the reduction of fire losses, namely, the physical condition of the property, and the care exercised by those in charge of it. Good housekeeping and training of employees in carefulness are simple methods of avoiding fires. Careless housekeeping and careless men are largely responsible for the high rates you are paying for fire insurance on your carhouses and equipment. If every electric railway company would seriously and earnestly get to work on these two hazards and keep at it, insurance companies would gladly reduce the rates. They would much rather have a good risk at a low rate than a bad risk at a high rate.

Some electric railway companies carry workmen's compensation insurance. Everything that has been said about economy in fire insurance applies as well to compensation insurance costs —your property and your men—good housekeeping and careful men. You have the same opportunity for reducing your compensation costs.

There is another class of protection which you are compelled to carry yourselves because you cannot buy it. Insurance companies will not accept the risk. This is your risk for liability on account of injury to the public and damage to public property. Unfortunately, this is a risk in which you and your organization do not bear all the responsibility and one which is largely not under control of the management. Fortunately, the public conscience is becoming aroused to the criminality of carelessness. That consciousness is going to help some.

Children are being educated in safety. When they grow to be the men and women of the day, that is going to help greatly. Your industry has had much to do with the present interest by the public and by school children in safety. No industry has been more diligent than the electric railways in trying to enlist public interest and cooperation in safety. You were the pioneers in the work. You have worked hard and it is certain the public is appreciative of your efforts. Results may be slow in coming, but they will come surely. Safety is the best insurance.

COMING MEETINGS OF *Electric Railway and Allied Associations*

April 9—Central Electric Railway Master Mechanics' Association, Fort Wayne, Ind.

April 20-25—International Regional Planning Congress, Hotel Pennsylvania and Grand Central Palace, New York City.

May 5-8—Southwestern Public Service Association, Rice Hotel, Houston, Tex.

June 3-4—Iowa Electric Railway Association, Waterloo, Iowa.

June 26-27—New York Electric Railway Association, Bluff Point, N. Y.

July 22-25—Pacific Claim Agents' Association, Hotel Biltmore, Los Angeles, Cal.

Maintenance of Equipment in Chicago*

By T. H. Shaughnessy
Assistant Superintendent Shops and Equipment, Chicago Surface Lines

ALTHOUGH many factors influence the cost of maintaining electric railway equipment and differences in schedule speeds, stops per mile, character of roadbed, weight of car and climatic conditions make it difficult to compare the results on one property with those on another, it may nevertheless be of interest to outline some of the practices in use and results obtained on this large property, where schedules are unusually severe and cars are operated over an extremely rigid roadbed.

We use a 5-in. trolley wheel. In 1924 the pounds of wheel used per thousand car-miles was 0.152, or an average of 6,578 miles per wheel. This represents 11.8 per cent increase in mileage over the results formerly obtained with a 6-in. diameter wheel.

The percentage of brake shoe wear to shoes applied for the year 1924 was 71 per cent and the pounds of brake shoes used per thousand car-miles was 39. This result was obtained mainly by close attention to the condition of brake shoe heads, hangers, brake beams and levers. Case-hardened bushings and pins are used in all moving brake parts.

On account of the rigidity of roadbed in Chicago, the wear on journal boxes has been severe and it has been difficult to keep covers tight. After using standard types of boxes, equipped with covers of various designs, with more or less success, a box was designed with a cover that fits in grooves on each side. A groove also extends across the lower edge of the opening and is cut away at the center to drain any water that may collect there. This cover is held in place by a ½-in. machine bolt and is lined with a piece of No. 515 oiled canvas, to prevent rattling and to keep out moisture and dust.

Case-hardened pedestal wear pieces are fastened to each side of the box. We tried electric welding, riveting and another scheme for fastening these wear pieces, but none of these methods was satisfactory. One of the truck manufacturers developed a means of holding the wear pieces in place by casting four lugs on each side of the box and bolting the plates to these with ½-in. bolts. This arrangement has proved successful. The pedestal jaws of the truck are also equipped with wear pieces made of 4-in. standard 5¼-lb. channels, case-hardened. All replacements can therefore be made at carhouses. The journal box wear plates, pedestal wear plates and bushings are hardened in our shops by the cyanide process in a special furnace. An article describing this furnace appears in ELECTRIC RAILWAY JOURNAL for Feb. 28, 1925.

The number of new rolled steel wheels installed and the number of pairs turned on this property are shown by the figures below:

WHEELS INSTALLED AND TURNED BY CHICAGO SURFACE LINES

Year	New Wheels Installed	Pairs of Wheels Turned
1921	8,723	15,238
1922	7,534	17,115
1923	8,451	16,215
1924	11,428	17,812

Open circuits which develop on armatures of various types due to the severe service and rigid roadbed in Chicago have been the subject of extensive investigation. Expansion and contraction of armature coils and leads were carefully studied. Armatures were tested at the shop to determine the effect of temperature changes on the coils. Current was passed through these coils to give temperatures as high as 125 to 130 deg. C. and the expansion of the core, coils and commutator was noted. It was found that the coils and cores expanded $\frac{3}{32}$ in. in a longitudinal direction. The expansion of the top leads in a radial direction was found to be as much as 0.022 in. Since these measurements were made with the armature stationary, the effect of centrifugal force was not noted. The tests made, however, show that there is a decided movement of the coils and leads.

Centrifugal force has evidently played a considerable part in causing the open circuits which have occurred on these armatures. Evidence of chafing between the top of the armature coils at the commutator end and the bottom of the upper leads indicated that there had been motion at this point. Wire bands have, therefore, been installed to bind down the coil extensions beyond the core so as to prevent them from throwing out against the top leads under the action of centrifugal force. This band is 1 in. wide and is located 2 in. from the end of the armature core under the top leads. It has been adopted on all armatures where the band can be held in place, the object being to allow the top leads to expand and contract as freely as possible.

The lay of the leads has been arranged so that they come out of the commutator bars straight and parallel

*Abstract of paper before Electric Railway Section of Joint Convention Illinois Utilities Associations, Chicago, March 18-19, 1925.

Digitized by Google

to the bars for a distance of not less than $\frac{1}{8}$ in. In soldering the commutator, the solder is kept back for about $\frac{3}{16}$ in. from the back end of the slot in the commutator bar. This tends to distribute any motion of the lead over some distance and prevents crystallization caused by confining this motion to one spot.

The following table shows the number of armatures rewound and repaired and their proportion to the total number of armatures on the system:

ARMATURE REPAIRS, CHICAGO SURFACE LINES

	Armatures Rewound		Motor and Compressor Armatures Repaired	
Year	Number	Per Cent Total	Number	Per Cent Total
1921.....	3,689	25.4	15,557	107
1922.....	3,923	27.6	14,604	103
1923.....	4,711	21.8	14,490	98
1924.....	4,359	28.5	14,499	94.7

In the last figures are included armatures sent to the shops for changing pinions and bearings, as practically all these changes are made at the shop.

Ordinary heat-treated carbon steel armature shafts were not standing up in Chicago service. Chrome nickel electric steel of the following analysis and specification has been used for all shaft renewals for several years:

Carbon	0.30 to 0.40
Manganese	0.50 to 0.80
Phosphorous	Not to exceed 0.04
Sulphur	Not to exceed 0.04
Nickel	1.00 to 1.50
Chrome	0.45 to 0.75
Physical.	
Tensile strength	90,000 lb. per sq.in.
Elastic limit	50,000 lb.
Elongation in 2 in.	22 per cent
Reduction in area	45 per cent

We have several hundred of these shafts in service and since their installation have never had a failure due to breakage. The effect of this improved material is given in the following figures showing the number of shafts renewed each year since 1921:

1921	1,576
1922	1,717
1923	1,058
1924	858

Budgeting Overhead Line Maintenance*

BY F. V. SKELLEY
Superintendent Tri-City Railway, Rock Island, Ill.

UNDER modern methods of handling finances a railway manager must know each year how much money is needed in each of his departments. To prepare the budget for the overhead department the engineer must determine first the amount of repairs actually needed and then estimate, for each job, the labor costs, the material to be purchased, the material on hand and paid for and the value of scrap trolley, brass and poles taken down.

Speaking from the standpoint of the road with 100 miles or less of trolley, opinions vary as to the best method of obtaining the information necessary to make out a definite plan for repair work. One thing is certain, that with 100 miles of trolley in service 8 or 10 miles must be replaced each year. The age of the wire means nothing, for on some lines No. 00 trolley has been up for 22 years and yet during that time it has had less than 500,000 car movements under it. You cannot allow a wire to wear out, for that means trolley breaks and interrupted service. In measuring 100 ft. of worn trolley wire with a micrometer I found that there was a variation of 25 per cent in the diameter of the wire.

The maintenance crew of a line department may properly consist of a foreman, two linemen and a groundman. An experienced driver is necessary to handle the 2½-ton line truck, as he is usually working in traffic and must occasionally pull a trailer. Under ordinary conditions this crew should do all the maintenance work on 100 miles of trolley for nine months of each year. During the summer months a second crew is necessary for stringing difficult pieces of trolley.

The small or average-sized road cannot go to the expense of holding a maintenance crew in readiness for an emergency, so the line foreman should keep a central telephone operator informed at all times of his location, and an emergency call can be relayed to the nearest carhouse, where a waiting automobile is ready to go for the crew. Supervisors, or other road men, should be able to clear the line in an emergency.

The largest part of the overhead investment is in the pole line, and the major part of these poles are of wood, which if untreated is subject to rapid deterioration when in contact with the soil. The decay of wood is caused by the growth and activity of fungi, which thrive in the soil and attack wood when air, moisture and heat are present. Every user of wood poles knows that the poles start to rot at the ground line where these conditions are to be found. The spores of the fungi germinating in the wood penetrate every part of the sapwood where complex compounds are formed, causing fermentation. Once started the action is rapid, as the wood fiber then becomes food for the fungi. There are several processes in use to prevent rot. Any method that will close the pores of the wood against moisture and air is beneficial. If a pole line is too far gone on account of rot below the ground line, the new pole should never be set in an old hole, as the fungi will immediately attack the new pole.

There is not much to say on the maintenance of iron poles. Paint them every six or eight years and they will take care of themselves. Thirty-foot tubular iron poles have been painted for $1.55 each, using a good grade of steel preservative and paying a painter 75 cents per hour and a helper 50 cents per hour. Bates expanded steel poles cost $1.65 per pole. All poles should be wire brushed to remove scale and rust.

Track Maintenance Practices*

BY J. I. CATHERMAN
Engineer Maintenance of Way Illinois Traction System

IN EITHER open track or paved track drainage is of utmost importance from the standpoint of satisfactory service and low maintenance cost. Without proper drainage, no track can be well maintained. Surface or subsurface water is probably the greatest enemy of good track. On open track drainage is obtained by properly shaping the ballast line, maintaining a proper shoulder on embankment and by keeping ditches open through cuts. In paved streets, a line of tile is located on either side, or beneath the center of the track, and connects to adjacent sewers. But the most effective measure in paved streets is to maintain the paving so that water cannot reach the foundation of the track. Once there, it is certain to cause trouble.

There are many other things which we must look to in properly maintaining open track. The rail, joints, ties and ballast make up the track structure, and on these four elements the bulk of the time of the trackman is spent. Little attention is necessary to the rail itself, so far as everyday maintenance is concerned. Primary attention is directed to keeping it in proper line and surface. Rail does wear out, however, and it will break after a certain length of time unless periodical renewals are made. If this is not given attention disastrous wrecks may be caused. We cannot tell when a rail is about to fail, and the only safe policy is to so shape our rail renewal program that such failures will be reduced to a minimum.

Neglected joints soon produce rough riding tracks. Passengers are quick to note lurching cars and money saved on joints is at the expense of passenger business. Poorly maintained joints give a greater opportunity for spreading rails, and many a truck spring has been broken by a low joint.

OILING THE TRACK JOINTS

About two years ago on the Illinois Traction System we started oiling our joints. We used Standard Oil Company No. 4 Road Oil, and we now have approximately 50 miles of oiled joints. We have found this to be most economical. On one section where we first started oiling I had a recent report that showed approximately one-half keg of bolts used on 5 miles of track for renewals this winter. This is less than 10 per cent of what would ordinarily have been used. Threads on the old bolts and nuts are preserved by the oil and can be readily tightened.

In the maintenance of ties, much money can be wasted or saved. A tie requires approximately one man-hour to install. It costs just as much to install a poor tie—one that will last but five years—as to install one that will last twenty years. It is becoming generally recognized that untreated ties are no longer economical. We began installing treated ties in 1910. Today more than three-fourths of our ties are treated. Renewals are becoming less each year. For 1925 our maintenance program

*Abstract of paper before Electric Railway Section of Joint Convention Illinois Utilities Associations, Chicago, March 18-19, 1925.

Digitized by Google

calls for 25 per cent less ties than it did in 1924, and I fully expect to see an equal reduction in 1926. What does this mean to us? Simply that this year we will install 15,000 fewer ties than we did last year and probably 75,000 less than would have been the case had we never installed treated ties. It is evident that the matter is worthy of the greatest consideration as a measure of economy. Ties are becoming more scarce and higher priced each year and we must look to the future when our yearly supply of ties is purchased.

Fortunate is the maintenance man whose track is ballasted with crushed stone or some similar material. A little labor on such track will go a long way. However, many of us must depend upon cinders and other inferior material. Cinders, especially those from a stoker fed furnace, are soft and often very fine. Consequently, they do not stand up under track like the heavier material. Crushed stone, slag, gravel, chatts, or some equal material, results in a very material saving in maintenance labor. Ballast must be kept clean and free from weeds. The latter hold moisture, and in addition to their unsightly appearance tend to produce more rapid deterioration of the structure.

Adoption of standard materials and standard methods helps to make better track at lower cost. Too many foremen are reluctant to give up old practices and prejudices. They must be made to appreciate the importance of their work and must understand that little things neglected make costs mount rapidly.

Labor-Saving Tools

The importance of tools as time and labor savers in the maintenance of way department is receiving more attention each year. On open trackwork five men with a set of tie tampers will tamp more track and do it much more efficiently in one day than will fifteen men by hand. Electric drills and saws are great labor savers. Welding outfits can save their original cost in a very short time. Cupped rails can be built up, frogs and crossings given new points and the gage intersections rebuilt at a small cost with welding equipment. We have many times built up crossings, solid manganese as well as bolted, and increased their life fully 50 per cent.

Maintenance men must be on the lookout continually for new ways of doing things, new ideas, new tools and equipment; devices that will save labor and also save material. These are the days of high costs and it is up to the man in charge of maintenance to keep those costs down. To maintain his track efficiently and well and at a minimum cost is his job, and it is up to him to keep himself educated to the modern ideas and ways of doing things. If he is not constantly on the lookout for new ideas, is not willing to accept them and give them a trial he is not on to his job. Those who most quickly and earnestly adjust themselves to the new conditions will be the first to increase the efficiency of their organizations, which will in turn be reflected in the general condition of their property.

Operating Improvements at Providence*

New Substation Equipment and Transmission Lines, a Block Signal System and Rehabilitation of a Power Station for Use of Pulverized Coal Earn 14.4 per Cent on Cash Expenditures

By W. C. Slade
Vice-President United Electric Railways,
Providence, R. I.

During the last three years the United Electric Railways has carried out a comprehensive program to enlarge and to modernize its power system. Studies were undertaken in the fall of 1921 which led to extensive purchases of equipment during the next two years and to active construction work over a period of three years which required appropriations totaling nearly $2,100,000. Of this, very closely $1,300,000 was for the power plant; $700,000 for substations, transmission and distribution feeders both overhead and underground; $100,000 for track-circuit block signal systems with automatic flagmen at crossings, and for construction and emergency tower trucks for the line department.

Woonsocket Division Power Development

A new semi-outdoor substation was built containing two 1,000-kw. rotaries, with space for a third. To serve this station a double-circuit No. 00 copper transmission line was built from Providence to Woonsocket, with four sectionalizing oil circuit breakers at Lincoln substation near the midway point. A 12-mile single circuit branch-off from this line at Lincoln substation was built cross country to Oakland automatic substation. At Lincoln substation two new rotary converters were installed, together with new switchboards for control of seven new outdoor oil circuit breakers, including the four sectionalizing breakers previously mentioned. Supervisory control apparatus has also been installed at Lincoln and at North Main Street substations, so that in the near future the seven oil circuit breakers can be operated over pilot wires from the latter substation, which is in Providence. All transmission lines and new oil switches and transformer equipment are built for ultimate operation at 22,000 volts, although at present they will be operated at 11,000 volts. This development made it possible for the United Electric Railways to supply its own power generated at its modernized power plant to a distant division for which power generated largely in an old steam plant in Woonsocket had been purchased for many years.

North Main Street Substation

A combined transmission switching and rotary converter substation was built on North Main Street in the city of Providence. The switching station, which contains entirely General Electric equipment, has a ring bus, sectionalized at four places, and provides for ultimately twelve oil circuit breakers of H-3 type. Bus and circuit breakers are on separate floors. At present there are eight breakers in service; two serving rotaries in the building, two serving the Woonsocket transmission lines, and four serving lines running to the generating plant and to Pawtucket substation. This switching station permits power to be trunked from the generating plant in large quantity, with a consequent material saving in number (and hence cost) of underground cables at a future time, to a convenient point for distribution as required over several transmission lines. Altogether, six substations receive power delivered over this ring bus. This rotary station is an all-Westinghouse station with two 2,000-kw. rotaries supplied by three-phase transformers, and there is space for two more similar units. The construction of this rotary substation made it possible to relieve the Pawtucket substation, which was seriously overloaded in winter, of approximately 1,000 kw., and to give much improved voltage to a section of the distribution system where poor conditions had previously prevailed. With improved voltage the important Providence-Pawtucket express service was also benefited.

Additional Equipment in City Substations

A new General Electric 2,000-kw. rotary and three-phase transformer were installed at Manchester Street substation to replace one of the two d.c. engine-driven generators that had to be scrapped when the generating plant was remodeled. A similar unit was installed in Olneyville substation after a 1,000-kw. unit had been transferred to the new Woonsocket substation.

Underground Conduits and Cables

A start was made to put certain important power circuits underground to replace existing overhead feeders with feeders of much increased capacity. Approximately 2.02 miles of trench of single and multi-duct tile and fiber conduit, totaling an equivalent of 23.9 miles of single conduit, has already been laid. In some of this duct space 2.65 miles of underground cable was installed. In addition, 1.55 miles of submarine cable was laid under the Providence and the Seekonk Rivers.

Block Signal Systems

Eight miles of single track and some double track on right-of-way on the high-speed line between Providence and Woonsocket were equipped with Union Switch & Signal Company's track circuit TDB signal system. Also the same manufacturer's automatic flagmen were installed at all highway crossings. Extensive repairs to signal trunking and ground circuits have been in progress on another high-speed road (Providence to Buttonwoods) and are now nearly

*Abstract of a paper delivered before the New England Street Railway Club on Feb 5, 1925.

Digitized by Google

complete. A number of additional Chapman automatic signals have been installed on city lines operated with one-man cars.

Rehabilitation of Manchester Street Power Station

The large amount of work at the Manchester Street power station was done both to provide additional dependable generating capacity and to introduce operating economies throughout the plant to as great an extent as possible.

It was decided to wipe out of existence the entire 8,000 kw. of engine-driven generating equipment and the entire low-pressure boiler equipment, retaining only for the time being the small 2,500-kw. turbine for stand-by service. This decision at once required practically the elimination of the original power-plant equipment and necessitated writing off our books in one lump sum approximately $633,000.

In the turbine room it was decided after careful study to install an 18,000-kw. General Electric turbo-generator with a Westinghouse twin jet condenser. This went in the same location previously occupied by one of the 2,500-kw., d.c. engine-driven generators. It is interesting to note that the generating capacity was increased sevenfold without any tax on additional building capacity, except for the small space occupied by a rotary converter and its transformer, pending the time when the substation equipment can be housed outside. In the boiler plant the space originally occupied by two decks of boilers of approximately 8,000 boiler-horsepower was used to accommodate ultimately four 1,266-hp. boilers set high in the air. Only three boilers were installed at this time.

Inasmuch as a description of the new plant in reasonable detail was published in the ELECTRIC RAILWAY JOURNAL of April 28, 1923, a detailed description will not be repeated at this time. Reference should be made to this article for details of equipment and the description of the method of handling and preparing the coal for burning.

Boilers Fired with Pulverized Coal

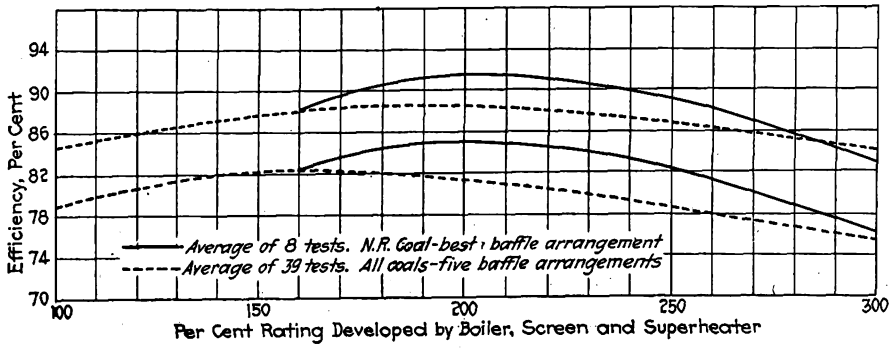
After one year's experience we believe that our decision to use pulverized coal under the conditions prevailing has been thoroughly justified. First of all, we expected to get better over-all boiler plant efficiency than we could get with stokers. The results obtained lead us to believe that we have done so. This increased efficiency has been due to the elimination of banking losses on the one hand and to the more efficient burning of coal on the other hand. One of our pulverized-coal-fired furnaces can be closed up tightly, like corking a huge thermos bottle, as there are no gases to contend with from a banked fire. For example: a boiler banked while the pressure was at 205 lb. showed 15 lb. pressure after a period of 24 hours, and some pressure after 48 hours. In burning the pulverized coal, the amount of excess air can be reduced with care to as low as 12 per cent or 15 per cent, and it is easy to operate with excess air ranging from 20 per cent to 25 per cent, which in itself spells efficiency. It is easy to maintain from 14 per cent to 15 per cent CO_2 in the flue gases leaving the boiler, and on test work 15 per cent to 15½ per cent CO_2 is often maintained throughout the test.

It was also expected that with pulverized coal boiler outage would be greatly reduced because as a rule in stoker-fired plants boiler outage is due more often to clinker trouble on the stoker or on the furnace walls than to trouble with the boiler itself. We have had a remarkable record during the first year of operation of our new furnaces and boilers. During this entire period we have not had to replace a single tube in any boiler, superheater or economizer. We had to reroll only two boiler tubes after the installation was started up. This speaks well for the equipment, for the workmanship of installation and for the favorable conditions obtained in pulverized coal practice. Also, during this entire period we have not had to renew any brickwork* in any one of the three furnaces, which together have burned now from 35,000 to 40,000 gross tons of coal, including 1,200 tons from Rhode Island.

The flexibility of operation of a pulverized-coal-fired furnace also appealed greatly to us. A furnace can be started quickly with pulverized coal. We put a stone-cold furnace on the line in 50 minutes and an idle but warm boiler was brought up to a fair rate of steaming within twenty minutes without difficulty. Boilers fired by pulverized coal can be banked instantly when desired. It is indeed necessary to guard against accidental banking due to any unexpected failure of the supply of electrical energy to the boiler plant for plant motors. The equipment must be mainly motor driven. It is advisable therefore to have the feeder motors and the primary air-pressure blower motors supplied either in whole or in part from an independent source—by use possibly of a suitable auxiliary steam-driven generator. These essential motors are really in about the same class with boiler feed pumps which are generally steam turbine driven.

Another consideration that we gave to our decision to use pulverized coal was the reduced ash to be handled as well as the ease with which it could be handled by mechanical means and with little labor. We ran our first boiler for five weeks before any ash was removed from the ash hopper. This was because we were burning a very low-ash coal. As a regular procedure, however, we now remove the little ash that does collect each day from the ash hoppers.

Finally, from observations that we had made in the West, we were convinced that by burning coal in pulverized form we could burn with practically equal efficiency low-grade coals and high-grade coals. In fact, we concluded that we could burn with high efficiency any coal that was worth shipping from the coal fields to New England. Our pulverized-coal-fired furnaces were designed to burn bituminous coal of 14,000 B.t.u. as fired with maximum capacity and maximum efficiency, and to burn anthracite coal with reduced capacity, but, we hoped, with reasonably high efficiency. During the past year we carried out a number of tests in burning Rhode Island coal. We found that we could not burn Rhode Island coal alone successfully because of the lack of volatile which is required to sustain combustion. We did find, however, that a small amount of bituminous coal with approximately 20 per cent volatile mixed with Rhode Island coal enables us to burn the mixture entirely satisfactorily and with high efficiency. We burned on many occasions mixtures containing as high as 75 per cent Rhode Island coal. On our test work, however, we confined our mixtures to those which contained 50 per cent and to those which contained 66⅔ per cent Rhode Island coal. Taking seven of these tests made with these mixtures, you will be interested to know that our unit efficiencies with economizer ranged from 84.4 per cent to 88.4 per cent. The over-all rating on the unit, expressed in terms of boiler rating for these same seven tests, ranged from 157 per cent to 272 per cent. The heat units in the coal mixture as fired ranged from approximately 10,800 B.t.u. to 11,600 B.t.u.†



Results of Boiler Tests with Pulverized Coal

No. 9, Bigelow-Hornsby 1,266-hp. boiler with Foster economizer.
Upper curves are for unit efficiency.
Lower curves are for boiler, furnace screen and superheater efficiency.
New River semi-bituminous coal, 30 tests.
Gas coal, Wise County, Va., two tests.
Combination of Rhode Island anthracite and New River bituminous mixed, seven tests.

*The deterioration of the front wall of the furnace had progressed further than realized when the paper was delivered, Feb. 5, so that on Feb. 18 it failed near the top to such an extent that it was considered advisable to remove all of the old wall down to the bottom of the lowest air passage. In places the brick had gradually spalled away, leaving only 2½ in. to 4 in. of material. It is believed that the refractory had in general wasted away by spalling rather than by slagging with molten ash. The wall is being rebuilt with improved construction and a still longer life is expected from the rebuilt wall.

†For further information regarding these tests refer to a paper presented by Henry Kreisinger before the A.S.M.E. at its December meeting in 1924.

Digitized by Google

It was once thought necessary to dry all coal to be pulverized and burned in pulverized form. In order to be on the safe side we installed waste gas driers in our boiler plant. We feel comfortable in having the driers available for use in case of emergency should the coal be excessively wet. We have not yet, however, been obliged to use our driers and we have burned a considerable amount of coal that contained between 4 per cent and 6 per cent moisture at time of milling.

We installed four Raymond six-roll mills rated at a ton per roll. We can pulverize sufficiently fine to burn efficiently New River and Pocahontas coal at the rate of 7, 8 and even 9 gross tons per hour, the output being reduced as the moisture in the coal increases. On the average it takes only 12 kw.-hr. per gross ton to mill this kind of coal. It is costing us less than 9 cents a ton to do the milling as far as power is concerned.

Although the plant has run a little more than a year, we have as yet no definite idea of what the annual maintenance will be because of the fact that we have not yet begun to renew some things which are subject to renewal. Thus far maintenance on the outside has cost us not more than 3½ cents per gross ton pulverized. Labor of milling is also reduced because the man on each shift who looks out for the mills regularly has other duties to perform throughout the boiler plant when not milling coal. Based on actual time employed in milling, labor costs approximately 5 cents per ton and not over 11 cents per ton with all idle time charged in.

Operating Results from the New Boiler Plant

All tests were carried out on the same boiler between the months of May and October, 1924. No changes were made in the boiler (known as No. 9 unit) throughout the test except in case of the baffling arrangement in the front half of the boiler. Altogether five different baffling arrangements were used, giving for certain arrangements relatively poor results and for other arrangements good or very good results. Baffling arrangement known as No. 5 gave the best results. I am showing you two sets of efficiency curves; one set representing the average of all 39 tests, good, bad and indifferent; the other higher set representing the average of the eight tests with bituminous coal carried out with No. 5 baffling arrangement. The two top curves represent over-all unit efficiency with economizer. The two lower curves represent over-all efficiency without the economizer. With the best baffling arrangement 90 per cent or better over-all efficiency was obtained over a part of the curve from 175 per cent to 225 per cent of boiler rating; and 86 per cent or better from 150 per cent to 275 per cent of rating.

I have listed also the first fifteen most efficient tests, without consideration of the relation to the baffling scheme, the rate of steaming, the order of the test or possibility of gross error. Note that five tests run between 90 per cent and 93 per cent, and that the other ten run between 87 per cent and 90 per cent for over-all unit efficiency. Seven of these tests were made with the boiler ratings averaging between 200 per cent and 260 per cent of nominal rating. Note that throughout the tests the exit gas temperatures from the economizer were satisfactorily low, ranging from 250 deg. up to 300 deg. where the rating of the boiler did not exceed approximately 235 per cent to 240 per cent. Note also the high CO_2 in flue gas maintained throughout tests, ranging from 13.8 to 15.5 per cent.

As compared with these high efficiency figures on test, the average day-in and day-out over-all boiler plant efficiency for a period of 3½ months was found to be 85.3 per cent for the pulverized-coal-fired plant. This is to be compared with an over-all efficiency of 81.6 per cent for the new and old boiler plants combined during the same period. The efficiency for the entire boiler plant was pulled down because of stoker-fired banked boilers, a few of which were kept available for service during the testing period and during the time that the pulverized coal-fired plant was being tuned up, so to speak. At very poor efficiency we evaporated in the stoker-fired plant approximately 10 per cent of the total water evaporated, based on actual water fed to the boilers determined by meters. This indicates, therefore, that with the elimination of all stoker-fired boilers we can count on an over-all efficiency of the boiler plant of at least 85 per cent, averaged over a long period.

BOILER TESTS ON NO. 9 BOILER FIRED WITH PULVERIZED COAL, MANCHESTER STREET STATION, UNITED ELECTRIC RAILWAYS OF PROVIDENCE

A Discussion of Operating Results in Plant Economy

For a five-month period ending Nov. 30, 1924, the plant was run on 22,800 B.t.u. per kilowatt-hour generated, which is equivalent to 23,800 B.t.u. per net kilowatt-hour. The corresponding coal factors are 1.70 lb. per kilowatt-hour (net) and 1.63 lb. per kilowatt-hour (generated).

Based on these data, we feel that we may confidently expect to produce a net kilowatt-hour on 22,000 B.t.u. with 300-lb. steam pressure at the turbine throttle, with banked boilers eliminated and with machine hours of the vertical turbines further reduced. This, assuming for fuel 14,000 B.t.u. coal as fired, means 1.5 lb. per kilowatt-hour generated and 1.57 lb. per kilowatt-hour output. It is further based on the assumption that power generated per year will not exceed 75,000,000 kw.-hr., as the equipment performance at the time of designing the plant was predicated as a 70,000,000 kw.-hr. load.‡ The new equipment by itself will, of course, do better than this, as should be expected, based both on the excellent boiler plant efficiency and on the excellent water rate of the new turbine, which at its best point requires only 10.5 lb. steam per kilowatt-hour; at one-third load, 11.8 lb.; at full load, 10.65 lb.

Return on the Investment

From Jan. 1, 1918, to June 30, 1923, a period of 66 months, the average coal factor was 2.62 on the generated basis and 2.65 on the output basis. There has, therefore, actually been a decrease of 0.95 lb. coal per net kilowatt-hour and 0.99 lb. coal per kilowatt-hour generated. With the improvement in economy yet to be expected, this improvement is subject to increase. But let us take an even pound for conservative figuring. This means 31,200 gross tons coal saved per annum, on the basis of 70,000,000 kw.-hr. generated. At a cost of $6 a ton as fired, this represents $187,200 saved per annum. This, incidentally, is a return of 14.4 per cent on the cash outlay of $1,300,000. It is, however, a return of nearly 28 per cent on the increase in book value of the plant, after allowing for deductions for retirements.

Taking the entire power system development as a whole, we are now confident that with the proved success of the power plant job we will receive a return on the entire investment in excess of that originally hoped for, and equal to not less than 13½ per cent. This statement is made on the assumption that coal as fired at the power plant costs $6 per gross ton. Included in this investment are all non-revenue producing expenditures such as block signal system, underground conduits, etc.

‡The wide variation in the railway load curve with consequent unfavorable load factor is another element affecting adversely better performance.

Automotive Discussion at Brussels

THE rôle of the motor car in the economic development of the United States during the last two decades will be told in a report to be prepared by a committee of prominent Americans for consideration at the third general meeting of the International Chamber of Commerce at Brussels, June 21-27. Thirty-nine countries holding membership in the International Chamber will be represented at the Brussels meeting, at which prominence will be given to "Economic Restoration."

The general subject of motor transportation and highway development was added to the agenda of the Brussels meeting at the solicitation of the American Section. In the opinion of the American Section, the economic and social effects of the development of motor transportation in the United States have been of such great importance that a representation of the past and present American situation would be of great benefit to European delegates.

Roy D. Chapin, chairman of the board of the Hudson Motor Car Company, has been named chairman of the committee which will draft the report. Particular stress will be laid upon the use of motor transportation in supplementing the existing lines of rail and other transport. The question of highway development will also be covered in the report. The experience of the United States in the matter of "Rules and Regulations" of traffic and taxation of motor vehicles will be put before the Brussels meeting.

Tramway and Bus Relations

THIS subject came up at the annual meeting of the Tramways and Light Railways Association in London, England, and was discussed by many distinguished railway officials. It was the general opinion that the tramways were the only solution of the traffic problem, both from the economic and financial point of view, and that while the motor bus should be used extensively in auxiliary service, it was incapable of handling mass transportation.

National Association of Purchasing Agents

THE tenth annual convention of the National Association of Purchasing Agents will be held in Milwaukee May 25-28, inclusive. An exhibit will be held in connection with the convention. W. L. Chandler, Woolworth Building, New York, is secretary of the association.

Utility Men to Meet with Advertising Clubs

EXECUTIVES of public utility companies will take an important part in the convention of the Associated Advertising Clubs of the World at Houston, Tex., May 10 and 15, according to an announcement by William H. Hodge of Chicago, president of the Public Utilities Advertising Association. The public utility men will hold two sessions of their own. Subjects to be discussed are, "Costs and Results," "Better Copy," "Keeping an Organization Abreast of Its Advertising," "Motion Pictures," and "Good Will and Institutional Advertising."

Russians Hold Tramway Conference

THE second all-Russian tramway conference was held in Leningrad on Jan. 25. After two years of elaborate research work, the standing committee presented for the aproval of the conference standards covering axles, wheels and tires, grooved rails, trolley wires and rubber hose. Specifications were also presented for car springs, lamps, trolley and span wires, brushes and paving materials, white metal, and aluminum bows. Other parts of equipment were also considered. Standards for traction motors were discussed, and the question was raised as to whether standardization will be taken up with the International Tramway Association.

American Association News

Power Generation and Conversion

A MEETING of the committee on power generation and conversion was held at association headquarters, New York, N. Y., on March 13. Those present were: L. D. Bale, chairman; C. E. Bennett, H. W. Codding, H. E. Davis, F. W. Peters, R. L. Weber and G. I. Wright. Mr. Dixon represented C. A. Butcher and Mr. Mueller represented G. W. Saathoff.

An outline of the progress made by the National Electric Light Association on the subject of specifications for the purchase of fuel was given. The revision of these specifications has been a subject of investigation by a subcommittee of the prime movers committee of the N. E. L. A., and a tentative specification was submitted in 1923. Additional comments were included in the 1924 report. The committee on power generation and conversion considered it unnecessary to duplicate the work of the N. E. L. A., but a review of the subject will enable the committee to submit desired revisions.

Substations were divided into three proposed groups, full automatic, semi-automatic, and partially attended stations. Considerable difficulty was experienced in differentiating between substations to be classed in the second and third groups. The committee decided to define rather definitely automatic substations, in so far as these plants can properly be classified as fully automatic and semi-automatic substations. In regard to the third classification, the committee decided that where the results obtained by the functioning of the control schemes were not sufficient to justify a station being termed as semi-automatic, that the term automatic would be applied incorrectly, and therefore should not be used in describing this type of plant.

A full automatic substation was defined as a plant in which the control installed will give maximum protection to service and equipment and where all the functions of operation are performed without the aid of an attendant. A semi-automatic station is one in which the control installed will give partial protection to service and maximum protection to equipment. The act of placing this class of plant in operation after it has been discontinued either by reason of normal or abnormal operation must be accomplished manually.

The final report of the committee will contain a tabulation of various automatic devices, which are included in the functioning of equipment operating in the two classifications of substations.

An outline of the principal scheme of direct-current automatic feeder control was presented. This covered three combinations, not including the well-known resistor type. The committee decided to include in the report a discussion of the adaptability of the various control schemes offered with a view of determining the limitations of each.

A very comprehensive procedure for conducting tests of ventilation and investigation as to noise reduction in operation of automatic substations was presented.

In regard to the subject of high tensile strength bolts for use of superheated steam line pipes, it was brought out that the American Society for Testing Materials is preparing specifications on this subject, which are also being considered by the National Electric Light Association. In view of this, it appears unnecessary for the committee on power generation and conversion to take action at the present time.

Accident Prevention Posters Ready

FOLLOWING the recent national conference on highway safety which was held at Washington the American Electric Railway Association pledged itself to display certain accident prevention posters in its cars during the coming year. Subsequently, the committee on publicity caused the first of these posters to be prepared. Samples of them are being sent out now. Other posters will be worked out in co-operation with the representatives of the conference at various times during the year.

No charge will be made for these posters when ordered in reasonable quantities. By this is meant a sufficient quantity to cover the cars on a single system or the bulletin boards of a plant. Should an organization plan a city-wide campaign that would require the use of hundreds of posters, some charge might be found necessary.

The Advertising Section is receiving orders for the posters.

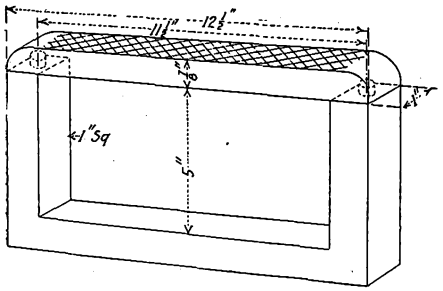
Maintenance of Equipment

Grinding Triple Valve Seats

A SIMPLE device for grinding triple valve seats has been installed in the Naval Academy Junction Shops of the Washington, Baltimore & Annapolis Electric Railroad. This company operates high-speed multiple-unit interurban trains between Baltimore, Annapolis, Washington and intermediate points. To prevent air blowing past the triple valve ports it is necessary that the surfaces of the piston and the valve seat be smooth and in close contact. As the piston can be removed easily it is a simple matter to grind down any high spots on its contact surface.

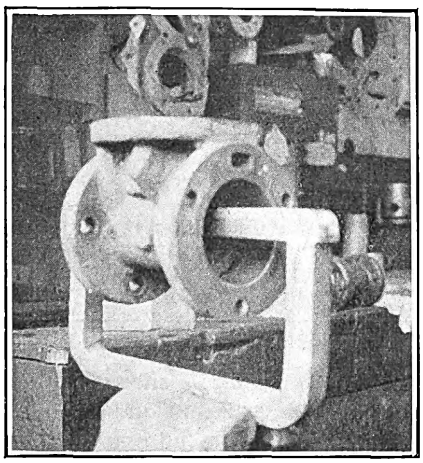


This Jig Is Used by the Washington, Baltimore & Annapolis Electric Railway for Grinding Down Triple Valves

The valve seat, on the contrary, is rather inaccessible for grinding. To accomplish this a jig has been built in the shape of a hollow square as shown in the accompanying illustration. A piece of 1-in. square steel has been bent to form three sides of the square. Across the fourth side is a piece of 1-in. x ⅜-in. cast iron with ⅜-in. serrations on its upper surface. The dimensions of the cross-piece are arranged to correspond with the interior dimensions of the valve. This piece is held by dowel pins extending from the ends of the larger member.

A vise holds the bottom of the U-shaped piece in a vertical position. The top bar is placed inside the triple valve casting as shown in the accompanying illustration. Grade FF carborundum is applied to the serrated cast iron surface and by moving the valve back and forth the seat is ground smooth.

By means of this apparatus it has been possible to restore triple



Triple Valve Casting in Position on a Jig Designed to Grind Down the Valve Seat

valves to good condition in a comparatively short time. The average is about two hours for taking the valve apart, grinding smooth the piston and the valve seat, and reassembling the parts. Previously it was necessary to send the valves back to the manufacturer for repairs.

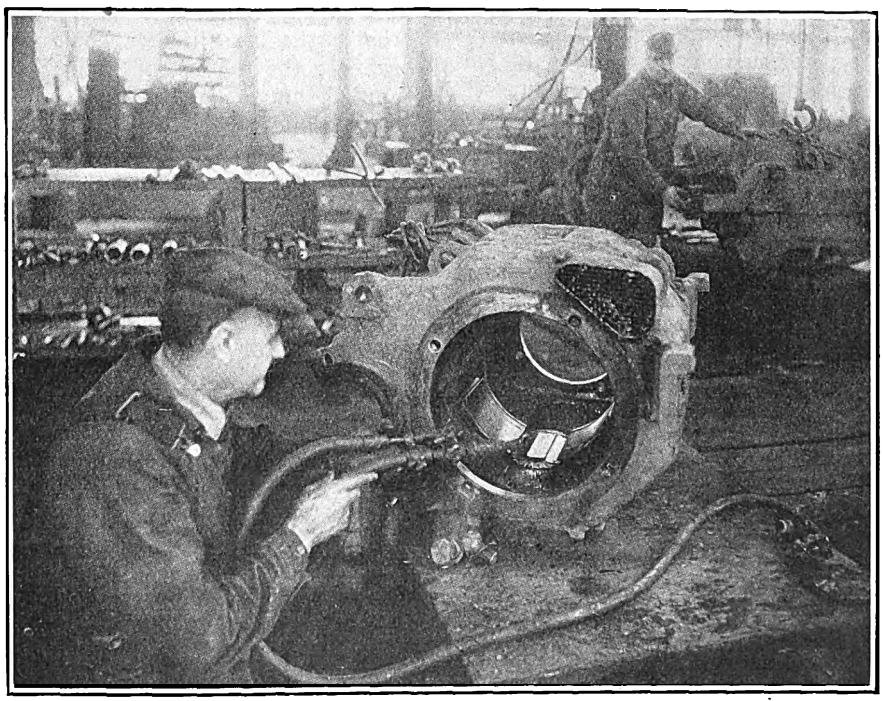
Spraying Varnish Inside Motor Frames

THE practice of coating the inside of motor frames with Sterling varnish after the field coils have been assembled is employed in the shops of the Department of Street Railways for the City of Detroit, Mich. The varnish is applied with a home-made spraying gun which has two flexible connections, one for the air supply and the other for the Sterling varnish. Convenient valves in the two lines provide for ready adjustment by the operator. The varnish is sprayed in around the field coils, and also covers places of the frame which are liable to cause short circuits or grounding from flashovers. An accompanying illustration shows a motor frame being coated with the varnish.

"Bad Order" Cards

THE blanks used in the repair shops of the Interborough Rapid Transit Company for "bad order" field coils and armature coils are reproduced in the accompanying engravings. These cards were mentioned in the article on the Interborough shops on pages 440 to 449 in last week's issue. These cards are 5½ in. x 7 in. The field coil card is printed on white stock, the interpole field card on blue stock and the armature card on buff stock.

The feature of these cards is the



Spraying Varnish Inside Motor Frame in the Shops of the Detroit Municipal Railway

Bad Order Cards at Interborough Shops

use of a cut on which the defects in the coil may be marked. The backs of these cards contain space for further remarks and also a duplicate of the cut.

Improved Motor Suspension

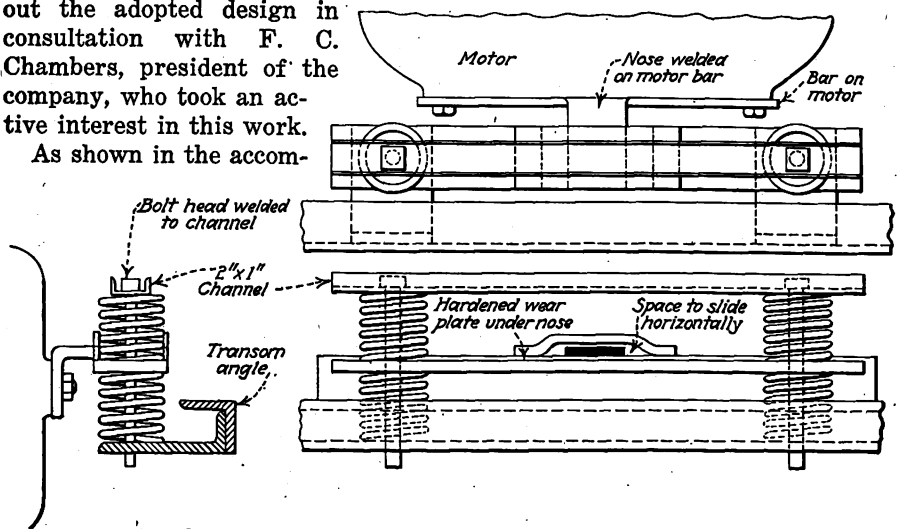
AN IMPROVED type of motor suspension has been developed by the Des Moines City Railway and is being installed on Brill 77-E-1 trucks in use on that property. The object has been to make the suspension more flexible to relieve the shock on the entire equipment. At the same time the design employed permits a certain amount of lateral motion at the suspension nose, so as to avoid binding and breakage of axle bearings.

Improvement in the customary type of suspension was considered an important and necessary step. C. R. McMahon, master mechanic, worked out the adopted design in consultation with F. C. Chambers, president of the company, who took an active interest in this work.

As shown in the accompanying drawing, a short flat nose is welded to the suspension bar bolted to the motor. This nose is supported between the two sets of suspension springs, on a flat bar. It can be seen from the design that the nose is thus permitted a certain amount of lateral motion.

Across the tops of the suspension springs, a 2-in. x 1-in. channel is carried. The bolts passing down through the springs are welded to this channel. This helps to hold the springs in a vertical position under the action of any side stress. The bottoms of the springs are supported on short pieces of angle fastened to the lower face of the transom angle to lower the point of support so as to permit the use of a longer spring.

Results from the use of this type of spring motor suspension show that the resilient construction relieves the motors of many shocks and hammer blows and reduces motor failures.



By Supporting the Motor on a Suspension Arranged to Permit a Certain Amount of Lateral Motion Axle Bearings Are Relieved of Binding and Excessive Wear and Breakage Are Avoided

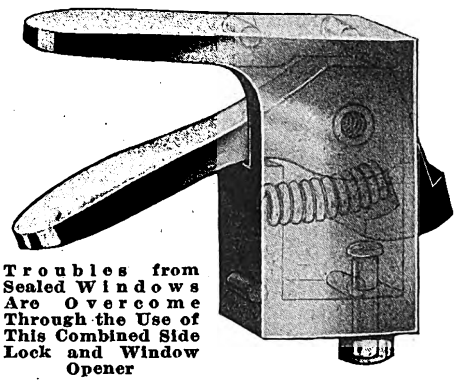
New Equipment Available

Buffing and Polishing Machine

AN EXTRA heavy-duty double spindle and a heavy-duty single spindle buffing and polishing machine have recently been placed on the market by the Cleveland Armature Works, Cleveland, Ohio. Both of these machines are chain-driven by alternating-current motors, designed for the particular service, set close to the spindles. The double-spindle unit is provided with two motors, each spindle being entirely independent mechanically and electrically. Both machines are equipped with Timken tapered adjustable roller bearings. Control is through an oil circuit breaker and push-button.

Window Opener Combined with Sash Lock

TO MEET the demand for a device which will assist in starting windows after they have been left shut for some time, the National Lock Washer Company, Newark, N. J., is placing a combined sash lock and window opener on the market. This device acts as a sash lock on a rack in a manner similar to other types manufactured by the company. In addition, a pin extends through the bottom of the lock case which, when the window is closed, rests on a plate on the window sill or a section of the rack turned at right angles. Pressure exerted against the lower finger piece of the lock is multiplied many times and transmits a downward thrust to the pin against the sill. This is sufficient to start the sash. When started, it usually can be raised quite readily. The lock is secured to the sash frame by four dowel pins and a through screw.



Troubles from Sealed Windows Are Overcome Through the Use of This Combined Side Lock and Window Opener

The News of the Industry

Railways Not Hard Hit

Small Damage to Electric Systems in Storm-Swept Zone—Distribution Plants Suffer

Despite the terrible loss of life and property in the tornado-stricken districts of southern Illinois and western Indiana, reports from the utilities operating in these territories indicate relatively small damage to electric railway properties. Many representatives of utility companies attending the convention of the Illinois Utilities Association in Chicago left hurriedly to return to their stations in the stricken districts. Of the towns which suffered the worst casualties, West Frankfort and De Soto, Ill., and Griffin and Princeton, Ind., are served by the Central Illinois Public Service Company, controlled by the Middle West Utilities Company; Murphysboro, Ill., by the Western United Corporation, and Duquoin, Ill., by the Illinois Power & Light Corporation. Other towns in which casualties were heavy in proportion to the population are served by municipal plants from which no reports have yet been received.

Everywhere in the devastated towns the electric light and power companies showed their public spirit by prompt restoration of service and the extension of help of every kind within their power. In West Frankfort, for instance, where it will take a month to restore gas service, electric lights were burning two days after the disaster.

A typical example of the effects of the storm is contained in the experience at Princeton, Ind., with more than seven thousand inhabitants. The tornado devastated the southern half of this town, completely wrecking a portion of the Consumers Power Company's 33,000-volt double-circuit transmission line and its distribution system. The Southern Indiana Gas & Electric Company's 33,000-volt transmission line supplying that company's interurban railway into Princeton was completely wrecked for more than a mile, and it will probably be several weeks before the traction line is again in operation between that point and Evansville, Ind.

Will Appeal to Governor on International Railway Rate Case

Frank C. Perkins, the Socialist member of the City Council of Buffalo, N. Y., has demanded that the International Railway be required to post a bond for $500,000 and give rebate slips to car riders in case the 8-cent fare decision of the Public Service Commission is not sustained. An appeal from the higher fare allowed by the state utilities board will be taken by the City Council.

The City Council also will ask Governor Smith to review the rate case with the idea that if the Public Service Commission has been found negligent, the Governor could be asked to recommend the removal of the commissioners from office.

When the City Council informed William R. Pooley, member of the state utilities board, of the ultimatum that the railway would undertake no track reconstruction or repaving because of lack of funds, Commissioner Pooley replied that the city has authority to compel the railway to put its tracks in such condition that the city can carry out its 1925 street paving program.

William F. Schwartz, commissioner in charge of this phase of municipal work, has informed the City Council and members of the Public Service Commission that the ultimatum of President Tulley of the International is delaying the repaving and improvement of more than 30 miles of streets in Buffalo.

$700,000,000 Transit Program

City of New York Proposes Staggering Expenditure for System to Be Municipally Operated—Thirty-nine Miles of Rapid Transit Construction Proposed

THE Board of Transportation of New York City on March 20 adopted additional subway routes in Manhattan, Brooklyn and the Bronx, aggregating 22.90 miles, the construction cost of which, not including track laying, station finish nor equipment, is estimated at $186,046,000.

The routes announced are to become important parts of Mayor Hylan's projected independently owned and operated system of rapid transit. They are additions to the city administration's independent subway building program as announced by Mr. Delaney last December. The figure quoted includes the boring of tunnels under the East and Harlem Rivers and Newtown Creek, but not that of the Staten Island tube nor its approaches and connections.

In the Board of Transportation's report it is estimated that construction of each mile of the new routes just adopted will involve an average expenditure of about $8,862,282.

Mere construction costs of the subways on routes adopted on March 20, together with the costs of the portions of the system approved on Dec. 9 last, have reached a total of $345,629,000.

A recapitulation of the estimated cost of the entire proposed comprehensive rapid transit development sponsored by the Mayor and as recently calculated by an administration spokesman, including actual construction, tracks, yards, equipment and station finish, indicates a grand total approaching $700,000,000.

The 22.90 miles of routes adopted on March 20 plus the 16.82 miles of routes approved last December bring the total accepted routage of the Hylan system up to 39.72 miles. Including double and quadruple track lines, the accepted track mileage amounts to 118.60.

The board's estimated cost of each route, together with the route and track mileage, is shown in the accompanying table.

These figures do not include shops, yards or equipment. The report points out that the most costly items in the estimates' expenditures are the tunnels, three of which will be under the East River, one under the Harlem River, one under Newtown Creek and another under the Gowanus Canal.

In his report to the Board of Estimate and Apportionment Chairman Delaney said:

> The Brooklyn crosstown line will be two tracks: the Culver line extension will be four tracks as far as the Jay Street tunnel; then two tracks under the river to Rutgers, Essex and Houston Streets.
>
> The Bronx Concourse line will be three tracks in Manhattan and under the Harlem River, and four tracks in the Bronx. The Fort Washington Avenue-Broadway-216th Street extension will be two tracks.
>
> It is anticipated that detail drawings of the Brooklyn crosstown line will be ready for contract bids before summer.
>
> The routes adopted and estimates of cost will be forwarded to the Board of Estimate and Apportionment as soon as completed.
>
> The engineers of the board are nearing completion of their studies for the Queens extension from the Union Station at Nott and Jackson Avenues, Long Island City, to Jamaica.

Although the bare construction of the routes, so far as they have been adopted, is only $345,629,000, the final total cost will far exceed that sum. In the course of the inquiry before Justice John V. McAvoy experts testified that it would require a sum equal to about one-half of the mere construction cost to lay the tracks, finish the stations and provide rolling stock and other equipment. This would put the additional cost of the independent municipal system, as now proposed, at about $175,000,000, and this, in itself, would bring the grand total up to $520,000,000 for the routes covered only in the Board of Transportation reports of last December and of March 20.

Route	Estimated Cost	Route-Miles	Track Miles
Brooklyn crosstown.....	$64,884,000	9.24	19.18
Culver line extension.....	60,000,000	5.77	22.44
Bronx-Concourse.....	38,681,000	4.85	12.20
Houston-Essex and Rutgers Streets.....	17,337,000	2.08	6.26
193d-216th Streets.....	5,144,000	0.96	1.92
Total.....	$186,046,000	22.90	62.00

Digitized by Google

The Interborough Rapid Transit Company, New York, will appeal for protection to the courts if ordered to extend the local subway platforms as recommended in the McAvoy report. The company estimates the cost of the entire work at $28,000,000 and says that it has not the money to pay its share, under its contract with the city. This subject was considered again at a hearing before the Transit Commission on March 23, when the company presented detailed estimates of the cost of extending these platforms, of other obligations under its contract and of its probable earnings and expenses during the coming year. At the close of this testimony, the meeting was adjourned to allow representatives of city and commission to examine the figures and later cross-question the company representatives.

Chairman McAneny presided. He declared that there was no question that the company must carry out its contract obligations, but there was always a question whether any order issued to it was just and reasonable, and the company had a right to appeal to the courts in any particular case for the meaning of the words "just and reasonable." He also thought the financial condition of the company should be considered in determining what was just and reasonable. For that reason the testimony presented at the hearing was pertinent to the question.

During the early part of this week, the Interborough securities were subject to heavy pressure on the New York Stock Exchange. On Monday I. R. T. stock sold at 13⅛ as compared with a high of 34½ during 1925, and the 5 per cent refunding bonds sold at 59½ compared with a 1925 high of 74½. The drop in Manhattan Elevated stock was even greater. The guaranteed stock fell to 65 from the 1925 high of 100 and the modified guaranteed stock to 32⅜ from a 1925 high of 51¼. Owners of the guaranteed stock did not accept the suggested reduced guarantee in 1922, whereas the holders of the modified guaranteed stock did accept the modified guarantee. Mr. Quackenbush, general attorney for the company, declared on March 22 that there would be no receivership for the company pending judicial determination of the company's obligation to lengthen the local subway platforms.

Fate of Missouri Bus Bill in Balance

The McCawley measure, designed to provide for state control over buses operated in Missouri, has passed the Senate, but is in for a sharp fight in the House. Opinions concerning the probability of its passage are divided, but Senator McCawley has already prepared a "short bill," which he will try to rush through if the full measure fails. The "short bill" merely provides that buses shall be declared common carriers under the terms of the act creating the Public Service Commission.

The governing idea behind the original bill was to give the State Public Service Commission exclusive regulatory authority. A certificate of convenience and necessity would not give an exclusive right to a route and the commission could grant a certificate to a railway to operate buses over a route on which buses were already operated.

Philadelphia Rapid Transit Explains

Sees "Power in Coils of the Octopus" —Resents Recent Malingering of Mitten Management

Service Talks, published by the Philadelphia Rapid Transit Company, Philadelphia, Pa., says Drexel & Company have found in the Philadelphia Electric Company a choice morsel through the hold of the bankers on an option on the Conowingo power development, through which it is proposed to harness the waters of the Susquehanna for the manufacture of electricity. According to *Service Talks*, it is now planned that Philadelphia Electric surplus shall be so used up in the Conowingo project that millions of dollars will go to the bankers by way of profits and commissions. Says that paper:

P. R. T. was in desperate straits in 1910. The attorneys for the management, fearing the effect of bankruptcy, prevailed upon Mr. Stotesbury, through the pretext of a stockholder's petition, to assume financial responsibility for the property. Mitten Management came to Philadelphia in 1911 at Mr. Stotesbury's request and after examining the property and seeing its possibilities, promised, if given absolute authority in all things, to rehabilitate the property and make it a credit alike to the community, the employees and the company. Mitten Management has now succeeded, but for the first ten years the bankers' domination stood in the way of the complete achievement possible of attainment for public, employees and owners.

As the building up of the property proceeded, the strangling influence of the banker group increased in proportion. The last straw came in 1920, when the Stotesbury interests forced the increased fare—against the protest of Mitten Management—in order to advance their selfish ambitions in other cities where increased fares were made difficult of attainment because of our success here with the 5-cent fare. After a long struggle, the bankers succeeded in increasing the fare, but their despicable tactics so strengthened the hand of men and management that they finally fought free from their demoralizing influence. The bankers' only interest in P. R. T. improvement was obviously to use the stabilized property to advance their own interests, instead of for the legitimate owners and employees of the company, and for the car riders. The 1920 increased fare lost P. R. T. 100,000,000 short riders, which forced the fare increase of 1924.

Service Talks says that "Mitten Management's record since 1920, when the coils of the financial octopus were thrown off, is the best evidence of what the future may hold for the owners of public utilities—honestly administered."

In discussing the question of Mitten Management *Service Talks* says in part:

Mitten Management will cost P. R. T. for 1925 an estimated $250,000—one-half of 1 per cent of gross earnings, and $100,000, representing 3 per cent of all construction expenditures, a total of approximately $350,000. These fees are for operating P. R. T. property and supervising new construction, and are used to pay the salaries and expenses of those supervising the management, some of whom have been trained in the Mitten organization, while others have been chosen for unusual skill in some branch of public utility management.

The capitalistic press endeavor to create the impression that this fee is a personal salary paid to T. E. Mitten. It is no more a salary than the 4½ per cent of gross earnings paid by the Bell Telephone Company to the American Telephone & Telegraph Company for similar services, or the 3 per cent of gross earnings which it has been proposed should be paid in the hope of securing similarly efficient operation of New York's new subways.

Mitten Management has given to P. R. T., without royalties or other charges for patent rights, all of its inventions, which include the most important improvements made in street car equipment during the past fifteen years. These embrace the near-side car, the center-exit car and the one-man car, with their many safety devices, which have been almost universally adopted elsewhere. Mitten Management's gas-electric motor bus, which bids fair to revolutionize the bus industry, comes to P. R. T. free of any cost for patents.

If Philadelphia wants the best transit system in the world, it can only get it by having the best men in the world to manage and operate it. Whatever agency gives this service surely deserves to share in the benefits—at least to the extent of its expenses—and to be in a position to pay the men who make its success possible.

In *Service Talks* distributed on March 26 the Philadelphia Rapid Transit Company indicated that it is endeavoring to obtain control of the Philadelphia Electric Company as a result of the controversy over the Conowingo power project. The statement says the "P. R. T. management's sole interest in P. E. lies in preventing the uneconomic Conowingo project being imposed upon P. E. stockholders, P. E. customers and P. R. T. car riders for bankers' profit."

Attempt to Amend Grant May Delay Kansas City Franchise

The bus franchise under negotiation for several months in Kansas City, Mo., to give the Kansas City Railways exclusive right to operate auxiliary buses on the city's streets has experienced at least two additional setbacks recently.

A bill agreed to by the Council committee in all its outstanding points was introduced into the City Council on March 16. It was expected the measure would pass the house at once and become a bona fide ordinance as soon as put through the regular Council channels.

Contrary to its presumed acceptability previous to the time of introduction for passage of the bill, an amendment was at once proposed by one of the city Aldermen to make the franchise effective only from the date the ordinance is passed and approved until six months after the receivership. As the present receivership is expected to be lifted about Dec. 31, 1925, the franchise, if approved, would probably become ineffective in a little more than a year.

The receivers doubt that the franchise as amended would be accepted with the sanction of Judge Kimbrough Stone, referee. They believe the court will not favor any plan for an investment such as is entailed in purchasing 63 buses, if the bus franchise is to run for a period less than three years. This would probably mean that the railway may not be at liberty to purchase the buses necessary to start.

Matters may, however, be changed by state legislation. The McCawley bill will, if passed, place the control of bus lines within the state in the hands of the Public Service Commission and would automatically render null and void any objections which officials of any city in Missouri may raise in regard to bus services.

Decision Against Atlanta Jitneys Favors Railway

The battle of the Georgia Railway & Power Company, Atlanta, Ga., against unregulated jitney competition appears to have been won on March 19, when Judge George L. Bell of the Fulton Superior Court denied a petition on the part of the Atlanta Jitney Bus Association to set aside as unconstitutional the anti-jitney ordinance passed on Feb. 8 by the City Council of Atlanta.

Judge Bell ruled that the anti-jitney law was constitutional. He said he would sign a formal order dissolving the temporary injunction secured on March 8 by the jitney bus association to prevent the city from enforcing its ordinance.

The court also declined to grant a writ of supersedeas for cars of less than 17 passengers. This automatically withdraws all five and seven-passenger machines from the streets of Atlanta as soon as the order is signed.

Although the Atlanta Jitney Bus Association is planning to carry the matter to a higher court, the points of law are brought out so clearly in Judge Bell's decision as to make this seem almost a futile procedure. Moreover, many bus operators, apparently realizing the hopelessness of their case, have already abandoned their buses and have secured employment elsewhere. These men will not return to work, and it appears very unlikely that new jitney operators can be found to carry on under the present legal status of the jitney in Atlanta.

The regulatory measure at Atlanta has been referred to frequently in the ELECTRIC RAILWAY JOURNAL since the matter became acute recently. Stated very briefly, the new law provides that all jitneys be prohibited from operating on any streets where there are car lines, on streets within two blocks of and parallel to streets occupied by car lines, and on streets in the downtown district of the city in what is known as the congested area.

Denver Tramway Organizes Bus Subsidiary

Realizing the necessity of transportation lines in various parts of the city not served by the street cars the Denver Tramways, Denver, Col., has organized the Bus Transportation Company and has asked Mayor Stapleton to place upon the ballots in the May 19 election a plea that the company be given a franchise. The buses will run on regular schedule with a 10-cent fare and transfers will be issued from one bus to another. Whether or not the transfer will be good on the railway line is not yet decided. The initial equipment will be ten modern buses.

Receiver Stenger of the tramway said that if the voters acted favorably upon the franchise the company would have an opportunity to plan extensions in the future, and that if the franchise was granted the first buses would be put in operation within four or five months after election. On the question of the installation Mr. Stenger said:

> The last few years have witnessed great changes in city transportation in the combination of the gasoline engine with the old type of buses. A motor bus has been produced, and while it has not yet been developed to a point of perfection, nor to a point where it can be called standard, it has convinced many people that there is a necessity for it in connection with regular railway service.
>
> Because there seems to be some sentiment in favor of buses and with a view to meeting changing conditions, it is the intention of the Bus Transportation Company to give them a trial in Denver.

New Ordinance Introduced

Councilman Rose's Plan for Cincinnati Street Railway Provides for Initial 7½-Cent Fare

A new franchise ordinance, based upon a capitalization of $25,000,000 for the Cincinnati Street Railway, Cincinnati, Ohio, and providing for regulation of operation by the city rather than for entire control, has been introduced in the City Council by Charles O. Rose, Councilman. Mr. Rose explained that he drew the ordinance chiefly in the hope that the provisions contained might serve as a basis for settling the present deadlock over the question of passing a 25-year 7½-cent fare contract.

The ordinance would allow the Street Railroad Director to make his own decision regarding submitting any of his orders to arbitration, while the pending ordinance makes arbitration compulsory. It provides that the fare at the start would be fixed at 7½ cents for two years by Council, with provisions for revision according to the earnings of the company at the end of that period. Mr. Rose also would allow revision of the entire ordinance every five years. The fare, when low, would allow a higher percentage of return to the company than when high, thus making an incentive for the company to bring the fare down.

While the pending ordinance provides 6 per cent return on capital stock and requires that 1 per cent may be used for fare control until Jan. 1, 1928, the new ordinance sticks strictly to a return on the investment and bases the rate of return according to the rate of fare, as follows:

Fare, Cents	Return
7	6½ per cent
6½	6¼ per cent
7½	6¼ per cent
8	6 per cent
8½	5⅞ per cent
9	5½ per cent
9½	5¼ per cent
10	5 per cent

The pending ordinance fixes the initial rate at 7½ cents, subject to change every three months, based on the theory of service at cost. The new ordinance provides that Council fix the fare for one period of two years at a flat rate. The initial rate is 7½ cents; the revision of fare taking place every two years is not based entirely on cost at the time of revision, but on the expenses of the company. Special provision is made for a revision of fares before two years in case of emergency.

The brief filed with the new ordinance mentions four subjects that require special treatment — the Cincinnati & Hamilton Traction Company, bus competition, rapid transit loop and new passenger depot. It suggests surveys on each of these subjects.

Many Changes Recommended for Oklahoma Railway

George H. Clifford of Fort Worth, who has made a survey of the Oklahoma Railway, Oklahoma City, Okla., for Stone & Webster, Inc., has recommended drastic changes in operation. He would abandon the use of the terminal station in the business center and operate cars through the down town section instead of over the terminal station loop. He also recommends increased service and an aggressive selling campaign to induce the public to use the cars. He finds that automobile "pick-ups" cost the company $50,000 a year. He also recommends purchase of several new cars and reconstruction of many now in use. Co-operation of city and state authorities to prevent cut-throat bus competition is held essential.

The improvements recommended to be carried out would cost $202,500. The report says that the facilities of the company are adequate to handle service at present, and the changes suggested are recommended for convenience and economy, and in the interest of efficient operation.

Full co-operation of patrons of the railway, as well as that part of the public owning private automobiles, and city officials is the one essential to place the railway in a position to give adequate service. When the railway is rebuilt there will be no further need for the South Robinson jitneys.

Improvements in equipment include the purchase of fifteen new cars at a cost of $112,500; equipping ten of the present safety cars for both single and double-end operation, at a cost of $44,200; equipping cars with power-saving devices, to reduce operating cost, at a cost of $6,100.

Parking rules should be amended to provide that automobiles moving into and out of parking spaces can do so without blocking traffic. Mr. Clifford said:

> Our study shows that it requires seven times more space to a person to move people in Oklahoma City by private cars than by street cars, and that in addition to automobiles moving in the streets, the parking space used by them is from 25 to 40 per cent of the total street space.

Increasing the average speed of cars from 8.7 miles to 9.8 miles an hour also can be accomplished under the proposed recommendations.

The report indicates that operation of buses as an adjunct to the railway probably will not be needed for some time, but as the city develops, it probably will be found necessary to operate buses as a supplement to electric service, for cross-town or suburban service.

A bill is pending in the State Senate which, if adopted, will authorize electric railways to operate buses in connection with city and interurban car service. George A Henshaw, receiver for the Oklahoma Railway Company, plans to establish bus lines as feeders to the interurban system at Guthrie, El Reno and Norman, if the bill passes, and also, if permitted by the State Corporation Commission, to abandon certain non-paying lines in Oklahoma City and provide bus transportation in lieu thereof.

Iowa Interurban Organizes Bus Company

The Fort Dodge, Des Moines & Southern Railroad, operating an interurban system through Boone, Iowa, will organize a bus line with $50,000 capital as the Fort Dodge, Des Moines & Southern Transportation Company, with officials of the interurban line as incorporators. The new company will establish and operate bus transportation through the same territory served by the electric lines. C. H. Crooks, president of the interurban, announcing the new corporation, said that the growing use of the automobile as a means of transportation was rapidly changing the desires of the public as to service requirements. Recognizing this fact and believing that it was the company's duty to serve the community it had determined to enter the bus business. He stated further that the bus service to be installed between the points now served by his road would be in addition to the electric service provided, and that operation of the buses would be in the hands of experienced transportation officials. The organizers of the new corporation are: C. H. Crooks, F. M. Johnston, C. M. Kelly, F. M. Steele and W. R. Dyer.

Electrification Measure Passed in Ohio

The Norfolk & Western Railway and the Van Sweringen railroad interests are said to be greatly interested in a bill passed by the Ohio State Legislature that provides methods whereby they can electrify their railroad properties. The bill gives the Public Service Commission power to make regulations for electrification of steam roads. The measure is required by the Van Sweringen interests to aid them in carrying out their plans for a new central terminal station in Cleveland. Under the franchise, roads entering the terminal must be electrified within five years after the new station is ready for use. The Norfolk & Western is understood to be considering the use of electricity on its lines within the state during the next few years.

Bus Proposal for Palo Alto Outlined

The Peninsular Railway, San José, Cal., has submitted to the City Council its plan for the substitution of buses on certain lines in Palo Alto proposed to be abandoned. Buses would be run on the same headway now used by the street cars over the route from the Southern Pacific Station or the Circle. The fare between Stanford University and the Southern Pacific station, Palo Alto, on the street cars will be the same as at present, namely, 6 cents for the one-way trip. The fare on buses will be 10 cents, passengers to be allowed to transfer free from bus to street car, but to pay 4 cents to transfer from street car to bus. The franchise for buses is to be limited to Aug. 15, 1953, the expiration date of the present franchise. If after operation for a year the revenue derived from the buses is not sufficient to pay operating expenses, depreciation, taxes and 6 per cent on the investment, it would be left to the company to decide whether the service would be abandoned. City lines in Palo Alto have been able to pay only operating expenses for several years. The city intended to improve streets in connection with paving. This would demand a reconstruction cost to the company of about $230,000. Conferences between the company and the City Council of Palo Alto followed, with the result that the company petitioned for abandonment of city lines north or east of the Southern Pacific Railway's tracks.

Some Recent Newspaper Comments

"Exit the Trolley—Enter the Motor Bus." This is the title of an editorial in a recent issue of the Detroit *Free Press* in which the statement is made: "That the trolley car as a means of transportation is already out of date is perfectly obvious." Likewise the *Free Press* says that further building of trolleys in Detroit will prove a mistake and a waste. It is "convinced that if the main arteries . . . could be cleared of their tracks, and an adequate number of motor buses substituted for the present trolley cars, the public would be more satisfactorily served." The *Free Press* was fearful about the city's purchase of the local railway from the very outset. It "warned the voters that they were purchasing a system of transportation that was fast becoming obsolete."

But these are not expressions of opinion that are isolated. Similar prattle in the daily press is encountered at almost every turn. Says a paper down in Georgia (identity unknown): "We may be called foolish for writing it but the street car—the old, clumsy, costly, noisy, weighty blunderbuss of the present day—is headed for the junk heap." In a reference to the jitney situation in Atlanta it warns the "arrogant street railway officials" to remember. On the other hand, the Toronto *Globe* says that "the day of the trolley may have gone in Detroit, but the present system will likely remain in Toronto for some years at least." But the *Globe* appears to be not altogether sure of itself, for in another place it says that "the future of the trolley car, of course, presents a grave problem for Toronto." It sees the Toronto Transportation Commission "not entirely wedded to the trolley car," despite the vast expenditures made in recent months on the railway.

As the Greenboro *Record* sees it "there is no argument against the bus." It sees an economic warfare being waged the country over between vehicles that run on rubber and those that run on rails, and it looks upon the matter as having "developed some interesting situations." However, that paper inclines to the belief that "the time is not yet come when the street cars have outlived their usefulness." Even the New York *Evening Sun*, in its issue of March 26, referred to the "present old-fashioned street railway car."

These quotations, taken at random from recent newspapers, are fairly representative of much of the comment current at the present time.

Merchants Lease Lebanon Lines for Day

Every one in the city of Lebanon, Pa., and surrounding territory rode free on the street cars on March 11. That day, from 8 a.m. to 5 p.m., the entire railway system of the Reading Transit Company, in Lebanon, was leased to the retail merchants and free transportation was provided as a means of getting more people to attend a special "Prosperity Day" sale in the stores.

The plan was suggested by officials of the Reading Transit Company to the merchants with the claim that it would increase sales. More people rode the cars than on any previous occasion in the history of the Lebanon division of the system, and the merchants had bigger total sales than were ever recorded for a single day's business.

Normal daily receipts of the railway increased about 50 per cent. Merchants leased the lines for a sum representing the average full day's receipts. The extra money received by the railway came from patrons who rode the cars prior to and following the hours during which the lease was effective. Fares were also collected from people who rode between zones on the suburban routes, the free service being restricted to those who traveled the entire distance into the city from points outside of Lebanon.

Aside from the increased revenues of the day the railway received a tremendous amount of favorable publicity in Lebanon and the surrounding towns. The company, in its own advertising, called attention to the free service, and in addition every merchant in his advertising for the "Prosperity Day" sale urged patrons to "ride the street cars." Posters were used on the street cars for several days prior to "Prosperity Day" to remind people to "Ride Free Wednesday and Shop in Lebanon."

$20,000 in Prizes Offered

Prizes aggregating $10,000 have been offered by Bonbright & Company, Inc., New York, for the best contemporary review and forecast of the electric light and power industry, to be written in the form of an article summarizing the progress of the decade 1920-1930, and dated as of Jan. 1, 1930. It will thus be, in effect, a five years' review and a five years' forecast.

The article should comprehend the development of the industry in all its phases. It should treat not only of engineering accomplishments, but include also matters affecting public relations, finance, markets, transmission and distribution of electricity, its utilization and its effect on the industrial and social structure of the nation.

Bonbright & Company, Inc., are conducting this competition in the hope and belief that such constructive analysis will prove of real value to the industry. The donors have prepared a "Data Book" of the most generally accepted statistics on the industry at present, a copy of which will be forwarded without charge to any contestant.

The American Superpower Corporation is offering a supplementary award of $10,000. The competition is open to all.

Hylan Transit Bills Killed

Mayor Hylan's transit bills were defeated in the New York Senate on the night of March 26 by a party vote of 28 to 21.

The Legislature took a step toward carrying out the recommendations of the McAvoy report, however, when the Assembly passed the Nicoll bill taking away from the Transit Commission the power it now has to alter contracts entered into by the city administration. Its passage by the Senate is forecast.

The three bills defeated had the approval of Governor Smith. They provided for the exemption of $275,000,000 in transit bonds from the city's constitutional debt limit, the abolition of the Transit Commission and for permission to the city to own and operate a municipal bus system.

News Notes

Wants to Substitute Buses. — The Seattle & Rainier Valley Railway, through its general manager, Walter N. Brown, has applied to the Department of Public Works at Olympia, Wash., for permission to replace street cars with buses on its Seattle-Renton line. The company will use the equipment taken off the Renton line to improve its service on the line within the city. The rails to Renton will be left for freight carriers and for emergency passenger service. Rail passenger service will be maintained to Rainier Beach. The buses, the application states, will make the entire round trip between Seattle's downtown section and Renton over the same route now covered by the cars and presumably on the same half-hour schedule. The bus rate will be 20 cents between Seattle downtown and Renton and 15 cents between Bryn Mawr and Seattle. The distance between Seattle city limits and Renton is about 4 miles and the entire run from downtown 12.59 miles.

Buses Will Succeed One-Man Cars.— Buses soon will supplant one-man trolleys on the streets of the city of Geneva, N. Y., and will replace interurban cars on the Geneva-Waterloo-Seneca Falls line, according to plans announced by C. D. Skuse, superintendent of the Geneva, Seneca Falls & Auburn Railroad. Formal application will be made to the Public Service Commission for permission to abandon the trolley lines and operate two or more buses instead. The move is said to be a popular one as the buses will reach districts not now accessible to the trolley lines, notably factory and park districts. The company expects to operate 29-passenger buses. This road parallels the present trolley route.

Relief from Paving Charges Granted. —On March 12, 1925, the Governor of Montana signed a bill intended to relieve the electric railways of the State from all charges for paving except where the damage to the pavement is caused by the presence of the tracks in the highway or by the carrying out of repairs to the tracks.

Retains Attorney for Appeal.—The city of Denver, Col., declares that it has retained Harvey Riddell as special attorney to prepare its appeal from the decision of Judge Lewis relative to the Denver Tramway having a perpetual franchise over the streets of Denver and that it will carry the case direct to the United States Supreme Court.

Investigation Recommended. — In a recent report to Mayor Kendrick of Philadelphia, Pa., City Solicitor Gaffney stated that he believed an investigation should be made into the operation of the Philadelphia Rapid Transit Company. The communication was in compliance with a request by the Mayor for an opinion regarding the company's purpose to increase the dividend rate on its stock from 6 to 8 per cent and to give Mitten Management, Inc., extra compensation estimated at upward of $300,000 a year. In his letter to the Mayor Mr. Gaffney pointed out alleged discrepancies in P.R.T.'s annual report and figures submitted to the Public Service Commission at the time the company applied for the latest fare increase. He said further that he recommended, as he did in his letter of Jan. 21, the passage of an ordinance appropriating $75,000 for the carrying on by the city of such investigation. At a subsequent meeting Councilmen were divided on the advisability of granting the $75,000.

City Not Party to Suit.—Newspaper reports from Shreveport, La., state that the time has expired for the filing of opposition by the city to the petition of the Shreveport Railways asking for an increase in fares from 6 cents to 7 cents. The company petitioned for the higher fare more than 60 days ago. Following the newspaper comment that the city was too late and that the case could be proved by default, Mayor L. E. Thomas issued a statement in which he said that the city was no party to the suit brought by the company before the Louisiana Public Service Commission. He said further that the proceeding was an *ex parte* one and that the company was compelled to furnisn to the commission sufficient evidence to justify any judgment rendered.

Rates Approved. — The New York Public Service Commission has approved the amended tariff of the International Railway applying to service on the Buffalo-Tonawanda-Gratwick and Kenmore-Tonawanda lines. The rate between Buffalo and Kenmore has been changed from 7 cents cash fare, four tickets for 25 cents to 8 cents cash fare with two tickets for 15 cents. The new ruling became effective on March 19. The commission has also approved the tariff applying to passenger service on the Buffalo-Lancaster division of the International Railway, which provides that tickets sold in strips of two will be accepted on cars of this line and applied in part payment of through fares as the equivalent of 8 cents. It also provides that passengers boarding local cars in Buffalo, upon payment of the local fare and application to the conductor, will receive a transfer, which, when presented by original purchaser to a conductor on the Buffalo-Lancaster division, will entitle purchaser to a credit, equal to the local fare so paid, toward the payment of fare on the interurban.

Foreign News

London Dividends Declared

Final dividends were declared on Feb. 5, for the year 1924, on the stocks of the London Underground group of companies. The rates for the whole year were as follows:

Company	Per Cent
Metropolitan District Railway (ordinary)	3½
London Electric Railway	4
Central London Railway (deferred)	4
City & South London Railway	4
London General Omnibus Company	6

These are all at the same rates as the dividends of the previous year, except in the case of the bus company, which paid 9 per cent for 1923. The bus company dividend, unlike those of the others, is free of income tax.

German Electrification Plans

Information regarding the electrification of the German railway system was given out at a recent meeting of the German Association of Architects and Engineers in Berlin. The greatest progress has been made in Bavaria, this being largely due to the abundant water-power resources. Work is nearing completion on the electrification of the Munich-Garmisch line. Financial credits have been secured for the conversion of the Munich-Rosenheim-Kufstein line.

The projected electrification work for 1926 includes the Munich-Ratisbonne and the Halle-Magdeburg lines. At a later date it is intended to convert the Berlin-Munich lines via Progstzella and via Hof and other lines which will link up the sections already electrified in Saxony and Silesia. There are 600 km. of electrified lines now operating.

Glasgow Railways May Electrify

Electrification of the underground and surface railways in Glasgow, Scotland, is now under discussion. The Town Council's health committee has passed a resolution asking the Town Council to promote an order in Parliament providing that within a certain number of years the railways within the city should be electrified, and that thereafter no steam locomotive should be used in that area. The object of this move is to diminish the smoke, which is pronounced in Glasgow.

Some time ago electrification of the underground lines in Glasgow was considered, but was turned down on the ground that the possible traffic increase would not allow a return on the additional capital expenditure.

Tramway Passes Given as School Prizes.—A free pass on the tramcars for one year has been offered by the Tramways Committee, West Ham, England, as a prize for the best essay on the 21st anniversary of the local tramway undertaking. The second prize is a free pass for six months and the third prize a free pass for three months.

Valuations Before Courts

St. Paul and Minneapolis Procedures Regarded Largely as Formalities in Connection with Fare Matters

The Minnesota Railroad and Warehouse Commission and the St. Paul City Railway have appealed to the Minnesota Supreme Court from an order of Judge R. D. O'Brien of the Ramsey County District Court which required the commission to make a return to the court of its findings published March 6 as to the valuation of the property of the railway. The return was to have been made March 9, but the time was extended to March 14. An endeavor will be made to have the case advanced on the calendar for April review.

Notice of the appeal was served on Corporation Counsel C. F. McNally and his assistant, A. A. Stewart, who instituted the suit against the commission for an order to show cause, they said, in an effort to protect the rights of the public by getting a court decision as to whether the commission's valuation order is final.

The appeal comes upon the refusal of the court to quash the order to show cause, on petition of the commission, et al. It was maintained by the petitioners, the commission and Judge D. F. Simpson of counsel for the company that the findings on valuation by the commission and returned March 6 do not constitute an appealable order and that therefore there was nothing to return. They question the jurisdiction of the court on the ground no final order has been filed. The court held that until it had examined the findings it could not decide whether they constituted an appealable order.

These proceedings are another step in the commission's exercise of a function to determine a fair rate of fare.

As a matter of precaution the city of Minneapolis has appealed to the Hennepin County District Court from the valuation of $25,300,000 placed on the property of the Minneapolis Street Railway in the process of determining a proper permanent rate of fare. This is only a precaution and does not indicate the city will fight the valuation, although the company will ask a 7-cent fare instead of the 6-cent emergency rate in effect now, it is understood. The action is based on the fact that on April 30 the Supreme Court will hear St. Paul's appeal from the valuation placed in rate finding proceedings on the property of the St. Paul City Railway. City Attorney N. M. Cronin said that if the Supreme Court should hold with St. Paul that the valuation fixed by the commission on the property of the St. Paul City Railway was final the 30-day period in which the city might appeal would have gone by, and so to protect itself the city had served notice.

The Senate committee on general legislation has recommended for passage a bill introduced by St. Paul Senators allowing the Minnesota Railroad and Warehouse Commission to establish a metropolitan district of Minneapolis and St. Paul with a single rate of fare, where now there is a rate of one fare of 6 cents in either city and 12 cents for interurban traffic between the intercity political limits. This measure will complicate the rate fixing proceedings before the commission if it is passed and signed. Another bill up for public hearing transfers control of the railways in Minneapolis, St. Paul and Duluth from the commission back to the several city councils.

The first bill is opposed by Minneapolis on the ground that inasmuch as the Minneapolis Street Railway carried 51,000,000 more passengers last year than did the St. Paul City Railway under the proposed law 4.8 per cent of the riders would be benefited, or the proportion that travels from one city to the other, and Minneapolis riders would lose more than $1,000,000 a year thereby.

Results for Year in Chicago Considered Satisfactory—Residue Receipts $11,506,717—$92,240,480 Paid to City for the Eighteen Years of Present Contract

A YEAR of intensive expansion of facilities and energetic cultivation of customer good will is indicated by the annual reports of the Chicago Surface Lines and the companies comprising them, the Chicago Railways, Chicago City Railway, Calumet & South Chicago Railway and the Southern Street Railway. Total earnings were $58,081,700, the highest in the history of the consolidation except the year of 8-cent fare, 1922.

Residue receipts were $11,506,717, from which the deduction of 5 per cent on purchase price was $8,127,158. The net is divisible under the franchises 55 per cent to the city and 45 per cent to the companies. Thus the city received $1,611,257. The income accounts of the two major divisions of the surface lines show:

	Residue Receipts	Net Income
Chicago City Railway....	4,602,687	1,444,888
Chicago Railways.....	6,904,030	777,173

The Chicago City Railway paid four quarterly dividends of 1½ per cent each on the $18,000,000 of capital stock, the dividend amounting to $1,080,000 and leaving $364,188 to be carried to the surplus fund, which at the close of the year was $2,829,349. The company paid off $136,000 loans representing capital expenditures of previous years. The Chicago City Railway report was delivered by Leonard A. Busby, president, separate from the Surface Lines report.

The year was noted as a record breaker from the standpoint of passengers carried. Henry A. Blair, president of the Surface Lines, points out that in April, 1924, the high month, the daily average of revenue passengers carried was 2,352,285, while on Dec. 24 the staggering total of 4,657,793 (2,674,064 revenue) was registered. The percentage of revenue passenger increase was 0.64. The accompanying table shows the average and totals for four years. The increase in car-miles was 4.14 per cent.

The lines added 98 double-truck passenger cars, which brought the total to 4,008 (all kinds). Seventy-three were built in the company shops and 25 were in process of construction. The number of cars overhauled was 1,000, a record. There was an increase in the use of multiple-unit trains and in one-man cars, which are being used on fourteen routes. Under the heading operation, Mr. Blair says:

> In pursuance of our established policy of service improvement, much was accomplished during the year covered by this report. All of the 317 new cars purchased since Feb. 1, 1923, are in operation, and there was an increase of 5,000,000 in car-mile operation in 1924 and 1925 as compared with the previous fiscal period. A total of 1,000 cars was overhauled and painted, an increase of 197, or 24 per cent, over the preceding year. Practically all car schedules of the system have been rewritten, some of them several times, to secure more efficient use of equipment and to meet changing traffic conditions. Wages of the trainmen's organization were increased 3 cents an hour during the first four months of the year over a corresponding period in 1923 and 2 cents more from June 1, in compliance with the arbitration award of the previous year. Our trainmen are the highest paid platform men in the electric railway industry.

Rerouting in the loop district elimi-

EARNINGS, EXPENSES AND DIVISION OF RESIDUE RECEIPTS OF CHICAGO SURFACE LINES FOR TWELVE MONTHS ENDED JAN. 31

	1924	1923

INCOME STATEMENT OF CHICAGO RAILWAYS FOR YEAR ENDED JAN. 31, 1925

Company's share (60 per cent) of residue receipts of Chicago Surface Lines	$6,904,030
Deduct: Joint account expenses	225,000
	$6,679,030
Deduct: Interest at 5 per cent on capital valuation	4,684,130
Income divisible with city of Chicago	$1,994,900
City's 55 per cent of divisible income	$1,097,195
Company's income:	
45 per cent of divisible income	$897,705
5 per cent interest allowance on capital valuation of property	4,684,130
Interest on bank balances	109,253
Interest on treasury securities	79,057
Total income	$5,770,146
Deductions:	
Interest accrued on—	
First mortgage bonds	$2,784,700
Consolidated mortgage bonds	1,711,221
Purchase money bonds	203,650
Interest on loans	52,621
Federal income tax on interest coupons	67,500
Corporate expenses and interest adjustments with Chicago Surface Lines	173,280
Total deductions	$4,992,973
Net income	$777,173

INCOME STATEMENT OF CHICAGO CITY RAILWAY FOR YEAR ENDED JAN. 31, 1925

40 per cent of the residue receipts of Chicago Surface Lines	$4,602,687
Deduct: Joint account expenses, interest on capital investment of the Chicago City Railway, Calumet & South Chicago Railway and Southern Street Railway	3,668,028
Net earnings of South Side Lines	$934,658
City's 55 per cent as per ordinances	514,062
South Side Lines' 45 per cent as per ordinances	$420,596
Less: Southern Street Railway's proportion, as per ordinance	23,132
Company's proportion	$397,463
Add: Interest on capital investment	2,780,378
Income from operation	$3,177,842
Other income	17,526
	$3,195,368
Interest on bonds and notes outstanding	1,751,180
Net income	$1,444,188
Add: Surplus at Jan. 31, 1924	2,465,160
Surplus	$3,909,349
Dividends, 6 per cent	1,080,000
Surplus at Jan. 31, 1925	$2,829,349
Percentage of net income to capital stock at par	8.02%

nated 11,000 turns a day at congested corners. The average gain for each car in getting away from loop crossings was 20 seconds.

The attitude of the city administration and the Illinois Commerce Commission was favorable and the latter adopted a policy that it was uneconomical for the company to make extensions in streets where the city has not extended sewers, water mains and other underground improvements.

Bus expansion was vigorously contested and will continue to be so contested, the report notes. Application to expand the boulevard and park bus systems into general transportation systems are pending and numerous efforts have been made to extend bus service to outlying and suburban districts. However, a number of these applications have been amended so as to eliminate routes which would compete or interfere with the Surface Lines.

In the printing department 1,895,552,000 transfers were printed at a cost of $99,959, or 5.21 cents a thousand, as compared with 1,823,183,000 transfers printed last year.

The Surface Lines were under the management of Guy A. Richardson during the period covered by the report.

A total of $92,240,480 has been paid to the city by the companies for the eighteen years under the present ordinances, including $14,458,000 for street paving, $9,102,000 for cleaning and sprinkling right of way, $5,186,000 for maintenance paving and $27,260,000 for general taxes. The major item was the city's 55 per cent of net revenue, which totaled $34,352,492 and, with interest accretions, constitutes a fund of $40,000,000, which is the impetus for a $640,000,000 municipal ownership and subway proposal now before the voters.

E. A. Cudahy an Illinois Power & Light Director

The annual meetings of the Illinois Power & Light Corporation and its subsidiary, Illinois Traction, Inc. (Illinois Traction System), were held at Chicago, on March 16. Clement Studebaker, Jr., president, presented the annual report for the calendar year 1924. It showed the progress made in the properties operating in the States of Illinois, Iowa, Kansas and Nebraska.

The old officers and directors were re-elected, with the following changes:

E. A. Cudahy, Jr., Chicago, vice-president of the Cudahy Packing Company, was elected director of the Illinois Power & Light Corporation to succeed H. E. Chubbuck, Peoria, Ill. P. C. Dings, Chicago, one of the directors, was elected treasurer, to succeed George M. Mattis, Champaign, Ill.

STATISTICAL DATA OF CHICAGO SURFACE LINES FOR THE FISCAL YEARS ENDED JANUARY 31, 1925

Comment on D. U. R. Report

Remarks of Late President Stevenson on Outlook for Company Optimistic —Statistics Disappointing

The net income of the Detroit United Railway, Detroit, Mich., for the year ended Dec. 31, 1924, after payment of all taxes and interest charges, was $302,172, including profits on the purchase of 4½ per cent bonds during 1924, used to take down payments of $150,788 made by the city to the Security Trust Company. For the year 1923 the net revenue of the company was $942,430, after deductions for operating expenses, maintenance, taxes and interest payments made on bonded and other indebtedness.

In submitting the report for the year 1923 the late E. G. Stevenson, president, expressed the opinion that there was no reason to expect any diminution of earnings that would interfere with the continuation of the payment of dividends. For the first four months of 1924 the company experienced its greatest period of prosperity as compared with any similar period since the road was operated as a purely interurban property, but from May a general industrial depression occurred which especially affected the railway. Mr. Stevenson explained that in consequence of this and of the ever-increasing competition of buses operating on routes paralleling the principal interurban railways there was a decrease of $568,024 in the gross revenue from passenger traffic alone in the last eight months of the year as contrasted with the similar period in 1923.

Said Mr. Stevenson:

The increase in the operating expenses as compared with the previous year is more than accounted for by increased wages for platform men and other classes of labor which were in effect for only a part of 1923 and by additional car mileage run to meet the competition of buses. In addition, there was an unusually large expenditure on car equipment, which is now on the whole in much better condition than for some years past; indeed, this can be said of all the company's properties.

The competition of buses became so onerous both as regards frequency of service and reduction in fares that finally in the autumn of 1924 the board, after careful consideration, decided it would be necessary to effect arrangements that would result in the co-ordination of service between the buses and the railways, and a large expenditure has been made since that time in effecting such arrangement.

The directors are glad to be able to state that they confidently anticipate very substantial savings in the operating expenses of the railways in the year 1925 as compared with 1924, and this without any impairment of efficiency or of reasonable service to the public. These savings will be brought about mainly by the operation of electric cars by one man instead of by two men, the purchase of electric power instead of generating it ourselves, the substitution of buses for electric cars in the city of Detroit for the transportation of interurban passengers between your interurban lines and your central interurban station and the co-ordination of railway and bus services on all important routes, thus very appreciably reducing the mileage run by cars and buses.

Very substantial savings in these directions have already been made and in the aggregate your directors estimate the reductions in the operating expenses of your railways in 1925 as compared with 1924 at about $800,000.

Increased passenger fares now effective will, it is estimated, result in the addition of about $350,000 in the gross revenue in the year 1925 as contrasted with 1924, assuming that there is the same volume of traffic in both years.

During the year $9,000,000 of Detroit United Railway five-year 6 per cent first mortgage collateral trust sinking fund bonds were sold. The sinking fund for these bonds is $1,000,000 per annum, payable for the first three years out of money owing by the city of Detroit for the purchase of the city lines and in addition $500,000 per annum, for five years, payable by the company. During the year $750,000 of this sinking fund became due and was paid, of which $500,000 came from money owned the company by the city and $250,000 was paid by the company. At the end of the term of this mortgage, viz., five years, it will be reduced to $3,500,000 by sinking fund payments. The proceeds of the $9,000,000 issue were absorbed mainly in retiring un-

EARNINGS AND INCOME OF DETROIT UNITED RAILWAY FOR YEAR ENDED DEC. 31, 1924

Gross earnings from operations:		
Passenger		$6,773,475

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population.

Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials.

Wages index is relative average maximum hourly wage of motormen, conductors and operators on 100 of the largest street and interurban railways in the United States, weighted according to the number of such men employed.

derlying bonds and in payment for 4½ per cent bonds that had been purchased to take over the city of Detroit payments, which bonds were placed under the mortgage to provide for payments into the sinking fund of $1,000,000 per annum for the first three years.

In addition, during the year, $1,000,000 of Detroit United Railway 6 per cent ten-year equipment trust certificates were sold, secured by new electric cars and buses purchased. The sinking fund for these trust certificates will redeem them at the end of ten years.

$2,600,000 FOR BETTERMENTS

The sum of $2,608,020 was expended during the year on additions and betterments to the properties. In addition $1,813,416 was expended on way and structures and equipment and charged to operating expenses.

Large expenditures had to be made during the year to secure the co-ordination of competing bus services, for the purchase of buses and cars, for the provision of transfer stations and other facilities in connection with the substitution of buses for cars in the city of Detroit, for the fulfillment of obligations to municipalities and for necessary additions and betterments. Mr. Stevenson quite frankly said that further financing was necessary to reimburse the treasury for these disbursements.

Deficit in February in Toledo

Despite the highest average of revenue passengers carried per day since May, 1924, February operation of the Community Traction Company, Toledo, resulted in a deficit of $1,774, according to the report of Commissioner E. L. Graumlich submitted to the board of control at its regular meeting. Gross revenue was $308,259 and operating expense $216,589. Considerable savings are shown over last year in cost of transportation, power and general expense. Maintenance ran $40,000 ahead of February, 1924, due to a clean up of job orders. Auxiliary bus service showed a loss of $1,683.

A total of 4,087,510 revenue passengers was carried, averaging 7.91 per car-mile operated. The daily average was 145,982, compared with 182,092 at the industrial peak of last year, which came in the corresponding month.

The railway was forced to borrow nearly $100,000 recently for payment of bond interest and this is reflected in an increase in interest on floating debt. There is a shrinkage in income from track rentals due to the abandonment of city service by interurban lines.

February Poor Month in Grand Rapids. — With a drop in passenger revenue of $18,708 in February under the similar month in 1924 the Grand Rapids Railway, Grand Rapids, Mich., lacked $16,699 of meeting its expenses and its allowed 7¾ per cent return on its valuation. This boosted the deficit in the equalization account to $158,747. The number of passengers carried during the month was 15.76 per cent under February, 1924. The company in December and January met its expenses and also the allowed return on its valuation.

Net Income Decreases

Duluth-Superior Traction Company Reports Elimination of Jitney Has Increased Passenger Revenue

Gross revenues of the Duluth-Superior Traction Company, operating in Duluth, Minn., and Superior, Wis., for the year ended Dec. 31, 1924, showed a decrease of $118,575, compared with the previous year. The enforcement of the bus regulatory ordinance and improved general business conditions during the last four months of the year reduced this rate of decrease. These facts were contained in the annual report of the company, recently submitted to the stockholders by A. M. Robertson, president. Operating expenses showed a decrease of $14,929. The net income, transferred to profit and loss, also showed a decrease of $81,107 compared with the year 1923. During the year $55,933 was expended for renewals and charged against depreciation reserve. Additions to property during the year took $109,296.

The president of the company says that the officers have considered bus transportation as a feeder to street car lines and accordingly on Dec. 3 of last year organized the Duluth Coach Company, which purchased and put into operation on Dec. 18 an automobile coach as a feeder to a street car line, thus serving a residence district which had previously been without any public transportation service.

The report states that unfair jitney competition existed in the city of Duluth for two years prior to the fall of 1924 in spite of every effort made by the management to bring about proper regulation. At a special election held on June 16, 1924, an initiated bus ordinance was adopted. Under this ordinance jitneys are prohibited between the hours of 6 a.m. and 10 p.m. from operating on the streets in the city upon which a double-track railway is constructed and operated. This ordinance has so far been sustained by the courts, but an appeal is now pending in the Minnesota State Supreme Court. As a result of this jitney elimination the company's passenger revenue has been materially increased.

Mr. Robertson called the attention of the stockholders to the report for the year 1923, on the special master's report in the company's rate case then pending in the United States District Court. The case came up for argument before the court on the exceptions to the master's report on June 4 and 5, 1924, and on Dec. 29, last, the court decided that "the fair value of the property in Duluth as of Dec. 31, 1921, was increased from $4,600,000 to $5,009,510." The state commission's finding that the company was entitled to a rate of return on the fair value of the property of 7½ per cent was sustained. The temporary injunction permitting the collection of a straight 6-cent fare and restraining the enforcement of the commission's rate of 6 cents cash and five tickets for 25 cents was made permanent.

The number of revenue passengers carried in 1923 was 31,343,815, compared with 29,204,274 in 1924. The average total of all tracks reduced to single track during 1924 was 108.32 miles.

DULUTH-SUPERIOR TRACTION COMPANY —CONSOLIDATED INCOME STATEMENT

	1924	1923
Total railway operating revenues	$1,789,402	$1,904,606
Railway operating expenses:		
Way and structures	$206,146	$220,200
Equipment	194,919	188,997
Power	175,939	170,738
Conducting transportation	689,660	695,460
Traffic	967	751
General and miscellaneous	228,404	233,850
Transportation for investment—credit	—9,980	—9,009
Total railway operating expenses	$1,486,058	$1,500,987
Net revenue railway operation	$303,343	$403,618
Taxes assignable to railway operation	$113,313	$134,991
Operating income	$190,029	$268,627
Non-operating income:		
Income from funded securities	$8,713	$9,088
Income from unfunded securities and accounts	2,050	4,694
Income from sinking fund and other reserves	14,199	14,203
Miscellaneous income	397	743
Total non-operating income	$25,359	$28,730
Gross income	$215,389	$297,357
Deductions from gross income:		
Interest on funded debt	$172,651	$173,637
Interest on unfunded debt	127	.....
Miscellaneous debits	606	609
Total deductions from gross income	$173,385	$174,247
Net income transferred to profit and loss	$42,004	$123,110
General mortgage sinking fund payment	$23,912	$25,284

North American Company Has Its Best Year

The North American Company, New York, finished 1924 with the largest gross and net incomes in its 35 years history. Gross earnings for 1924 were $80,117,255, an increase of $4,651,988, or 6.16 per cent. Net income from operation was $29,955,492, an increase of $2,779,423, or 10.23 per cent. This increase in net income from operation is approximately 60 per cent of the increase in gross earnings. Of net income from operation, electricity and heating supplied 80.21 per cent, railway 10.37 per cent, gas 3.51 per cent, and coal and miscellaneous 5.91 per cent. Among the properties controlled are the Milwaukee Electric Railway & Light Company and the East St. Louis & Suburban Railway group.

Balance for depreciation reserves, dividends and surplus increased from $16,253,454 to $18,378,576, or after deduction of dividends on preferred stock, an increase of from $5.70 to $5.83 per share of common stock outstanding at the close of 1923 and 1924 respectively. After all charges for depreciation reserves and dividends on preferred stock consolidated earnings were equivalent to 31.6 per cent of the par value of North American common stock outstanding on Dec. 31, 1924. In December, because of favorable market conditions, more than $19,000,000 of financing was done for subsidiaries in anticipation of 1925 construction requirements, but no earnings are yet available from the proceeds thereof.

Expenditures for maintenance of the

Digitized by Google

plants and system of the subsidiary companies were $5,789,024, all of which were included in operating expenses and $7,795,811 additional was appropriated for reserves for depreciation.

A world's economy record is believed to have been attained in the steam generation of electricity. At any rate, the North American system was able to reduce its operating ratio more than 2 per cent below 1923, despite an increase of more than 5 per cent in taxes, for which an amount equal to more than 8 per cent of gross was expended or set aside. The system's generating stations as a whole produced 9.3 per cent more energy in 1924 than in 1923, with a coal saving equivalent to 330,000 tons, or 15.9 per cent.

Purchases made or arranged in 1924 included 99 per cent of the common stock of the Peninsular Power Company, operating in Wisconsin and Northern Michigan; the 23-story office building at 60 Broadway, New York, in which permanent headquarters are now established, and two coal properties in Kentucky, the acquisition of which makes the West Kentucky Coal Company the largest in the West Kentucky field, with an annual productive capacity exceeding 5,000,000 tons.

Receivership at Detroit a Protective Measure

Hope has been expressed by Joseph W. Simard, one of the receivers of the Detroit United Railway, Detroit, Mich., that the company will soon be taken out of receivership. Mr. Simard is vice-president of the Municipal Debenture Corporation, Montreal, and is acting with the Security Trust Company, Detroit. A plan has been worked out which is expected will be successful, as it is believed that the conditions that made receivership expedient will not prevail permanently.

It was stated in Detroit that the receivership announcement occasioned little surprise in financial circles, but it had been hoped that the crisis might be delayed if not averted.

It was suggested in some quarters that the receivership might have been averted had Elliott G. Stevenson, president, lived to submit a plan of procedure intended for the recent board meeting. This meeting had been called by Mr. Stevenson and although his failing health prevented him from attending the proceeding he had hoped to keep in touch with matters by telegraph.

It is understood that Mr. Simard will divide his time between Detroit and Montreal. The plaintiff was granted a temporary injunction by Judge Simons, restraining the D. U. R. from interfering with the receivers. The petition of the Yellow Coach Manufacturing Company to the court stated that the D. U. R. owed it approximately $25,000 which was past due and that further obligations that would be due shortly would total $276,670. This indebtedness was the result of recent purchases of buses by the D. U. R.

The petition conceded that the railway's assets represent a value approximately 50 per cent in excess of all indebtedness and liabilities, but the company had no means at hand to meet its immediate pressing needs. Apprehension was expressed lest some of the creditors bring suits in respect to their claims and levy attachments and executions. This would have hampered operation and created a danger that one or more of the lines now operated as a united system might be cut off from central control and operation. It was contended as essential that the property of the defendant should not be sacrificed or broken up.

Railway Earnings Eight per Cent of Total.—For the fiscal year ended Dec. 31, 1924, the Middle West Utilities Company, with main office in Chicago, Ill., reports total gross earnings of $41,402,607. Of this amount the railway earnings were $3,362,213, or 8.1 per cent of the total. The report gives detailed statistics on the subsidiary operating companies, but does not segregate the electric railway operation from its other utility operations.

Will Pay Bonds.—The $700,000 of 5 per cent bonds of the Butte Electric Railway, Butte, Mont., due March 1, were paid off at maturity, at the office of W. A. Clark & Brothers, Butte, Mont.

Another Property for American & Foreign.—Interests associated with the American & Foreign Power Company, Inc., New York, have bought control of the Empresa de Luz i Fuerza Electrica, S. A., serving with electric power and light and electric railway the city of Guayaquil, Ecuador.

Preferred Stock to Be Sold.—At the recent annual meeting of the stockholders of the Puget Sound Power & Light Company, Seattle, Wash., a new issue of 40,000 shares of preferred stock was authorized. The stock will be sold from time to time to furnish money to enable the company to carry on its new construction of substations, transmission and distribution lines.

Submits Purchase Offer.—The Illinois Power & Light Corporation has offered to purchase the Galesburg & Western Railroad, Rock Island, Ill., from county, township, city and school officials, with whom rests responsibility for ordering such a sale. The Illinois Power, it is understood, will utilize the right-of-way for the building of its 66,000-volt transmission line from Galesburg to Monmouth. The interurban condition is such that the Illinois Commerce Commission has directed immediate improvements and protective measures if the line is to continue to operate and enforcement of this order is likely to precipitate the sale order. The Illinois Power & Light Corporation has asked the Illinois Commerce Commission to permit it to suspend operations on its Galesburg-Abingdon line. The company proposes, upon formal approval of this suspension, to substitute a bus service between the two cities.

Petition to Sell Stock.—To rebuild the Interstate Consolidated Street Railway, the present owners, Hemphill & Wells, New York, have decided to issue $500,000 in stock and perhaps a proportionate amount of bonds. They have petitioned the Public Utilities Department of Massachusetts for authority to issue the stock. At the same time they desire to change the name, by dropping the word "Consolidated," so as to call it the Interstate Street Railway. Such change in name requires the approval of the state authorities. The railway is operating in Attleboro, North Attleboro, Plainville, Wrentham and Seekonk, to the Rhode Island line.

Removal of Tracks Allowed.—The Pacific Electric Railway has been authorized by the Railroad Commission to remove its tracks from Sunset Boulevard, from Gardner Junction to the end of the line at the intersection of Sunset Boulevard and Laurel Canyon Road, in the city of Los Angeles, Hollywood District. Receipts do not justify operation and an adequate bus service is being rendered by the Los Angeles Motor Bus Company.

Net Corporate Income Falls Off.—For the eight-month period ended Feb. 28, 1925, the passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., fell off from the corresponding period of last year, the figures being $7,485,501 and $7,751,230 respectively. The net corporate income was $936,832 for the eight-month period of the current year against $1,292,033 for the eight-month period ended Feb. 29, 1924.

Seeks Permit for Bond Issue.—The Georgia Railway & Electric Company, Atlanta, Ga., which owns the Georgia Railway & Power Company, operator of the railway in Atlanta and vicinity, has asked authority of the Public Service Commission to issue $599,000 in refunding and improvement mortgage bonds. The proceeds are to be used to reimburse the treasurer for capital additions and extensions made during the six-month period from July 1 to Dec. 31, 1924.

Net Income Increases.—For the eight-month period ended Feb. 28, 1925, operating revenues of the Brooklyn-Manhattan Transit Corporation and affiliated companies, Brooklyn, N. Y., were $28,384,142, against $25,990,928 for a similar period ended in 1924. The expenses increased from $17,413,748 to $18,608,755. The net income increased from $2,245,543 for the eight-month period ended February, 1924, to $3,255,476 for the eight-month period ended February of this year.

Stocks Sales Breaks Record.—The second customer-ownership stock-selling campaign held in St. Joseph, Mo., by the St. Joseph Railway, Light, Heat & Power Company closed on Feb. 28. The employees sold 4,032 shares of the preferred stock of the Cities Service Company, by which the company at St. Joseph is controlled, in ten days. A quota of 2,500 shares had been set by the New York office. The record of the first campaign was 4,024 shares.

Deficit in 1924.—Operation by the Springfield & Xenia Railway, Springfield, Ohio, during 1924 resulted in a deficit of $15,523 compared with a deficit of $3,225 for the previous year. The gross earnings fell from $106,867 in 1923 to $95,072 in 1924. Operating expenses were $104,496 in 1923 and $106,001 in 1924. The number of pay passengers carried was 373,268 for 1924. In 1923 the number was 391,427. Car-miles operated in 1924 and 1923 were 268,455 and 256,003 respectively.

New Assistant Secretary of the Treasury

General Andrews, Railway Official, Succeeds Mr. Wadsworth Under Secretary Mellon

Gen. Lincoln C. Andrews, receiver of the New York & Long Island Traction Company, the Long Island Electric Railway and the New York & Queens County Railway, Long Island City, has been appointed Assistant Secretary of the United States Treasury, succeeding Eliot Wadsworth, Boston, resigned. He has perfected arrangements to hold the receiverships.

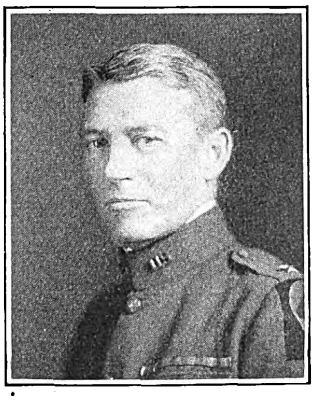
Gen. Andrews is a man of distinguished attainments. He is the second railway man in recent years to be picked by a president to occupy a place of great trust in the Treasury. Only a few years ago Oscar T. Crosby occupied a similar post under the late President Wilson.

General Andrews once said he left the regular army after the war to try his hand in business. He has succeeded in a big way. His first real experience was the year and a half he spent as chief executive officer of the New York Transit Commission. This simply served to whet his appetite for closer contact with the railways. As a result a little more than two years ago he accepted the appointment as receiver of the New York & Queens County Railway. Of all the posts around New York in the railway field this was one of the most difficult to fill acceptably. In fact, he was chaffed by his friends at that time, and welcomed by them "to the ranks of the slaves." The outlook certainly was anything but rosy. In the twenty years before the receivership the Interborough Rapid Transit Company, by which the New York & Queens County was controlled, dumped nearly $7,000,000 into the lines and got nowhere. During all these years there was a substantial operating deficit. More than $750,000 was the estimated amount needed to put the property in condition when General Andrews took charge.

But General Andrews did find it absorbing to take the sick property, work over it and see it respond. It is probable that he did many times damn the job and all that went with it, but he was back each morning with the bit in his teeth ready for another long, hard day. Doubtless he does not feel that everything desired has been accomplished, but considering the material with which he had to work he has made a wonderful record. Among many other things he succeeded in securing an advance in fare for the New York & Queens County road to 6 cents, with the understanding that for each $100,000 paving assessment charged against the company an additional cent was to be added to the carrying fee. Moreover, the general carried the case of the railway direct to the riding public. In a particularly striking announcement made about a year ago he summarized the accomplishments during the year with the defunct railway.

General Andrews did more than take into consideration the needs of the physical property and of the public. His army training made him conscious of the value of a proper personnel, but he realized the need for adjusting army tactics of discipline to the changed condition of public life. As an incentive toward greater co-operation he put into effect on the New York & Queens County Railway a profit-sharing plan which was the subject of an article in the ELECTRIC RAILWAY JOURNAL for April 12, 1924, page 583.

General Andrews is particularly well known to electric railway men in New York State through his participation in the deliberations of the New York Electric Railway Association. He is also well known to railway men elsewhere through contacts that were made by him in 1921 as a member of a party of railway men and public service commission officials that made a tour of inspection of the city railway properties as far west as Kansas City..



L. C. Andrews

General Andrews was appointed to the United States Military Academy from Seneca Falls, N. Y., in 1889 and was graduated in 1893. He was aid to General Sumner, commanding the cavalry division, in the Santiago campaign during the war with Spain and was a major of volunteer infantry in the Philippines and first American Governor of the Island of Leyte. Later he was instructor at the Military Academy and was active in officers' training work before the World War, in which he commanded a brigade in this country and in France. Later, as deputy provost marshal general in France, he assisted in the organization and training of the Military Police of the American Expeditionary Force.

E. C. Quinn is now superintendent of transportation of the Jacksonville Traction Company, Jacksonville, Fla.

Promotions Announced by Manhattan Surface Lines

Promotions have been announced by the New York Railways, New York, N. Y., as follows:

D. E. Lenahan, general superintendent.

J. Cowen, superintendent car equipment.

M. J. O'Connor, superintendent of transportation.

B. Carlin, superintendent way and structures.

H. J. O'Reilly, superintendent of transportation, resigned recently.

Dinner in Honor of Mr. Storrs

Lucius S. Storrs was guest of honor at a testimonial dinner given in the Lawn Club, New Haven, Conn., on the evening of March 23, by the officers and heads of departments to the Connecticut Company, of which Mr. Storrs is the retiring president. In a series of short addresses a number of his close associates in the company expressed sorrow at his going and yet congratulated him upon his new position of managing director of the advisory council of the American Electric Railway Association.

The dinner was presided over by J. K. Punderford, successor to Mr. Storrs as president of the company. Mr. Punderford introduced the speakers and read telegrams and letters from several guests who were unable to attend. At the close of the last address Joseph F. Berry, formerly connected with the Connecticut Company and now a member of a Hartford law firm, acting on behalf of those present, presented to Mr. Storrs a huge silver loving cup and a book of appreciation which contained the signatures of every one of the 3,800 employees of the company. On the wooden stand of the loving cup was engraved: "To Lucius Seymour Storrs from His Friends in the Connecticut Company in Remembrance of Many Years of Delightful Association, 1911-1925."

The speakers of the evening were: Charles C. Cheney, a Connecticut Company trustee; Leonard Daggett, trustee of New York, New Haven & Hartford Railroad; George D. Watrous, general counsel of the Connecticut Company; Edward M. Day, Hartford; J. W. Welch, secretary of the American Electric Railway Association; John W. Colton, editor of *Aera;* Joseph Berry.

Leslie Spraggon Superintendent of Equipment in Buffalo

Leslie Spraggon, superintendent of equipment of the International Railway, Buffalo, N. Y., as referred to in the ELECTRIC RAILWAY JOURNAL, issue f Feb. 14, is a new figure in Buffalo traction circles. Following his education in the public and technical schools of Pittsburgh, Mr. Spraggon was employed for four years by the Westinghouse Electric & Manufacturing Company in wiring, inspecting and testing railway and industrial control apparatus, railway and industrial motors and electric locomotives and in building power apparatus, but more especially railway motors, control apparatus and electric locomotives.

Digitized by Google

In January, 1914, he became assistant master mechanic of the eastern division of the Terre Haute, Indianapolis & Eastern Traction Company and served in that capacity for more than two years. Then it was that he was appointed inspector of rolling stock with the Connecticut Company, New Haven, Conn., acting in the capacity of assistant supervisor of equipment for a period of four years. From March, 1920, to August, 1921, he served as salesman for the Westinghouse Electric & Manufacturing Company in the Boston office, handling central station and industrials. From August, 1921, until December, 1924, he was supervisor of equipment with the Connecticut Company. His return to the Connecticut Company followed the death of H. W. Beebe, who had been supervisor of equipment. In December of last year he became superintendent of equipment with the International Railway. In this capacity he succeeds George Hulme, who was made superintendent of shops.

At the time of Mr. Spraggon's appointment, mention was also made in the ELECTRIC RAILWAY JOURNAL of the election of B. J. Yungbluth as vice-president in charge of operation and of the appointment of G. W. Barker as operating manager of the International Bus Corporation, a subsidiary of the International Railway.

Organization Changes in Pittsburgh

Jurisdiction of Messrs. Phillips, Rossell and Williams Rearranged in the Interest of Improved Effectiveness of Personnel

ACCORDING to a circular dated March 1, 1925, T. Fitzgerald, vice-president of the Pittsburgh Railways, Pittsburgh, Pa., announced the appointment of F. R. Phillips to the position of general manager in charge of operations. Mr. Phillips' former title of mechanical and electrical engineer is abolished.

Effective the same date, Mr. Phillips announced the appointment of W. T. Rossell to the newly created position of superintendent of maintenance. In this position Mr. Rossell, reporting to the general manager, will be in charge of all maintenance, track, equipment, shops, carhouses, overhead lines and substations. Oscar Williams was appointed to fill the vacancy caused by Mr. Rossell's advancement.

In essence, this amounts to the creation of two general managers, one charged with the operation of the property, the other charged with the maintenance of the plant and equipment.

The commercial manager and the research manager continue to report to the vice-president.

Mr. Phillips is prominently known in the electric railway industry. For many years he was master mechanic of the Cleveland Railway, a position which he held until he went to Pittsburgh in 1909 to assist in the development of railway service in that city. He is particularly well known for his inventive work, being the originator of a number of railway devices. He has also appeared as an expert in proceedings before public bodies in which expressions of opinion on moot points were sought from an authoritative source.

Mr. Rossell became superintendent of way of the company at Pittsburgh last July. He has been connected with many large railway companies and prior to going to Pittsburgh was connected with the city railway in Cincinnati.

Mr. Williams has been a resident of Pittsburgh most of his life. He entered the employ of the Pittsburgh Railways in 1902 and has been connected with that company ever since.

Each of the new officers has been the subject of a biographical sketch published within the last few years in the ELECTRIC RAILWAY JOURNAL in connection with appointments made previously at Pittsburgh.

F. R. Phillips

W. T. Rossell

Oscar Williams

P. C. Dings, a director of the Illinois Power & Light Corporation, Chicago, Ill., has been elected treasurer of the company to succeed George M. Mattis.

C. R. Winkler, power salesman for the Arkansas Central Power Company, Little Rock, Ark., and secretary of the local electric club, has gone to Jackson, Tenn., where he will be in charge of the commercial department of the Jackson Railway & Light Company.

W. Nelson Smith, consulting electrical engineer of the Winnipeg Electric Company, has returned to Winnipeg, Man., after a leave of absence of about a year in Vancouver, B. C., where he assisted the Sydney E. Junkins Company, Ltd., in preparing a report on the electrification of the mountain district of the Canadian Pacific Railway. Mr. Smith's experience in steam railway electrification reaches back more than 20 years. After designing a number of long interurban railway systems, he took a leading part in laying out the electrifications of the Erie Railroad at Rochester, N. Y., and the Long Island Railroad. Mr. Smith is now engaged in a valuation of the extensive light and power distribution system of the Winnipeg Electric Company.

Obituary

George F. McKay, secretary of the Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md., died on March 21 while en route from his office to his home. Since last year Mr. McKay has assumed the rôle of secretary as successor to Thomas Mason. Early in his career Mr. McKay entered the service of the Lake Shore & Michigan Southern Railroad in the traffic department. Later he became manager of the Erie *Dispatch*, which position he held for a number of years. He then accepted a position as traffic manager of the Lackawanna Steel Company, Buffalo, N. Y. He resigned this position several years ago to look after his personal interests in the chemical business. On Jan. 16, 1924, he became connected with the Washington, Baltimore & Annapolis Electric Railroad in the capacity of secretary, holding this position up to the time of his death. He was 64 years old.

Charles C. McBride, treasurer of the West Penn Company, the West Penn Railways, the West Penn Power Company and subsidiary companies, Pittsburgh, Pa., died March 13.

Logan Grant McPherson, economist and railroad authority, died on March 23 at St. Luke's Hospital, New York City. He served as chief statistician for the Rock Island System in 1904. The following year he became assistant to the late Samuel Spencer, who represented the associated railways of the United States. On the invitation of a committee of American railway presidents he organized the Bureau of Railway Economics in Washington in 1910 and was its director until 1914. Mr. McPherson was 62 years old.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Procedure of Federal Trade Commission Revised

Considerable reduction in the activity of the Federal Trade Commission is forecast by the recent change in its rules of procedure. Henceforth the commission will proceed only with those cases where the interests of the public are substantially involved. It will refuse to interfere in controversies between competitors where redress can be effected through the courts. Moreover, the respondents will always be granted an informal hearing before the complaint is issued and the case will be dismissed if there is a voluntary cessation of the unfair practice. Two cases have already been dismissed under the new rules and well-informed opinion in Washington is that the number of complaints issued will probably be reduced about 80 per cent.

A further decrease in the commission's activity may be expected as the result of a rider attached to a recent appropriation bill. This would require the assent of both houses of Congress to resolutions directing special investigations unless the inquiry is made necessary by a violation of the anti-trust laws.

First Grand Rapids Test Car Delivered

The first of three cars which are to be subjected this spring to competitive tests has been received by the Grand Rapids Railway, Grand Rapids, Mich. This car, or as the local railway officials prefer to call it, "electric motor coach," was made by the Light-Weight Noiseless Electric Car Company. The other two are being made by the St. Louis Car Company and the Kuhlman Car Company. These are expected to be delivered within the next two weeks.

L. J. DeLamarter, vice-president and general manager Grand Rapids Railway, and other officials made a preliminary test of the car and then ordered it to the shops for certain minor changes and additions to equipment. It is planned to install meters on all three cars to check every phase of their operation during the test. The first tryout indicated a substantial reduction in power consumption.

A reduction of 33,500 lb. has been made in the weight of the first car from that of the cars now being operated in Grand Rapids. It is constructed with heat-treated steel, specially prepared Haskelite veneered wood panels and aluminum to reduce the weight without impairing the strength and durability of the body. The axles are bored with a 2¼-in. hole throughout their length. Metal has been removed from the wheels by boring eight 3-in. holes in the web. This process is expected also to reduce noise due to vibration of the wheel. Roller bearings for journals and armatures are designed to provide quicker acceleration and to facilitate coasting. Automobile-type drum brakes are used on all four axles.

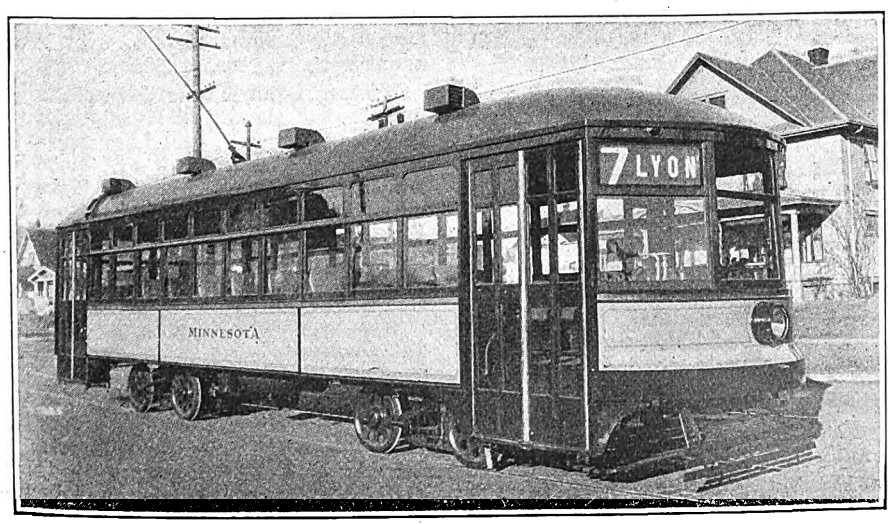
A new type of electric lighting arrangement designed by a member of the railway staff has been installed. This is intended to give the greatest intensity of light at the level of the eye of a seated passenger. The inside trim of the car is mahogany. The seats are wide with plenty of knee room and are of rattan stained green. The windows of the car are exceptionally wide and open upward. Low arm rests are provided.

The new cars are designed and equipped to be operated as single units with one trainman, or with a motorman and conductor as the density of traffic may require.

Door opening and closing at both ends can be controlled from the front platform. A comfortable seat specially designed is provided for the operator.

A feature of this first car is its outside coloring. It is painted in the colors of the University of Minnesota and carries the name "Minnesota" on the sides. The other two cars will be painted in the colors of the Ohio State and St. Louis Universities. Construction details are given in the accompanying table.

Date order was placed	Sept. 24, 1924
Date of delivery	March 24, 1925
Builder of car body	Lightweight Noiseless Electric Car Co.
Type of car	Closed passenger
Seating capacity	43
Total weight	24,500 lb.
Length over all	37 ft. 6 in.
Truck wheelbase	4 ft. 6 in.
Width over all	8 ft. 6 in.
Height, rail to trolley base	10 ft. 5 in.
Body	Haskelite
Interior trim	Mahogany
Headlining	Agasote
Roof	Arch
Air Brakes	Safety Car Devices Co. concentric clasp axle drum type
Armature bearings	Hyatt roller
Axles	Tubular
Bumpers	Lightweight-Noiseless Electric Car Co.
Car signal system	Faraday
Car trimmings	Lightweight-Noiseless Electric Car Co.
Center and side bearings	Lightweight-Noiseless Electric Car Co.
Conduits and junction boxes	Crouse-Hinds
Control	G.E. K-35-KK
Couplers	Lightweight-Noiseless Electric Car Co.
Curtain fixtures	National Lock Washer No. 86
Curtain material	Pantasote
Destination signs	Hunter
Door operating mechanism	National Pneumatic Co.
Fare boxes	Woods
Fenders	H. B. lifeguards
Gears and pinions	G.E. Grade M.
Hand brakes	Peacock staffless
Heater equipment	Railway Utility
Headlights	Crouse-Hinds
Journal bearings	Hyatt roller
Journal boxes	Lightweight-Noiseless Electric Car Co.
Lightning arresters	G.E. aluminum cell
Motors	Four G.E. No. 258, inside hung
Paint and varnish	Sherwin-Williams
Sanders	Keystone
Sash fixtures	National Lock Washer
Seats	Lightweight-Noiseless Electric Car Co.
Seating material	Rattan
Springs	Elliptic
Step treads	Kass
Trolley catchers	Ideal, No. 10
Trolley base	Ohio Brass, Form 1
Trolley	Wheels
Trucks	Smith No. 12
Ventilators	Railway Utility
Wheels	26-in. steel
Power-saving device	Economy meter



First of the Three Test Cars Being Built for the Grand Rapids Railway

Colorado Railway to Be Improved

The Southern Colorado Power Company, Pueblo, Col., will spend about $1,000,000 this spring for betterments. The work will include improvements to the car tracks in Pueblo, the erection of substations and the placing of larger capacity generators.

Metal, Coal and Material Prices

Metals—New York	Mar. 24, 1925
Copper, electrolytic, cents per lb.	14.00
Copper wire base, cents per lb.	16.50
Lead, cents per lb.	8.93
Zinc, cents per lb.	7.65
Tin, Straits, cents per lb.	53.875
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.375
Somerset mine run, Boston, net tons	2.125
Pittsburgh mine run, Pittsburgh, net tons	1.825
Franklin, Ill., screenings, Chicago, net tons	1.95
Central, Ill., screenings, Chicago, net tons	1.90
Kansas screenings, Kansas City, net tons	2.75
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$6.75
Weatherproof wire base, N.Y., cents per lb.	19.00
Cement, Chicago net prices, without bags	2.20
Linseed oil (5-lb. lots), N. Y., per gal.	$1.12
White lead in oil (100-lb. keg), N. Y., cents per lb., carloadlots	0.1272
Turpentine (bbl. lots), N. Y., per gal.	0.935

Power Show to Feature Heating and Ventilating Equipment

Heating and ventilating equipment will form one of the large sections of the Fourth National Exposition of Power and Mechanical Engineering to be held in the Grand Central Palace, New York City, from Nov. 30 through Dec. 5, 1925. At the present time 95 manufacturing concerns have signed contracts for space in which to exhibit all types of forced-draft apparatus, heating devices, ventilating equipment and temperature regulators, as well as instruments and fittings used in the heating and ventilating field.

Rolling Stock

Ohio Public Service Company, Mansfield, Ohio, recently placed in service two light-weight, single-end interurban cars built by the G. C. Kuhlman Car Company.

Georgia Railway & Power Company, Atlanta, Ga., has announced specifications on the twenty new cars mentioned in ELECTRIC RAILWAY JOURNAL, issue of Feb. 21, 1925. The details follow:

Date of delivery	Jan. to Feb., 1925
Builder of car body	Cincinnati Car Co.
Type of car	Double-truck, double end, city
Seating capacity	48
Total weight	35,000 lb.
Bolster centers, length	20 ft. 6 in.
Length over all	46 ft. ½ in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 3 in.
Height, rail to trolley base	11 ft. 8 in.
Body	All steel
Interior trim	Natural cherry
Headlining	Agasote ¼ in.
Roof	Monitor
Air brakes	Westinghouse
Axles	Quenched and tempered
Bumpers	Anti-climber, Cincinnati Car Company
Car signal system	Consolidated
Car trimmings	Statuary bronze
Center and side bearings	Oil-retaining slide
Control	K 35JJ
Destination signs	Keystone ILR
Door-operating mechanism	Sliding door
Lifeguards	H B, Atlanta type
Gears and pinions	GE long and short addendum
Hand brakes	Peacock staffless
Heater equipment	Consolidated. panel type
Headlights	Crouse-Hinds 28569
Journal boxes	MCB Symington
Lightning arresters	Aluminum cell
Motors, type and number,	Four GE No. 265-A, inside hung
Registers	Ohmer
Sanders	Ohio Brass No. 1
Sash fixtures	Rack and pinion
Seats	H & K, AWO 400
Seating material	Cane
Slack adjuster	American Brake Company, Form E
Step treads	Aluminum
Trolley catchers	Ohio Brass
Trolley base	O. B. Form 1
Trolley wheels	Nuttall
Trucks	Cincinnati Car Company (AB, 64 D)
Ventilators	Monitor sash
Wheels (type and size)	26-in. cast iron

Oklahoma Railway, Oklahoma City, Okla., will improve its equipment if the recommendations made by G. H. Clifford, acting as consultant, are carried out. These improvements include the purchase of fifteen new cars at a cost of $112,500, equipping ten of the present safety cars for both single and double operation at a cost of $44,200 and equipping cars with power-saving devices to reduce operating cost, at a cost of $6,100.

Denver Tramway, Denver, Col., will purchase ten buses in line with plans it has developed, to which reference is made elsewhere in this issue.

United Railways, St. Louis, Mo., has ordered five six-wheel buses from the Six Wheel Company, 1880 Lehigh Avenue, Philadelphia, Pa. The chassis is furnished by the Philadelphia Company, but the bodies of the buses are bought at St. Charles, Mo. The buses will be given a thorough trial on the St. Charles-Wellston line.

Stark Electric Railroad, Alliance, Ohio, has purchased two de luxe buses costing about $15,000 each. These supply continuous service between Alliance and Canton.

Track and Line

Connecticut Company, New Haven, Conn., will lay tracks in Hamilton Street from Chapel to Water Street and also in East Street from Water to Chapel Street. The company has also been granted permission to extend the Winchester Avenue track from Read Street to the Hamden line.

Seattle Municipal Railway, Seattle, Wash., is now in the market for $90,000 steel rail and special trackwork layouts A. F. Pierce, superintendent of construction, has completed plans for the special layouts and specifications covering the 400 tons of 80-lb., 7-in. T-rail desired. The rails will cost $25,000 and the special work about $65,000.

Pacific Electric Railway, Los Angeles, Cal., has completed the installation of a new double track curve connection at Ninth and San Pedro Streets, at a cost of $32,000. The new curve will permit the handling of freight traffic on San Pedro Street and make possible the serving of industries to be located in the industrial district between Ninth and Aliso Streets. This will permit freight service to the new Westinghouse Electric & Manufacturing Company plant recently established on San Pedro Street.

Shreveport Railways, Shreveport, La., will extend its line into the new Broadmoor subdivision if the engineers making the preliminary survey believe the extension is practical.

Puget Sound Power & Light Company, Seattle, Wash., will begin work immediately on replacing 60-lb. rails on West Holly Street with 93-lb. rails and the paving of its right-of-way on this street in Bellingham between the alley below Bay Street and B Street.

Power Houses, Shops and Buildings

Milwaukee Northern Railway-Wisconsin Power & Light Company recently opened up their new joint terminal at Sheboygan. The new terminal, modern in every detail, was designed to take care of the future growth of traffic. The main portion of the interior comprises a large waiting room. A pleasing feature is the loading and unloading of trains under the canopy.

Wheeling Traction Company, Wheeling, W. Va., is erecting a new terminal in Steubenville.

Trade Notes

Edgar C. Walthall has joined the sales organization of the Boiler Equipment Service Company, Candler Building, Atlanta, Ga., district engineers of the Conveyors Corporation of America, 326 West Madison Street, Chicago, Ill. Mr. Walthall was graduated from the Georgia Institute of Technology and was recently superintendent of the fire brick plant of Stevens, Inc., at Stevens Pottery, Ga. He is experienced in marine and heating engineering.

Wollmar Engineering Corporation, New York, N. Y., has appointed A. J. Gillespie sales representative for its Cleveland office for N. K. A. ball and disk bearings. He was for more than six years in the ball bearing industry in Ohio, having been district manager for Hess-Bright and S. K. F. and for the last three years in anti-friction engineering in his own business and president of the A. J. Gillespie Company. His headquarters will be at 8500 Lake Avenue, Cleveland, Ohio.

Universal Crane Company, Cleveland, Ohio, has appointed the Factory Products Company, 204 Oliver Building, Pittsburgh, Pa. its representative covering the Pittsburgh territory. W. W. Adams, president of the Factory Products Company, has been identified with the sale of locomotive cranes since 1907.

William Pestell has been made a vice-president of the Riley Stoker Corporation, Worcester, Mass., and will continue to have supervision of all sales for the Riley Stoker Corporation. Mr. Pestell is widely known in the power plant field because of his many years experience in charge of mechanical and electrical equipment with the Lynn & Boston Railroad, the Worcester Consolidated Street Railway, the United Electric Railways of Providence and the Allis-Chalmers Company, Boston. Mr. Pestell also spent several years as a mechanical engineer for the J. G. White Engineering Corporation. He is a fellow of the American Institute of Electrical Engineers and a member of the American Society of Mechanical Engineers. He has been connected with the sale of Riley stokers from the start of the company, first as Western sales manager, with headquarters at Chicago, and since 1921 as sales manager, with headquarters at New York and Worcester, Mass.

William Bonn, formerly plant superintendent of the auto body plant of the Pullman Company, and later assistant general sales manager, has been appointed assistant general manager, with headquarters at Chicago, of the W. M. Lalor Company, railway sales representatives of the Zapon Company, manufacturer of leather cloth, lacquers and enamels.

Mack Trucks, Inc., New York, N. Y., has purchased a square block in Jersey City on which the company will erect a large plant. Officials explain that the Jersey City site was decided upon because of the benefits for deliveries in Greater New York through the New York-New Jersey vehicular tunnel. The cost of the plant is not known.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review

Published by McGraw-Hill Company, Inc.

MORRIS BUCK, *Managing Editor*

Volume 65 New York, Saturday, April 4, 1925 *Number* 14

The New Era Begins for the American Association

A RED-LETTER day in the annals of the American Electric Railway Association is April 2, 1925, for on that day the new managing director, Lucius S. Storrs, formally took office. Coming as he does from a large property where he has made an enviable record, he has an excellent background to work on. Many problems await him. Financing electric railways deserves close attention. Securing better public relations, and telling the railway men how to present their side of the picture, is another problem. The adoption of the latest transportation tool, the bus, helping to see it in its true perspective and give it the proper place as an integral part of co-ordinated transportation service, is still another problem—and one of major proportions. Right now the industry is confronted with the need for regulation of interstate motor traffic, which has been thrown into chaos as a result of the recent decision of the United States Supreme Court. These are just a few of the things that will demand earnest attention from Mr. Storrs.

To obtain best results too much help cannot be given the new managing director. It is only by teamwork that he will be able to accomplish maximum results. While his services will be available to every railway in the country, as well as to the public, the railways and the public can well afford to make their services available to him. The ELECTRIC RAILWAY JOURNAL pledges its full support to Mr. Storrs, and at the outset wishes him and the association the greatest of success in the new undertaking.

Everything Points to the Best Convention Ever

PREPARATIONS for the annual convention of the American Association are now well under way. Arrangements have been made on substantially the same terms as last year for the use of the facilities at Atlantic City. Nothing is in the way of bettering the performance. The space available for exhibits is limited to some 90,000 sq.ft., hence to get the most out of it every bit must be made to count.

One thing that will make the exhibits more valuable is the display of products that have been in service. A railway man likes to see the latest developments, it is true. Even more is he interested in things that have been weighed in the balance and not found wanting. In the past the exhibits that have attracted the most attention from operators have been those that showed what the part looked like after it had been used for all or a considerable portion of its natural life.

An innovation this year is the construction of a temporary track that will permit exhibitors to transport complete cars to and from the pier and vicinity with less labor than in past years and at a cost that is not prohibitive. Not only should manufacturers seize the opportunity, but operating companies should be willing to give others the benefit of their experience by the exhibition of cars that have proved successful in service. Taken off the street, they should make apparent the value of the best practices in a way better than new equipment can do.

So let every one plan to show the best he has, and make it an exhibit that will be far and away in advance of anything ever before attempted by the association.

Boston Made a Good Bargain

NINE years ago the Boston Elevated Railway was on the verge of bankruptcy. The story is familiar to all who have followed traction history. Costs mounted along with the war, but as in many other cities fares were held down to the then universal 5 cents. The consulting engineer who made a report on the finances of the company found that there was an actual deficit resulting from the operations, including only a low rate of interest on the investment. As the property was being allowed to depreciate without proper allowance for renewals, the actual loss was still greater, the total cost being 20 per cent greater than the revenue. Evidently the road was headed for a receivership. As the city of Boston was interested financially, having spent large sums on subways, it felt that its investment should be protected. Yet the city officials were unwilling to give the company the financial relief it needed to carry on.

The solution adopted was that the State of Massachusetts became sponsor for the finances of the property. Though the company continued as a private corporation, the state assumed control. For the past nine years the road has been operated by a board of public trustees. The management has been progressive and far-seeing. Fares at Boston have been increased according to a formula automatic in its operation which could not be misinterpreted. Service was improved, maintenance was taken care of, and obsolete and discarded property written off the books. While there was a deficit the first few years conditions have since improved, so that eventually the state will get back every dollar that has been advanced to make good the loss.

The excellence of the arrangement was attested by Mayor James M. Curley of Boston, speaking before the New England Street Railway Club last week. His address is published elsewhere. The city is so well pleased that now it desires to extend the contract for control of the railway system an additional twenty years. More than that, the plan is held up by the Mayor as a model that might well be copied by cities all over the United States. With such an indorsement as this, the public trustees and the men who had the vision to put the plan forward may well feel repaid for their efforts in providing the Boston district with a modern transportation system.

Better Marking Is Needed to Indicate Bus Routes

DURING a recent visit to a small town where street railway service has been entirely replaced by buses, an editor of this paper had occasion to ask how to reach one of the local bus lines. He was directed to go down the street until he reached the car tracks, where he could get a bus.

Surely this was a strange way to give directions in a town where the bus has been substituted for the trolley car. But it illustrates an inherent advantage of the railway, and shows that something yet remains to be done by the bus men in the line of improving service.

Tracks, poles, and overhead wires are visible evidence of the location of a transportation route. Moreover, the trolley poles are usually so marked that prospective passengers know where to wait for their vehicles. Where traffic is heavy, many street railways have also adopted the practice of indicating the exact stopping places by the use of signs on the span wires or at the curb. This is seldom the case with a bus route. The advantages of having the route and stop locations clearly marked certainly justify the moderate cost of such a procedure. It is a matter that deserves the careful consideration of all bus operating companies.

Valuation Practice Must Be Clarified

THREE recent valuation decisions which have followed each other in rapid succession are deeply significant to the electric railway industry. These include the decisions of the federal courts in the Denver and Duluth cases, published in the Dec. 20, 1924, and the Jan. 24, 1925, issues of ELECTRIC RAILWAY JOURNAL, respectively. The recent findings of the Minnesota Railroad and Warehouse Commission fixing the value of the street railway properties in St. Paul and Minneapolis were published in the March 14, 1925, issue.

Each of these decisions shows an increasing insight, on the part of those charged with the review of valuation evidence, into the unsound but plausible theories that have been advanced in the past to obtain low valuations. There is a consistent rejection in these findings of the absurd and fantastic valuation and depreciation methods used by certain consultants engaged in the lucrative business of establishing junk values for railway properties.

In Denver, track which was conclusively shown by the company's engineers to be in excellent serviceable condition due to proper maintenance was scheduled by the city's consultant at a negative value. That is to say, its value was listed as less than zero, and subtracted from the total of the remaining property. Photographs introduced by the company to show the condition of this track evidently led the court to doubt the accuracy of the city's evidence.

The cities of Minneapolis and St. Paul employed different consultants. Apparently they had little confidence in each other's methods and failed to compare their figures. As an example, separate valuations on two sections of a continuous piece of track over the Mississippi River bridge were submitted. That on the east half of the bridge was scheduled as being in 80 per cent condition, while the portion on the west half of the bridge, which had received the same maintenance and had carried identical traffic, was assumed to be in 50 per cent condition.

On this same property, passenger cars built at the same time in the company's shop and used interchangeably between the two cities were found to be in 22 per cent condition by the consultant for one city and in 72 per cent condition by the other.

Such inconsistencies in the results obtained and in the values found for identical property drew caustic comment from the commission. Apparently much of the evidence submitted on this basis was discounted—and it should have been. The decisions of the courts and the commission in these recent cases, it is to be hoped, will establish additional precedents leading to more accurate statements by consultants of this class.

Central Western Meeting Suggested

MORE and more during recent years the advantages of group thinking have been demonstrated in the electric railway industry. New ideas and views on public relations, ride merchandising, safety work, modernization of plant and operating methods, financing and a host of other modern railway subjects have taken root and developed as a result of railway men getting together, comparing notes, taking stock of their situation and discussing methods of improving their practice.

The American Electric Railway Association, together with its affiliated organizations, has, of course, been the greatest single agency for bringing railway men into personal contact with each other. The various state and sectional associations have also played an important part in this interchange of ideas. They bring railway neighbors together, stimulate friendships and at the same time co-ordinate the efforts of various operators in a given territory to solve the local problems of mutual interest. In the Middle West, the Central Electric Railway Association has been an outstanding example of the value of sectional co-operative thinking and effort. More recently the railway men of Missouri, Kansas, Colorado, Nebraska and Oklahoma have formed the Mid-West Electric Railway Association.

It has been suggested that the railways in the intervening territory, comprising the states of Iowa, Illinois, Wisconsin and Minnesota might profitably hold a combined meeting once a year. Of these states, the first three each has a state utility association. In Iowa and Wisconsin, a general utility meeting is held once a year, and the railway men in each of these states get together again for a second exclusively railway meeting. The Illinois association holds only one meeting a year, which is a combined meeting of all the utilities. Minnesota has no state association.

Many large and progressive railway properties are located in this territory. By combining the railway meetings of Iowa and Wisconsin, and including the properties in Illinois and Minnesota, one general railway meeting could be held, which would be of immense value and profit to all of the properties participating. Payment of a comparatively small fee by each man who attends would afford a simple means of financing the plan. Unquestionably the benefits derived would be far in excess of the cost in time and expense.

Continued Improvement Expected in Electric Railway Situation

A Survey of the Present Status of the Industry Made by an Official of a Large Manufacturing Company Indicates that Developments of the Past Five Years Have Put the Railways on a More Stable Basis with Bright Prospects for Future Prosperity

DIFFICULTIES experienced by the electric railways in the years immediately following the war, and the apparently growing competition of other modes of transportation, aroused speculation as to their future destiny. This caused some anxiety in the industries which depend upon the electric railways for a large portion of their business. For this reason an investigation was made for the benefit of William Wharton, Jr., & Company by Victor Angerer, vice-president, to determine the present status and future prospects of the railways. Through the courtesy of the company a summary is given below of this survey, which is supported by statistics obtained from authoritative sources.

Although in the minds of the general public an impression is somewhat prevalent that the street railway is on the wane and likely to be supplanted by other means of transportation, statistics do not bear this out. On the contrary, the survey indicates that many of the difficulties of the past have been or are being overcome. Figures show a consistent, steady though moderate growth of the electric railway business. They also show its importance and that no other mode of transportation has been found that would so adequately and cheaply meet the requirements of the public in the cities where the bulk of the electric railway business lies. A continuation of the growth of that business is to be expected for many years to come, although perhaps not in proportion to the growth of the population.

Sources of Past Difficulties

Ills from which the street railways have suffered since the war may be summarized as follows:

1. Over-expansion; in the prosperous times before the war many lines and extensions were built on speculative grounds for development of territory which later proved inadequate to support them. During the war trackage and equipment were added for traffic to and from localities which at the close of the war became dead.
2. Increased cost of operation and taxes without simultaneous commensurate increases in fare.
3. Unregulated jitney competition, in many cases fostered by a hostile public reluctant to accept the necessity for an increase in the street car fare.
4. The phenomenal increase in the number of private automobiles and taxicabs.
5. Competition of the motor bus, apparently made possible by improved highways.
6. Traffic congestion in the hearts of cities, making street car operation more costly and slower and causing passengers to desert the electric railways for other means of transportation which promise to take them to their destination more quickly.

The crisis of the ills mentioned in the first four counts was reached in 1919, when 48 street railway companies went into the hands of receivers. In the years 1918 to 1920 some 1,500 miles of track were abandoned. Considerable abandonment of trackage reported in later years was planned at that time, but actual suspension of service or dismantling of tracks did not take place until the necessary legal arrangements were completed.

The inconvenience caused by the abandonment of service on some lines and in some localities, as well as the investigations conducted by various bodies, brought the public and the authorities to a realization of the necessity for higher fares. As a result, in 1920 the average fare on the electric railways of the country had advanced to 7.5 cents from the former almost universal nickel. With this increased revenue to the railways came also a better feeling between the public and the companies and a better understanding of the dependence of one upon the other.

Congestion Is Causing Automobile Owners to Return to Public Conveyances

The unregulated jitney, while still active in some localities, has largely eliminated itself as a competitor of the railways through its own undependability and irresponsibility and perhaps through a better realization by the jitney owner of the actual cost of operating such a vehicle.

A more important factor restricting the growth of the electric railway has been the private automobile and the taxicab. The extent of this influence in city traffic and in the congested districts is almost impossible to estimate. Undoubtedly it has affected interurban travel and the once popular pleasure riding on trolley cars in the summer and on holidays. As an offset, a most remarkable increase has taken place in the riding habit much greater than the growth of the population. Despite the increased use of the automobile and the taxicab, therefore, taking the electric railways as a whole, the number of passengers carried continues to increase.

In the hearts of the larger cities the congestion created by the automobile and consequent traffic regulations and parking restrictions have largely served as a check to further growth of the use of the private automobile. This situation is inducing automobile owners to return to the public conveyance for city travel. The taxicab, no doubt, has taken a large part of this travel. It is figured that the taxicab now transports 3,500,000 people per day as against about 45,000,000 passengers carried by the electric railways. In consideration of the great difference in the rate of fare, however, the taxicab cannot be classed as a competitor of the railway. It furnishes a service that stands by itself for greater comfort and speed. Traffic congestion may again set the limits to the future growth of

Digitized by Google

the taxicab traffic and to its function as a time saver. A conveyance more commodious than the street car and covering fixed routes, but carrying more passengers per square foot of street surface, may have to take its place. The de luxe bus may thus become a competitor of the taxicab and to some extent may even replace the private automobile for strictly city travel.

The competition of the motor bus, the survey shows, has attracted more attention to the future of the electric railway industry than has any other factor. The widespread construction of good highways and the development of the bus into a reliable motor vehicle led to bus routes being established in direct competition with the electric railways. A great propaganda for these lines was launched, mostly for exploitation and promotion purposes. Exaggerated statements in the sensational press, the somewhat hostile attitude of the public in numerous localities against the electric railways, and the public's enthusiasm for gasoline-driven vehicles are clouding sound judgment. The propaganda is still being pursued vigorously. Recently established or projected motor bus lines are heralded as replacing electric railways, but without stating that these electric lines were abandoned four or five years ago during the financial stress of the railways, or they are being substituted on non-paying lines. These statements give a wrong impression that the bus has forced the abandonment of the electric railway.

Replacements of Cars by Buses Have Been Few

According to statistics recently compiled, five electric railways have abandoned service entirely and are now operating nothing but buses. Independent bus lines have entirely superseded electric railway service in seven cases. In addition to this, buses have replaced parts of electric railway systems in a number of cases. Altogether the survey shows bus service has replaced trolley service on less than 500 miles of track. This gives an indication of the comparatively small extent to which bus service is actually replacing electric railway service. More than 2,000 miles of bus routes being operated by the electric railways themselves as feeders or auxiliaries represent new transportation facilities.

Reliable information is not available regarding independent bus lines operated in direct competition with existing railways or steam railroads. Their number is quite large but seems to have affected the steam railroads more than the electric lines. Competing bus lines in some cases are believed to have been established with the sole view of forcing the electric railway to take them over or co-ordinate the service.

The exploitation of the bus at the present rate has created the prediction that history will repeat itself. The development is going too fast and too far, courting disaster, as has been the experience with the electric railways, and with the steam railroads in the middle of the last century.

All students and investigators agree that the electric railway is the best medium known for mass transportation of passengers. In the interests of the public it must be preserved and protected against unnecessary competition, and must be the foundation of the coordinated transit system of the whole community. The necessity riders who constitute the masses want cheap transportation, and the safest and most reliable and regular transportation in all kinds of weather. The bus has not been proved equal to the electric street car in these essentials.

The economic advantages of rails to reduce tractive effort and electric transmission to reduce cost of power have been called fundamentals of the ability of the electric railway to furnish cheap transportation. The introduction of one-man cars on less frequented lines or between rush hours, lighter cars, improvements in transmission lines and permanent ways are all tending to lower the operating cost as well as to reduce the amount of capital invested.

The requirements for transportation in the large American cities cannot be compared with those of large cities in Europe, such as London, Paris or Berlin, where buses are the principal means of public surface transportation. Those cities have not the concentrated business sections with skyscraping office buildings holding the equivalent of the population of a small city which we have in this country. Their business is spread over a much wider area and the cities themselves extend from the business center in all directions. Furthermore, the number of automobiles is extremely small compared with the number on the streets of American cities. The fact that notwithstanding this easier situation there is congestion in the heart of those European cities on account of the bus traffic gives strength to the argument that to follow their example and attempt to handle surface transportation in American cities by buses instead of by street cars would create such an increase in congestion that it would prove unbearable.

American cities grow very rapidly. A comparison of the census of 1910 and that of 1920 shows that cities of from 250,000 to 500,000 population have on the average increased 40 per cent. Cities from 500,000 to 1,000,000 have increased 35 per cent. Smaller cities under 200,000 population did not increase quite so fast, the average being only 24 per cent. The larger cities of more than a million increased only 15 per cent. This growth and the increased number of riders produced thereby must be taken care of by the street railways by more frequent service on existing track systems, followed by track extensions into newly settled sections. Therein is the difference between the past and the future. In the past speculative extensions of the street railway preceded the settlement and building up of the suburbs. In the future such extensions will follow only after the new sections have been fully developed and the necessary amount of traffic is assured. The private automobile and the bus may suffice during the development, but the assurance of permanent and regular service offered by the rail lines will sooner or later be demanded.

Extensions Will Offset Abandonments

In the largest cities the problem has arisen as to when the large expenditure required for the building of rapid transit lines, elevated or subways is warranted. The actual carrying out of such plans has lagged behind the demands of growing population for additional transportation facilities. Statistics show that where such lines have been constructed they have had only a limited effect on the rate of continued increase in the number of passengers carried by the surface lines. In New York City it has been calculated that the increase in population adds more than 100,000 riders per day to the total number of passengers carried by the surface, elevated and subway roads.

There will no doubt be further abandonment of non-paying electric railway lines. This, however, is likely to be offset by the extension due to the natural growth

Digitized by Google

of the cities. As a whole it would appear from the facts that the developments of the past five years have put the electric railway on a more stable basis than they were, with prospects of a moderate, continued growth for many years to come. Where statistical figures show a diminution in number of miles of track and number of cars operated, they really indicate a healthy deflation. Quite a number of small companies operating less than 10 miles of track have been eliminated. The large companies are firmly established and carrying a constantly increasing number of revenue passengers.

This general study of the status of the electric railway industry was made with the ultimate object of determining the probable influence of developments on the future special trackwork requirements of the electric surface railway. The conclusions reached are that the purchases of special trackwork are not likely to diminish, as some may mistakenly believe, but may be expected to be materially larger during the next few years than they have been lately.

The bulk of the requirements comes from special trackwork renewal in the paved streets of a number of cities comprising only about one-third of the total electric railway track mileage of the country. More than 50 per cent of the renewal demands are for tracks in the hearts of cities with more than 250,000 inhabitants. The permanency of these tracks is not likely to be

Determination of Special Trackwork Requirements

To arrive at the total amount of special trackwork now in service, the proportion that it forms of the total track operated on representative systems was studied. Figures obtained varied from 5 per cent on systems having a large amount of suburban and some interurban track to more than 10 per cent on urban systems. Percentages were then applied to the mileage figures of the country to give the approximate number of feet of track of special trackwork in service under the different kinds of operation. Dividing the special trackwork into its various representative units — i.e., single branchoffs, double branchoffs, crossings, crossovers, turnouts, plain curves, etc., of average dimensions—the average value per foot of track was figured, taking into consideration the type of special trackwork generally used under the different conditions.

The next and most difficult figure to determine was the life of the work under different conditions. Records and opinions of street railway engineers were consulted, as well as the records of the Wharton company of partial and whole renewals of layouts in different localities. The number of years given in the fifth item of the table are believed to represent a fair average.

In addition to the renewals there is the new work required for extensions of trackage due to the natural growth of the cities. This is still quite a factor which is not likely to be counterbalanced through any further abandonment of existing tracks in the cities.

Total figures from this calculation show that the special trackwork in service on the surface electric railways of the United States represents a present replacement value of more than $100,000,000, and that the normal annual requirements for renewals and new work should amount to approximately $12,000,000 at present-day prices. Of this sum possibly about 10 per cent represents work done by the railways themselves.

In making a comparison with the past it is seen that the urban trackage has not changed materially since 1917—extensions offsetting abandonments. Interurban trackage in the same period fell off some 1,300 miles, but this affected the special trackwork requirements in a very small way. It meant that the total amount of special trackwork in service, at present values, was reduced less than 1 per cent and the annual renewal requirements were reduced by less than one-half of 1 per cent. The potential market for special trackwork for surface railways is, therefore, the same now as it was seven years ago.

Surface railways for several years past have not fully maintained their trackwork and have resorted to many temporary repairs. Some have kept their tracks in first-class condition, but taken as a whole throughout the country they have not done so and their purchases of special trackwork material for renewals, taken as a whole, averaged not more than about 60 per cent of normal during the past five years. As the financial condition of the companies improves, their policy will probably turn to ultimate economy as the object in place of the temporary economy practiced. Temporary repairs only postpone and increase the eventual heavier expenditures, and poorly maintained trackwork adds to the cost of upkeep of the rolling stock.

It cannot be expected that the purchases of special trackwork will at once take a jump, but the prospects are that they will fairly rapidly increase in the next few years from the present low level until they reach normal and possibly go beyond normal to make up for the shortcomings in maintenance in the past.

A factor that will have considerable influence is the length of time that a piece of special trackwork can be kept in serviceable condition, without renewal and without detriment to rolling stock and motive power, by such modern means of repairs as the electric welding of worn-out parts. It is generally admitted that such repairs cannot be repeated indefinitely, but as to when they become impractical or uneconomical and whether they are economical at all when applied to certain parts of special trackwork has not been sufficiently determined.

Another important factor has lately appeared. It is the demand of the public for less noise in the operation of the electric cars. The increased noise through the restricted upkeep, of late years, of both the cars and the track has probably brought this phase of electric railway operation more forcibly to the attention of the public, especially when comparison was made with the quieter operation of the rubber-tired motor vehicle. Investigating engineers and travelers abroad have also found a very noticeable difference in the noise produced by the electric cars in American cities and the much quieter operation in the cities of Europe, where much attention is paid to the upkeep of the cars and track.

Electric railways must heed demands from their customers—the public—and to eliminate noise the track department and equipment department must work hand in hand. The first step is better upkeep. This factor is, therefore, likely to counteract the retarding influence to complete renewals of the electric welding repairs and to hasten rehabilitation. It will also undoubtedly, in time, cause some detail changes in the construction of cars and trucks and in special trackwork to a more extensive use of the higher, slower wearing types of work as well as to a demand for greater accuracy and higher finish of the work. Developments in that direction which will affect the manufacturer of special trackwork both in value and volume are to be expected.

SPECIAL TRACKWORK IN SERVICE ON SURFACE RAILWAYS AND NORMAL RENEWALS

	Paved City Streets		Unpaved Streets and Highways		Total and Averages
	Cities Over 250,000	Small Cities and Outskirts	City and Suburban	Interurban	
Per cent of special trackwork to total trackage	10	5	3	2	2.8
Number of feet special trackwork	3,000,000	2,250,000	1,650,000	1,750,000	8,650,000 = 1,638 ½ miles
Average value per foot of track	$16.00	$12.00	$10.00	$7.00	$11.38
Total value	$48,000,000	$27,000,000	$16,500,000	$12,250,000	$103,750,000
Average life — years	8	10	12	15	10
Renewals per annum	$6,000,000	$2,700,000	$1,350,000	$800,000	$10,850,000
Requirements for new track per annum	.....	$500,000	$300,000	.....	$800,000
Total estimated requirements of special trackwork for surface street railways per annum at current prices					$11,650,000

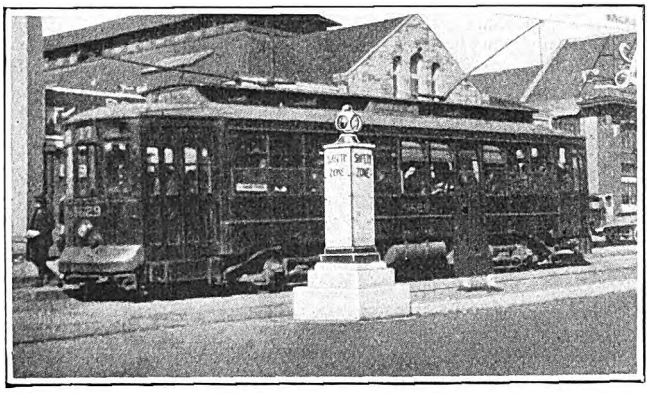
Digitized by Google

disturbed materially. The purchases for renewals during the past five years have been decidedly subnormal, and the returns to more normal upkeep for ultimate economy and efficiency under the improved conditions of the railways can be looked forward to.

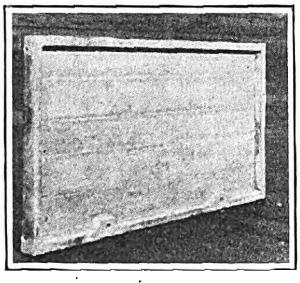
What may be considered normal average annual renewal of special trackwork at present-day values, figured from the probable total amount in service and the average life thereof, is given in the accompanying table. Adding thereto a moderate amount of new work and discounting the work done by the railways themselves gives a figure of $10,500,000 as the potential amount of the normal annual business in special trackwork material. This is for surface railways only and does not include elevated railways and subways, the business from which is slowly increasing as new rapid transit lines are added in the larger cities.

Trolley Loading Platforms in Baltimore Marked with Blinkers

INTERMITTENT warning lights of the type which are widely used to mark dangerous street intersections are being tried in Baltimore to mark the ends of trolley loading platforms. In this case the loading platforms are built and installed by the United Railways & Electric Company, while the warning lights are put up by the city. An interesting feature is the sectional construction of the platforms. Concrete slabs about 8 ft. long and 4 ft. wide are used for this purpose. They are hollow on the under side, as shown in one of the accompanying illustrations. The sections are made in the company's yard and are carried on flat cars to any desired location. This design makes it possible easily to install and remove the platforms or to increase and decrease their length. The blinker lights are made by the American Gas Accumulator Company.



Above, Intermittent Warning Lights Are Used at Safety Isles in Baltimore

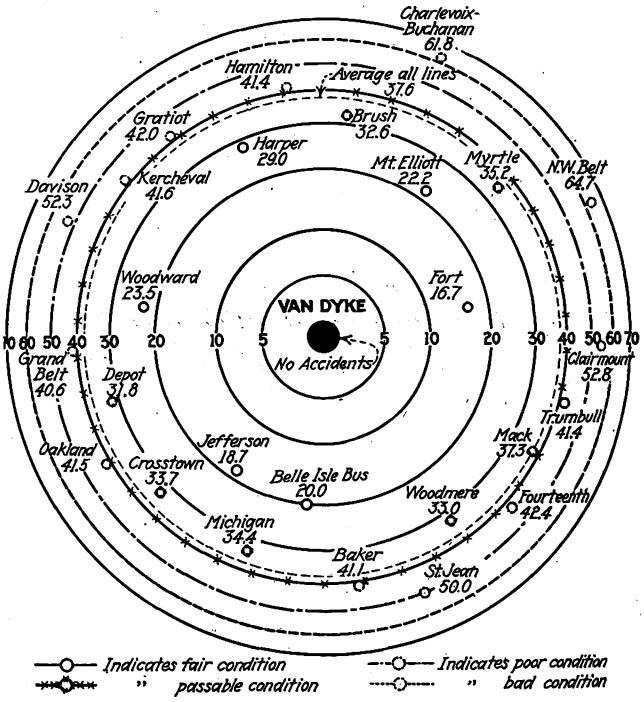


At Left, Hollow Concrete Slabs of This Type Are Used in Building Loading Platforms

Previous to their installation several unlighted types of sign were used to mark safety isles, but proved unsatisfactory on account of their being difficult to see at night.

Accident Prevention Target in Detroit

TO CREATE interest in the reduction of accidents and to present the results accomplished in interesting form, the target chart shown in the accompanying illustration was designed by the Department of Street Railways of Detroit at the suggestion of H. M. Gould, assistant general manager. This chart is called a "No Accident Bull's Eye" and is made up in the form of blueprints approximately 4 ft. square. These prints are displayed at the various carhouses and show in a forceful and interesting way the comparative accident record of each car line on the system. The figures represent the number of accidents per 100,000 car-miles. The center of the bull's eye represents no accidents.



Something to Shoot At

"No Accident Bull's Eye" used by the Department of Street Railways of Detroit for increasing interest in accident prevention measures. Each "bullet hole" indicates the record of an individual car line and the figures show the number of accidents per 100,000 car-miles.

On the targets displayed in the carhouses, colors are used to make them more attractive and also to tie them up more closely with street railway operation. Standard railway signal colors are used for this purpose. The "60" circle is colored red, as are also the "bullet holes" outside the "50" circle. This is intended to indicate danger to the lines whose scores carry them that far out from the center. The "50" circle is colored yellow, together with the "bullet holes" outside the "40" circle. The "40" circle and "bullet holes" outside the "30" circle are colored green. The "30" circle and everything inside of this point are white to indicate clear track and safety.

Each month the targets are displayed in conspicuous places in the carhouses. In calling attention to the results accomplished, and in urging the men to renewed interest in accident reduction, the company said:

"If every trainman will aim at the dead center and hit it, every line will make a bull's eye. Impossible? Perhaps, for some, but don't let it be you. Clean up the old blunderbus, adjust the sights, keep your head level, your arm steady, your eye clear, draw a bead on the center—and Shoot!"

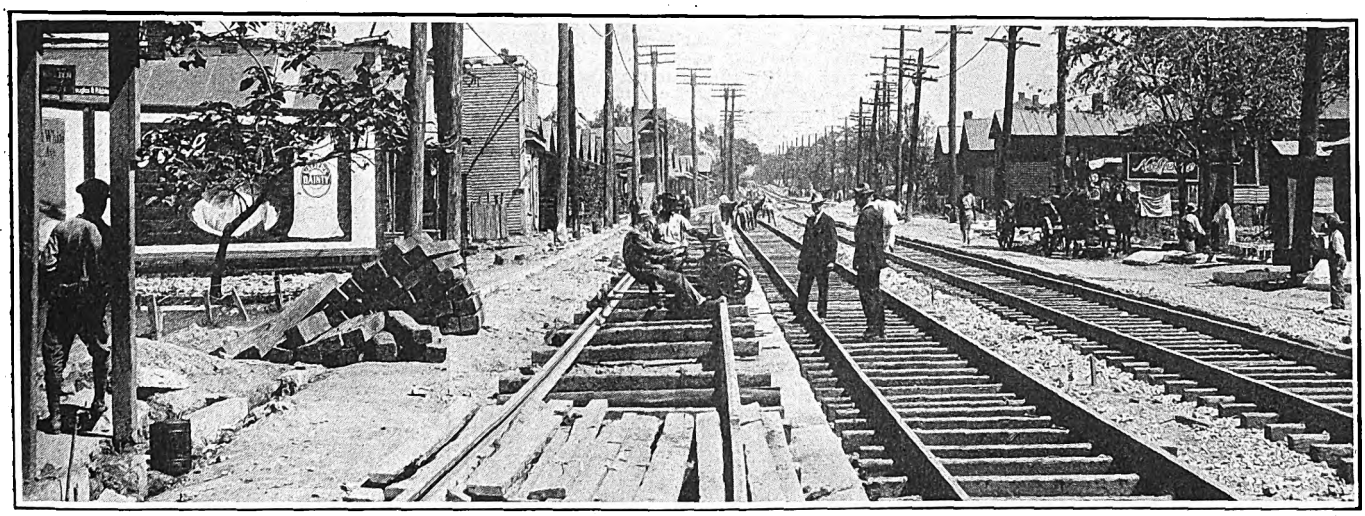
Track Reconstruction Cost Reduced by Use of Modern Equipment

Rail Pre-Welded in Lengths Up to 3,180 Ft. Was Installed by Birmingham Electric Company Without Interruption to Service—Joints Were Thermit Welded Under Pressure Produced by Special Clamps—Concrete Mixed at a Central Plant Was Transported and Poured from an End-Dumping Rail Car

By A. Taurman
Superintendent Equipment, Way and Structures Birmingham Electric Company
Birmingham, Ala.

DURING the year 1924 the Birmingham Electric Company was faced with the task of rebuilding the equivalent of approximately 10 miles of single track. This was on a street which is part of the state highway system and where the cars are operated on a six-minute headway during the non-rush hours, with three-minute service during the rush. To make the matter more difficult there was no parallel line to serve this territory nor any parallel paved street to which the vehicular traffic could be diverted.



On a Recent Track Job in Birmingham Long Sections of Rail Were Thermit Welded Before Being Installed. Joints Were Finished by a Rotary Grinder

It was, therefore, necessary to rebuild the track under traffic and with the least possible delay to car service.

To accomplish this the company decided to pre-weld the new rail alongside the existing track and then move it into position in long lengths. Feeling that the construction forces of an electric railway can compete successfully with local contractors in the matter of cost only when they have an adequate equipment of modern machinery, the company provided up-to-date cranes, work cars, welding and grinding apparatus, and a special end-dumping car to transport mixed concrete. By having a good organization and modern track machinery it was possible to do this reconstruction work at a cost substantially lower than on similar jobs in the past.

Slag ballast, wood ties, T-rail and brick paving were used. Eight inches of slag ballast was placed on the old track foundation. Creosoted ties with tie plates were used. The rail was Tennessee Coal & Iron R.E. 101.69 6-in. tee section. A 6-in. concrete slab with a 1-in. cushion of sand serves as a foundation for the paving. Three-inch bricks were used grouted with concrete to within ½ in. of the top of the brick, so a hot asphalt binder was then poured over the top and the surface covered with sand. It was agreed between the railway and the city to allow the ends of the bricks to go under the head of the rail inside the track and to come flush with the outer rail head and in the dummy strip.

After deciding on the type of track structure most desirable for this location, the next question was that of selecting and assembling equipment suitable for the rapid construction of the line. A Universal crane mounted on a 7½-ton Mack chassis was equipped with a clamshell bucket and used for excavating. The old track was stripped of its chert ballast, which was thrown to one side and hauled away either by Differential dump car or by motor truck, depending on the quantity to be hauled at any particular time. An end-dump car of special design was used to haul concrete from the mixing plant and deposit it between the rails.

Usually in the construction of track under traffic the electric seam-welded joint has advantages over other types. Before undertaking this job a series of tests was made by the company on seam-welded joints and thermit-welded joints. From this it appeared that the thermit-welded joints could be successfully used under these conditions by welding long lengths of rail before placing it in the track. A question arose, however, as to the best method of securing compression on the joints while they were being welded. This was accomplished by placing clamps on each end of the abutting rails and connecting them by 1-in. steel rods. An accompanying illustration shows the arrangement of

Three-Car Differential Dump Trains Used in Birmingham to Haul Material for Track Jobs

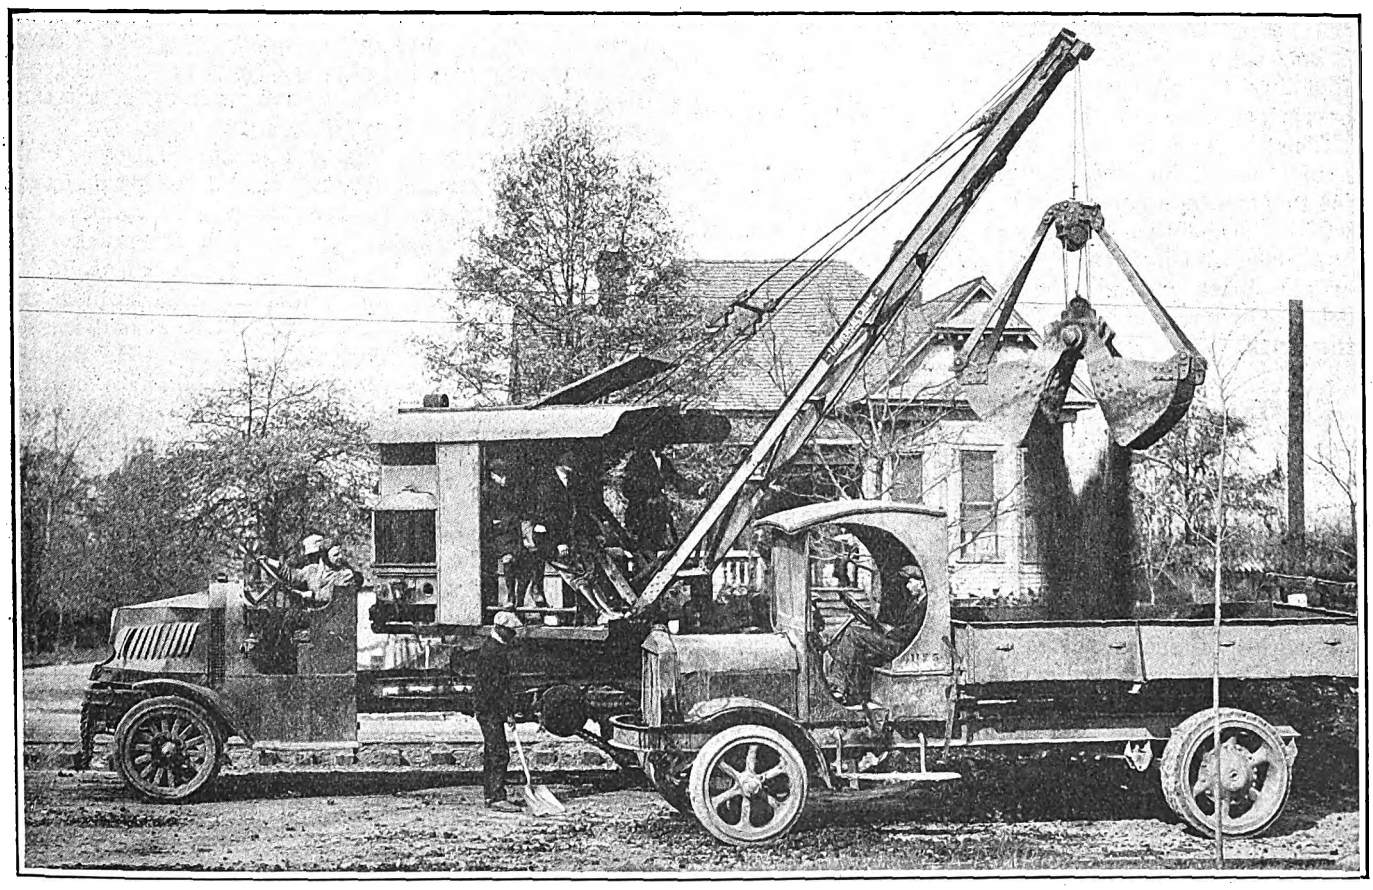
these clamps. They not only pull the rail into proper line and surface, but hold the insert in place while the mold is being put in position. They also make it possible to secure sufficient compression to upset the ends of the rails while the weld is being made.

After this, the new rail was laid parallel to the existing track and spiked down to the correct gage, on old ties, which were placed on the pavement near by. One of the illustrations shows this step in the procedure. This was done in order to permit the use of a Universal track grinder to finish the newly welded joints.

Rail was welded into lengths, at first of 950 ft., and later increased to as much as 3,180 ft. in a single section. After rails were properly welded and ground they were slid over by using crowbars into the track area and laid closely alongside the existing rails. At every fifth or sixth tie they were spiked down. This was all accomplished without interruption to car service. The old rail was then cut into pieces and moved to one side. New rail was then slipped in and connected up. Existing ties and plates were used to support the new rail, except where inspection showed a need for renewal. Afterward the old rail was removed and the cars operated over the new while it was being surfaced and lined up.

An interesting feature of this construction work was the rapidity with which rail could be transferred from the side of the street into place in the track area. In one instance 1,600 ft. of rail was moved over into position in five minutes. Cars were operated over the new rail as soon as it went into the track and there was practically no interruption to service.

Careful organization of a welding crew reduced materially the length of time required to make a thermit

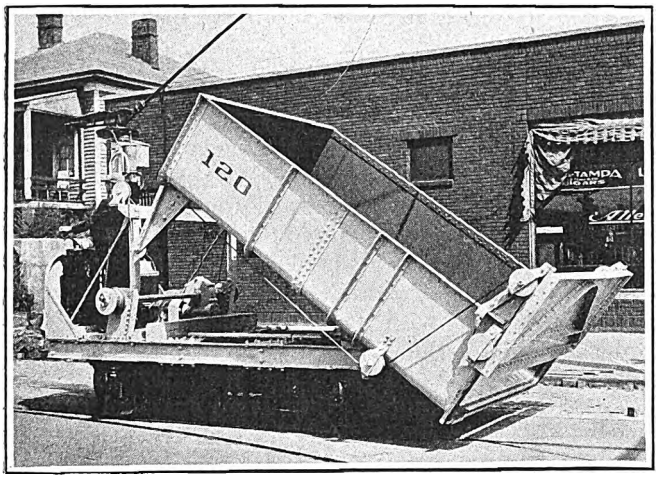


Universal Crane Mounted on a 7½-Ton Mack Chassis Removing Old Ballast

Digitized by Google

weld. One crew of seven men was able to weld as many as 60 joints in an 8½-hour day. Patterns used for making molds, the mold boxes themselves and the special clamp used for compressing the rail ends during the welding process are shown in accompanying illustrations.

To prevent vehicular congestion on this street an unusual method of placing the concrete was adopted, using a specially designed single-truck rail car. A single section of an ordinary Differential dump car was arranged with a modified hoisting apparatus so that it could be dumped endwise instead of sidewise. The railway arranged with a local construction company to purchase concrete already mixed at the latter's plant. For this purpose a special central mixing plant was installed to provide 300 cu.yd. of concrete a day. The



A Specially Designed End-Dumping Rail Car Was Used to Place the Concrete Without Interruption to Car Service

price was $4.90 a cubic yard. From the mixing plant it was carried by the end-dumping rail car and deposited directly between the rails. The car is shown in operation in one of the illustrations.

The use of labor-saving machinery and careful organization of the work enabled the railway to finish the job two months sooner than the original estimate, which was eight months. Work was commenced on Sept. 2, 1924, and finished on Feb. 1, 1925, except for some of the brick paving, the completion of which was delayed by the inability of the manufacturer to supply the brick.

Boston Completes Accident Prevention Campaign

Boston Elevated Concludes Its Series of Helpful Talks on Safety—Precautions to Prevent Various Types of Accidents Are Given

THE Boston Elevated Railway has just completed a series of successful talks to trainmen on safety topics. These talks, as explained in page 185 of the issue of this paper for Jan. 31, are issued as if given as speeches at mass meetings of the employees and are sent by mail to each employee. Louis H. Butterworth, claims attorney of the company, was the speaker at the "meeting" on Jan. 28.

Mr. Butterworth took the position that the present generation is no more careless than preceding ones, only that it is more in a hurry and is able to rush about with greater speed than its predecessors. This means that motormen and bus operators must exercise great care and skill to avoid accidents. He declared car collisions could be grouped under six classes as follows: The rear-end collision, which is nearly always the fault of the operator of the rear vehicle. The precaution to follow is not to run too close to the vehicle ahead and to have the car well under control in case the driver ahead should stop suddenly. The second type of collision, the head-on, is usually the fault of the auto driver, but motormen can frequently clear themselves of all blame if they are alert enough to sense the danger and bring their cars to a dead stop before the actual collision takes place. The third is the sidewipe, often occurring when a motorman tries to pass a vehicle which has a load projecting over its side. The leg of a chair or other part of the load may just catch the side of the car and break one or more windows and shower the passengers with glass. Such collisions often occur on icy streets where there seems to be sufficient space for the car to pass the loaded truck, but this space will be found to narrow suddenly to nothing by the truck sliding or slipping off a ridge of snow or ice. Brainwork is the only precaution. The fourth type of collision is the rear-end swing on curves. The conductor should look out for this kind of accident, particularly when the car has made a stop and an auto or team drives alongside it on a curve. He should warn the motorman of such condition. The fifth type is collisions of apparatus of the fire and police departments, which have right-of-way. For this there is no defence. The sixth is "cutting in" collisions, the most frequent kind of vehicle collisions. Motormen may be rarely at fault for collisions of this kind, but as the trolley car is the rear vehicle, juries often say that the company must pay for the damage. The cross-street collision is the seventh and last type to be considered. While not more frequent than the cut-in collision, there is greater likelihood of injury because the blow is given at right angles. Special care is required at cross-streets where the view is obstructed, and warning of the car's approach should be given through the gong.

At the meeting on Feb. 4 Michael F. Doyle, chief investigator of claims, declared it to be very important, while getting the names of witnesses in an automobile accident, to obtain as well the registration numbers of other automobiles at the scene of the accident, if the drivers or other occupants would be likely to have any knowledge of the accident. Mr. Doyle also discussed boarding, alighting and "falling" cases. He pointed out how alertness on the part of the guards or conductors in watching passengers board and leave, and the care of motormen in starting the car without jerks, could reduce these classes of accidents. Other "don'ts" related to giving the starting signal too quickly when an old or maimed person is about to leave or board the car, allowing the passenger to leave bundles where some one might trip over them, of neglecting to see that the floor is in good condition, especially in winter, etc.

On Feb. 18 David S. Lee dwelt on how accidents are paid for, and Miss Mary L. Donnelly, head stenographer of the department, on Feb. 25 mentioned some amusing claims, as that of the passenger for his hat because it was blown off while he was riding in an open car. On March 4 R. L. Mappleback, trial attorney, gave several striking examples of the way in which slight troubles on the car developed into serious accidents when described in court. The best remedy, he said, is to avoid accidents.

Holyoke Contracts for Power

Some of the Considerations Which Influenced the Holyoke Street Railway Company to Purchase Its Electrical Energy Instead of Continuing to Generate It in Its Own Plant—Railway's Generating Plant Is Purchased by the Power Company

By George E. Pellissier
Assistant General Manager Holyoke Street Railway

AFTER operating its own power plant for the past 30 years, the Holyoke Street Railway recently decided to discontinue the generation of electricity and has entered into a contract with the Turners Falls Power & Electric Company of Greenfield, Mass., for the supply of all the electrical energy which will be required in the conduct of its business for the next twenty years.

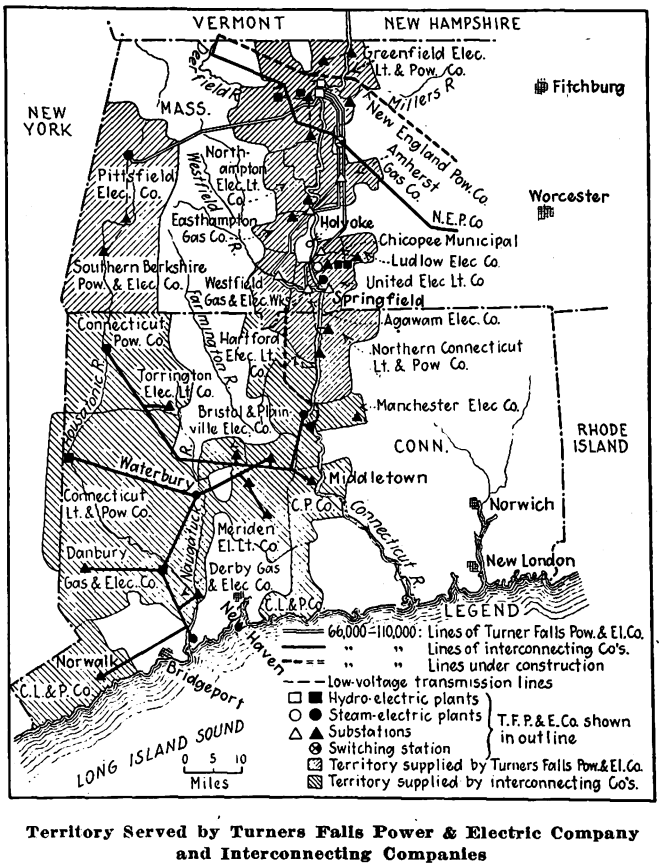
While the results obtained from the isolated power plant which is now to be abandoned have been eminently satisfactory, both as to cost and reliability, changes in conditions since the plant was built made the directors weigh very carefully the advantages and disadvantages of purchasing power before making the additional investment which would soon be necessary if the company was to continue generating its own power.

When the road was electrically equipped in 1891, and until the year 1895, all the electrical energy required for the operation of the Holyoke Street Railway was purchased from the Holyoke Water Power Company. In the latter year the railway company decided to build its own power plant, partly because the voltage regulation of the hydro-electric machines of the Water Bureau Company, in use at that time, was not very satisfactory, partly because the cost of purchased power was high, but also largely because the electric railway system was expanding so rapidly that the purchase of sufficient power for its requirements appeared difficult.

Its first power installation consisted of three 300-kw. direct-current generators direct connected to steam engines. This installation proved to be very satisfactory, and as the maximum distance the energy had to be transmitted at that time was less than 5 miles the losses in distribution were not excessive.

In the next decade the extension of the Holyoke railway system necessitated the enlargement of the plant to furnish the additional energy required. During this period the company acquired several small connecting railway properties, one of which had a small steam station at North Amherst. This station was kept in operation as it was some 20 miles from the main power station at Holyoke, and it was obviously out of the question to transmit the necessary energy at direct current. These extensions and consolidations shifted the center of gravity of the power load several miles from the main power station, involving serious energy losses in transmission, in addition to the inefficiency of operating the small steam station located at North Amherst.

In consequence, in 1915, contracts for energy were made with the Turners Falls Power & Electric Company, which had recently completed its hydro-electric plant on the Connecticut River at Turners Falls and had erected substations at Amherst, Mount Tom Junction and Alderville, all of them in close proximity to



Territory Served by Turners Falls Power & Electric Company and Interconnecting Companies

the distribution lines of the street railway company. The amount of energy contracted for was all which could be economically supplied from these stations and amounted approximately to 2,000,000 kw.-hr. a year, or one-fourth of the Holyoke Street Railway Company's total requirements. This permitted the railway to shut down its small Amherst station. As the power company had no substation or transmission lines in Holyoke and as the cost of generating power in the street railway plant, which had recently been overhauled, compared very favorably with the price of purchased power, there was no incentive at that time for the company to abandon its main plant, which was then in good operating condition.

Reasons for Purchased Power Today

In the ten years which have elapsed since 1915, several important changes in conditions have had a decisive influence in the company's decision to purchase electrical energy instead of continuing to generate it in its own station.

First in importance was the difficulty in financing the extensions and modernizing of the existing plant, which would have involved an expenditure of approximately $750,000. Under the laws of Massachusetts,

Digitized by Google

electric railways are not allowed to issue stock at less than par and can issue bonds only up to the amount of capital actually paid in. For the past few years, on account of the financial difficulties experienced by many electric railways due to rising costs, bus competition, etc., electric railway stock, even of roads which have been able to maintain the payment of dividends, has not been considered a particularly attractive investment, so that, at present, few if any of the electric railways in Massachusetts can issue stock at par. In the case of the Holyoke Street Railway, although in excellent physical condition and with a continuous dividend record extending over a period of 30 years with the single exception of 1917, when the company passed its dividend rather than curtail the maintenance of the property, the stock could not be issued at par at the present time. As under the law it would be possible to issue only $200,000 additional in bonds, the question of financing the necessary power-house improvements was a very important factor in the decision.

A second factor was the attractive rate offered for electrical energy by the power company. This rate was possible because the power company could supply a great portion of the energy from existing transmission lines and substations and had arranged to use the existing steam generating station of the Holyoke Street Railway as a substation from which to supply the remainder of the electrical energy required for the operation of the railway system. This means that practically no change will be required in the distribution system other than that necessary in connection with the transfer of the conversion now in the carhouse at Amherst to the substation of the Turners Falls company, which is about a mile nearer the center of gravity of the load. This change will eliminate the expense of substation operators at the carhouse.

Three Clauses of Holyoke Street Railway Contract for Purchase of Energy

ARTICLE 9. RATES

(a) Base Rate per Kilowatt-Hour. For all electrical energy delivered by the power company to the railway in each month and measured as set forth in Article 8 hereof the railway shall pay the base rate of one and eight-tenths cents ($0.018) per kilowatt-hour.

(b) Change in Base Rate Due to Cost of Coal. If on the first day of any month the market price of coal as hereinafter defined is greater than eight ($8) dollars per gross ton (2,240 lb.) then the railway shall pay an additional rate per kilowatt-hour for all kilowatt-hours paid for during such month. Said additional rate shall be the amount of seventy-five ten-thousandths of a mill ($0.0000075) for each 1 cent ($0.01) by which the average cost of coal per gross ton as hereinbefore stated exceeds eight ($8) dollars.

If on the first day of any month said market price of coal is less than seven ($7) dollars per gross ton (2,240 lb.), then the rate per kilowatt-hour to be paid by the railway for all kilowatt-hours paid for during such month shall be reduced as herein provided. Said reduction shall be the amount of seventy-five ten-thousandths of a mill ($0.0000075) per kilowatt-hour for each 1 cent ($0.01) by which the average cost of coal per gross ton as hereinbefore stated is less than seven ($7) dollars.

The market price of coal whenever referred to in this article shall mean the market price f.o.b. cars at Chicopee Junction, Mass., of bituminous coal having from fourteen thousand (14,000) to fourteen thousand five hundred (14,500) British thermal units per pound.

(c) Minimum Charge. In consideration of the investment made by the power company to serve the railway and the maintenance by the power company of its plant and equipment in condition at all times to supply the electrical energy herein contracted for, the railway agrees that if in any period of twelve (12) months during the continuance of the contract beginning on the first day of any January and ending on the thirty-first day of the following December the railway shall actually take under this contract less than six million five hundred thousand (6,500,000) kilowatt-hours of electrical energy, it will pay to the power company at the end of said period of twelve (12) months at the base rate set forth in paragraph (a) of this article for the number of kilowatt-hours equal to the difference between six million five hundred thousand (6,500,000) and the number of kilowatt-hours actually taken as aforesaid. This minimum amount of electrical energy to be paid for hereunder as above provided shall be increased from time to time in direct proportion to each and every increase in the total amount of electrical energy which the power company is required to keep available for the use of the railway as provided in Article 4 hereof.

ARTICLE 15. ARBITRATION

In the event of a difference of opinion as to the interpretation of the several articles of the contract, or as to the fulfilling of its conditions by the respective parties, the parties hereto do mutually agree that the questions be submitted to a board of arbitration consisting of one member, if the parties are able to agree upon such person, otherwise consisting of three (3) members, one appointed by the power company, one by the railway, and the third chosen by the chairman of the Department of Public Utilities or the chairman of the board which shall then have the public duties now performed by said department, and in case such chairman fails to make such appointment within sixty (60) days of the request to him so to do, the third arbitrator shall be chosen by the other two, to hear the parties and to decide such questions. The decision of said arbitrator or any two of the three arbitrators shall be final and binding. In the event of either party failing to appoint an arbitrator within ten (10) days after written request from the other party, such arbitrator, as well as the third arbitrator shall be appointed by the chairman of the Department of Public Utilities or the chairman of the board which shall then have the public duties now performed by said department. The expense of the board of arbitration shall be shared equally by the parties hereto.

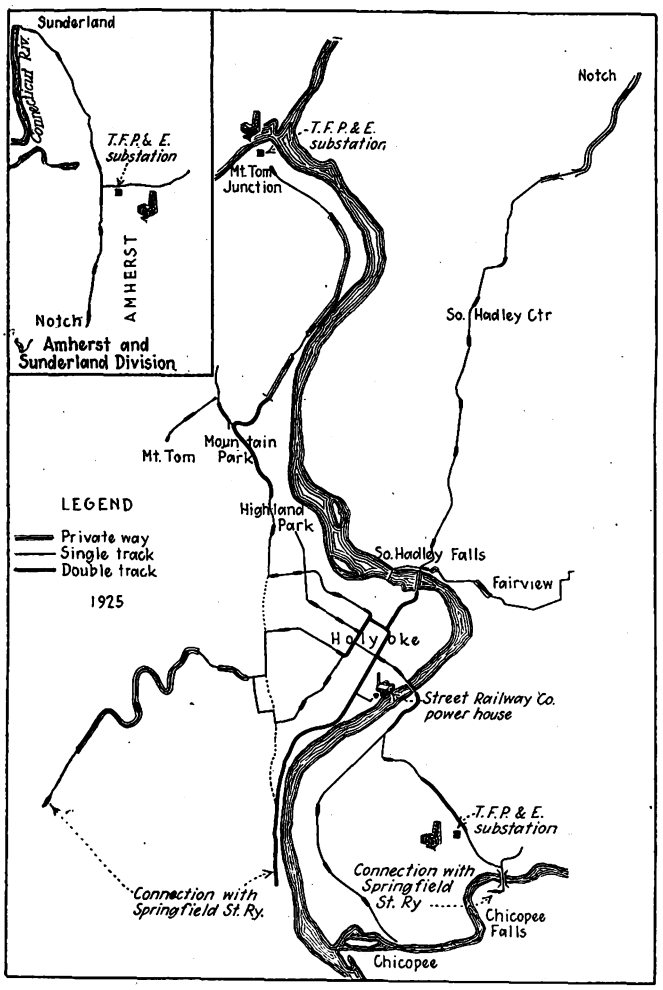
In case any difference of opinion shall arise as to the construction or performance of any of the covenants or agreements herein contained, such difference shall cause no interruption in the transaction of the business contemplated by this contract, and all such business shall continue to be transacted, and all payments hereunder to be made in the same manner in which the same have been transacted and made prior to the arising of such difference until the matters in difference shall have been fully determined by agreement or by arbitration as herein provided.

ARTICLE 16. REVISION OF RATES

At any time during the first three (3) months of the year 1936, and of the year 1941, either party hereto may apply to the Department of Public Utilities for a revision or alteration of any or all of the provisions of Article 9 of this contract relating to payments to be made by the railway for or in connection with the electrical energy delivered or kept available under this contract, including the minimum amount of electrical energy to be paid for, and thereupon said department shall have full power to revise and alter any or all of the aforesaid provisions in such manner as said department shall determine to be just and equitable, with due regard to the interests of both parties, and the revisions and alterations so made shall be final and binding upon both parties and shall become effective at such time not earlier than the date of the application therefor as said department may determine.

Whenever the Department of Public Utilities is herein referred to, such reference shall be taken to mean either said department or such other department, board or commission as shall have at the time of any application made hereunder the general powers and duties which are now vested in and imposed upon said Department of Public Utilities.

Digitized by Google



Holyoke Street Railway Lines, Showing Locations of Substations

A third factor influencing the decision in favor of purchased power was the agreement of the power company to purchase the existing power plant for $400,000, which is the book value less accrued depreciation (for which a reserve had been already set up). This amount will be available to the railway company for taking up outstanding mortgage bonds or for financing other improvements.

The fourth important consideration was the fact that the power company, because of its interconnection with other large power developments as shown by the accompanying diagram, offers a far greater protection against interruption of service than could possibly be obtained from any isolated direct-current steam-generating station.

COMPARISON OF COST OF ENERGY PURCHASED AND COST OF POWER GENERATED BY HOLYOKE STREET RAILWAY AT BERKSHIRE STREET POWER STATION

(Based upon the generation of 6,800,000 kw.-hr. direct current a year and coal at $8 per gross ton)

Generation of power at Berkshire Street station:

		Amount per Annum	Cents per Kw.-Hr.
Superintendence		$2,500.00	0.037
Buildings, fixtures and grounds		534.28	0.008
Equipment		5,108.17	0.075
Labor		30,305.51	0.446
Fuel (8,803.1 gross ton at $8 per gross ton)		70,424.80	1.036
Water		110.64	0.002
Lubricants		2,643.47	0.039
Miscellaneous supplies and expenses		1,399.19	0.020
Insurance—Fire	$980.00		
Use and occupancy—earnings	388.33		
Use and occupancy—boiler	357.14		
Steam boiler	140.60		
Flywheel	623.37		
Workmen's compensation	318.02	2,807.46	0.041
Interest on land, building and equipment		24,558.58	0.361
Interest on investment in coal supply		1,800.00	0.025
Depreciation		19,287.45	0.284
Taxes		11,585.92	0.171
Total cost to develop 6,800,000 kw.-hr. direct current		$173,065.47	2.545
Under proposed contract of Turners Falls Power Company: 6,800,000 kw.-hr. direct current at 1.80 cents		$122,400.00	1.800
Difference in favor of purchased power		$50,665.47	0.745

TERMS OF POWER CONTRACT AND COST DATA

The power contract itself does not differ materially from that usual except as to rates and possibly the provision for revision of rates at the end of the ten and fifteen-year periods, and the provision for arbitration of disputed questions through the Department of Public Utilities. These clauses are shown on page 542.

The accompanying table gives the cost of purchased energy as compared with that generated in the existing steam-generating station, based upon actual operating figures for 1923 with coal at $8 per gross ton. It shows the saving effected by purchasing energy will be approximately $50,000 per annum.

Automatic Barriers Protect Highway Crossing

Safety Gates of Steel Cable Installed at Highway Crossing on North Shore Line Are Designed to Yield but to Withstand Impact of Moving Automobile—Preliminary Signal of Approaching Train Given by Whiplash

AUTOMATICALLY CONTROLLED highway barriers of the yielding type have been installed by the Chicago, North Shore & Milwaukee Railroad on either side of the Middle Road crossing, Racine, Wis. These barriers are designed to stop an automobile should the driver fail to heed the warning signals. Each barrier contains a gate of steel cable which may be lowered across the highway. An automobile striking the gate is gradually retarded and brought to a stop before the tracks are reached. The barriers and retarding mechanism are strong enough to stop an automobile traveling 60 m.p.h. The gates are similar to those installed at the Austin Avenue crossing on the Chicago Elevated Railways, and described in this paper for Nov. 31, 1921, page 1145. A preliminary warning of the approaching train is given to the driver by a whiplash placed adjacent to the highway 150 ft. in front of each barrier. The movement of the gate is interlocked with color light signals on the railways.

Mounted across the highway 50 ft. from the nearest track rail is the barrier supporting frame, which consists of fabricated steel columns carrying a truss that spans the road. Upon the bridge is mounted the electric motor and propelling mechanism for raising and lowering the steel cable gate, which consists of three ⅜-in. steel cables suspended approximately 1 ft. apart, and reinforced by means of lighter vertical steel cables fastened between them. Square pieces of heavy canvas, striped black and white, form a checkerboard design calling attention to the barrier. The ends of the gate travel in guides in the columns, and are so arranged that it can be deflected to a total distance of 30 ft. when lowered. The yielding action is governed by weights and adjustable friction brakes, the retarding force increasing the farther the gate is deflected, so that it is possible to bring a moving automobile to a stop without the destructive result caused by a collision with an immovable gate.

On the right-hand side of the road, 150 ft. ahead of

Digitized by Google

the barrier, is the balanced whiplash or arm, which is 12 ft. long and is mounted on a column approximately 15 ft. high. From the arm are suspended bamboo-covered tell-tales of small cable, which will be struck by a moving automobile when the whiplash is extended across the road. In addition an illuminated sign reading "train coming" is carried above the arm, and the barriers themselves carry gongs and illuminated red stop signs.

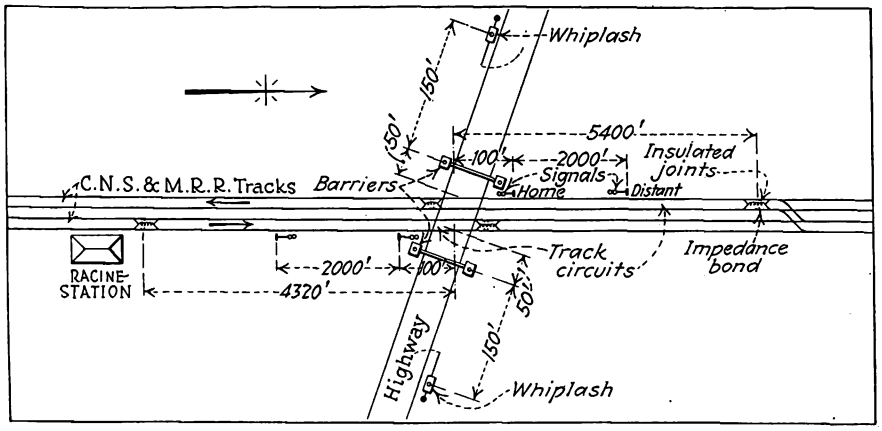
Two-position colored light signals mounted along the railroad right-of-way indicate the conditions at the crossing to the motorman. Two are located on the right side of each track. The home signals, located 100 ft. from the crossing, show green for "proceed" and red for "stop." The distant signals, 2,000 ft. ahead of the home signals, have green for "proceed" and yellow for "caution." The changes in these signals are controlled by the movement of the barriers.

METHOD OF AUTOMATIC CONTROL

Both tracks carry 12-volt a.c. track circuits on both rails, the current being confined to insulated joints and impedance bonds. The track circuit for northbound trains starts 4,320 ft. south of the intersection, while the southbound one starts 5,400 ft. north of the crossing. Both circuits terminate a few feet beyond the highway. A train entering the track circuit trips the track relay, which actuates the time element relay and also closes the motor control circuit, causing the motors to swing the whiplashes into position across the highway. Twenty-five seconds after the time element relay has dropped, the control circuit of the barrier is closed and the barrier starts down, the warning gong begins to ring and the red stop sign on the truss of the barrier is lighted. It requires seven seconds for the barrier to move down. During the 32 seconds between the time the train enters the track circuit and the time the barriers reach their lowest position, the railroad signals remain in their normal positions of yellow for the distant one and red for the home. When the barriers are completely lowered a circuit is closed and actuates the signal relays to change the indications to green. After a train has cleared the crossing and left the block, the operating sequence is reversed, the railroad signals go to their normal positions, the barriers are raised and the whiplashes swing out of position automatically. A three-phase, 220-volt, 60-cycle line operates the barrier and whiplash motors. Single-phase, 110-volt, 60-cycle current is used for the lighting control circuits, and is stepped down to 9-12 volts for the track circuit.

Should a train enter the block on one track just as a train on the other track is clearing the block the barriers would stay down, the whiplashes remain in position and the railroad signals would remain at proceed, retaining the right-of-way for the railroad. Should the automatic control fail, the barriers go down, and after a period of 10 minutes a bell notifies the maintainer, who lives near the crossing, that traffic at the crossing is at a standstill. In that event he may throw over a switch in the relay house that connects the control circuit with a push-button control located outside, so that the apparatus may be operated manually in a similar manner as by the automatic control. Notification is given the dispatcher at Milwaukee and a repair man is sent out. Should either barrier fail to operate, even with the manual control, it can be moved with an endless chain located in one of the columns.

The locations of the various parts of the apparatus and the time delay feature of the control have been carefully worked out to make the crossing safe. An automobile traveling 40 m.p.h. may be stopped with its own brakes in the 150 ft. between the whiplash and the barrier. The 32-second period is sufficient to allow an automobile traveling but 6 m.p.h. to pass the whiplash as it swings into position and clear the barrier on the far side of the railroad right-of-way before it is lowered. A train traveling 60 m.p.h. will cross the highway 33 seconds after the barriers have been lowered. At this speed an allowance of four seconds is given between the time the barriers are all the way down and the time the train reaches the distant signal, so this signal will clear just four seconds ahead of the train. However, as this is a caution signal and not a stop signal, the train may pass it and have 2,000 ft. in which to stop before the home signal is reached.



Schematic Layout of Crossing Showing Location of Whiplash, Barriers and Signals

This is the initial installation of this type of crossing protection on the North Shore Line. Before the barrier was placed in service, it was subjected to operating tests, including impact with a 5-ton truck. At 16 m.p.h. a coasting impact resulted in a deflection of 16 ft. At 16 m.p.h., with the clutch in, the truck was brought to a stop in 24 ft. As this was the maximum speed of the truck, it was impossible to obtain the maximum deflection of 30 ft. No damage was done to either the crossing protection apparatus or to the truck as a result of these tests.

How Railway Aids Safety Work

AS PART of its contribution to the work of the Baltimore Safety Council the United Railways & Electric Company has distributed 100,000 copies of *Trolley Topics* containing an article on "The Value of the Playground in Keeping Children Off the Streets." In addition to this, 4,500 cards bearing safety messages have been posted in the cars of the railway during the past year.

According to L. H. Palmer, vice-president and general manager, the company feels that there is a dual responsibility, and that any local effort to reduce accidents should be supported by all interests concerned, thus developing a co-partnership in accident prevention that will accomplish maximum results.

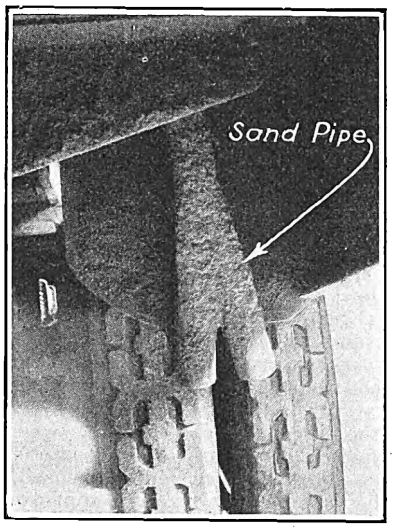
Sand Boxes on Buses

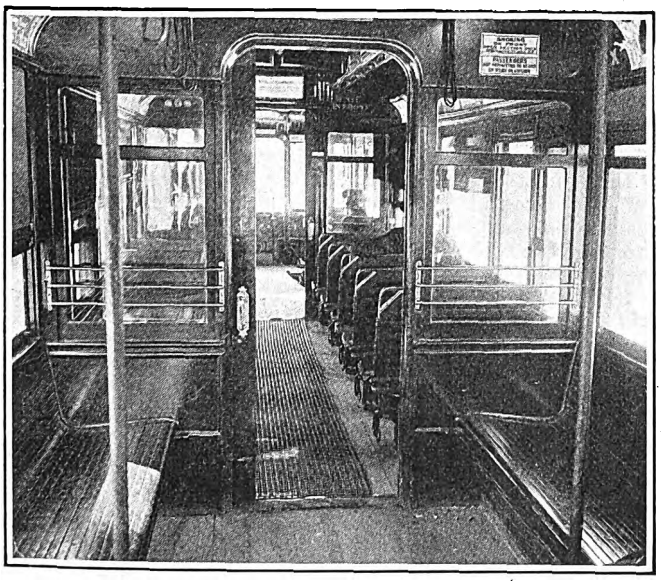
SAND boxes have been installed on the buses operated by the Des Moines City Railway, Des Moines, Iowa. The sand is controlled by a mechanical lever mounted near the emergency brake lever in a position convenient to the driver. Sand boxes are located under cross-seats on each side in positions immediately above the sand pipe outlet. A rod runs back from the driver's control lever and is connected by small bell cranks with the slide valves under the sand boxes. The arrangement is such that the valves on both sides of the bus are operated at the same time, thus discharging sand in front of both rear wheels. These wheels carry dual pneumatic tires, and each sand pipe has two outlets so as to distribute the sand under both tires.



Sand Boxes on the Buses of the Des Moines City Railway Are Arranged to Prevent Skidding on Slippery Pavements

Seat Rearrangement on Los Angeles Cars Proves Popular

A REARRANGEMENT of seats was made recently on a test car of the Los Angeles Railway and tried out on a crosstown line. The cars of this company have open ends and an inclosed center section separated by two bulkheads with sliding doors.



Longitudinal Seats in the End Sections of This Car Provide Larger Loading Platforms

Reversing the plan in use on the majority of the cars, the seats in the open ends on the test car were placed longitudinally and cross-seats were installed in the center section. The purpose of the longitudinal seats was to provide more space on the loading platforms and reduce the congestion on the back end. A postcard vote of passengers showed a five to one preference for the new arrangement.

The Readers' Forum

PITTSBURGH RAILWAYS COMPANY

PITTSBURGH, PA., March 28, 1925.

To the Editor:

I have read with unusual interest your article giving the facts regarding the St. Louis situation and heartily approve your method.

The conclusion reached by me after reading your article is that the people of St. Louis are going to pay a large penalty, either in impaired service or excessive cost of service or both, for their failure to bring about a co-ordination of street railway and bus services.

The unbiased and frank statement of all the essential facts you have made seems to me to be in line with the only worth-while method of attacking any unsound practice and especially the vicious practice of destructive competition.

T. FITZGERALD,
Vice-President.

Comment on the St. Louis Situation

MOUNT VERNON, N. Y., March 25, 1925.

To the Editor:

Your article in the March 14 issue on "Transit Conditions in St. Louis Today" is, to use a bromidic but truthful phrase, worth a whole year's subscription. It is of the essence of good journalism to tell the truth regardless of consequences—and, still better, to tell the truth from first-hand study.

The situation in St. Louis well illustrates the adage that "There is much to be said on both sides." You have fairly set forth all that can be said by both parties. When we interpret the data so clearly stated we become aware that this is far more a conflict between two transport undertakings than between two modes of transport. It is made obvious that when car and bus are run by separate concerns, clashing and overlapping are inevitable; but that when car and bus are run by one concern the public can get the advantages of de luxe bus service without losing the great benefits of necessity trolley service.

You have done wisely in refraining from comment on the information presented. Doubtless, each man will view your facts through the lens of his prejudices, yet the truthfulness of your outline will survive all distortion. At a critical moment, you have permitted the industry to see to what extent the incursion of the independent bus is due to genuine demand and how much to the vulnerable opening afforded by an electric railway bound in the thongs of receivership. May your work prove more immediately fruitful than the jitney studies which the ELECTRIC RAILWAY JOURNAL of the past decade was privileged to offer to its readers.

WALTER JACKSON.

With the advent of the first warm spring-like days, the New York Railways, New York City, commenced the operation of open cars on the Broadway line. To attract passengers these cars carried large bulkhead signs with white letters on a black background reading "Ride in the open."

Association News & Discussions

Changes in A.S.T.M. Specifications

AS the proceedings of the American Society for Testing Materials are not available to all electric railway men a brief summary of those matters of special interest to electric railways which have come before the society during the past year is given.

Revisions have been made in a number of the specifications coming under the jurisdiction of the committee on steel. These include specifications for steel track spikes; specifications for welded and seamless steel pipe; specifications for open-hearth steel girder and high T-rails. In all of these the changes, if any, are of minor importance.

The revised specifications for structural steel for cars now adopted as standard provide an important change in the addition of a paragraph, which recognizes the use of "copper-bearing" steel, the rust-resisting properties of which have been the subject of much study during the past four years. Other revisions apply to the preparation of test specimens and to the weight of individual plates ordered to thickness.

Specifications for steel castings amended and adopted in 1924 as tentative standard relate to the heat treatment of Class A castings and Class B castings (the former not requiring heat treatment unless specified) and explain that the heat treatment may consist of annealing, or of normalizing, or of normalizing followed by annealing, or of normalizing followed by a drawback to a temperature below the critical range. No castings quenched in any liquid medium are to be offered under these specifications.

Annealing consists in allowing the castings to cool after pouring to a temperature below the critical range, then reheating them to the proper temperature to refine the grain and permitting them to cool uniformly in the furnace. In normalizing, on the other hand, the castings are allowed to cool after pouring, the same as for annealing, to a temperature below the critical range. They are then reheated to refine the grain, also the same as in annealing, but instead of allowing them to cool in the furnace, as in annealing, they are allowed to cool outside the furnace in still air. The old maximum limit of tensile strength has been omitted, it being felt that no maximum limit should be specified.

Various revisions were presented this year for the first time in specifications for carbon steel rail, low-carbon steel splice bars, quenched carbon steel track bolts, structural steel for bridges and wrought carbon steel wheels for electric railway service.

It is interesting to note that the inspection of the test steel sheets at Fort Sheridan, Pittsburgh, and Annapolis shows additional failures among the non-copper-bearing groups of sheets, with no failures in any of the copper-bearing groups. It will be remembered that the term "copper-bearing" indicates a steel, otherwise of the ordinary commercial variety, which contains about 0.20 per cent of copper.

The above sheets are exposed to air and show the superiority of copper-bearing material under atmospheric conditions. Tests, however, of sheets completely immersed, some in city of Washington water and others in Calumet mine water, do not indicate any outstanding superiority for any one type of metal, and the presence of copper added to the various types of metal does not increase its resistance to corrosion when the samples are totally and continually submerged in running water of acid or alkaline reaction. The tests further show that the average life of the sheets immersed in water from the city of Washington supply to be about 18½ times longer than those immersed in mine water.

The sheets at Fort Sheridan exposed to air were first exposed in April, 1917. It should be noted that all the sheets in four groups of low-copper bessemer and open-hearth steel and pure iron have failed, and that of the total No. 22 gage non-copper-bearing sheets 50 per cent have failed, whereas none of the copper-bearing sheets has failed.

The society has undertaken a series of field tests on hot-dip galvanizing, sherardizing, electro-zinc plating, zinc coating by spraying, cadmium plating, calorizing, chromium plating and terne coating. Sheets of No. 22 gage basic open-hearth steel, without copper, are to be exposed, and, in addition, castings of an approved form, made of both cast and malleable iron.

Wire test specimens of material to be determined by further consultation with the coated-wire industry are to be included in the test. In all cases uncoated control pieces are to be exposed.

New England Club Honors Past-Presidents

Badges Presented to Twelve Former Executives at 25th Anniversary Dinner—Mr. Shannahan Tells Plans of American Association—Officers Elected for Ensuing Year

THE New England Street Railway Club celebrated its 25th anniversary with a dinner held the evening of March 26 at the Copley Plaza Hotel, Boston. More than 500 were present. The feature of the evening was the presentation of badges to twelve of the 24 past-presidents of the club. These included H. E. Farrington, H. C. Page, W. D. Wright, Thomas Lees, Elton S. Wilde, John T. Conway, Clark V. Wood, R. W. Perkins, I. A. May, Edward Dana, Ralph D. Hood, and the retiring president, T. H. Kendrigan. In a humorous address C. C. Peirce of the General Electric Company, who acted as toastmaster, gave a brief history of the club and said that the members, principally the manufacturers, had felt that a fitting remembrance should be given to the presidents who had labored so faithfully for its success.

In his presidential address Mr. Kendrigan gave a review of the events of the past year and the progress that had been made by the club in that period. He was followed by the president-elect, L. D. Pellissier, who spoke briefly of his appreciation of the honor conferred upon him.

President John N. Shannahan of the American Association, the speaker of the evening, told of the work of the association and events which led to the appointment of Mr. Storrs as managing director, as well as of some of the problems now confronting the industry. An abstract of Mr. Shannahan's address is given elsewhere.

Mr. Storrs responded briefly, telling of the aims of the association and the responsibilities of the new arrangement.

Mayor Curley of Boston gave an interesting talk on the relations existing between the Boston Elevated Railway and the city. He expressed great satisfaction at the results which had been obtained by public control, and said that he was desirous of continuing the arrangement for a full twenty-year period. An abstract of Mayor Curley's talk appears elsewhere in this issue.

Following the addresses a vaudeville program entertained those present.

ELECTION OF OFFICERS

At an afternoon meeting officers for the ensuing year were elected as follows:

President: L. D. Pellissier, Holyoke, Mass.

Vice-presidents: H. F. Fritch, Boston, Mass.; J. K. Punderford, New Haven, Conn.; J. B. Crawford, Concord, N. H.; T. B. Jones, Burlington, Vt.; F. D. Gordon, Portland, Me.; E. A. Brown, Newport, R. I.

Secretary: J. W. Belling, Boston, Mass.

Treasurer: Fred F. Stockwell, Cambridge, Mass.

Executive Committee: W. W. Field, Cambridge, Mass.; C. H. Wood, Boston, Mass.; G. H. Martin, Boston, Mass.; H. M. Flanders, Springfield, Mass.; H. H. Hanson, Newtonville, Mass.; R. B. Stearns, Boston, Mass.; J. P. Alexander, New Haven, Conn.

Broadening the American Electric Railway Association's Work*

Changing Conditions and Problems of the Industry Call for Greater Service from the Association—Appointment of Mr. Storrs Opens Up New Field of Endeavor

By J. N. SHANNAHAN
President American Electric Railway Association

ONE of the features of the electric railway business that keeps us fellows in it and draws in the younger men is the fascinating effect of change. The transportation industry is in a continuous state of evolution. I don't need to remind you men of the changes that have come in the last 30 years. These continual changes in the demand of the public for transportation service have kept transportation men on the jump. They make our work intensely interesting. They fill our lives with difficulties and troubles, but we do not break down under them—we try to meet each situation as it arises and give the public the best that is in us.

Speaking for myself, I think that perhaps our greatest fault is that we have been too prone to see only the things in our own back yards. We have gone about individually, studying our problems and doing our best to meet them. A great many times some of our neighbors have had similar difficulties and have come through them successfully, but we have paid little attention to what the other fellow did.

You all remember that it took a crisis to bring about collective action on our part in 1919. At that time the industry was in a bad way. We had been compelled to meet the increasing cost of materials and labor and had been prevented from increasing our income. President Wilson appointed the Federal Electric Railways Commission and before it appeared representatives of our industry from all parts of the country. For the first time in our history the public was informed of the facts concerning the street railway business. Since the Federal Electric Railways Commission made its report there has been a marked improvement in public understanding. Since then the financial condition of the industry has improved greatly. I believe that the service we are rendering is better, but, gentlemen, we have not yet rung the bell, and I don't believe that we will until you men in Massachusetts realize that success in our business depends in a large measure upon the successful conduct of the public transportation business in every other part of the country, and until the railway men in other parts of the country get it into their minds that their success is in a measure dependent on your success. I believe it was Patrick Henry who said something to the effect that if "we don't hang together we will hang separately," and another well-known quotation is that a house divided against itself cannot stand.

Now, we have made good progress at getting together, but we haven't gone as far as we must. The American Electric Railway Association, of which I have the honor to be president, represents about 90 per cent of the electric railway mileage in the country. In 1924 the electric railways of the country carried some 16,000,000,000 passengers. This was an increase of nearly 1,000,000,000 over the number carried in 1923, and this in the face of a tremendous increase in the number of automobiles. The American Electric Railway Association has done its best to inculcate a spirit of progressiveness in the minds and hearts of its members. It has encouraged and assisted member companies to carry on public relations work; it supplies them with a large amount of information on operating problems; through its various committees it is rendering a service that is of inestimable value to you. But there is a point beyond which the association cannot go. It cannot deal with questions of management, questions of relations between the individual members and the public they serve, questions of policy with reference to local conditions. It can and does reflect the opinion of the industry as a whole in its announcements and the recommendations that are made at its conventions, but these have not always been adequate to meet a given problem.

BETTER OFF, BUT STILL SOME TROUBLES

While as an industry we are better off financially and otherwise than we were in the bad old days of 1919, we are still having our troubles, and they are not altogether of our own making. You don't have any interurban railway lines in New England that are comparable with those in the Middle West, where the hauls are long and the lines are paralleled by state highways, over which in many states unregulated motor vehicle competition has been rife. Within the last four months two of the largest interurban railways in the country have been forced into receivership, largely because the public had not recognized the essentiality of the service rendered. Several legislatures now in session have enacted laws which will help to preserve to the public the service that is indispensable, but many of the railways have suffered damage that is very serious, and it will be some time before some of them will have completely recovered.

It has been in the minds of some of us for a long time that a way must be found to render the electric railways greater service than can come through routine association activities. This thought led to the suggestion that there should be a committee or council of men representing not only the operators of the electric railways, but also the owners of them, this council to give its best thought and advice toward leading the industry to permanent prosperity. Acting on this suggestion there has been created what is known as the Advisory Council of the American Electric Railway Association. These gentlemen quickly determined that to work out their ideas and policies they needed the services of a man who would have the whole-hearted respect of every electric railway man in the country, who would have those personal qualities that make a man attractive, whose technical knowledge would make his advice authoritative, and whose vision would be so broad as to make it possible for him to see into the future. I am happy to say that one of your members was chosen for this position—Lucius S. Storrs. Mr. Storrs will assume the position of managing director on April 2. He will give his entire time to the problems that confront us. He is at your service, whether you operate in New England, in Kansas, in California, or wherever you may be. You can talk to him as a brother and he will talk the same way to you. He knows the public transportation business from "A" to "izzard" and I know that nothing will give him greater pleasure than to feel that he can be of real service to you.

STORRS APPOINTMENT INDORSED

Since the announcement of the appointment of Mr. Storrs was made at our Midyear Meeting in Washington, I have received scores of letters and telegrams indorsing the action of the association. The feeling is general that this is the most important step the industry has ever taken. We believe it is, but let me say now that the accomplishments of the Advisory Council and of Mr. Storrs will be measured entirely by the co-operation which they get from the electric railway interests. Every electric railway company in the United States and every manufacturer of goods which are used by electric railways should give the council and Mr. Storrs their whole-hearted support, both moral and financial.

A few minutes ago I said that our industry is continually changing. With its evolutions there come new problems, not only in the practical operating of our business, but in matters concerning regulation and legislation. All of us are in a measure feeling our way. We find the public demanding motor vehicle transportation, and we also find that if we do not meet that demand somebody else will. The jitney hit us a hard wallop, and by the time the public had discovered that jitney competition was more ruinous to its own interest than it was to the electric railway, although we all know it did much damage to us, there had developed the bus.

Now the bus is merely a new tool for electric railways to use wherever it will fit best. I do not mean to say that you men should put on a lot of buses in response to clamor from a noisy minority and run those buses under conditions and on fares that will not return a profit to you—not at all; but I do believe that where bus service can be rendered with profit to the public and to the railway company, it is in the interest of the public that the railway company should run the buses. Only surveys of local territory by competent persons will determine whether and

*Abstract of an address at the annual dinner of the New England Street Railway Club, Boston, Mass., March 26, 1925.

Digitized by Google

how buses should be run, but once the decision to run them is made it devolves upon the electric railway management to see that the same care is taken to maintain schedules and to render service that is characteristic of their rail lines.

And in that connection there arises the question of protection of the established rail and bus lines against unfair competition. Massachusetts is one of the very few remaining states in the Union that have neglected to give the railways the protection to which they are entitled. You were one of the first states to establish the principle of state regulation of public utilities. But Massachusetts has been slow to protect the railways which it regulates. Unless your Legislature has acted within the last few days, you have no law authorizing your Department of Public Utilities to determine whether public convenience and necessity calls for the establishment of highway motor vehicle lines that would compete with steam and electric lines. Certainly such authority should be given your public utility regulatory body. It is obviously in the public interest.

Highway Interstate Commerce

In many ways the attitude of New England toward the electric railways has been progressive and enlightened. Here you have recognized that the investors are entitled to fair pay for the work their money is doing for the public. Here in Boston and in most of your large communities you have found the 10-cent fare to be necessary and your people recognized the justice of it. Under the public trustee acts, under which the Boston Elevated and the Eastern Massachusetts systems operate, the return to the investors is limited to 6 per cent, certainly a small enough return. Yet there are many companies that are not earning even 6 per cent, though they are rendering service that is as vital to the prosperity of the communities as the air we breathe.

Because of the dense population of New England, the closeness of your important communities to each other and the wonderful system of highways that has been developed by your states, and the close relations of the people in the different communities to each other, there has developed in the last two years an interstate motor vehicle business that has reached considerable proportions. Under the decision handed down by the United States Supreme Court on March 2, the states are without power to regulate this interstate business except so far as the safety of the public and the preservation of the highways themselves are concerned. As matters stand the states cannot deprive anyone of the right to operate interstate highway vehicles for hire, nor can the states regulate the rates of fare to be charged nor the quality of the service to be rendered. The coming summer may see your highways filled with vehicles competing not only with the steam and electric lines, but with bus lines which had been established in response to public demand, and which are subject to state regulation.

There can be no doubt in anybody's mind that this situation cannot continue without tremendous damage being done to the interests of the people on the one hand, and to the interests of all regulated common carriers on the other. It seems to me, and I feel sure it is the belief of others who have given the subject any study, that the Interstate Commerce Commission, perhaps jointly with the state commissions, should be empowered by Congress to exercise regulatory powers over interstate highway carriers. The Interstate Commerce Commission can be relied on to protect the public interest. Its long experience has given it understanding of the place which the various agencies of transportation occupy in the life of the communities. Before this authority can be given to the Interstate Commerce Commission, or anything can be done to increase the jurisdiction of the state commissions by Congress, however, there probably will be a great deal of harm done to the established rail and bus lines. This, of course, is extremely regrettable, and we all must hope that the condition will be remedied as quickly as possible.

Results with Public Control*

The Agreement Between the State of Massachusetts and the Boston Elevated, Made in 1918, Has Proved a Wise One and Should Be Extended for Twenty Years

By Hon. James M. Curley
Mayor of Boston

IT HAS been my very great pleasure to associate during the past 24 hours with the guest whom the street railway men are tonight honoring, and whom the city of Boston esteems it an honor to have within its gates, President Shannahan. Through his courtesy to me, and that of the presiding officer, I am permitted to come here and say just a word.

We are very proud of the officials in charge of our street railway transportation system. I am deeply in sympathy with their efforts to turn an annual deficit into an annual profit, because they owe us $1,700,000, and we could use the money.

At no time during the evolution—or revolution period, if you will—of street railway transportation has the public of New England, or that portion represented by the city of Boston, had a better realization or a more true perspective of the value of street railway transportation to the development of the community, or looked upon it with a more kindly spirit or a greater desire to be of assistance, than at the present hour.

What was deemed revolutionary in 1918 with reference to the Boston Elevated System is now regarded, after the passage of seven years, as the wisest character of legislation, and a plan that might be tried with profit by every section of the entire United States of America.

We gave them a peculiar charter in 1918. We have permitted a concern which was almost on the verge of bankruptcy to go before the General Court and receive a warrant which permitted it to charge any rate of fare which it saw fit, and in the event of its inability in any year to meet its expenditures in operation and the payment of its dividend, to assess its deficit on the cities and towns in which it operates.

It rather savored of the old days when what is now Manhattan was exchanged for a string of glass beads, but we feel that it has been a wise investment and the Boston Elevated System is now before the Legislature seeking further legislation, and two propositions are being considered—one the question of direct ownership by the cities and towns through which the road operates, which at a recent hearing had but one supporter to the project, and the other an extension of the franchise granted in 1918 for the period of twenty years. It is my firm belief that the Legislature in its wisdom will reject the proposal for a year's further study of the project, and, recognizing the need of adequate railway transportation, will grant an extension of the existing franchise for a further period of twenty years.

The whole public attitude with reference to street railway transportation has undergone a transition, if you will, during the past three years. We are beginning to realize that the competition of motor buses has been a serious competition in cities outside of Boston, and would have been a serious competition in Boston were it not for the fact that the Mayor of Boston recognizes that a street railway transportation corporation cannot do business on good wishes and promises, and that it requires something more substantial than it is possible to develop with outside competition which will operate only when the sun shines and roads are in good condition, and the remainder of the year compel people to use that which God gave them as a means of locomotion, before the birth of Henry Ford.

So we are taking a different view of the proposition. Our perspective has been broadened, and we are beginning to appreciate that street railway transportation has passed the stage of a non-essential; that it is an absolute essential for the conduct of business activity, and for the convenience of those members of the public who either find it impossible to own a car, or have difficulty in retaining in their service men who are competent to operate cars. And, taking that view of the proposition, we do not believe that it is a violation of the law, and we do not believe that it is bad judgment, to consider it in the same light as we do other essentials to the development of the prosperity and the happiness of society, such essentials as water, public sewerage, public lighting, public health, and public education.

*Abstract of an address at the annual dinner of the New England Street Railway Club, Boston, Mass., March 26, 1925.

Digitized by Google

We realize that no one individual, unaided, can maintain a personal transportation system of his own, and considering it in the main essentials we recognize that it is necessary, when support from its patrons is insufficient to meet the cost of operation with a reasonable return to the investors of a street railway transportation system, to make direct levies on the taxpayers for the maintenance of that institution, and contribute the money to the street railway companies that are operating in the community. So that it is a great pleasure to me, as the Mayor of a city which has considered with some intelligence and with some degree of generosity its street railway transportation, to come before you men and express the wish, aye, the hope, that the same intelligent direction and the same generous spirit which have made possible the continued existence of the Boston Elevated transportation system, will be in evidence before the 26th banquet of this organization in every intelligent community in New England, and that means every city and town in all New England.

Electrical Night at N. Y. R.R. Club

AT THE second "electrical night" meeting for the season of the New York Railroad Club, held on March 20, William B. Potter, chief engineer railway department, General Electric Company, spoke on "The Latest Developments in Electric Locomotive Design." The main floor of the auditorium of the United Engineering Society's building in New York City was filled to capacity, indicating keen interest in recent developments in electric motive power.

Electrification Progress

Mr. Potter said, first, that while electrification of steam railroads had not come about as rapidly as had been hoped for, substantial progress had been made. He quoted data from the recent report of the statistical department of the Chicago, Milwaukee & St. Paul Railway, showing substantial savings from the electrification. (See ELECTRIC RAILWAY JOURNAL for Feb. 28, 1925, page 338). The electrification was, therefore, not responsible for the railroad's recent financial difficulties. He also touched briefly upon recent foreign electric locomotives, particularly with reference to the problems involved in the use of siderods, which are popular abroad. Pictures of an experimental type of geared drive, with the gears outside the bearings, were shown on the screen as an example of recent studies in the line of simplification. The utilization of electric motive power, said Mr. Potter, should be along lines of the natural characteristics of this motive power, not along steam locomotive lines. Perhaps the electric locomotive of the future will be more like the trolley car, with bogie trucks, rather than like a steam locomotive. He showed pictures of locomotives recently supplied for operation in Mexico, between Vera Cruz and Mexico City, where regeneration is an important factor. Reference was made also to the type of locomotive being built for the New York, New Haven & Hartford Railroad, on which 600-volt direct-current motors will drive the axles. A motor-generator set will convert the 11,000-volt, single-phase alternating current into direct current.

Gasoline and oil engines were regarded by Mr. Potter as bound to play an important part in transportation in the future on account of their high efficiency. With these engines the rail car offers an opportunity to save operating expenses on lines of light traffic, and the bus has its place also. Electric speed reduction is preferable to mechanical in such vehicles, on account of its flexibility.

In conclusion, Mr. Potter explained the construction of the "otheograph" (see ELECTRIC RAILWAY JOURNAL for Aug. 25, 1923, page 294), by means of which the vertical and lateral stresses in track can be recorded as locomotives and cars pass over it at any desired speed.

Radio for Railways

Mr. Potter was followed by G. Y. Allen of the Westinghouse Electric & Manufacturing Company, who, speaking on "Radio on Railways and Elsewhere," described the principles of "wired wireless," in which power lines can be used for telephone transmission without interfering with their main function. Direct application to railroading has been slow due to the demand for radio apparatus in other fields, but transmission of signals from end to end of long freight trains on electrified railroads has been developed.

H. H. Vreeland, Elisha Lee and D. M. Brady then spoke briefly on the value of membership in the club, and a high-class vaudeville entertainment followed. There was no discussion of the technical papers. Refreshments were served at the close.

The program was in charge of a special committee consisting of W. G. Gove, chairman; J. S. Doyle and H. H. Norris.

COMING MEETINGS OF *Electric Railway and Allied Associations*

April 9—Central Electric Railway Master Mechanics' Association, Hotel Keenan, Fort Wayne, Ind.

April 16—Wisconsin Utilities Association, Hotel Pfister, Milwaukee, Wis.

April 20-25—International Regional Planning Congress, Hotel Pennsylvania and Grand Central Palace, New York City.

May 5-8—Southwestern Public Service Association, Rice Hotel, Houston, Tex.

May 25-28—National Association of Purchasing Agents, Milwaukee, Wis.

June 2-4—Central Electric Railway Association, French Lick Springs, Ind.

June 3-4—Iowa Electric Railway Association, Waterloo, Iowa.

June 10-12—Canadian Electric Railway Association, Montreal, Quebec.

June 26-27—New York Electric Railway Association, Bluff Point, N. Y.

July 22-25—Pacific Claim Agents' Association, Hotel Biltmore, Los Angeles, Cal.

Oct. 5-9—American Electric Railway Association, annual convention and exhibits, Young's Million Dollar Pier, Atlantic City, N. J.

Central Association to Meet at French Lick

THE annual summer meeting of the Central Electric Railway Association will be held at French Lick Springs, Ind., on June 2, 3 and 4. Arrangements are under way to assure a profitable and enjoyable meeting. A program of the business sessions will be published when completed.

Special rates have been made by the hotel company. The amusement facilities of French Lick include two eighteen-hole golf courses owned by the hotel company. Natural surroundings also offer an excellent opportunity for hiking, horseback riding and other outdoor sports. A swimming pool is included in the facilities. A large room in the recently completed addition to the hotel is available for light exhibits of manufacturers who may desire to send samples of equipment to the meeting.

Reservations should be made directly with the hotel company.

Internationaler Strassenbahn und Kleinbahn Verein

THE Internationaler Strassenbahn und Kleinbahn Verein (Street and Interurban Railway Association of Central Europe) will hold its next annual meeting June 21-25, 1925, at Budapest. The twelve subjects announced for discussion are as follows: "Railways in Hungary"; "The von Kando Alternating-Current Locomotive"; "Schedule Speeds on (a) Street Railways, (b) Interurban Railways"; "Recent Developments in the Design and Construction of Automatic Substations"; "Electrically Welded Rail Joints"; "Thermit Joint Welding on Exposed Track"; "Design and Operation of New Types of Street Railway Cars"; "Safety Precautions at Grade Crossings, at Which There Are No Flagmen"; "Developments in Internal Combustion Engines for Independent Units on Interurban Railways"; "Different Methods of Securing Economy in Suburban Rail Service"; "Present Status and Recent Developments in Construction and Operation of Auto-Motor Cars (a) for City Service, (b) for Interurban Service"; "Effect of the Auto Bus on the Street Railway."

Second Regional Motor Conference in May

THE second regional motor transportation conference under the auspices of the National Automobile Chamber of Commerce is announced for Chicago on May 26-27. The main theme, as in the first conference in Boston, will be the co-ordination of bus and truck uses with railway facilities.

Digitized by Google

Central Master Mechanics' Program

THE next regular meeting of the Central Electric Railway Master Mechanics' Association will be held at Hotel Keenan, Fort Wayne, Ind., commencing at 9 a.m., Thursday, April 9.

The program will include a talk by a steam railroad representative on interchange rules, reports of committees, and such other business as may be properly presented. There also will be a round-table discussion on matters of interest to the members attending. Some time will also be devoted to inspection of the shops of the local street railway.

American Association News

Mr. Storrs Takes Office

Railway Financing and Problems Arising from the Operation of Buses Will Receive Attention

LUCIUS S. STORRS, who recently was appointed managing director for the traction industry by the American Electric Railway Association, opened his office at 292 Madison Avenue, New York City, on April 2. Mr. Storrs, who is an executive of wide experience and particularly well known for his ability to deal with the public, will act largely as a general adviser and guiding hand for the electric railway interests, large and small.

Entrance of Mr. Storrs into the national electric railway situation is a part of the general modernization movement, according to a statement issued from association headquarters. Major problems facing the industry include co-ordination of electric railway and bus service, financing of extensions and betterments, and the procuring of legislation for the regulation of interstate bus traffic. Adoption of the bus as an integral part of electric railway service is becoming general throughout the country. At present about 200 electric railway companies are using the bus in supplemental service. In further co-ordination of bus and electric car service, Mr. Storrs' advice will be valuable. As president of the Connecticut Company, which operates practically all the electric lines and many buses in Connecticut, he had long experience with bus service. Ever since the bus began to occupy a place in local transportation, Mr. Storrs has been actively associated with joint committees of the automotive and electric railway groups.

Financing is occupying a prominent place in the traction picture now. Prior to his entrance in the electric railway business, Mr. Storrs was president of the New England Investment & Securities Company, and also now is a director of the Union Trust Company of Springfield, Mass. After becoming associated with the Connecticut Company he successfully financed that property despite the general gloomy attitude entertained by bankers regarding tractions.

The interstate bus situation is probably the most pressing immediate problem that Mr. Storrs must face. It was brought to a climax by the recent decision of the United States Supreme Court which put the determination of the convenience and necessity of interstate lines beyond the power of the state commissions. The Interstate Commerce Commission having held that it has no authority for highway transport, there now appears to be no regulatory authority controlling buses. Any relief which is effected probably will have to come through Congress, and doubtless legislation will be sought by the various interested industries.

Exhibits

SEVERAL of the members of the convention committees on exhibits and entertainment held a preliminary meeting at Atlantic City on March 20. Members present were: C. E. Morgan, chairman exhibit committee; S. J. Cotsworth, chairman entertainment committee; J. W. Welsh, executive secretary; F. C. J. Dell, director of exhibits; J. C. McQuiston, A. J. Purinton, A. M. Robinson and L. W. Shugg. Mayor E. M. Bader of Atlantic City and representatives of the local interests were also present. Satisfactory arrangements were concluded for the use of Young's Million Dollar Pier and for the decorations and other arrangements.

An innovation has been made this year by arranging for the construction of a temporary railroad track so that electric cars can be placed on exhibit without the difficulties of transportation to and from the pier that have been encountered in past years.

It was recommended by the exhibit committee that Wednesday, Oct. 7, be set aside for the inspection of exhibits, the same as the corresponding day last year. It was also recommended that the association look with displeasure on any exhibit or demonstration of buses elsewhere than on the pier.

A sub-committee was appointed to assist in securing exhibitors, as follows: Morris Buck, chairman; T. W. Casey, L. W. Shugg, B. E. Tilton, New York district; A. M. Robinson, S. J. Cotsworth, Philadelphia district; Thomas Fitzgerald, J. C. McQuiston, Pittsburgh district; A. L. Price, R. C. Snell, Cleveland, Detroit and Toledo districts; H. H. Adams, J. R. Fitzpatrick, L. E. Gould, Chicago district; G. L. Kippenberger, St. Louis district; R. H. Dalgleish, Washington district; H. B. Potter, Baltimore district; G. H. Clifford, Southern district.

Other sub-committees appointed were: Decorations—J. C. McQuiston, chairman; L. W. Shugg, F. C. J. Dell; space—H. B. Potter, chairman; L. E. Gould, G. H. Clifford; power—T. W. Casey, J. R. Fitzpatrick, A. L. Price; car and bus exhibits—A. J. Purinton, chairman; S. J. Cotsworth, R. H. Dalgleish, G. L. Kippenberger, A. M. Robinson; insurance—J. W. Welsh, F. C. J. Dell; co-operation with entertainment committee—Morris Buck, chairman, H. H. Adams, B. E. Tilton.

Equipment

A MEETING of the equipment committee of the Engineering Association was held in Cleveland, Ohio, on March 16 and 17. Those present were: P.V.C. See, chairman; W. S. Adams, R. S. Bull, A. T. Clark, L. H. Fry, J. M. Hipple, W. H. McAloney, J. C. McCune, M. O'Brien, E. S. Sawtelle, W. G. Stuck, H. S. Williams, G. L. Schermerhorn representing E. D. Priest, Robert Long representing J. L. Gould, and D. C. Fenner and J. S. McWhirter, visitors.

In connection with the review of existing standards, the committee considered it desirable to give further attention to the matter of clearances for bearings, in order that these might be definitely specified. The specifications for proof-testing of forgings as submitted by sub-committee No. 1 were approved. In regard to wheel mounting and check gages, it was decided to recommend two gages, one for mounting wheels and the other for checking the gage of wheels after they are mounted. The mounting gage is to be made up without tolerance, and the checking gage with tolerance. The present standard gage should be revised to change the slope of the wheel tread from 1 in 25 to 1 in 20. The suggestion that a gage be made up to determine when wheels should need further attention was disapproved. Questions of proper tolerance for bore of gears and the revision of plain gages for wheels and permissible eccentricity of axles were discussed, and it was decided that further information should be obtained.

The sub-committee on brakes and foundation brake rigging made a very complete report. This included definitions of the various brake equipment parts, methods and formulas for computing stresses in foundation brake gear, frequent causes for poor braking conditions and recommended practices for overcoming troubles. This was reviewed and several changes were suggested. The sub-committee will revise this report and submit it for further consideration. Car painting was discussed and the committee on this subject reported that a questionnaire had been sent out. As soon as replies are received, these will be tabulated for further consideration.

The minutes of a meeting of the motor coach committee of the Society of Automotive Engineers, held on March 9, were read and the members of the equipment committee decided to co-operate in the work as outlined.

The subject of reduction of car noise was reported on by the sub-committee, and discussion of the work brought out the fact that certain tests were desirable. In order to carry out the tests properly, instruments and various testing equipment would be needed. The committee decided to recommend that the subject of tests in connection with car noise be referred to next year's equipment committee with the recommendation that an appropriation be made to cover the cost of instruments necessary for making the tests.

Digitized by Google

to be used in making the various tests. The committee reported that a questionnaire had been prepared and would be sent out.

Reports of the chairman of the various sub-committees brought out the fact that members have been delinquent in answering correspondence, so that many reports have been held up, awaiting replies. More prompt attention is necessary if the large amount of work assigned to the committee for this year is to be completed.

Rapid Transit

THE first meeting of the rapid transit committee for the year 1924-1925 was held at association headquarters, New York City, on March 27, with the following members in attendance: G. A. Richardson, chairman; J. H. Alexander, C. E. Smith, D. L. Turner, James Walker, R. B. White and W. B. Bennett.

A discussion of the objects of the committee was followed by a discussion of its activities during the previous year. It was pointed out that a start was made last year in the compilation of statistical and historical data covering the principal cities in the United States and in foreign countries in which rapid transit facilities are in operation; and also similar data for those cities in the United States whose populations have reached a point where rapid transit facilities either have been under consideration or may in the near future be under consideration. It was agreed that this information would be of incalculable value in studying rapid transit developments to date and in furnishing information for guidance in the near future.

Mr. Walker, who compiled this data, stated that some companies had not responded in furnishing the information requested. After considerable discussion it was the consensus of opinion that an attempt should be made immediately to arouse the interest of those companies with a view to securing their co-operation in furnishing the desired information. Mr. Richardson suggested that Mr. Storrs personally write to the executives of the companies in cities of 500,000 population or more, pointing out to them the value of the work this committee proposes to do, and thereby attempting to secure their co-operation in furnishing the necessary data. This letter is to be accompanied with a questionnaire outlining the data desired.

The following subjects were discussed as being worthy of consideration and possibly of inclusion in the final report:

Forms of rapid transit other than elevated or subway for cities having populations from 500,000 upward. It was pointed out that in some instances street widening would permit the construction of tracks in a ballasted central portion either with or without grade crossings, depending upon the particular local conditions. On such tracks a form of express service might be operated which would result in very much higher schedule speeds than are possible at present on surface lines under ordinary conditions. Such construction could readily be made with a view to the later installation of elevated or submerged tracks when traffic conditions warrant the additional investment.

Possibilities of materially increasing schedule speeds on ordinary surface lines by strict police regulation of traffic designed to keep the tracks clear of other vehicular traffic during the rush hours.

Methods of financing rapid transit facilities, i.e., whether or not such facilities should be constructed with private capital by general taxation in the community, by assessment against abutting property (the value of which would be greatly enhanced by the rapid transit facilities) or by combinations of any of these methods.

Enhanced value of property resulting from the installation of rapid transit service in the community.

The general discussion covered many phases of rapid transit service, including the use of motor buses as feeders to rapid transit lines. There was unanimous agreement that all facilities of whatever kind should be co-ordinated into a single unified system in the interest of the community served.

Two Convention Committees Named

THE personnel of two important convention committees, those on exhibits and entertainment, has been completed and was announced recently by President Shannahan. The complete list of names follows:

EXHIBITS

C. E. Morgan, vice-president and general manager Brooklyn City Railroad, Brooklyn, N. Y., chairman.
H. H. Adams, Chicago, Ill.
Morris Buck, New York, N. Y.
T. W. Casey, New York, N. Y.
G. H. Clifford, Fort Worth, Texas.
S. J. Cotsworth, Philadelphia, Pa.
R. H. Dalgleish, Washington, D. C.
Thomas Fitzgerald, Pittsburgh, Pa.
J. R. Fitzpatrick, Chicago, Ill.
L. E. Gould, Chicago, Ill.
G. L. Kippenberger, St. Louis, Mo.
J. C. McQuiston, East Pittsburgh, Pa.
H. B. Potter, Baltimore, Md.
A. L. Price, Mansfield, Ohio.
A. J. Purinton, Atlantic City, N. J.
A. M. Robinson, Philadelphia, Pa.
L. W. Shugg, Schenectady, N. Y.
R. C. Snell, Cleveland, Ohio.
B. E. Tilton, Syracuse, N. Y.

ENTERTAINMENT

S. J. Cotsworth, sales agent Lorain Steel Company, Philadelphia, Pa., chairman.
G. A. Barnes, New York, N. Y.
Carl H. Beck, New York, N. Y.
E. J. Blair, Chicago, Ill.
H. L. Brown, Mansfield, Ohio.
F. A. Elmquist, New York, N. Y.
E. C. Faber, New York, N. Y.
C. E. Hale, Pittsburgh, Pa.
J. W. Hancock, Roanoke, Va.
H. J. Kenfield, Chicago, Ill.
G. R. Lyman, New York, N. Y.
C. E. Morgan, Brooklyn, N. Y.
L. H. Palmer, Baltimore, Md.
W. C. Parker, Lansing, Mich.
C. L. Pierce, Jr., Pittsburgh, Pa.
Harry Reid, Indianapolis, Ind.
W. J. Stanton, New York, N. Y.

Engineering Symbols

A MEETING of the committee on engineering symbols was held at association headquarters, New York City, on March 30. Those present were: H. R. Stamm, chairman; R. C. Cram, sponsor; H. W. Codding, C. W. Squier and W. J. Quinn, representing J. F. Neild.

A large number of symbols were submitted by various members of the committee for consideration. These symbols were divided into six classes: (1) Topographical; (2) buildings and structures; (3) electrical; (4) railroad; (5) mathematical; (6) mechanical.

Topographical symbols used by the United States Geological Survey and by the committee on national defence maps were considered by the members in connection with those suggested in the Engineering Association Proceedings of 1915. As symbols used by the United States Geological Survey are printed in three colors, it was decided to use the symbols suggested in 1915, together with additional ones from the United States Geological Survey and committee on national defense maps, which could be shown in black and white.

Standard symbols for the electrical equipment of buildings as approved for a tentative American standard by the American Engineering Standards Committee were considered as satisfactory. Two sheets of architectural symbols were submitted for consideration. Symbols for heating and ventilating, as shown in a preliminary draft code of the American Society of Heating and Ventilating Engineers, were submitted, together with symbols used by several manufacturers of heating and ventilating equipment. It was decided to use those approved by the Society of Heating and Ventilating Engineers, together with any additions from the manufacturer's design, which were considered essential. A sheet of symbols on reinforced concrete, taken from the Structural Engineers' Handbook by Milo S. Ketchum, was submitted for criticism, together with symbols for structural mechanics taken from the same source. These were considered satisfactory by the members of the committee present, and they are to be sent to other members of the committee for consideration and criticism.

Several hundred symbols for electrical equipment were submitted for consideration. The number of these was reduced to approximately 75, which were considered essential for electric railway use. Sheets embodying these 75 symbols are to be prepared, and submitted for further consideration.

The symbols for track and rail as submitted in 1915 were considered satisfactory. These are to be supplemented by additional symbols which have been suggested as important to be incorporated in the report. Several sheets of symbols as used by the Railway Signal Association were submitted for consideration. These are to be sent to all members of the committee for their criticism and suggestion as to the ones which should be incorporated and for any modification, should that appear desirable. A sheet of mechanical symbols embracing desirable additions is to be prepared.

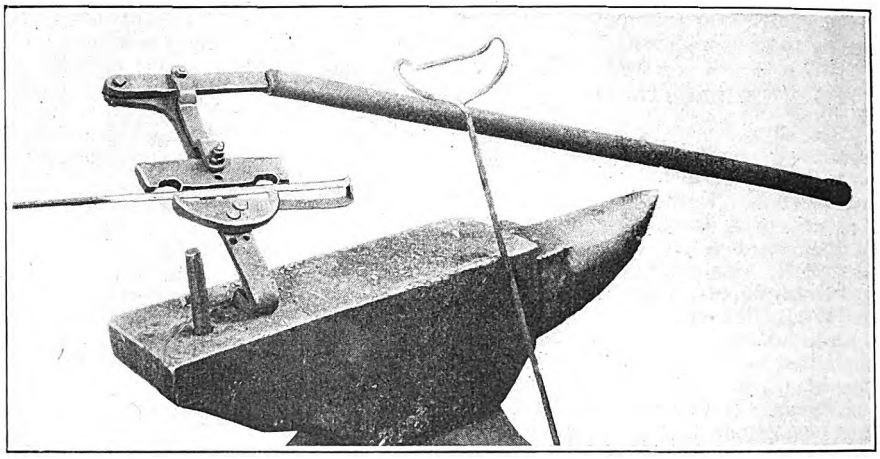
Maintenance of Equipment

Forming Handles at Ends of Iron Rods

A CONVENIENT fixture for bending the ends of switch levers, underground conduit cleaning rods and other similar devices used by electric railways has been devised by C. P. Westlake, supervisor of equipment, Eighth Avenue Railroad, New York City. The supporting member of the fixture is arranged to fit into the hardie hole of the anvil, so that it is convenient to forge and tools. The part of the fixture used to bend the rod has two parts, one stationary and the other movable. The stationary part has the shape of the inside of the handle and the movable part when it is pressed down forms the upper portion. Pressure for the bending operation is obtained from a handle with fulcrum at the end acting through a link to the movable part. A pipe extension is used to provide necessary pressure through increased leverage.

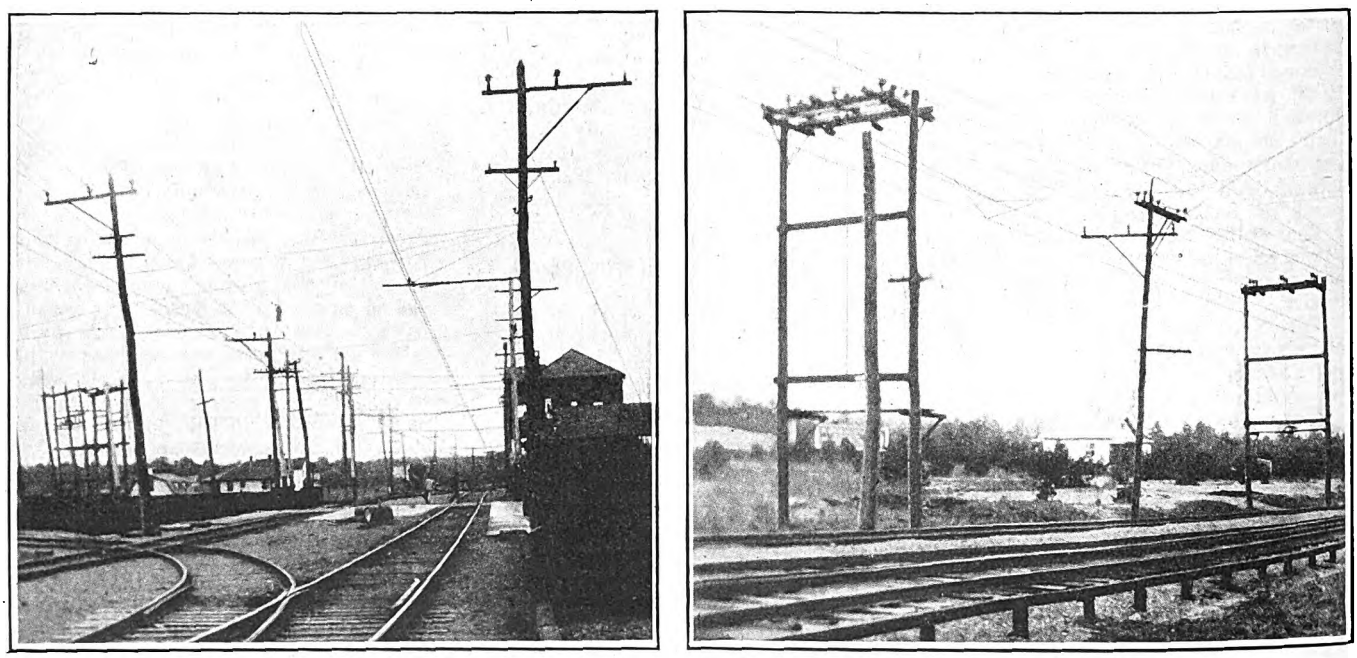
To bend the end of the rod into the shape desired, the end is heated at the forge and is then placed in the fixture with the end of the rod coming up against a stop, so as to determine accurately the amount of material to be used for the outside end of the bend. The movable part of the fixture is then pressed down by operating the handle, and the upper part is thus shaped. The long part of the rod is then bent down around the stationary part of the fixture, so as to form one side of the handle, and the short side of the rod is bent around the other side of the stationary fixture to make the complete handle. The accompanying illustration shows the fixture with a rod in position ready to start the bending. A completed rod with handle formed is also shown at the right. This is used for cleaning dirt out of the underground conduit.



Fixture Used for Forming Handles at the End of Rods

Span Wires Replace Bracket Arms

IN MAINTAINING its overhead lines, the Washington, Baltimore & Annapolis Electric Railroad has followed the practice of replacing the bracket arms from which the trolley wire is suspended by span wires, as shown in an accompanying illustration. From Baltimore to Washington this railway has double track and the overhead structure is supported by wood poles on both sides of the track. Catenary construction is used and ⅜-in. hard steel messenger wire formerly was suspended



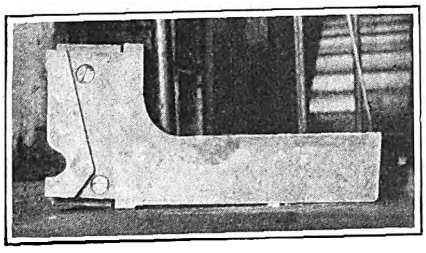
At Left, Old Arrangement with Messenger Wire Suspended from Bracket Arms. At Right, Messenger Wire Is Now Suspended Directly from Span Wires with Guys to Hold Trolley Wire in Position

Digitized by Google

from bracket arms extending over the track from the poles. Span wires acted as guys for the bracket arms and connected opposite poles. More recently the arms have been eliminated and the No. 0000 copper trolley and steel messenger wires are suspended by a triangular rigging as illustrated.

Finishing Wheel Tread and Flange at One Setting

STEEL-TIRED wheels are finished at the Unionport Road Shop, New York City, of the New York, Westchester & Boston Railroad with a tool accurately shaped to conform to the tread and flange contour. After the rough cuts are taken in the wheel lathe, this tool is used to



Cutting Tool Used for Finishing Wheel Tread and Flange at One Setting

finish the turning operation. It provides a very accurate contour and also saves considerable in the cost of turning.

The cutting part of the tool is of tool steel, welded to a steel plate which screws to the end of the tool shank. This provides a renewable and removable cutting surface. At the same time it permits the use of a high quality of tool steel for cutting, with a lower grade material for the shank. An accompanying illustration shows the construction.

Accurately Fitted Bearings Have Long Life

THE use of plastic bronze for armature bearings instead of babbitt-lined cast-iron shells was begun in April, 1921, on the Utica lines of the New York State Railways. Particular attention was given to the boring of the new bearings, a clearance of 0.006 in. over the actual size of the armature shaft being allowed. After two years of service covering approximately 147,000 miles, the first car fitted out was brought in for a grounded armature. The bearings were examined carefully, and measurement showed a wear of 0.003 in. over the original clearance. Since the total clearance of 0.009 in. was not considered excessive the bearings were reinstalled and continued in service.

Bearings are bored on the same horizontal boring mill that is used for wheels. A special fixture has been designed which is capable of holding the two housings of the motor in a horizontal position. A boring bar of special construction is fastened to the spindle of the mill. This has a center bearing with micrometric adjustment to take up wear. Two bearings are bored in position at one time.

New Equipment Available

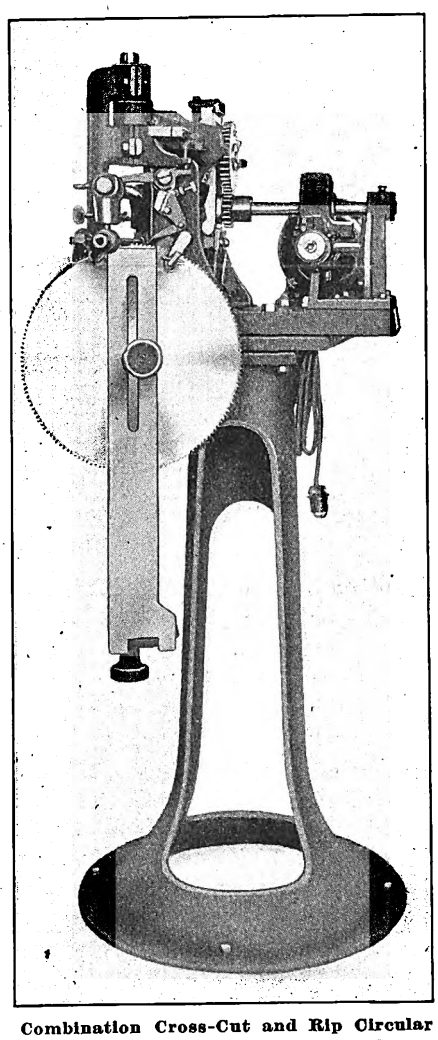
Circular Saw Filer

TO MEET the demand for an automatic machine to sharpen circular cross-cut and rip saws, the Wardwell Manufacturing Company, Cleveland, Ohio, has brought out a type known as the model Y. This has a capacity for filing all types of circular saws up to 18-in. diameter with teeth from the smallest up to ½ in. from point to point.

Among the special features of construction is the oblique elliptical movement of the filing arm, which gives the same stroke to the file as in hand work. A cam is connected to the main drive shaft. This cam raises the slide frame at a slight angle out of the vertical, which gives an oblique movement to the file and allows it to enter and leave any hook of tooth. A hardened steel roller on the point of the cam operates the horizontal slide filing arm. Two adjustments are provided for the movement of the lever attached to the swiveling head. One of these adjustments covers the length of stroke and the other the amount of cut removed from the face of the tooth. An elevating screw raises or lowers the saw at the point of filing.

The swiveling movement of the head and saw vise is secured through a 2 to 1 gear connection from the main drive shaft. The saw is turned alternately from right to left an amount depending on the degree of bevel to be given the teeth. The teeth of cross-cut saws are thus consecutively sharpened with alternate bevels through the swiveling of the saw between the stroke of the file. Ripsaws whose teeth do not require beveling are filed straight across by slipping the gears out of mesh and tightening the vise head in position at right angles to the file. The saw vise is easily removed for cleaning when necessary.

The machine can be furnished either for belt drive or with a direct-connected motor mounted on a pedestal. The bench type machine



Combination Cross-Cut and Rip Circular Saw Filer Mounted on Pedestal

weighs 165 lb. When mounted on a pedestal, the weight is 315 lb. The machine can be operated at a speed sufficient to sharpen 65 teeth per minute. Standard triangular files are used of a size depending on the size of the teeth to be sharpened. These files can be used for their entire length and on all three sides.

Crane Control

A DEVELOPMENT that is of value where reversing and non-reversing direct-current motors are used is the new magnetic time controller marketed by the General Electric Company of Schenectady,

Digitized by Google

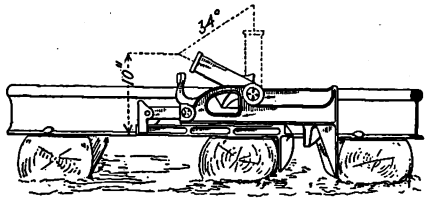
N. Y. This control has been especially designed for use with cranes and hoists.

Among the advantages claimed are ease in repair, well constructed and easily accessible parts, simplicity in wiring and a strong angle iron frame on which the control is mounted. Bases are moisture resisting, being constructed of a strong compound and chosen for their dielectric strength.

A time limit scheme of acceleration is provided when starting and current limit for plugging when reversing. Controls are provided with instantaneous electrical reset overload relays.

Tie-Spacing Cap and Shoe for Jacks

A CAP and shoe which can be instantly applied to Simplex track jacks, so as to adapt them for spacing ties, is being placed on the market by Templeton, Kenly & Company, Ltd., Chicago, Ill. To straighten skewed ties, the toe of the tie-spacing shoe engages the tie below the



Spacing Cap and Shoe in Position on Track Jack for Spacing Ties

center, while the base of the jack presses against the adjacent tie.

This device can be placed on any Simplex track jack. But two new parts are required, the cap and the shoe. The cap is a drop forging and is recessed to hold the shoe. It serves the purpose of the old cap by keeping the rack bar from coming out and also provides the shoe attachment. A greater safety feature is provided in the new cap by reason of its rounded edge and the downward projection which prevents the fingers from being pinched.

The tie-spacing shoe is a drop forging. It can be adjusted so as to give two positions of the toe. When adjusted in either position it does not swing away from the jack, nor can it drop out.

To use the new attachment for spacing ties, the ballast is removed ahead of the first tie and the jack and toe are placed in position. After the first tie has been spaced the others can be pushed ahead without removing additional ballast.

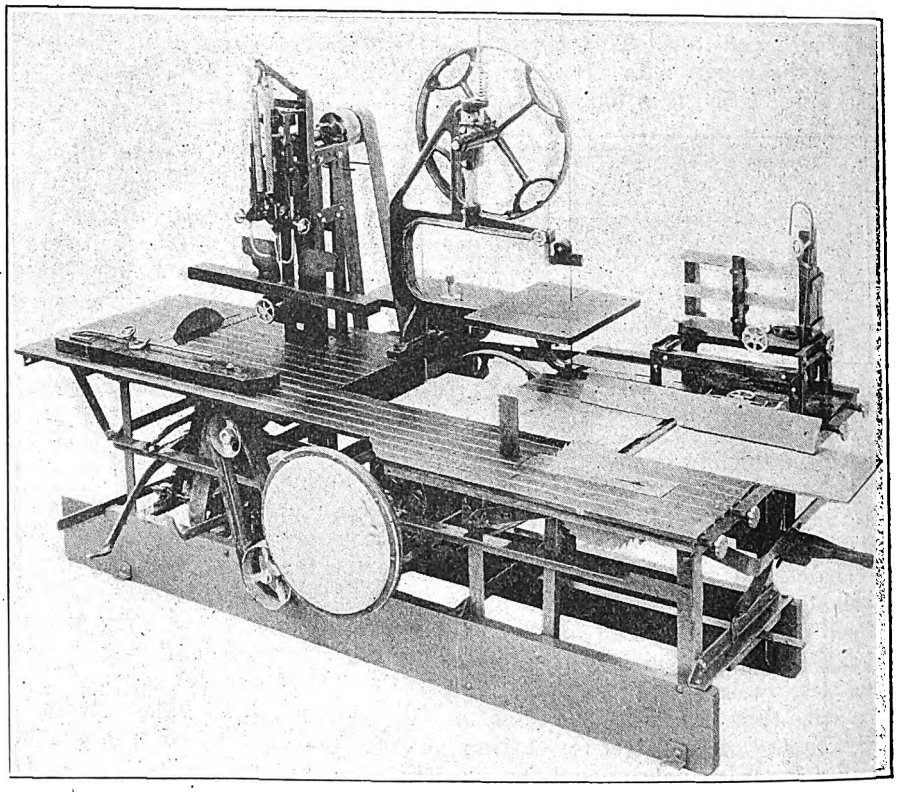
Combination Woodworking Machine

A COMBINATION working machine manufactured by the Parks Ball Bearing Machine Company, Cincinnati, Ohio, is designed to provide practically all of the more important wood-working machine tools in one piece of equipment at a very low price. The machine is built up on a steel frame made of 2-in. angles and is supported on two base timbers of 2-in. x 10-in. material, 8 ft. long and set 2 ft. apart. The circular saw table has a double working surface made up of channel slats welded to the angle frame. This table is 3 ft. 8 in. wide and 3 ft. long. The distance between saws is 28 in. A positive and accurate adjustment of the depth of cut is provided by the mandrel control device. These mandrels will take saws with a 1-in. hole and are stopped and started with a friction clutch.

A 12-in. wide joiner is provided, with a round safety head and four knives. The cutting circle is 4½ in. diameter. The steel plates are raised or lowered on an incline with hand wheel screws to adjust the depth of cut. A tilting guide on the joiner tilts to an angle of 45 deg. and is adjustable up to 17 in. width. A spring holds down the material.

At one side of the frame a band saw is mounted, which cuts to the center of a 44-in. circle. The band saw table measures 14½ in. x 17½ in. and can be tilted for sawing bevels. The wheels take saws 12 ft. long and the upper guide can be raised to take material up to 7 in. thickness. A belt-shifting device is used for convenience of the operator in stopping and starting.

There is a swing cut-off saw, which will cut 1-in. material 15 in. wide, or 3-in. material 12 in. wide. It has an adjustable stop, so as not to swing back further than is desired for the particular width of the work. When not in use the saw drops below the table surface.



This Machine Has Ten Wood-Working Tools Combined in a Single Mounting

Other tools on the machine include a reversible spindle shaper, an upright hollow chisel mortiser and borer, a tenoner, an 18-in. sand disk, a rip guide adjustable for any width up to 22 in. and a cross-cut guide which slides in milled grooves in the table.

The combination of tools included in the machine would answer the requirements of a small electric railway, where the investment in a more expensive installation of individual machines is not warranted by the amount of millwork to be done, or where limited shop space does not allow a more complete installation.

The News of the Industry

New Plan for Cleveland

Steam Railroad and Electric Railway Officials Discuss Terminal Problem and Suburban Co-ordination

Plans for handling and co-ordinating transportation in the metropolitan area of Cleveland, including its large suburbs, are now being worked out in a series of meetings between the officials of the Cleveland Railway and O. P. and M. J. Van Sweringen, Cleveland, who are building Cleveland's new union terminal station, to be completed about 1928. All of the Van Sweringen plans for rapid transit from the Cleveland suburbs call for electrification.

Details of the working out of the transportation plans of the Van Sweringens with the Cleveland Railway have not as yet been made public, but in a statement to the Metropolitan Transportation Commission Mr. Van Sweringen said he felt that his companies would furnish the Cleveland suburbs with their rapid transit facilities, while the Cleveland Railway should have a monopoly over the bus and traction service within the city proper, which means a radius of 5 to 7 miles from the Public Square.

This may eventually mean that some of the Cleveland Railway suburban lines may come into the hands of the Van Sweringens and that there may be an interchange of transfers between the Van Sweringen rapid transit lines, which will lead into Cleveland's new union station, and the Cleveland Railway's city lines.

It is also possible that the Van Sweringens may arrange with the Cleveland Railway to build a downtown subway terminal underneath the Public Square, with approaches to the new union station.

When the Van Sweringens and the Cleveland Railway officials have completed their discussions in executive sessions it is expected that the metropolitan area of Cleveland will have one of the finest co-ordinated transportation systems in the country.

Bus Permit Denied—Iowa Interurban Would Be Impaired

A request for a permit to operate a bus line from Davenport, Iowa, to Clinton, Iowa, and from Davenport to Muscatine, Iowa, has been denied the Scenic Stage Line Company of St. Paul by the Iowa Railroad Commission. The proposed bus line would have paralleled the route of the Clinton, Davenport & Muscatine Railway, an electric line operated by the United Light & Power Company. It was brought out at a hearing conducted at Muscatine that the proposed bus line would touch at nearly all of the towns along the interurban line in addition to serving the three terminals. The bus line would have served three points which the interurban does not serve. The three towns are served by three steam trains each way daily and the towns on the interurban, 21 in number, are served by eleven trains each way daily. Some little time past the interurban railway company put in effect a new and faster schedule, increased the number of trains and has been advertising for business.

The commission held that as the Clinton, Davenport & Muscatine Railway was dependent on business from the towns along its line alone and did not traverse other states so that it could make up a loss in business elsewhere a competing bus line would probably destroy a large property investment now adequately serving the public; that it would not promote the public convenience, but would more likely inconvenience a greater number of people by impairing rail line service now provided for.

$500,000,000 Traction Vote in Chicago

Co-ordination Measure Goes Before Voters on April 7—Exciting Campaign—Ex-Mayors Oppose New Plan

CHICAGO, noted for two defeats of transportation proposals at the polls in the last twelve years, votes on April 7 on the Dever-Schwartz $500,000,000 subway co-ordination measure. The finishing touches have been put to a remarkable campaign in which 150 meetings were held in the last week alone.

The economic aspects are unusual in that the city expects to acquire the Chicago Surface Lines for $163,000,000, the elevated for about $85,000,000 and build a subway without any direct outlay on its part. The whole financing except $40,000,000 paid to the city by the Surface Lines is expected to be done out of earnings. The ordinance calls for the outlay of $702,000,000 for the physical plant over a 20-year period, all to be paid for by notes.

Three Ex-Mayors Pictured by Chicago "Tribune" as Blocking the Track

Possibility of a 27-mile ride for 6 cents after the co-ordination has operated a year is held out by the campaigners. At its inception the fare will be 7 cents for elevated and surface lines (subways later) with interchangeable transfers. Col. Bion J. Arnold, Major R. F. Kelker, Jr., and Robert Isham Randolph, widely known consulting engineers, support the fare reduction promise through the Non-Partisan Committee of One Thousand, which directed Mayor Dever's campaigning.

The ordinance provides a $5,000,000 stabilizing fund. When this passes $7,000,000 the fare comes down 1 cent. The experts explain that if the courts uphold the contention that this is a municipal property and tax exempt, $4,400,000 will be immediately available. This is the sum which the elevated and surface lines would have to pay in taxes. Besides, there will be an end to the burden of paying 55 per cent of net operating income into the city treasury, which the surface lines have done for eighteen years.

An early issue as to whether this was to be a privately owned or municipally owned system grew cold as the vote neared. Private investors will hold a mortgage on more than half the lines for twenty years. At that time the city will be conceded more than half ownership and will assume majority control of the operating board which will run the lines. The city will never have less than an equal voice in naming the operating board.

An anomoly has been presented by the campaigners in the declaration that the surface lines are the finest transportation plant in the country and rendering excellent service—of course with limitations. Far from the cry of inefficiency usually heard in campaigns, the city speakers have pointed out that it is physically impossible, without subways, to better downtown transportation on account of congestion.

Buses have come in for a share of the debate, but proponents of a complete bus system have made little headway. Their arguments were answered by pictures of long lines of buses, automobiles and street cars wedged for blocks

Digitized by Google

in the shopping district. Buses, the campaigners said, will be used for feeders to rapid transit lines in neighborhoods not populous enough to support surface cars.

Underground campaigning has been explosive. Chicago's three ex-Mayors, William Hale Thompson, Carter H. Harrison and former Governor Dunne, came out against the ordinance. Supporting Thompson, Governor Small ordered the Illinois Commerce Commission to investigate, and supposedly condemn, the plan and was defied by the chairman, Frank L. Smith. The Thompson "transportation district," which was beaten at the polls five years ago, was revamped into a bill for the Legislature. None of the opposition moves seemed to stick.

Dunne declared his belief that the operating board has already been agreed on in the city hall and doubts whether nine men can be found who will run the lines honestly and without politics. He charges that once a man is in one of the positions, which may pay as high as $50,000 a year salary, he will be unassailable. There is no removal provision in the ordinance.

Carter Harrison declared its insufficiency condemned the subway plan. He said he would stand for nothing less than subways to every district. Under his plan there would be little surface transportation.

Hearst newspapers are working with Thompson. They claimed to have brokers' literature promising $240 gain in the market price of surface lines bonds and $37 gain for every share of stock, which is headlined: "Rich melon promised if Dever wins," and a keyline "Who Pays? Poor old city."

Thompson, ordering his own political machine solidly to the polls to vote no, has appealed to other citizens to stay away from the polls so they would not make the mistake of helping to pass the ordinance.

It has been generally conceded that the ordinance will be adopted, although it is a by-election. A poll, however, showed the sentiment to be very close. Support of 303 civic bodies is claimed for the ordinance with 25 against it.

Will Report on New York City's Suburban Problems

Governor Smith signed the Mastick bill on April 2 which creates a commission of eleven members to investigate and report upon the suburban transportation problem of the city of New York and its environs.

Buffalo Conference Postponed

The Public Service Commission has adjourned until April 15 the conference to be attended by the members of the commission, the municipal authorities and officials of the International Railway, Buffalo, including Thomas E. Mitten of Philadelphia. At this conference the report of the engineers of the commission detailed to check up on local service and equipment conditions will be ready and the co-operation of municipal authorities and the railway management will be asked by the commission as the most effective means of ending the traction problems of Buffalo.

New Fare in Youngstown

Weekly Ticket Plan Started as Means of Inducing Off-Peak Riding —Token Holders Sold

The Youngstown Municipal Railway Youngstown, Ohio, contemplates building up off-peak riding by the sale of a weekly ticket good for 25 rides to sell at $1.25, making the individual rides 5 cents each, and in this way restoring in a measure the 5-cent fare. This innovation will in no way affect the existing rates of fare. They are 8 cents cash or seven tickets for 50 cents, with a 1-cent charge for transfer on either cash or ticket fare.

Appeal to Youngstown Riders to Use Token Holders

Each ticket will contain 25 spaces for the conductor or operator to punch out the rides as taken. The ticket will be presented by the passenger for this punching for each ride taken. Between the hours of 5 a.m. and 7 p.m. weekdays the weekly ticket is good for only one person. Between 7 p.m. and 5 a.m. weekdays and all day Sundays and legal holidays it is good for any number of persons, one ride being punched out for each of the group using the ticket in common.

No transfers will be issued on fares paid by use of this ticket.

The ticket will be good for a specified week only, starting at 12 a.m. Monday and continuing through till 12 midnight the following Sunday. This week will be designated on the face of each pass by the dates, the first week, for instance, being good from April 6 to April 12, 1925, inclusive.

The arguments in favor of the use of this form of transportation are that it will encourage short riding at the reduced rate, will increase the noonday riding, in a number of instances probably a number of persons going to and from home for lunch, and thus taking four rides a day at a total cost of 20 cents instead of two rides at a cost of 14 to 16 cents, and increasing the use of cars and buses in the evening by having family parties or other groups use the cars with weekly tickets rather than the automobiles for pleasure riding. An increase in use of the cars Sundays and holidays is also anticipated.

The introduction of this form of ticket is experimental. Whether it will be continued depends upon the results obtained after a sufficiently long trial period.

Furthermore the Youngstown Municipal Railway began the use of metal tickets in lieu of the paper strip tickets on Sunday, March 29. Apparently the change in form of tickets was most successful. More than 70,000 tokens were sold on the first day and a supply of 10,000 token carriers given free with purchase of these tickets was exhausted long before the day was finished. As a result the company has ordered more of these carriers.

Out to Win in Dallas

To win the Charles A. Coffin Foundation award in 1925 is the hope of the Dallas Railway, Dallas, Tex., and the ambition of its patrons and employees. The company is urging the co-operation of all in its effort to increase its employees' benefit fund by $1,000 to win the gold medal and to put Dallas in the forefront as the most progressive city in the United States. Every day, "in the interest of a greater Dallas by the Dallas Railway," the company is publishing *Trolley-grams*, a news sheet containing some interesting history on the company as well as some stories of a lighter vein for the amusement of the car riders. The Coffin award, established three years ago by the General Electric Company as a memorial to its late president, is made to the electric railway which during the year makes the greatest contribution toward increasing the advantages of electric transportation for the benefit of the public and the industry. The Northern Texas Traction Company, Fort Worth, won the award in 1924.

Draft of Railway-Bus System for Toledo Awaited

In answer to the demand of the city for better service and some move toward a reduction of street railway fares the Community Traction Company, Toledo, Ohio, plans to submit to the City Council in about three weeks a tentative draft of a combined street railway and bus system to serve the entire city. Along with the plan will be provision for securing the necessary additional capital to take care of approximately $900,000 of new track and street work and purchase new bus and garage equipment.

Officials of the company now are working on plans for complete rerouting and abandonment of some lines. Parts of existing lines will be given up and new all-bus routes established and in other parts of the city the bus feeder system will be enlarged. A condition of this plan for betterment of service and extensions of lines will be a monopoly of the street transportation. This is possible now because the City Council has complete authority over the establishment of city bus lines through the recently enacted Collister-Krueger act. It is almost certain that a crosstown bus line will be a feature of the new system. Company officials take the attitude that the fare problem is not the paramount issue now, but that

Digitized by Google

citizens want the best service. It is pointed out that most of the responsible bus system offers which have been received by the company contemplate a 10-cent fare.

A corps of engineers from Henry L. Doherty & Company, headed by R. F. Carbutt, arrived in Toledo on March 31 to go over the plans and make estimates of needed capital and possible revenue over a period of five years. Their findings will be submitted to the New York office of the Doherty interests and then the final plan will be presented to the City Council of Toledo.

The new plan is to be presented with the idea of not modifying the Milner service-at-cost ordinance. However, it is believed that the board of control, City Council and other city authorities believe that some changes will have to be made in the ordinance to make it more effective and more responsive to conditions that have changed since it was adopted. Easier sinking fund charges may be asked.

Financing of Bus Purchases Arranged at Cleveland

The City Council of Cleveland, Ohio, on March 30 approved an unusual method of raising $2,000,000 for the purpose of improving Cleveland's transportation system by the purchase of buses and the making of rail extensions.

The $2,000,000 of new capital is to be raised by taking $33,333.33 a month out of the street car revenues, starting April 1, for a period of two years, thus accumulating $800,000. This money ordinarily would go to the interest fund and tend to reduce the rate of fare. The balance of the $2,000,000, namely, $1,200,000, is to be also set aside out of the company's income by trimming down its regular allowances for maintenance, depreciation and renewal.

With this $2,000,000 buses are to be purchased, rail lines extended and a new carhouse built.

The buses are to be purchased at once and to be ready for service in June over fourteen routes already mapped out by the company.

There will be double-deck buses on two main thoroughfares, one running east and the other west from the Public Square.

More Five-Cent Zones on New Jersey Railway

The Public Service Railway, Newark, N. J., has filed with the State Board of Public Utility Commissioners a tariff which abolishes the 8-cent unit fare on all its lines in Bergen County and substitutes a 5-cent fare. The new tariff applies to the company's Bergen Division the fare plan originally recommended by the State Board of Public Utility Commissioners and now in effect throughout the greater part of its system.

The change will reduce the length of the zones at the same time it reduces the fare in each zone. Under the present tariff there are on the lines in question thirteen 8-cent and six 5-cent zones, a total of nineteen. Under the new tariff there will be a total of 26 5-cent zones. The through fare, terminal to terminal, on the Englewood line will be reduced from 24 to 20 cents; on the Palisade line from 18 to 15 cents; on the Bergen Pike line from 26 to 20 cents. Through fares on the Hudson River and Hackensack lines are increased by 1 cent, the new fare being 30 cents, as compared with a present 29 cents; on the Fort Lee 2 cents—from 8 to 10 cents.

Long Island Work Ready

Electrification to Jamaica to Start with Summer Schedule—100 Cars Almost Ready

The work of electrifying the Montauk Division of the Long Island Railroad as far as Babylon is more than 80 per cent completed. With the exception of a short stretch at Babylon, where track changes are about to be made, the third rail has been installed on both tracks from Laurelton to Babylon. The work west of Laurelton is progressing rapidly. It is more than 20 route-miles from Jamaica to Babylon.

When the summer schedule of the Long Island Railroad, now in course of preparation, goes into effect on May 21, all steam passenger service will be removed from the Montauk Division between Babylon and Jamaica. This means that more than 80 local trains will be operated by electricity.

Sixty steel passenger cars now used in steam service will be equipped for electric operation, and 40 new motor cars are being constructed for service on the new electrified line to Babylon.

From Laurelton substation to Lindenhurst, the third rails have been alive for construction purposes. Current is being taken from the third rail for use in installing bonds at the joints in the running rails. This bonding work has been completed between Laurelton and a point just west of Lindenhurst.

The track circuits and relays of the automatic signals have been changed from direct to alternating current between Valley Stream and a point east of Lindenhurst, to permit the use of the track rails for the return circuit of the train propulsion system, as well as for the operation of the automatic signals.

Construction work on the substation buildings at Laurelton, Freeport, Wantagh, Amityville and Babylon has been completed. Similar work on the substation at Lynbrook is nearly finished. The installation of electrical equipment in the substations at Laurelton, Lynbrook, Wantagh and Babylon is well advanced; at Freeport installation work has commenced, and will also be undertaken shortly at Amityville.

Aside from a short gap at each substation, the transmission line has been completed, including poles and wires, from Lynbrook to Belmont Junction, west of Babylon.

The work of rehabilitating the existing transmission line between Rockaway Junction and Valley Stream is about 90 per cent completed.

Valuation of Cincinnati Properties Recommended

The report of the traction committee of the Cincinnati, Ohio, Chamber of Commerce on the 25-year traction ordinance now before the City Council has been accepted by the board of directors of the chamber. In accepting the report, which is based on the findings of Dr. Milo Maltbie, New York, public utilities expert, engaged by the chamber as consultant, the directors of the Chamber of Commerce definitely opposed the new ordinance drafted several months ago by representatives of the city administration and the Cincinnati Traction and the Cincinnati Street Railway.

According to its findings the committee is of the opinion that the proposed ordinance favors the traction interests unduly and at the expense of both the city and the car rider. With this report as a basis the Chamber of Commerce will suggest to the City Council that representatives of interested parties be called together for the purpose of drafting an entirely new ordinance. This new ordinance, it is indicated, should adjust more equitably the points raised in the chamber report.

Among the recommendations incorporated in the report is that of a valuation of the traction companies. Such a valuation is the basic and controlling factor for the settlement of all points at issue, particularly capitalization, it indicates. Other equally important recommendations are the strengthening of the city's control of the electric railways, a limitation of powers of arbitrating orders of the director of street railways, narrowing the field of court appeals, increasing the company's responsibilities with regard to street paving the maintenance, a more adequate control by the city over the management of reserves and other funds, elimination of provisions which in reality will necessitate a renewal of the ordinance in ten years, provision that the city may construct or provide other plants or equipment and elimination of the clause which might prevent the city from operating other transportations. In discussing the question of fares the report says that this issue is dependent upon the question of valuation.

Additional Bus Rights Sought in Bridgeport

Representatives of the City Service Corporation, backed by Walter B. Lashar and others, testified at a hearing held in Bridgeport, Conn., on March 28 before the Public Service Commission in regard to two applications for bus routes over which it seeks permission to operate. Counsel for Mr. Lashar was quite frank about the matter. He is reported by the Bridgeport *Telegram* to have said:

> We are ready to concede that the passenger transportation business in Bridgeport is a natural monopoly and will retire gracefully when the traction company deserves such a monopoly. We are out to force the Connecticut Company to adopt the 5-cent fare in Bridgeport.

Mr. Lashar, who is head of the American Chain Company, hopes to "bring the trustees of the Connecticut Company out of winter quarters to look Bridgeport over" and not to say again that "Lashar is crazy."

The new company is seeking the right to operate over two routes. Not only the Connecticut Company but the Bridgeport Auto Transit Corporation interposed objections to the granting of rights to the new company on the ground that its operation would mean needless duplication of facilities. The Connecticut Company representatives indicated their willingness to increase their facilities to meet the city's needs.

The commission reserved decision on all of the applications.

Incidentally Mr. Lashar has indicated that with the completion of the new Lordship highway from Hollister Avenue to the shore manor the present scheme of operating a trolley system to Lordship will be abandoned and buses substituted. The Lordship Railway is a 4-mile line. Mr. Lashar is understood to be its owner.

Kansas City Bus Ordinance Still Deadlocked

The March 30 meeting of the City Council of Kansas City, Mo., failed to break the deadlock in the lower house over certain issues regarding the ordinance which was drafted and introduced to the City Council for the purpose of granting the Kansas City Railways a three-year franchise for the operation of an auxiliary bus service upon the city's streets. Two weeks ago, when the bill came up for consideration in the lower house, one of the Democratic Aldermen proposed an amendment which would reduce the term of the franchise from three years, upon which the railway's receivers and the Council committee had previously agreed, to a period terminating six months after the end of the present receivership. Upon receipt of the bill, as amended, the bus committee reconsidered, but returned the bill to the lower house in its original state.

Rumors were current on March 30 to the effect that the Democratic faction would propose to amend again the bill so as to terminate the franchise one year after the close of the railway receivership. However, when the bill came up the Democratic bloc carried the vote to refer it once more to the special bus committee. The vote was 8 to 7 in favor of returning the bill, the seven Republican Aldermen being in favor of decisive action.

Another hearing on the bill is expected to be held by the special bus committee at a meeting April 3.

It seems doubtful whether the bloc in the lower house can be broken, and if it cannot and the bill is amended, there is said to be much skepticism in regard to possible approval of Judge Kimbrough Stone, referee in bankruptcy, since the receivership is expected to terminate at the end of this year. It is thought that Judge Stone will consider the time limit too short for the required investment.

Sliding Fare Scale Suggested for Atlanta

The special traction committee of the City Council will recommend a sliding fare for Atlanta, Ga., it was learned on March 30. This is in accordance with the Beeler plan and the request of the Georgia Railway & Power Company for a revision of its contract with the city. The contract to be recommended is understood to include the following provisions:

> That the initial fare be 10 cents, four tickets for a quarter, a 5-cent fare for children and free transfers.
>
> That the company establish a barometric fund of $250,000. Should earnings sink to a point where it was necessary to use this fund, and drop, say, below $50,000, a second scale of fares would go into effect. Under this scale, fares would be 10 cents, no tickets, a 5-cent rate for children, and free transfers. Still further adjustments are provided.

The valuation of the railway will be fixed by the committee at $16,500,000, with 8 per cent declared a fair return. Should rates under the first fare scale fail to give this 8 per cent return, then the barometric fund would be used until it fell below the $50,000 mark, when the second scale would become effective.

The committee, it is understood, will refuse to strike out the tax on gross receipts, but may recommend the payment of a lump sum in its place. The committee may also set a lump sum of $100,000 a year for street repair work.

Sweeping changes in the routing of cars are also in prospect.

With the consent of the city, the company anticipates no difficulty in securing the permission of the Public Service Commission to adopt a sliding scale of fares.

Phoenix Controversy Unchanged

The case brought by the city of Phoenix, Ariz., to revoke the franchise of the Phoenix Railway is still in the Superior Court, having been transferred from the United States District Court. It is likely that the hearing will not take place until next fall. It was charged by the city that the company had failed to live up to the conditions of its franchise, particularly with respect to carrying out paving work. In the meantime the Yellow Taxicab has applied for a permit to operate on one of the principal thoroughfares. At a recent hearing before the Arizona Corporation Commission on this matter the Phoenix Railway was not represented as an opponent, but many citizens on their own initiative opposed the granting of the permit. No decision has as yet been rendered.

Summary of Recent Bus News

The decisions of the United States Supreme Court in the Buck and Bush cases are expected in Washington to bring about regulation of highway transport by the Interstate Commerce Commission. Those decisions also are thought to imply a new obligation of the federal government in the matter of road construction. The states, of course, still are in a position to prescribe regulations for the use of roads which could be made so onerous as to discourage bus operations, but it is believed that the state public service commissions will enter into the spirit of the decision and prescribe reasonable regulations. The decisions are also regarded as furnishing another high obstacle in the path of those who contend that the federal government has no constitutional authority to participate in road building.

Installation of bus service in the city of Oswego, N. Y., with an estimated outlay of $75,000, is planned by the Empire State Railroad Corporation. Operation over four routes with at least six buses is planned. The only obstacle appears to be a decision as to the fare to be charged. The Council demands that the fare be put at 5 cents. T. C. Cherry, vice-president of the corporation, contends that it is impossible to operate buses at that fare. He has asked that the city run the buses for six months as an experiment to prove his contention.

Governor Fuller of Massachusetts has signed the bill, enacted this year by the Legislature, authorizing the railroads to carry freight and passengers by motor vehicles, when the Public Utilities Department certifies that such service is in conformity with public convenience and necessity. This bill was offered in the Legislature by former Representative James B. Brown, legislative counsel for the Boston & Maine Railroad. This law will have a far-reaching effect upon the present contest with the railroad, motor truck and bus line companies.

In Connecticut the usual procedure of attempting to give electric railways the right to operate buses directly has been reversed. In order to clear up a controversy in which the trolley interests claimed the right to establish bus lines anywhere a bill provides that such companies must get permission from the Public Utilities Commission, just as an independent company would. A bill allowing electric railways to substitute buses for street cars without sacrificing the franchise has also been introduced.

Mayor Van Zandt has signed an ordinance authorizing the Rochester Railways Co-ordinated Bus Lines, Inc., subsidiary of the New York State Railways, to operate a bus line in the Ridge Road from the city line to Waggs' Corners, where it will connect with city trolley lines. The action of the Mayor is significant in that it indicates the policy of the city to vest transportation in the city exclusively in the railway, with which it has a service-at-cost contract. The company now has only to obtain the permission of the State Public Service Commission.

News Notes

Federal Court Will Decide Income Tax Question. — Suit to determine whether Seattle public employees in utility service are legally liable to income tax will be pressed through the federal courts to the Supreme Court, if necessary to secure a final adjudication of the question. This is in accordance with approval by the City Council finance committee of an ordinance giving Corporation Counsel T. J. L. Kennedy permission to prosecute such a case. Under an order from the internal revenue department, street railway employees have already paid income tax, and the proposed suit will take the form of an attempt by one of the employees to recover the amount of the tax so paid.

Commission Approves Milwaukee Contract. — The Wisconsin Railroad Commission has approved the proposed service-at-cost contract between the city of Milwaukee and the Milwaukee Electric Railway & Light Company, leaving only the vote of the people to decide whether the city should accept the agreement. The commission declared that the value of the company's properties as fixed in the contract was both reasonable and just, as was the method provided for ascertaining the value in the future. Referring to the rate of return fixed in the contract, the commission found that the rate allowed was reasonable and would serve as a satisfactory basis for adjustment of utility rates.

Magnanimous Action of Employees. —Following a recent meeting of 250 employees of the Cass Avenue division of the United Railways, St. Louis, Mo., when a prize of $200 was awarded the workers for having the best accident record during February, A. O. Kelly, a motorman, arose and moved that the money be sent to the tornado sufferers of southern Illinois. The motion was adopted unanimously and the prize money was immediately wired to Murphysboro, Ill., to swell the relief funds being raised for the victims of the storm.

"Ride the Street Cars for Safety."— In a recent newspaper advertisement the East St. Louis & Suburban Railway, East St. Louis, Ill., says that "ride the street cars for safety" is more than a slogan—it is a definitely proved fact. In proof of its statement it gives a little of the history of its own company with respect to fatalities. Since Jan. 1, 1917, when the present method of keeping records was installed, the East Side Electric Railway carried on all divisions more than 276,000,000 passengers and operated more than 44,000,000 car-miles, all without a single fatality to a riding passenger. "Think it over," says the ad, "not a single fatality over the whole system in more than eight years." The company states that statistics show that riding on street cars is safer than walking. Further, that riding on street cars is safer than any other form of urban transportation.

Higher Fare Sought.—With operating expenses exceeding revenues on its Kenosha-Waukegan motor coach line, the Chicago, North Shore & Milwaukee Railroad has been forced to apply to the Illinois Commerce Commission for permission to increase fares between these two points to 3.6 cents for tickets and 4 cents a mile cash fare. The rate of fare which has been in effect since the installation of the service in December, 1923, has been 3 cents a mile when tickets are purchased or 3.3 cents a mile when cash fares are paid.

Considers Seven-Cent Fare Request. —After hearing argument by the counsel of the Virginia Railway & Power Company and attorneys representing the city of Richmond, Va., the State Corporation Commission recently took under advisement the request of the company for a 7-cent fare. The present fare charged by the company on all of its railway lines in the city of Richmond is 6 cents.

Mayor Wants Municipal Ownership. —Mayor J. Herman Hallstrom, Rockford, Ill., has publicly gone on record as favoring municipal ownership of Rockford's traction system. The Mayor is opposed to the present traction company and has indicated that any other company which might obtain a franchise was only a means to an end in his plan for a municipally owned system.

Reduced Fare Books Authorized.— The Oklahoma Corporation Commission recently granted the application of the Shawnee-Tecumseh Traction Company for permission to sell books containing 20 tickets for $4 to cover fare on interurbans from Shawnee to Tecumseh. The books may be used by the purchaser or any member of his immediate family. The application was accompanied by resolutions adopted by the citizens of Shawnee and Tecumseh consenting to the change.

New Negotiations Expected. — The Supreme Court of Ohio has decided against the city of Toledo in its fight on behalf of a lower power rate and for the return of $200,000 of excess power charges. These charges were collected from the Community Traction Company by the Toledo Edison Company over a period of two years or more when no power contract between the two companies had been approved by the street railway commission. This action now clears the way for new negotiations between the commissioner and officials of the Toledo Edison. The courts held all the way through that the Public Utilities Commission, by terms of the ordinance, had jurisdiction over the power rate. Action is also pending before the utilities body. The court battle was started under Commissioner W. E. Cann.

Operators Take Cash Fares. — The United Traction Company, operating in Albany, N. Y., and vicinity, recently eliminated the fare collection boxes and passengers now hand cash fares directly to the operator of the car, who rings them up. Cars have been equipped with facilities for recording fares so received. This marks a departure in the operation of one-man cars in this section. It is expected the new system will expedite the movement of cars.

Foreign News

Operation of One-Man Express Bus in Paris Successful

Express bus service inaugurated in September by the Société des Transports en Commun de la Région Parisienne on the Passy-Bourse line is proving very satisfactory. A 15-minute reduction in the running time has been made by these new express buses.

The new vehicles are similar to those recently placed in service in Calais, Anvers, Rotterdam and The Hague. A four-cylinder motor with a speed of 1,500 r.p.m. is mounted on a 3-ton chassis. Seats are provided for 25 passengers. Entrance and exit facilities are provided at the right hand side at the front, similar to the arrangement ordinarily found on one-man buses in the United States.

Instead of a door, however, a low wire gate is used. Its operation is interlocked with that of folding steps. Opening and closing of the gate is controlled by a lever placed at the left of the operator. To permit quick opening by a passenger in case of emergency, a foot pedal has been placed in front of the entrance. This pedal is painted red and instructions concerning its use are posted in the vehicle. A second emergency exit has been arranged at the rear of the bus.

Metropolitan Railway Electrification

Operation of electric trains on the Metropolitan Railway, London, England, between Harrow and Richmansworth began on Jan. 5. This extension involves approximately 23 miles of single track, on which the 600-volt third-rail system is used. Automatic signals were also installed. At present half-hourly service will be rendered. The area served is a growing residential district and the introduction of electric service is expected to hasten the development of this section.

A short branch line to Watford is now being electrified. When this work is completed there will be two electric railways operating from London to Watford, the other being an extension of the Baker Street & Waterloo Railway. The line from the Baker Street terminal, London, to Harrow was electrified several years ago.

London Tubes to Have Additional Escalators.—Contracts of the value of £107,000 have been placed by the City & South London Railway with Waygood-Otis, Ltd., for the construction of escalators at the six underground stations on the Morden extension, now under construction. These moving stairs will be of the cleat comb type, found satisfactory in the installation at Clapham Common station.

One Tramway in Paraguay.—Paraguay has only one tramway, which is in Asuncion, and 17 miles of this line is operated by electricity, 7 miles by steam and 2 miles by animal power.

Financial and Corporate

2,000 Winnipeg Shares Sold in Five Days

New stockholders to the number of 1,280 were added by the Winnipeg Electric Company, Winnipeg, Man., at the close of its recent customer-ownership campaign. The sale of 2,000 shares of preferred stock met with instant success. Although advertised as a ten-day sale, the whole allotment had been sold before the end of the fifth day. The campaign was continued throughout the ten days, ended March 11; however, in order not to disappoint many Winnipeg people who desired to become owners of the company's securities, 2,845 shares, in all, were sold.

The actual selling of the stock was conducted by employees of the company—motormen, conductors, linemen, clerks, meter readers, stenographers, etc. Their efforts were supplemented by a well-planned advertising campaign, by means of which every householder was reached.

The work of the company in the matter of organizing the stock-selling campaign has been very favorably commented upon. At the outset A. W. McLimont, vice-president, appointed a committee consisting of L. Palk, M. F. Wardhaugh and H. C. Howard, publicity agent, to direct the sale and effect the organization necessary. Meetings of employees were addressed by members of the committee and instructions on "How to Sell" were given. Each employee turned in to the committee the names of ten prospects likely to purchase stock, to whom specially prepared literature was sent prior to the time the employees called.

It was the policy of the company to sell not more than five shares to any one customer. Rigid observance of this rule resulted in wide distribution of the stock. Among the new stockholders are men and women in all walks of life, located in all sections of the community. It is estimated that as a result of this campaign the number of preferred stockholders was doubled.

The stock which was sold was part of an issue of preferred stock made a number of years ago and was acquired from large holders for customer-ownership campaign purposes.

Railway Bus Operation Analyzed

Twenty-three cents per mile is the average cost of operating 25-passenger capacity buses during 1924 by 38 electric railways, either directly or through subsidiary companies. So says E. J. Murphy, chief statistician of the American Electric Railway Association, in an analysis of reports contributed by him to April *Aera*.

These 38 companies operated 14,358,084 bus-miles and had in daily operation 328 buses out of a total of 497 owned, with a seating capacity of 12,050, or an average of 24.54 per bus.

Information obtained from 45 companies owning 564 buses indicates a revenue of $3,491,800 for the year, 44 of which, operating 806.5 miles of route, report 15,972,552 bus-miles. The number of passengers carried as reported by 43 companies was 47,852,899.

Complete reports were obtained from 38 companies for the full calendar year, but sixteen companies reported a comparison of operations for two years. Taken as a whole the 38 companies failed to earn revenue sufficient even to meet operating expenses, not including taxes and fixed charges.

Revenue Passengers Total 38,049,947

The railway properties of the Columbia Gas & Electric Company during 1924 carried 38,049,947 revenue passengers and operated 3,948,561 car-miles. The Columbia system operates an electric railway serving several cities and towns in northern Kentucky, directly across the Ohio River from Cincinnati. Cars are operated on eighteen separate routes, crossing two bridges over the Licking River, which connect Newport with Covington, and over two Ohio River bridges, bringing the railway system into the modern Dixie Terminal in Cincinnati. The transportation system serves a total population of 120,000 people on the Kentucky side of the Ohio River.

$636,696 Loss at Boston

Wage Increases Have Adverse Effect on Company Under Public Control—Increase in Local Fares from Five Cents to Six Cents Not Harmful—Trustees Hope to Close June 30 Year Even

DURING the calendar year which closed with Dec. 31, 1924, gross receipts and number of revenue passengers carried were the largest in the experience of the Boston Elevated Railway, Boston, Mass., either under private management or public control. Owing, however, to increases in wages, the first under the Mayberry award and then later under the McLaughlin award, the operating labor cost of the past calendar year has mounted to $17,358,670, an increase of $1,134,394.55 over the operating labor cost of 1923. There was a loss of $636,696 for 1924, compared with a gain of $679,631 for 1923.

Immediately following the announcement of the decision in the last arbitration proceedings it was necessary to increase the 5-cent local fare, which had been established largely for the outlying district, to a basis of 6 cents. The trustees say that there has been no substantial diminution in traffic as a result of this increase, and feel that the additional revenue thereby secured will aid largely in meeting the increased costs.

During 1924 739,151 more revenue passengers were carried than in 1923. Passenger revenue mileage increased by 1,939,014, in large measure due to increased use of one-man cars, which permitted an increased service without corresponding increase in cost. The one-man car and bus-miles were 31.7 per cent of the total surface-miles operated. The number of revenue passengers increased on weekdays and Saturdays, but there was a decrease of traffic on Sundays and holidays. The operation of buses increased. The miles covered in 1922 were 63,937; in 1923, 465,382, and in 1924, 890,901.

The sixth fiscal year of public operation of the railway closed with June 30, 1924. As there was at that time no excess of receipts over expenditures for the preceding twelve months, no payments were made to the cities and towns which had contributed to the loan assessment to meet the deficit of the first year of public operation. The aggregate amount contributed by the municipalities in 1919 was $3,980,151. The excess of receipts over cost of service during the past years had been applied, first, to the restoration of the exhausted reserve fund, and after this was accomplished there was paid back to the cities and towns $517,196 in July, 1922, and $1,114,557 in July, 1923. The aggregate of these amounts was distributed among the cities and towns served by the railway and reduced to $2,348,397, the balance still due them.

The trustees explain that the summer and fall months were characterized

COMPARATIVE DIVISION OF RECEIPTS AND EXPENDITURES OF THE BOSTON ELEVATED RAILWAY FOR YEAR ENDED DEC. 31

	1924	1923	1922	1921	1920
Total receipts	$34,175,319	$34,096,813	$37,699,176	$33,277,025	$34,031,636
Operating expenses

as usual by large expenditures in reconstruction work. While the summer traffic was affected as usual by vacation and holiday limitations, it was influenced to an unusual extent by automobile competition and a depression in certain lines of business with accompanying lack of employment and consequent loss in riding. From July 1 to Nov. 1 the excess of cost of service over receipts was $1,042,556, exclusive of charge for back pay and profit and loss adjustments, an aggregate considerably larger than during the same period of 1923, and the restoration to a surplus of receipts over cost of service was slow. This exhausted the reserve fund, but November showed a small excess of receipts over cost of service, and the receipts for December exceeded expenditures by $305,503. Since then a gratifying increase in receipts has taken place. The trustees feel there is reason to believe that with the closing of this fiscal year on June 30 it will be found that receipts have been equal to expenditures. To accomplish this result, in view of the increased rate of wages awarded last summer, the trustees have been compelled to lessen service and to decrease working hours and number of men employed.

Since the last annual report the matter of capital requirements and future control of this railway has been exhaustively considered by a recess committee of the general court, and the report of that body is now before a joint committee.

The trustees review the principal improvements to the property during the year. The need does not exist for noting all of them here. On April 21 the operation of surface cars in the East Boston tunnel was superseded by the operation of specially constructed steel rapid transit trains. This change materially decreased the running time, eliminated congestion at way stations and made possible a far larger use of the tunnel. Since Aug. 27 elevated train service has been extended daily from 12:30 to 1:15 a.m. for the convenience of night patrons. Block signals have been installed on curves in the Tremont Street subway. The new instruction school in Sullivan Square was completed and has been placed in service. A new alternating-current signal system for the entire Forest Hills section was placed in operation during October. The so-called Bartlett Street units of the Everett repair shops were completed and the personnel and equipment transferred from the Bartlett Street shops on March 1, 1924. The work of erecting at Forest Hills a new lobby building for the car service men, a large garage for buses and a suitable heating plant to provide for all of the buildings grouped at this location has been nearly completed.

Final plans for the extension of rapid transit service in the Dorchester district by utilization of the Shawmut branch of the New Haven Railroad have been worked out in conjunction with the Boston Transit Department. The lease of the premises has been executed, all legal formalities completed, the contract for the first section let and work of construction started. When finished this extension will provide for opera-

TRAFFIC STATISTICS OF THE BOSTON ELEVATED RAILWAY FOR YEAR ENDING DEC. 31

	1924	1923	1922	1921

tion of the Cambridge-Dorchester tunnel trains as far as Ashmont, or 3¾ miles from the present terminus at Andrew Square, and the operation of high-speed trolley service on private right-of-way from Ashmont to Mattapan. During the twelve months 17.15 miles of track and special work have been rebuilt and 3.77 miles of track and special work repaired.

During the year eight East Boston tunnel cars were received in addition to the forty originally purchased and eighty-nine new cars of the one-man, two-men type.

In 1918 the number of cars held out of service for repairs was 18 per cent. During 1924 a satisfactory record of 6 per cent has been maintained. Whereas in 1918 50 per cent of the surface car mileage was operated with articulated and box cars, during the year 1924 only 7 per cent was so operated.

Operating expenses on account of accidents were lowered from $975,020 in 1923 to $914,043 in 1924. Accidents per million miles operated with one-man cars were reduced from 230 in 1923 to 205 in 1924. Accidents per million miles operated with two-men cars were reduced from 259 in 1923 to 249 in 1924.

Power costs were lower in 1924 than in 1923, due to plant improvements and to lower price of coal. The average number of pounds of coal consumed per kilowatt-hour direct current at the cars was 2.068, the lowest of any year in the history of the railway. The average cost of coal for power during the year was $5.921 per long ton. The number of tons of coal burned was reduced from 260,032 in 1923 to 240,493 in 1924, notwithstanding an increase in kilowatt-hour output. The maximum current output for any one hour was 86,245 kw., which was the greatest in the history of the railway. During the year 115,675 ft. of underground conduit was laid.

Revenue Well Maintained at Pittsburgh

First Report Since Receivership Reflects Good Results of Operation Under New Agreement with Municipalities—Plans for Bus Service Ahead—Intensive Merchandising Program

THE first annual report of the Pittsburgh Railways, Pittsburgh, Pa., since 1918 has just been presented. In 1918 the railway passed into the hands of the United States court and was operated by three receivers. By agreements with the administration of the city of Pittsburgh the report now made public includes the entire year, and the various statements are based on the full years' activity. Gross revenue from railway operation was $22,063,776 and net income for the year $10,075. But these figures tell only part of the story. The year was one in which the management had to feel its way and adjust itself to a changed environment.

Revenues of the railway were well maintained during the year even though the general business depression caused some recession as compared with the previous year. The budget requirements and operating expenses were kept within bounds, with the result that the report shows a small surplus with ample funds being used for rehabilitation of property and the providing of better service. Nearly 19 miles of track were rebuilt.

The company says that the policy of furnishing more and better transportation service has been productive of increased earnings. This policy will be continued, and it is expected that still better results will be obtained in the future. Among the innovations which were tried was the Sunday 25-cent pass, extension of transfer privileges and special Sunday 10-cent transfer. In two cities, Washington and McKeesport, a weekly pass is being tried out. Of the new commercial department it is said some new innovations have resulted and a feeling on the part of patrons that the railway was co-operating to give the best possible service. The results have been gratifying.

Negotiations are in progress with the Philadelphia Company and one of its subsidiaries to supplement the transportation service of the Pittsburgh Railways with buses. The railway is not in a position to finance such additional operations. A contract between the ralway and the bus company will protect the railway and is expected to be of mutual advantage in rendering adequate and effective service.

The need for rapid transit as well as adequate trolley service is evident, and ways and means are being studied to meet these conditions. While it is realized that railway service in Pittsburgh is rendered under great difficulties, a situation prevails now because of improved service, new equipment, arrangements to meet changing conditions in the communities served, of harmonious feeling which embraces the municipal administrations, the railway and the public. It is the endeavor of the management to continue this situation and improve the service.

Termination of the receivership on Feb. 1, 1924, was made possible through the contract or agreement with the city of Pittsburgh, which was of a mutual nature and in brief provides:

Recognition of property valuation established by the Public Service Commission.

Annual return of sufficient amount to pay fixed charges, including return on some Philadelphia Company holdings, plus interest on new money put into the property.

Car fare to be adjusted to provide sufficient revenues to meet the allowed return on investment after operating expenses, depreciation, taxes, etc.

Previous license fees, paving charges, taxes, etc., to be substituted by blanket payment aggregating $300,000 per annum, payment to be made only when earned.

Establishment of a traction conference board to represent the city and the boroughs which entered the agreement, the public, and the railways. The board is composed of four members, all of whom are to receive annual compensation.

An incentive for economical management through a division of any surplus.

It is explained that this contract also paves the way for readjustment of capitalization to result eventually in one ownership of corporate properties that now number more than 100.

SUMMARY OF INCOME OF PITTSBURGH RAILWAYS FOR THE YEAR ENDED DEC. 31, 1924

(Prepared in accordance with the terms of the agreement between the city of Pittsburgh, sundry other municipalities, Philadelphia Company and Pittsburgh Railways.)

Gross revenue from street railway operations		$22,063,776
Operating expenses:		
Maintenance of way and structures	$2,685,014	
Maintenance of equipment	2,513,962	
Traffic	160,225	
Power	2,034,876	
Transportation	7,440,743	
General	761,235	
Miscellaneous	1,764,846	
Taxes	668,017	
Total		18,028,918
Net revenue from street railway operations		$4,034,859
Auxiliary operations:		
Operating revenues	$182,357	
Operating expenses	125,607	
Net revenue from auxiliary operations		56,750
Total net revenue from operations		$4,091,608
Non-operating revenues:		
Rental of real estate and buildings	$30,777	
Interest and discount	299,985	
Miscellaneous	3,405	
Total	$334,167	
Non-operating expenses	16,233	
Net revenue from other operations		317,934
Gross income		$4,409,542
Income charges:		
Items under agreement:		
Return of 6 per cent on property valuation of $62,500,000	$3,750,000	
Return of 6 per cent on additional capital of $5,000,000 for new property	300,000	
Payments to city of Pittsburgh and other municipalities in lieu of licenses, paving assessments, etc.	331,019	
Items not under agreement:		
Interest on judgments and settlements	15,464	
Rental of Seventeenth Street incline plane	2,984	
Total		4,399,467
Net income for the year		$10,075

STATISTICS OF OPERATIONS OF THE PITTSBURGH RAILWAYS FOR 1924

Miles of road		329.27
Miles of track		592.06
Car houses		23
Car shops		5
Passenger cars—motor	1,088	
Passenger cars—trail	238	
Miscellaneous cars	257	
Total cars		1,583
Passengers carried—revenue		272,315,161
Passengers carried—total		324,688,853
Car-miles operated		39,593,051
Car-hours operated		4,455,466
Earnings per passenger car-mile—cents		55.3
Average fare per revenue passenger—cents		7.95

As provided for in the contract with the city, a current liability of approximately $8,200,000 was assumed and the various creditors agreed to take one-tenth of their claims per annum over a period of ten years, without interest.

Immediately on return of the property to corporate management arrangements were made to consummate the $5,000,000 of new financing, which was provided for under the agreement. These arrangements were made through the Union Trust Company, Pittsburgh. There were issued $2,000,000 of 6 per cent notes, maturing serially over a period of four years; $3,000,000 of 6 per cent car trust bonds, maturing serially over a period of fifteen years.

Digitized by Google

The proceeds of the equipment trust bonds purchased 225 modern passenger cars. The proceeds of the note issue are being spent for improved carhouses, shop equipment, tracks, etc. Nearly all of the $3,000,000 has been used, and practically all of this equipment has been received or is en route. A small portion of the $2,000,000 has been spent and the balance will be expended during next year.

The matter of refunding and refinancing the railways is progressing and it is hoped and expected that in the next annual report a satisfactory plan will be announced.

Among the problems confronting the management of the railways the first year was the adjustment of wages as proposed by the motormen and conductors. The working agreement with the men expired on April 30. After protracted negotiations there was a cessation of service for about 60 hours. As a result an agreement was entered into to continue the contract with the men for a period of two years at the same rates of pay.

Operating Income Higher

Boston & Maine's Electric Lines Show Improvement—Report Gives Details of Bus Plan

The 92d annual report of the Boston & Maine Railroad to the stockholders explains in detail the company's plan of correlating rail and bus service "with the hope of bringing about an economic relationship which will avoid wasteful duplication of transportation agencies and result in benefit and convenience to the public." Reference has been made in the ELECTRIC RAILWAY JOURNAL previously to the activities of the Boston & Maine Railroad in that direction. President Hustis states that because of the belief that in many instances transportation on rails could be better and more economically performed by motor vehicles on the highways the Boston & Maine Transportation Company has been incorporated to undertake highway motor service where the traffic warrants. This company will also supply service when other means of transportation are not available. In this way the discontinuance of railway lines as may be authorized will be accomplished with the least possible hardship to the communities affected.

Competition of common carrier passenger buses along the main line routes of the railroad became so keen in 1914, particularly in Massachusetts, in which state no certificate of exigency is required, that it seemed necessary for the railroad to present its case to the various cities and towns where bus companies were applying for licenses to compete with the railroad. Some cities and towns have declined to issue licenses to independent bus lines, recognizing that they were taking from the railroad the more profitable standard fare traffic, and that, deprived of this traffic, the railroad could not afford to continue low rate service for commuters. In some instances where such bus companies continued to operate without licenses, in violation of the law, legal proceedings were taken and are now pending.

The report for the year 1924 segregates the electric railway earnings. The accompanying statement shows figures for the operation of the Portsmouth Electric Railway, running from Portsmouth to Hampton, N. H., and the Concord Electric Railway, which operates from Concord to Manchester and Penacook, N. H., both under the supervision of the Boston & Maine.

PORTSMOUTH ELECTRIC RAILWAY AND CONCORD ELECTRIC RAILWAY

	Year Ended Dec. 31, 1924	Dec. 31, 1923
Passenger revenue	$263,529	$298,787
Other revenue	11,675	16,125
Total	$275,204	$314,912
Expenses:		
Maintenance of way and structures	$32,039	41,477
Maintenance of equipment	47,946	69,748
Power	37,042	47,093
Transportation	83,315	87,442
Other expenses	16,809	17,884
Total operating expenses	$217,152	$263,645
Net revenue	58,053	51,267
Tax accruals	24,817	24,308
Operating income	$33,236	$26,959

Surplus for January Quarter on Rochester Lines.—The report of the operations of the Rochester lines of the New York State Railways for the quarter ended Jan. 31, 1925, shows a surplus of $33,627 in excess of the 6 per cent guaranteed return on its property investment under the service-at-cost contract. From railway operations alone a surplus of $38,814 is shown, with a deficit from bus operations of $1,384 from the crosstown trackless trolley line and $1,349 from the Dewey Avenue bus feeder route. The balancing account of Jan. 31 shows a deficit of $251,564.

Fitkin Interests Reported After More Railways.—An agreement is reported looking toward the sale of the Municipal Service Company, Philadelphia, Pa., to Fitkin & Company, New York. The Municipal Service Company owns the Citizens' Traction Company, Oil City and Franklin; the York Railways, York, Pa., and the Youngstown & Suburban Railway, Youngstown, Ohio.

Security Issue Sought.—The Key System Transit Company, Oakland, Cal., has applied to the Railroad Commission for authority to issue and sell $500,000 of its series B first mortgage gold bonds, dated Jan. 1, 1925, and due July 1, 1938, and bearing interest at the rate of 6 per cent. It is proposed to use the proceeds from the sale of these bonds in acquiring all the properties of the Oakland & Haywards Railway and the East Oakland Railway and to redeem all outstanding bonds of those two corporations.

Belt Line Increases Earnings.—Operation of the Tacoma Municipal Railway, Tacoma, Wash., as an industrial belt line for the tideflat district resulted in increasing the car line's earnings by $1,525 during February, a figure nearly double the best previous showing, according to the report for the month. The city is ahead $4,238 on belt line operation for the past four months, it is reported.

Deficit for Eight Months.—For the eight months ended Feb. 28, 1925, the Interborough Rapid Transit Company, New York, N. Y., showed an increase in total revenue from all sources of $567,972 over the corresponding period ended Feb. 29, 1924. This advance was more than offset, however, by increaase in taxes and in income deductions, chiefly higher Manhattan (elevated) rental, which became effective July 1, 1924, under the readjustment plan. While operating expenses were lower than during the preceding period, there was a deficit for the first eight months of the current fiscal year of $247,700. Compared with a similar period in 1924 this figure represented an improvement of $1,047,389.

Merger Talk Started in Washington.—Officials of the Washington Railway & Electric Company and of the Capital Traction Company, Washington, D. C., have had one informal conference recently to consider the possibility of bringing about a merger. No further developments are expected, however, for some time. Just before adjournment Congress passed a bill authorizing a voluntary consolidation, with a proviso that the actual terms of merger be ratified by Congress at the next session. Following passage of the act the chairman of the Public Service Commission of the District suggested to the heads of both companies that they confer informally on the question. At the same time the commissioner let it be known that the commission stands ready to assist in arriving at a basis for a union of the two systems should later developments warrant such a course.

Revenues Showed Decrease in February.—In spite of diminishing jitney competition, total revenues from the railway department of the Georgia Railway & Power Company, Atlanta, Ga., showed a decrease of $23,650 during the month of February compared with February of last year. This brings the total decrease for the last eight months up to more than $263,650. The February decrease was $4,650 greater than the $19,000 figure of January. March figures, however, are expected to show the effects of jitney elimination.

Old Equipment Sold.—The Quincy Street Railway, Quincy, Ill., recently sold to a junk dealer sixteen cars which had been idle in the carhouse, many of them since the days after the mule cars. The Quincy system has 28 cars in regular service and sufficient reserves to handle traffic loads.

Heavy Bond Issue Under Discussion.—Possibility of floating a $20,000,000 bond issue for the Seattle Municipal Railway, Seattle, Wash., with which to retire the present bonds, purchase new equipment, pave between tracks and make other necessary improvements is being discussed among members of the City Council. The present bonds against the railway bear 5 per cent interest. By floating an issue extending over a longer period, the advocates of the plan assert that the annual payments would not be so heavy, and the system would be in a position to buy new equipment, make extensions and needed improvements. The street railway department has gone back to a cash basis six weeks earlier than anticipated, owing to an increase in revenue and savings by the department. The date set for abandoning the warrant plan had been May 10, but was set forward to March 25.

Legal Notes

CALIFORNIA.—*Company Responsible for Assault by Motorman.*

The conductor got into a dispute with a passenger in regard to transfers and summoned the motorman, according to rule, by emergency three bells. The motorman assaulted the passenger and this assault was held to be within the scope of his employment and the company was responsible. (Galloway vs. United R.R.'s of San Francisco, 232 Pacific Rep., 491.)

CALIFORNIA. — *Passenger Injured at Station While Crossing Track to Board the Car.*

A passenger lawfully on the premises of an interurban railroad at a place provided for the stopping of cars to take on passengers is not negligent *per se* in failing to stop, look and listen before crossing the intervening track to board a car. A shelter having three sides but no windows, provided by the carrier and used by passengers awaiting the arrival of cars was held to be a "station," as respecting the degree of care to be used by both passengers and carriers. (Wilkinson vs. United Railroads of San Francisco, 232 Pacific Rep., 131.)

CONNECTICUT.—*Burden of Evidence in Accident to Infant.*

A child five years old, while crossing the track, was injured in a city street by a trolley car. In a case of this kind, the Supreme Court of Connecticut declared the burden was on the plaintiff to adduce evidence of facts from which the jury might reasonably find the defendant's motorman was negligent as alleged and that such negligence was the approximate cause of the injury. (Simuaskas vs. Connecticut Co., 127 Atlantic Rep., 918.)

FEDERAL COURT—*Expert Witness Must Be Especially Qualified — Treatment of Depreciation, Franchises, etc., in Valuation*

This decision was in the District Court of the District of Colorado on the valuation of the Denver Tramway and was rendered Dec. 13, 1924. The company, through its receiver, claimed that the ordinance by which the city permitted the city to charge only 6 cents for fare was confiscatory, and asked permission to charge a higher fare from the federal court by whom the receiver had been appointed. The city intervened. Its answer claimed that the tramway was contractually bound to a 5-cent fare, and that the 6-cent ordinances were for temporary purposes only and did not change the contractual obligations of the company. The court appointed a special master to hear testimony as to the value of the property, and evidence was presented by Frank T. Woy and A. L. Drum for the company and Dr. D. F. Wilcox for the city. In its decision rendered Dec. 13, 1924, the court reviews the qualifications of each of these witnesses to act as an expert on valuation and it held that Messrs. Drum and Woy could qualify as expert witnesses on the value of the railway property but that it was an error in matter of law to permit Dr. Wilcox to testify as such an expert. The court also said that, ordinarily, reproduction cost new, less depreciation, is the dominant factor in the valuation inquiry under consideration, and it must be the rule where there are no other data on the subject. Testimony on values of experts who have given the subject long study and reflection ought not to be lightly weighed. The figures of the experts Woy and Drum on depreciation, as ascertained by inspection, and other items, were largely followed in the decision. An allowance was permitted for going value, but the court held that the value of the company's perpetual easements in the city streets, which was put at $2,000,000 could not be included in the valuation of the company's property for rate making purposes. The court upheld the receiver's plea that the 6-cent fare was confiscatory. (Westinghouse Electric & Mfg. Co. vs. Denver Tramway, 3 Federal (2d) Rep., 285.)

FEDERAL COURT.—*Greater Care Necessary by Motorman Where View Is Obstructed.*

The judge in a District Court charged the jury that where the view of a crossing is obstructed, increased caution is required of the person undertaking to cross the interurban track at this point, but he refused the request of the plaintiff's counsel to charge "that the defendant was required to use increased or greater care as it approached this crossing, if the weeds and bushes were on its own right-of-way." This refusal was held to be prejudicial error in the Circuit Court of Appeals, Sixth Circuit. (Napier vs. Northwestern Ohio Ry. & Power Co., 2 Fed. Rep. (2nd), 701.)

MARYLAND—*Railroad Liable to Person at Freight Yards Receiving Shipment Only for Injuries Arising from Concealed Peril.*

A truckman visited the freight yards of a railway company to take away a shipment, and to save time tried to remove the shipment himself from the bottom of a pile. Other freight fell on him and injured him. The railway company was not held responsible. (Texas Co. vs. Washington, B. & A. Electric Ry., 127 Atlantic Rep., 752.)

MASSACHUSETTS — *Attempt to Board Car at Alighting Platform.*

After leaving a rapid transit train at a platform, a passenger changed her mind and decided to board the next train. When it arrived and all passengers leaving the car at that point had disembarked, she attempted to enter by the open door but was caught by the door and thrown to the floor. It developed that there were two platforms, one a loading and the other an unloading platform, and the company did not expect any passengers to board a car at the unloading platform, but as there were no conspicuous signs to warn passengers not to board the train at this point the company was held responsible for this accident. (Threlkeld vs. Boston Elevated Railway, 146 Northeast Rep., 367.)

MINNESOTA.—*Injury from Emergency Stop.*

A motorman made an emergency stop to avoid a collision with a vehicle and because of this sudden stop a passenger was thrown to the floor and injured. It was held that the company was not negligent as a matter of law, but that the case should be decided by a jury. (Sullivan et al. vs. Minneapolis Street Railway, 200 Northwest Rep., 922.)

MISSOURI.—*Last Clear Chance Doctrine in Case of Trespasser.*

Where a boy, while riding as a trespasser on the rear end of a trailer, was injured when the trailer backed against another car standing in the rear, the last clear chance doctrine was upheld. An instruction by the trial court requiring the jury to find, before rendering a verdict for the plaintiff, that the motorman of the rear car negligently failed to move his car backward, when in the exercise of ordinary care he could have backed car without danger to any person, was held by the Court of Appeals not erroneous for failure expressly to require the jury to find that there was free space into which motorman could back. (Finn vs. United Railways of St. Louis, 267 Southwest Rep. 416.)

NEW YORK.—*Value of Property for Rate-Making Purposes.*

The present increased cost of construction must be considered in determining the value of a public utility property for rate making purposes, and due weight must be given to present reproductive costs. It is inadequate to use the average of the ten-year period prior to the date of valuation. Where a power and light company had been allowed a low rate of return for a long period, it was entitled to a return of more than 7.1 per cent on the value of its property. (People ex rel. Adirondacks P. & L. Co. vs. Public Service Commission, 217 New York, Sup., 284.)

OKLAHOMA.—*Time Taken at Stops.*

It is the duty of a street railway company, at car stops, to stop the cars a sufficient length of time to afford passengers an opportunity, by the use of ordinary care and diligence to alight therefrom while the car remains stationary. (Oklahoma Union Railway vs. Mitchell, 231 Pacific Rep., 1062.)

WISCONSIN. — *Care Required of Driver of Automobile.*

Where the driver of a heavily loaded truck drove it onto a car track, when his view of the track was obstructed because of an automobile parked at the curb, he was negligent as a matter of law, although the trolley car which struck him was going at illegal speed. (Griffin vs. Milwaukee E. R. & L. Co., 201 Northwestern Rep. 254.)

New President in New England

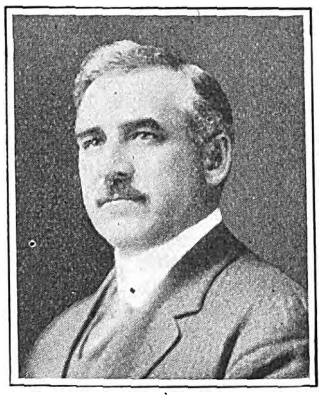
Operator of the Holyoke Street Railway Elected President of the New England Street Railway Club

Louis D. Pellissier, president and general manager of the Holyoke Street Railway, Holyoke, Mass., was elected president of the New England Street Railway Club at the meeting on March 26. Mr. Pellissier, with his brother, George, who is assistant general manager and chief engineer of the company, has made an enviable reputation in handling this 70-mile Massachusetts road. In fact, his work has attracted attention even outside of the electric railway industry. Not so long ago an editor of one of the foremost papers in the country, a man concerned only incidentally with railway operations, expressed the wish privately that more railway men had the knowledge and insight into railway matters possessed by the Pellissier brothers. He wanted to get them to make recommendations in his own city, but said he realized that it was impossible. He lamented that fact, but said he recognized it was the prerogative of the Pellissiers to stick to their knitting.

This is exactly what they have done. They have applied themselves intensively to their own tasks, and their application has been intelligently directed. The Holyoke property has one of the few zone systems in the country. Like many other cities, Holyoke found during the war that it was necessary to raise fares. The maximum fare on the Holyoke system was, however, kept down by dividing the property into a number of zones on the principle of one zone in each community. The layout of the system is well adapted for this plan. With this sense of salesmanship has gone the realization of the need for keeping up the physical property. As a result the Holyoke Street Railway is one of the best maintained in the country. In fact, in 1917 the company passed its dividend rather than curtail the appropriation for maintenance. It is significant that the company has an unbroken dividend record for 30 years, except in this one instance; that it is now paying 6 per cent and that for much of this long period it paid 8 per cent.

Louis D. Pellissier began his work for the company immediately after his graduation from business college in Springfield, Mass., in 1892. The Holyoke Street Railway had recently been electrified and Mr. Pellissier served first as a conductor. Three years later he was appointed bookkeeper and paymaster and continued in these positions until 1903, when he was elected treasurer of the company, acting also as claim agent. This office he retained until 1912 and then he was made vice-president and general manager. Upon the death of W. S. Loomis, president of the company, in 1914 Mr. Pellissier was made president. In 1919 he was also made treasurer and general manager of the Northampton Street Railway, which position he still holds. Since 1914 he has also been president of the Mount Tom Railroad, which runs the beautiful scenic resort known the world over as Mount Tom, together with its noted mountain railway.

Mr. Pellissier was born in Superior, Wis., Feb. 18, 1870. His parents settled in the historic old town of Hadley shortly after Mr. Pellissier was born, and there he grew to manhood. He attended the local public schools and Hopkins Academy, reputed to be the second oldest institution in the United States. He remained on the farm until he was 21 years old and then decided to enter business, for which he fitted himself by attending business college.



L. D. Pellissier

Last year Mr. Pellissier was vice-president of the New England Street Railway Club, representing Massachusetts. The club has six vice-presidents, one for each state in New England. Mr. Pellissier is a strong believer in association activities. He attends the conventions himself and sees to it that the members of the staff also attend.

Interstate Changes Announced

W. Marshall Dale has succeeded Ira E. Guthrie as secretary and treasurer of the Interstate Public Service Company, Indianapolis, Ind.

W. S. Campbell is purchasing agent in place of G. H. Dallow.

W. J. Fox is now superintendent of shops at Scottsburg, succeeding J. E. Hester, who resigned last May to enter business for himself.

Joseph O'Hara, general superintendent of the railway division of the Illinois Power Company, Springfield, Ill., is on an indefinite leave of absence to recuperate from a long illness. Carl E. Davis, former claim adjuster, will act in his place.

Mr. Storrs in New Office—His Book

Lucius S. Storrs, recently appointed as managing director of the American Electric Railway Association, entered upon the duties of that office on April 2. His desk in the temporary quarters arranged for him at the association's office was covered with flowers in anticipation of his coming. As one of his first acts Mr. Storrs had himself formally presented by Secretary Welsh to all the employees whether or not he had ever met them before. His services will be available to every electric railway in the United States. They will also be available to the public. One of his outstanding duties will be to act as a liaison officer between large national business or civic organizations and the electric railway interests.

As indicated very briefly in the ELECTRIC RAILWAY JOURNAL for March 26 Mr. Storrs was the guest of honor at a testimonial and farewell dinner given at the New Haven Lawn Club by the officers and heads of the Connecticut Company. John K. Punderford, the incoming president, presided. The speakers were unanimous in commending Mr. Storrs for his tact, diplomacy and fairness in dealing with the public and the employees and the successful manner in which he administered the affairs of the company at all times, and particularly through the war and the post-war period, with its many difficult problems, until now, when the property is regarded as second to none in the world. All expressed their regret at his leaving and were eloquent in their assurance of the high regard with which he is held by his associates and the public. Congratulations were showered upon him for the eminent position he is to occupy in the transportation industry and all predicted a continuation of his success in the broader field to which he has been chosen. The speeches were punctuated with much delightful humor.

At the close of the last address Joseph F. Berry, formerly counsel of the Connecticut Company at New Haven, acting in behalf of those present, presented to Mr. Storrs a beautiful silver loving cup.

A novel and impressive testimonial in the form of an album containing the signatures of more that 3,800 officers and employees of the company, which was compiled by William J. Sellner of the construction department, was also given to Mr. Storrs. It was prefaced with the following inscription:

Time, the Immortal, in whose book all things are recorded, opens its pages to receive the record of your passing to the newer and broader field of activity to which your ability as an executive has led.

It is with profound regret that we look upon your going (although knowing full well that it is a big step forward and upward) for we cannot help the selfish wish that it were not so. Nor can we doubt that you, too, find it difficult to sever the ties that for so many years have bound you to a company which, under your leadership, has grown to occupy the high position which the Connecticut Company now holds.

Appreciating to the fullest extent the honor bestowed upon you and upon us as a company by the election of you, our president, to the most eminent position in the electric railway industry, we offer you our sincerest congratulations and our best wishes for the continuation of that success which has characterized your progress.

And, in parting, we pledge ourselves to

Digitized by Google

the maintenance of that high standard for the company which has ever been inspired by our association with you.

Following the presentation, Mr. Storrs responded feelingly to the many praises expressed during the evening and for the testimonials. He said the past fourteen years would live in his memory as the happiest of his life, claiming that whatever success he has attained was made possible only through the loyal co-operation of all. He prophesied for Mr. Punderford the same loyalty, the same faithfulness and the same success. Mr. Storrs said it was impossible adequately to express his regret at leaving so splendid a group of friends and co-workers and wished them Godspeed.

The committee of arrangements consisted of Walter J. Flickinger, Edward T. Chapman and John M. Hamilton.

At the speakers' table were: John W. Colton, Walter J. Flickinger, Edward M. Day, George D. Watrous, Charles Cheney, John K. Punderford, Lucius S. Storrs, Leonard M. Daggett, Joseph F. Berry, Victor S. Curtis and James W. Welsh.

G. H. Harris Acting General Manager at Oakland

Important changes have been made in the personnel of the Key System Transit Company, Oakland, Cal., most of which went into effect April 1.

C. O. G. Miller remains as president and W. R. Alberger as vice-president, but Mr. Alberger has temporarily relinquished his duties as general manager.

The acting general manager of the company is George H. Harris, formerly chief engineer, who was inducted into his new duties when Mr. Alberger started on a trip to the East the latter part of March. Mr. Alberger, it is announced, will visit Chicago, St. Louis, Detroit, Cleveland, Philadelphia, New York and other large Eastern cities, where he will study transit problems and make a report thereon when he returns to duty.

President Miller has denied that Mr. Alberger contemplates going on the retired list after his trip.

"The report has been repeated a great deal lately," he said, "and I should like to see it stopped."

A new position has been created—that of assistant to the president. This will be filled by C. C. Vargas, who will retain his duties as comptroller in charge of the auditing and accounting departments. The purchasing and stores departments will also be under him.

E. F. Smith, cashier, has been promoted to the office of assistant manager of the department of public relations, and Angus Clark has been advanced from land and tax agent to the position of cashier. He will also be assistant secretary.

Frank Locke has been appointed assistant cashier and Wayne Allen has been promoted from chief clerk of the purchasing department to assistant purchasing agent.

It is explained that constantly increasing duties compelled President Miller to ask for an assistant. The other changes are made, it is understood, largely at the behest of the new assistant to the president.

The land and tax office has been abolished and the several functions previously performed by that department have been distributed among the others.

J. Frank Johnson Resident Head of Toledo Traction

Announcement has been made in Toledo, Ohio, that Benjamin C. Adams, president of the Community Traction Company, and vice-president and general manager of the Toledo Edison Company for the last two years, is to leave soon for Kansas City to become head of a large company combining the gas properties of Henry L. Doherty & Company in several nearby states.

Management of the Community Traction Company will be put entirely in the hands of J. Frank Johnson, now vice-president and general superintendent. Mr. Johnson has been in the Doherty organization for a number of years, serving first as an executive with the Toledo & Western Railroad. He was one of the receivers of that property. Later he was sent to Toledo and assigned to the Community Traction Company, and some time ago was made general superintendent.

Mr. Adams will be succeeded as president by either Henry L. Doherty or Frank R. Coates. Mr. Adams has served on the Doherty properties at Joplin and St. Joseph.

Carroll L. Proctor, for three years head of the Empire District Electric Company, Joplin, Mo., will go to Toledo to succeed Mr. Adams as vice-president and general manager of the Toledo Edison Company. He was born in Charlotte County, Virginia, in 1880 and was graduated from the Virginia Polytechnic Institute. His first job was with the General Electric Company at Schenectady as a tester.

Later Mr. Proctor went to Athens, Ga., as general superintendent of the Athens Railway & Electric Company, and in 1912, when the property was taken over by the Doherty interests, he remained and has been a Doherty executive ever since. After seven years at Athens he was assigned to Joplin. He served for a time as vice-president and general manager of the Danbury Gas & Electric Company, Danbury, Conn., and later returned to Joplin.

Frank R. Coates remains as president of the Toledo Edison Company.

The change in Toledo will be effective about April 15.

Mr. Woodlock on I.C.C.

Thomas F. Woodlock, financial writer and a member of the board of directors of the Père Marquette and St. Louis-San Francisco Railroads, was sworn in April 1 as a member of the Interstate Commerce Commission under the recess appointment offered him by President Coolidge. Mr. Woodlock has resigned from the two railroad boards.

Forest E. Winterding, formerly connected with the Wisconsin-Minnesota Light & Power Company at Eau Claire, Wis., as civil engineer, has left that company to become chief engineer of the Wisconsin Traction, Light, Heat & Power Company at Appleton in charge of all construction work.

George Kuhn is superintendent of shops of the International Railway, Buffalo, N. Y., and not George Hulme, as was erroneously published in the ELECTRIC RAILWAY JOURNAL, issue of March 28, 1925, page 528. J. W. Hulme was superintendent of shops at Buffalo some time ago, but resigned in 1923 to become assistant superintendent of car equipment of the Interborough Rapid Transit Company, New York, N. Y.

L. E. Hollar was promoted to general superintendent of the Michigan Railroad and the Chicago, Holland & Grand Rapids Railway with headquarters in Grand Rapids, Mich., effective March 1. Mr. Hollar started with the Chicago, South Bend & Northern Indiana Railway and the Southern Michigan Railway at South Bend, Ind., in 1906 and remained there until 1920 as superintendent of transportation. He relinquished that position to become affiliated with the Michigan Railroad as superintendent of the Northeastern division, which he retained until his present advancement.

John L. Fahey has been made chief claim agent of the Scranton Railway, Scranton, Pa. He entered the employ of the company in 1913. Later he became affiliated with the claim department and acted as private secretary to his father. He continued in that capacity up to the time of his father's death on Feb. 16, 1925. Announcement of his appointment to succeed his father was made on Feb. 19.

Charles W. Chase, Gary, Ind., has been appointed general manager for Charles Currie, the receiver of the Chicago, Lake Shore & South Bend Railway, Michigan City, Ind. Mr. Chase is president of the Gary Street Railway. As general manager for the receiver of the South Shore lines, he will have active charge of the operation of that property.

A. G. Carson has been appointed manager of the Wisconsin Public Service Corporation, Green Bay, Wis., in charge of all utility departments. L. B. Works has been appointed assistant manager. Mr. Carson has been identified with Wisconsin properties for several years. In 1919, while manager of the Manitowoc & Northern Traction Company and also of the business of the Wisconsin Public Service Company in Manitowoc and Two Rivers, he had his field of operations extended by the additional appointment as general superintendent of the Wisconsin Public Service Company in Green Bay. Before going to Manitowoc he was superintendent of the Eastern Wisconsin Electric Company in Fond du Lac and chief engineer of the Wisconsin Electric Railway and of the Eastern Wisconsin Electric Railway & Light Company in Oshkosh for several years. He began his public service work with the Grand Rapids, Grand Haven & Muskegon Railway in the power and transportation department and later he was made chief engineer of the Winnebago Traction Company of Oshkosh.

General Electric Sales Hold Up Well

Orders received by the General Electric Company, Schenectady, N. Y., during the year 1924 were $283,107,697, compared with $304,199,746 in the year 1923, a decrease of 7 per cent.

Unfilled orders at the end of the year were $68,958,000, compared with $87,112,000 at the end of 1923.

The export business of the company is conducted by the International General Electric Company, Inc. The total of all orders received by the International company during the year was $17,590,000, compared with $21,743,000 during 1923. The net sales billed were $22,590,107 during 1924, compared with $22,371,526 for 1923.

	1924	1923
Net sales billed	$299,251,869	$271,309,695
Less: Cost of sales billed, including operating, maintenance and depreciation charges, reserves and provision for all taxes	264,909,538	241,653,948
Net income from sales	$34,342,330	$29,655,746
Income from other sources	10,793,352	8,345,781
Total income	$45,135,683	$38,001,528
Less: Interest and discount on debentures and other interest payments, and additions to general reserve	5,900,135	4,476,410
Profit available for dividends	$39,235,548	$33,525,118
Less: 6 per cent cash dividends on special stock	1,195,405	656,379
	$38,040,142	$32,868,739
Less: 8 per cent cash dividends on common stock	14,404,980	14,289,316
Surplus in excess of cash dividends	$23,635,162	$18,579,423
Surplus at Dec. 31, 1923	82,762,095	.....
	$106,397,258	.....
Less: 5 per cent dividend paid in special stock, $9,005,035; delivery of Electric Bond & Share Company stock, $25,030,000	34,035,035	.....
Surplus at Dec. 31, 1924	$72,362,223	.....

The International company's business was conducted at a profit available for dividends of $2,474,845, compared with $2,469,463 in 1923. Dividends of $700,000 were paid during 1924, of which the General Electric Company received $592,082. This sum is included in the financial statement as part of the income from investments.

In carrying out the provisions of the Coffin Foundation the following awards were made for the year:

In May, 1924, the committee of the National Electric Light Association awarded the Charles A. Coffin medal to the Public Service Corporation of Northern Illinois and $1,000 to the Employees' Benefit Association of that company.

In October, 1924, the committee of the American Electric Railway Association awarded the Charles A. Coffin medal to the Northern Texas Traction Company of Fort Worth, Tex., and $1,000 to the Mutual Aid Association of that company.

The advisory committee of the company awarded forty-three Charles A. Coffin certificates of merit, carrying with them honorariums in cash to employees of the company for meritorious work and distinguished service performed during the past year. Among them were twelve workmen in the shops, seven foremen, fifteen engineers and nine members of the commercial organization.

$4,000,000 Order Impending

Plans and specifications for new subway cars which will cost between $3,000,000 and $4,000,000 have been sent by the Brooklyn-Manhattan Transit Corporation to the Transit Commission for approval. These plans call for subway cars of a type different from the present B.-M.T. subway cars. The new cars are known as triplex articulated cars. Each triplex unit is made up of three car bodies permanently united and mounted on four trucks with wide end doors to permit passage between cars. In capacity, each triplex unit, with its three car bodies, is the equivalent of two of the largest present subway cars.

The company already has under construction and nearly completed four of these triplex units, the equivalent of an eight-car train of the present subway cars. This train of cars will alone cost close to $300,000. It is expected that these new cars, now under construction, will be delivered in May of this year. In the progress of construction, various changes and improvements in the plans have been made and these are embodied in the plans now submitted to the Transit Commission for approval in order that the company may buy additional cars.

After approval by the commission, bids will be invited from car builders for 50 or 65 triplex cars, the equivalent of 100 or 130 present cars. If prices are sufficiently reasonable the larger number will be ordered and a program started of retirement of certain types of "L" cars. The company now has a number of "L" cars requiring major repairs which cannot be made because of inadequate shop facilities due to failure of the city to build shops, as it agreed to do in Contract No. 4 made in 1913. If the cost of new cars is reasonable as compared with the cost of repairing present "L" cars, the company states that it will place an order for the larger number of new cars.

The new cars were mentioned in the ELECTRIC RAILWAY JOURNAL, issue of Sept. 20 and Sept. 27, 1924, pages 466 and 538.

To Improve Organization of Executive Departments

It is expected that the Bureau of Mines will be transferred from the Interior Department to the Department of Commerce. The Bureau of Mines is a scientific bureau intended as a direct aid to industry and commerce. Its usefulness depends largely on its ability to co-operate with industry. This transfer, by Presidential order, is expected to follow the action of President Coolidge in transferring the Patent Office from the Department of the Interior to the Department of Commerce. In this connection Secretary Hoover said that a vigorous campaign should be undertaken for the removal of the present injustices toward American patentees and American manufacturers which exist by virtue of the character of patent laws in many other countries. He said that at the present time an American patentee is required to manufacture continuously in foreign countries under his patent or lose his patent rights. Further, that no such requirement is made in the United States. The result is that our inventors and manufacturers, in order to protect their inventions, have been driven to the establishment of a large number of factories abroad, whereas foreign patentees have been able to use their patents in the United States actually to prevent manufacture here.

Mr. Hoover stated that an international convention for the protection of industrial property would take place at the Hague on Oct. 8, 1925, at which the American government was to be represented and where proposals would be made for the equitable and equal treatment of patentees in all countries.

Gasoline Electric Buses on Long-Term Payments to Railways

The Electric Truck Transportation Corporation, 25-31 W. 43d Street, New York, N. Y., has announced that it is considering the opening of a new department to finance the sale to electric railways of gasoline-electric buses on an attractive basis of long-term lease payments.

Mr. Cardoza, president of the corporation, stated that it is the idea to confine the plan to the established utilities in the best position to operate the equipment properly.

Metal, Coal and Material Prices

Metals—New York	Apr. 1, 1925
Copper, electrolytic, cents per lb	13.625
Copper wire base, cents per lb	15.875
Lead, cents per lb	8.425
Zinc, cents per lb	7.43
Tin, Straits, cents per lb	52.75
Bituminous Coal f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.35
Somerset mine run, Boston, net tons	2.125
Pittsburgh mine run, Pittsburgh, net tons	1.825
Franklin, Ill., screenings, Chicago, net tons	1.95
Central, Ill., screenings, Chicago, net tons	1.90
Kansas screenings, Kansas City, net tons	2.75
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$6.75
Weatherproof wire base, N.Y., cents per lb.	18.75
Cement, Chicago net prices, without bags	2.20
Linseed oil (5-lb. lots), N. Y., per gal	$1.07
White lead in oil (100-lb. keg), N. Y., cents per lb., carload lots	0.1272
Turpentine (bbl. lots), N. Y., per gal	0.93

New Sales Representative for Six Wheel Company in Chicago

P. B. McGinnis, mechanical expert and sales representative with the Chicago office of the Westinghouse Air Brake Company since 1911, has joined the Six Wheel Company, Philadelphia, in charge of sales in central Western territory, with an office in Chicago.

In 1902, at the age of 16, he entered the car repair department of the Frisco Railroad. He served a short time as wireman's helper with the Westinghouse Electric & Manufacturing Company when the Chicago Metropolitan Elevated was being equipped with multiple-unit control by that company. He then joined the elevated operating organization as air brake and control inspector and remained in that capacity for a period of five years.

In 1909 he was engaged by the L. B. Stillwell Company, New York, to assist in equipping the cars of the Hudson & Manhattan Railroad, then under construction at the plant of the Pressed Steel Car Company. Later in the same year he became general air brake inspector of the Inland Empire System, Spokane, Wash. In the summer of 1910 he again went East to take charge of air brake installation on the cars being built for the Hudson & Manhattan Railroad by the American Car & Foundry Company.

For about a year Mr. McGinnis remained with the Hudson & Manhattan Railroad as general air brake inspector, and then joined the forces of the Westinghouse Air Brake Company.

Rolling Stock

Knoxville Power & Light Company, Knoxville, Tenn., has announced specifications on the sixteen new cars referred to in the ELECTRIC RAILWAY JOURNAL, issue of March 14, page 436. The details follow:

Date order was placed	Feb. 27, 1925
Date of delivery	June 1, 1925
Builder of car body	Cincinnati Car Company
Type of car	Double-end, single-truck, closed passenger
Seating capacity	28
Total weight	19,000 lb.
Length over all	28 ft. 6 in.
Truck wheelbase	8 ft. 6 in.
Width over all	8 ft. 4½ in.
Height, rail to trolley base	10 ft. 3¾ in.
Body	Steel
Interior trim	Natural mahogany
Headlining	¼-in. Agasote
Roof	Arch
Air brakes	Westinghouse
Curtain material	Pantosote No. 89
Destination signs	Keystone
Door-operating mechanism,	National Pneumatic Company
Fare boxes	Cleveland
Heater equipment	Consolidated Car Heating Company No. 1522-I
Headlights	Ohio Brass WDF No. 28519
Journal boxes	3-in. x 6-in.
Lightning arresters	Electrolytic
Motors	General Electric, 35 hp.
Finish	Yellow enamel
Registers	None
Sanders	Air
Seats	Pullman type
Seating material	Green velour
Trolley catchers	Ohio Brass No. 13141
Trolley base	General Electric
Trucks	Cincinnati
Ventilators	Railway Utility Company honeycomb
Wheels	26-in.

Piedmont & Northern Railway, Charlotte, N. C., has placed an order with the Pressed Steel Car Company, Pittsburgh, Pa., for 150 automobile freight cars of 100,000 lb. capacity. These cars have Hutchins steel roofs with Hutchins steel ends. They are to have steel underframes with steel superstructure, 10-ft. 6-in. double door opening, cast-steel truck side frames, cast-steel truck bolsters and Westinghouse friction draft gear with Symington attachments. The cars are to be delivered about July 1.

Empire State Railroad, Syracuse, N. Y., will likely be in the market for six buses if the plans looking toward the installation of bus service in Oswego are carried out.

Missouri & Kansas Railway, Kansas City, Mo., it is reported, has purchased three new cars, at a cost of $14,000 each. Since the fire in Overland Park last month the company has borrowed cars from the Kansas City Railways.

United Railways, St. Louis, Mo., has ordered five six-wheel chassis from the Six Wheel Company, 1800 Lehigh Avenue, Philadelphia, Pa., not 1880 Lehigh Avenue, as reported in the ELECTRIC RAILWAY JOURNAL for March 28, page 530. The five bus bodies are being built at the plant of the St. Louis Car Company.

Track and Line

New Brunswick, Canada.—An electric railway is to be constructed from Caraquet to Plaster Rock, New Brunswick to join the Canadian Pacific Railway Plaster Rock-Perth branch. Notice of application for charter has been given. The new line will be approximately 90 miles long. Indications are that a start in construction will be made this year on the Caraquet end. Operation of the line is expected to be from provincial hydro-electric stations, including a new development to be opened this year at Grand Falls.

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has completed work on the installation of double tracks on its Thirty-fifth Street line.

Power Houses, Shops and Buildings

Ottawa Electric Railway, Ottawa, Canada, has just completed its new shops, situated about ½ mile from the center of the city, which have been under construction since last April. The area of the shops, which are to be known in the future as Champagne Shops, is 235 ft. x 300 ft. The new building will contain the electrical shops, air-brake department, machine shop, carpenter shop, paint shop and another carhouse. The type of construction is structural steel frame, reinforced-concrete roof slab and floor slabs. Convenient to the carhouse section is a large conductors' and motormen's rest room. The storeroom, offices, paint shop, conductors' and motormen's rest room are heated by direct low-pressure steam. The remainder of the building is heated by an indirect system designed to keep temperature at 60 deg. The lighting wiring is run entirely in steel conduit.

Trade Notes

Wagner Electric Corporation, St. Louis, Mo., has announced the removal of its Atlanta office and service station on April 1 to 145 West Peachtree Street, also the removal of its Cleveland office and service station on the same date to 1412 East 25th Street.

Gold Car Heating & Lighting Company, Brooklyn, N. Y., has announced that Tom Moore, formerly purchasing agent of the Virginian Railway, has been appointed its representative in charge of the Southern territory. He is located at Room 811, Royster Building, Norfolk, Va.

Riley Stoker Corporation, Worcester, Mass., announces the following changes in sales representatives. G. H. Sanger has been transferred to the Chicago office at 541 Marquette Building, having formerly been located at the Philadelphia office. He succeeds E. W. Wagenseil, who has resigned to become sales manager for the Buckeye Drier Company. A new representative of the Riley Stoker Corporation in the Denver and Salt Lake territory is the Mine & Smelter Supply Company, with offices at Seventeenth and Blake Streets, Denver, and at Salt Lake City.

Page Steel & Wire Company, Chicago, Ill., coincident with the establishing of a welding service department to handle welding rod problems for customers, announces the appointment of J. J. Flaherty to direct sales of armco, high carbon and low carbon welding rod wire. Mr. Flaherty was formerly in charge of welding for the Boston Elevated Railway. He will have headquarters at Bridgeport, Conn.

Bridgeport Brass Company, Bridgeport, Conn., has announced that Alfred W. Lockwood has joined its sales organization as a special representative, operating out of the New York office, handling brass pipe and flush valves. For some years past he was connected with Cauldwell Wingate & Company, well known New York contractors.

New Advertising Literature

Plibrico Jointless Firebrick Company, Chicago, Ill., has issued a new edition of its catalog covering the subject of furnace lining. The booklet consists of 36 pages, some of which are devoted to the installation of monolithic furnace linings and the use of this lining for furnace fronts, arches, side walls and bridge walls in boiler furnaces and for heating furnaces, baking ovens and other industrial furnace and miscellaneous applications. A copy of this catalog will be sent free on request to the company at 1130 Clay Street, Chicago.

American Bridge Company, Pittsburgh, Pa., engineers, designers and manufacturers of steel towers, poles and other steel structures, has issued its 1925 edition of "Transmission Towers," a 200-page illustrated catalog covering steel towers and poles. "General Specifications for Steel Radio Towers" is added.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review

Published by McGraw-Hill Company, Inc.

MORRIS BUCK, *Managing Editor*

Volume 65 New York, Saturday, April 11, 1925 *Number* 15

Purchase of Railway Energy Requires Change in Regulation Methods

ENERGY for the operation of many electric railways is now either purchased in whole or in part from comparatively large electric power systems. Railway load is considered as bulk supply. Regulation of voltage for railway bulk supply frequently is defined by a hazy clause in the usual contract, such as "Small variations of frequency or voltage to be allowed." The result in many cases is high voltage during hours of light load after midnight and comparatively low voltage during railway peak hours. This is exactly the opposite of what is desirable for car operation. The drop in a.c. voltage from the lightly loaded hours to the peak periods may be in the neighborhood of 10 per cent. Flash-overs on owl car equipments set an upper limit to the d.c. voltage and this in turn dictates an undesirable lower potential in the morning or afternoon peaks.

When power systems were smaller and were regulated at the source for the ultimate consumer, the compound-wound synchronous converter without auxiliary means of regulation gave a reasonably satisfactory account of itself in railway service. Even with the change in power supply, the same method still prevails in many cases, despite its unsatisfactory control of voltage.

In the article in this issue Mr. Woodbridge describes the solution he has worked out for the voltage control problem as applied to the delivery of power for street railway service in San Francisco. Regulation of transformer ratios under load to offset all reasonable variations of the supply does away with the need for the compound winding, thereby giving the equipment a more drooping voltage characteristic. According to Mr. Woodbridge, this results in greater peace of mind of the operating force, which is reflected in the operating accounts in the shape of less spare apparatus required and less apparatus in service.

A Novel Method for Disposal of Substation Losses

DESIGN of all classes of rotating electrical machines ranging in size from railway motors up has tended more and more during recent years toward directed ventilation. The last type of machine to be affected by this tendency is the rotary converter. The excuse for this lag is that converters are high-speed machines which have inherently low losses and excessive windage. They can therefore stew in their own juice without ill effects. Of course windage is no aid to final disposition of the losses where large units are closely confined in small quarters, as they must be in restricted locations.

When applied to converters the real disadvantage of directed ventilation as ordinarily practiced is that it necessitates the inclosure of one end or the other of the machine, both of which should be open for most convenient inspection and maintenance. An unusual solution of this problem is described in an article by J. E. Woodbridge in this issue. With the arrangement adopted both ends are open, giving convenient access and ingress of air from the operating room, the inclosure covering the field structure, access to which is required much less frequently.

The system of ventilation in this case reverses usual practice, drawing air from a monitor on the roof into the machines and into the tops of air-blast transformers. From both of these it is blown out through ducts in the basement. This is said to keep the operating room cool and to eliminate street dirt, reducing the need of conditioning apparatus, provided offensive chimneys are not in the vicinity of the monitor. Warmth for the station when required can be obtained either by blocking or by short circuiting the ventilation path. Draft forced in this way by the centrifugal action of a converter armature, which in 60-cycle work usually has a peripheral speed of from 1½ to 2 miles per minute, is easily able to overcome the natural tendency of warm air to rise, and the restriction of windage tends toward an improvement in efficiency.

Annual Report Reflects Improvement in New Jersey

CAREFUL reading is suggested of the report of the Public Service Railway of New Jersey, an abstract of which is published elsewhere in this issue. In many respects this is an unusual statement. Not only does it indicate the measure of success that has attended the company's efforts to rehabilitate its railway lines, but it shows the extent to which the Public Service Railway is engaging in bus operation. The conversion of the system from two-man to one-man operation has been the subject of extended comment in these columns, but the report emphasizes the importance of this change and reflects in the operating statement the extent to which this and other operating economies have been carried.

As President Thomas N. McCarter has pointed out, the effect of the economies so far introduced may reasonably be expected to be more apparent in the future. Aside from these matters another fact of outstanding interest is that the expenditure charged to fixed capital for buses was $5,493,790 in 1924 compared with $1,289,011 in 1923. The need for rebuilding or replacing many of the buses taken over reflects the extent to which bus operators were living out of their capital. The 5-cent fare unit appears to be working well. It was first tried in 1923 and has been extended to additional lines during the past year. Since the period covered by the report, it has been still further extended. All in all, the report reflects great credit

Digitized by Google

on the perspicacity of those charged directly with the responsibility of carrying out the program of restoring the railway to its rightful place alongside of the other successful operating units of this state-wide system, which last year did a gross business of $87,689,-453 and returned net earnings of $5,583,072 available to the payment of dividends on the common stock.

Pruning the Branches to Strengthen the Tree

SIGNIFICANT among the developments of the last few years is the readiness with which a number of railway companies, both steam and electric, have sought to abandon unprofitable lines. A conspicuous example within the last month has been the Boston & Maine Railroad (steam), which has said that it wants to give up service on 186 miles of branch line railroad. Another notable example a few years ago was the Eastern Massachusetts Street Railway, which boldly abandoned a number of its unpaying branches.

Briefly the advocates of this policy reject the idea, long current by both public and railway companies, that a railway, like Tennyson's brook, must go on forever. The railway feared to allow the franchise to lapse lest the line be taken over by a competitor and operated to the detriment of the original owner. The public was opposed to such abandonment because it would leave the territory without transportation.

In the opinion of the advocates of the plan of curtailment, modern conditions have changed this situation entirely. To the average railway man, an unprofitable franchise is a distinct liability rather than an asset, and if the community served does not consider it worth while to make up for the loss from its operation it is hardly the duty of the railway company to do so. Hence, according to this policy, broadly speaking, a railway company should be as independent in such matters as a manufacturing company, which will close down an unprofitable department, or even its main factory, if times are bad.

In this automobile age, especially in the densely populated sections of the country, it is hard to imagine any community cut off from communication with the world simply because its rail transport has stopped. Automobile, bus and truck transport may not be as comfortable or as cheap as that by rail, but this is not an unanswerable argument for the indefinite supply of the better service at the expense of the railway stockholders. Much of this wayside business has gone to the rubber-tired vehicle already.

Calculating Profit or Loss on Transportation Service

DETERMINATION of profit or loss on an individual railway route, so that a decision may be made as to its retention or rejection by the operating company, is the real difficulty in the application of the rule proposed above. Where the company operates only a single line, it is no difficult matter to tell whether it is or is not covering expenses or returning a fair profit. But where the route in question is one of many, the segregation of revenues and costs is by no means easy.

On the revenue side, a number of the passengers may also ride on other routes and make them profitable, so that abandonment of the losing line may convert another line into a loser. Contrariwise, a line that apparently is making money may be doing so at the expense of some other line that could handle the business equally well and at less cost.

Expenses of operation, as well as overhead charges, can seldom if ever be determined individually for the routes of a system. The usual procedure is to make an allocation, which of necessity is based on the car-mile, the car-hour, or the mile of track. Such apportionment is at best only approximate, and may be far from the truth.

Still another complication arises in determining the value of a line. The operators of the property may feel that everything possible has been done to bring traffic to the line or to cut down expenses. Another operator, or a consulting engineer, who is able to inspect the property with a wider background, may see at once possibilities for more revenue and less cost.

Undoubtedly many of the lines which have been abandoned could have been placed on a profitable basis by the application of principles that have been worked out on other properties. In fact, there are some instances of roads which have been abandoned and have lain idle for a time, only to be taken up by others and operated with some degree of success. The decision to cease operation, then, is one that demands careful analysis, preferably by some one not too close to the immediate problem, and attention to all the points involved.

Furnishing Service Along Abandoned Routes

OPERATION of some form of public conveyance along a route abandoned should be preferable from the standpoint of the railway to no service at all. Even though some one else operated the line it would still be a feeder to the main road. Even though a railway may abandon operation on a branch line, for reasons set forth above, it still is often in a better position than any one else to conduct the operation of the substitute means of transport proposed. It has the organization and the transportation knowledge. Very often it has also the equipment and the means for keeping it in repair. In the Boston & Maine instance, Homer Loring, chairman of the company's executive committee, suggested that the substitute bus and motor truck service proposed should be supplied by the railway. He offered to leave the question of the amount of the service to be given and the fare to be charged in each case for the communities themselves to determine, the only provision being that the service and fares would be such that the revenue should at least equal the cost of operating the routes.

There is no doubt that there are a number of advantages in this new plan of operation—or of abandonment—if the reader prefers that word. Had it been adopted earlier in New England, some of the troubles experienced by the Eastern Massachusetts Street Railway, the Boston & Maine Railroad and the New Haven Railroad would not have occurred. In each of these cases the main routes were profitable, but great difficulties came to the property through losses incurred by operation on the branch lines. All in all, the plan has the merit of placing the cost of transportation where it belongs, namely, on those chiefly benefited.

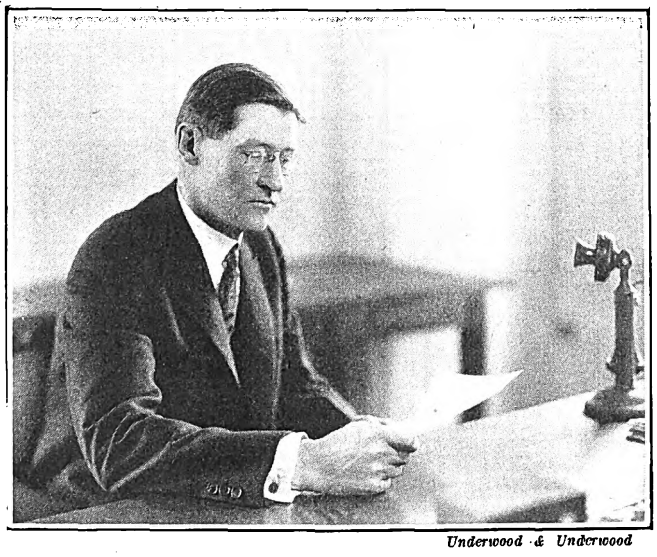
THE NEW MANAGING DIRECTOR of the American Electric Railway Association expresses a desire to co-operate to assist the industry in the many situations that are arising. In no sense is he to be considered a czar or a dictator to the electric railways.

Working with Our Shoulders to the Wheel

The Industry's Problems Can Be Solved



Underwood & Underwood

Mr. Storrs Is Quite at Home in His New Offices

LUCIUS S. STORRS, the new managing director of the American Electric Railway Association, deplores keenly the imputation of being a czar or a dictator, which has been put on him by the daily newspapers. This was almost the first thing that he said when asked by the managing editor of ELECTRIC RAILWAY JOURNAL to talk at first hand about his new duties. Of course, it seems almost ridiculous that any such notion could exist. Those who know Mr. Storrs at all well realize that if a czar were needed he would be one of the last men who could qualify for the part. Kindly, courteous, ready to listen to the other man's point of view, and withal having a keen insight into human nature, no one seems farther from the attributes that one looks for in a czar. Rather is he a big brother, ready to give his help to those who need it.

But the idea that he is to be a czar seems to be fairly widespread. It has distressed Mr. Storrs not a little. So he insisted on talking about that first. Not only did he talk about it, but he indicated that it would please him to have it mentioned first, although from the standpoint of the interviewer it might appear to be less important than other things that were said.

"I do not regard myself as 'czar' of the traction industry, as some of the newspaper headline writers have seen fit to call me," said Mr. Storrs. "I am anything but a czar on this job. What I really am and hope to be is a hired man, worthy of his hire and helpful to the industry.

"No one could possibly resent more than I do the appellation of 'czar.' It slipped into the newspapers, I suppose, because such a term made the news stories sound well, and because four-letter words fit easily in headlines.

"Certainly it did not get into the newspapers because I or any one connected with the American Electric Railway Association by word or act left the impression that I had any idea of being an overlord of any kind."

Although he has been on the job only since April 2 and has occupied his own suite of offices since the first of this week, Mr. Storrs has already got well into the swing of his new position and is laying plans for a wide range of activities. It should be explained, perhaps, that the work which Mr. Storrs will perform will be in addition to the service heretofore rendered by the association. The position of managing director was created because of the need for the whole time of an executive experienced in financing, managing, operating, employee and public relations, and the other problems which come up from day to day on large properties. The place was not created with any thought of performing the service heretofore given by the asso-

Digitized by Google

ciation any differently, or in dividing the duties of the staff. They will function as previously, giving such aid to Mr. Storrs's office as will be helpful.

The familiarity of Mr. Storrs with association work has made it possible for him to step into his new position and co-ordinate his new work with existing facilities of the organization without a hitch. As president of the association he became thoroughly familiar with its machinery and personnel. Further, his devotion and attention to association affairs since leaving the presidency, in 1917, have been unflagging. Each year it has been a question as to what committees were most entitled to his services.

The open-door policy was one of the first which Mr. Storrs adopted upon assuming the managing directorship. Already executives have begun to call on him and they have found him ready and anxious to work in the rôle of friend and adviser.

Right there is the nub of the whole situation. It is just what Mr. Storrs hopes to be to the entire industry —a helpful friend and adviser. A spirit of mutual understanding and helpfulness underlies the whole ideal that Mr. Storrs has set up as his aim. His long successful connection with the industry gives him a particularly keen insight into the various problems that are developing constantly. Qualified as he is to deal with almost any situation that may arise, the managing director is, on the other hand, conscious of his own limitations. He knows that in his new endeavor nothing worth while can be achieved single-handed.

Necessarily he is proceeding slowly. Above all, he is making no promises as to what he hopes to accomplish. Just at the present time he is seeking mainly to acclimate himself. He was promised the co-operation of the industry by those who were responsible for his selection. That is all he asks. Results will depend largely on the measure of that co-operation. Said Mr. Storrs:

"It would be ridiculous for any one man to say that he alone could or would attempt to solve the manifold problems which face the transportation industry of the United States. But it is not ridiculous to say that all of us, working with our shoulders to the wheel, can solve them.

"Had the advisory council, which suggested to me that I accept the managing directorship of the industry, told me that I was expected to go out single-handed and fight the battles of traction, of course I should have refused to consider this position.

"But when the council—composed of large owners of the industry—came and offered its help and the help of the thousands of other workers in our field, then I accepted gladly, because I know that all of us, working together in a common cause, can bring order, excellent service and prosperity to the transportation business.

"I am ready to do my part to the fullest extent of my ability, and I want and need the help of every traction man."

Already there are indications that the industry is prepared to play the game along the lines Mr. Storrs has spoken of as essential to the success of the work into which he has entered. Invitations to meet railway men and requests that he attend meetings and dinners are coming in to him in large number. His engagement book is almost filled now for the next several months. While he considers that it is desirable to attend as many of these functions as possible, still he feels that in order to learn the problems which confront the industry it is necessary for him to go out into the field. Only in that way, as he sees it, will he be able to obtain the full co-operation of others. In the field it will be possible for him to meet the people with whom he will have to work out the details and get at first hand their immediate viewpoints.

Office Location Is Convenient

The association was fortunate in securing a suite of offices for Mr. Storrs on the twelfth floor of the Johns-Manville Building, 292 Madison Avenue, immediately below the offices into which the headquarters recently were moved. This makes it possible for him to attend the meetings and confer with the association staff and committees without loss of time. His telephone is connected on the main switchboard of the association, so that he is in close touch with the members of the staff at all times. The suite consists of a large reception room, an office for Mr. Storrs, and three other offices which will be occupied by his staff as the duties of the new position increase. Just at present, however, he is being assisted only by his secretary, Walter Jerome, who was his secretary while he was president of the Connecticut Company. Mr. Jerome has worked with Mr. Storrs for a number of years, so that moving to New York meant little more than a change of his office and his telephone number, so far as his relations with his chief were concerned.

WITH THE OPENING of his new offices, Mr. Storrs has taken up the work actively. But in order to make it a success, he needs the help of all. Let every railway man keep in mind his one request:

"I am ready to do my part to the fullest extent of my ability, and I want and need the help of every traction man."

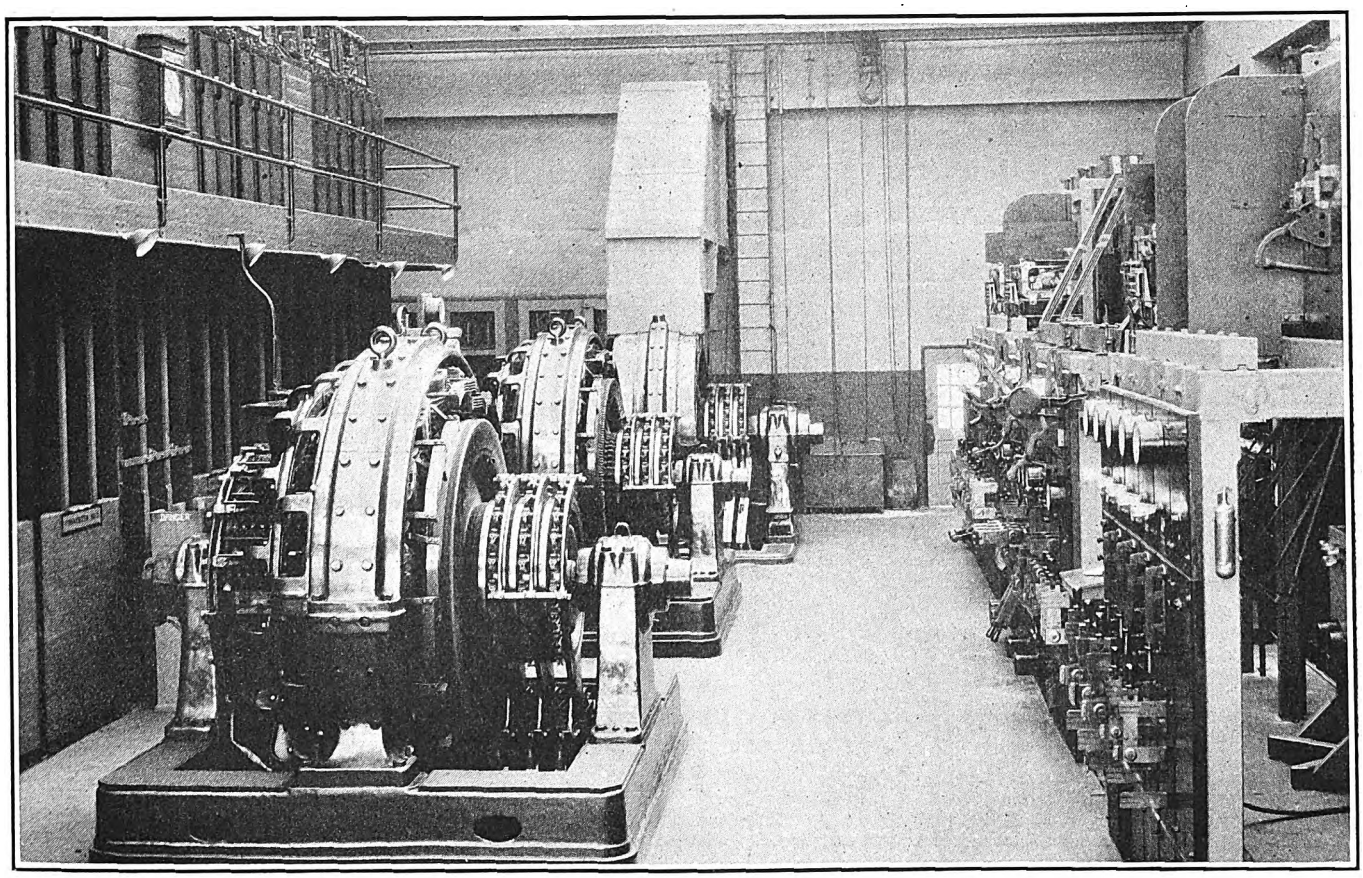
Developments in Substation Practice in San Francisco

Method of Ventilation Differing Materially from Ordinary Practice Has Been Adopted by the Market Street Railway—Shunt-Wound Converters Give Better Service than Compound-Wound Machines

By J. E. Woodbridge
Resident Engineer Ford, Bacon & Davis, Inc., San Francisco



This View of the Downtown Substation of the Market Street Railway Shows the Two 2,000-Kw. Converters and the New 3,000-Kw. Directed-Ventilation Machine in the Rear

THE growth of the city of San Francisco has increased the demand for power to operate the cars of the Market Street Railway to such an extent as to require two additional converting units during the past year. While the demand at each of the substations has increased the additions have been made to the stations containing rotary converters, and feeder copper has been altered in such a way as to divert load from the stations equipped with motor-generators to those equipped with converters. This has been done to obtain the economies of converters, which cannot be operated satisfactorily in the same stations with motor-generator sets.

The additions have been one 3,000-kw. unit in what is known as the Downtown station, which previously contained two 2,000-kw. units, and one 2,000-kw. unit in the Eighth Avenue station in the Richmond district, previously equipped with two 1,500-kw. machines.

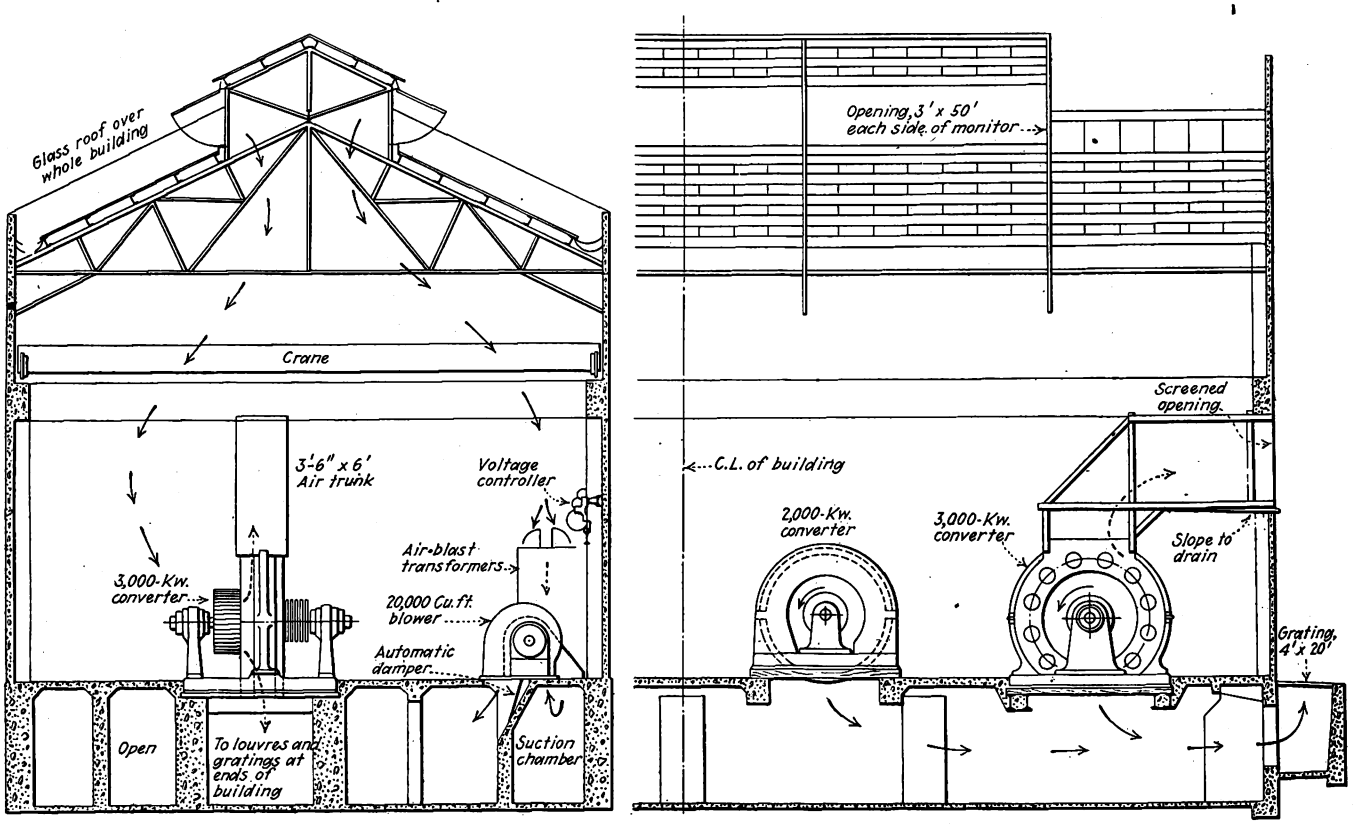
The Downtown substation was originally installed four years ago with several features departing from usual practice. The station was described in an article by the writer in ELECTRIC RAILWAY JOURNAL for Aug. 20, 1921, page 269. It may be of interest to note at this time their performance. The converters are shunt-wound and supplied from transformers of the high-reactance type (15 per cent) usually advocated only for compound-wound units. The drooping voltage characteristic of these machines with increase of load, and particularly with excessive overloads, has been found to be advantageous in more ways than was anticipated. Unexpected severe increases of load, such as those due to other stations backing off or dropping out multiple feeders, are relieved, and the shunt-wound converters continue to operate at times when compound converters would trip their overload circuit breakers. Instead of the constant voltage characteristic of compound-wound machines regardless of load, shunt machines tend more toward constant power regardless of external demand,

Digitized by Google

reducing load swings and relieving the supply system, the machines themselves, the circuit breakers and the feeders to that extent.

The influence of the voltage droop on the car service is inappreciable, giving the effect (without the loss) of a moderate feeder drop on the short feeders characteristic of a city center. In case of unusual loads due to car congestion the reduction of voltage probably results in a saving of energy. Contrary to some theories that have been published in technical proceedings, the effect of the shunt winding on the power factor of the converter is better than that of a compound winding. Reactive factor indicators with both current and potential elements connected between the transformers and the converters, thus giving the power factor at the rings, show a variation of 12 per cent without field

The original units were also supplied with manually operated voltage controllers consisting of contactors for varying the number of turns in the transformer primaries under load. The operating department has found these controllers of great assistance in regulating the d.c. voltage to railway requirements regardless of that delivered by the supply company. The drooping characteristic of the converters and use of the controllers make it unnecessary to keep running a margin of converter capacity to absorb unexpected load swings. It also has been found possible to continue service (momentarily at reduced voltage) when excessive overloads occur either due to increase of outside demand or to the accidental interruption of service from a machine within the station. In other words, the converters inherently back away from excessive overloads.



Plan of Directed Ventilation Adopted in the Downtown Substation of the Market Street Railway

adjustment over the full range of load and of consequent voltage drop. This is less than the difference between 99 and 100 per cent power factor.

The actual drop of d.c. voltage of the 2,000-kw. converters installed in the Downtown station four years ago has been found on test to be 45 volts from no load to 50 per cent overload or 5,000 amp. per machine, after correction to constant impressed voltage on the transformer primaries. The regulation curve is nearly a straight line over the total range tested, departing therefrom in the direction of an increase of droop at the overload end. In actual service there is the added drop in the a.c. lines supplying the station, due to the load. No such values of drop as 45 volts occur in normal service, as the momentary load fluctuations are only about 1,000 amp. per converter.[2] The drops obtained are comparable to ordinary impressed voltage fluctuations. But in cases of emergency, such as suddenly applied overloads, the lack of any tendency of the machines to "root in" is a notable contrast with the action of compound-wound apparatus.

They can be backed away still further if necessary by hand. This reduces the tendency of the row of machine breakers to blow one after the other like a row of ninepins, in case any disturbance occurs that is sufficient to operate one breaker when all are well loaded. This tendency is characteristic of compound-wound equipments. A station equipped with the shunt machines can be worked more closely to its breaker settings, i.e., its overload capacity, than can a station with compound-wound units, without the increased danger, to use the vernacular, "of losing the house," with attendant delays in restoring service. The actual available increase of capacity in kilowatt-hours output per peak hour is in this case estimated at about 20 per cent.

On account of the success of these features they were incorporated in the new units. These are shunt-wound, supplied from 15 per cent reactance transformers, and fitted with voltage controllers giving a range of 12 per cent of the ratio of transformation. The series field windings of the two older machines in Eighth Avenue have been cut out of circuit. One of

Digitized by Google

these machines, operating shunt-wound, gave closer regulation than the two others in the same station and tended to take all the load swings. To overcome this, the series field has been cut in again reversed.

Directed Ventilation a Feature of New Converter

On account of ventilation difficulties inherent to a station in a densely built-up district the new 3,000-kw. unit in the Downtown station has been made with directed ventilation. In order to avoid inclosing the brush rigging on either the collector or commutator end, the unit was specified open to the substation room at both ends but inclosed around the armature periphery and the fields. Air is taken from the room through the commutator spider and is discharged radially through the armature, around the field structure and through four exhaust nozzles, two opening downward into the basement and the other two upward into an air trunk carried through the end of the building.

The inclosure of the machine restricts windage, which would otherwise be excessive and reduce the efficiency, especially at low loads, as the armature diameter is 7 ft. 6 in., giving a peripheral speed of 9,400 ft. per minute. Further restriction of windage is made by a baffle plate on the armature spider, which shuts off the entry of air from the collector end. This also keeps out collector ring cuttings. All the air which enters the armature is forced to come through the commutator spider, so that it effectively cools the commutator, which is of rather unusual size for a 60-cycle railway machine, being 52 in. in diameter by 24 in. effective length, with a peripheral speed of 5,400 ft. per minute.

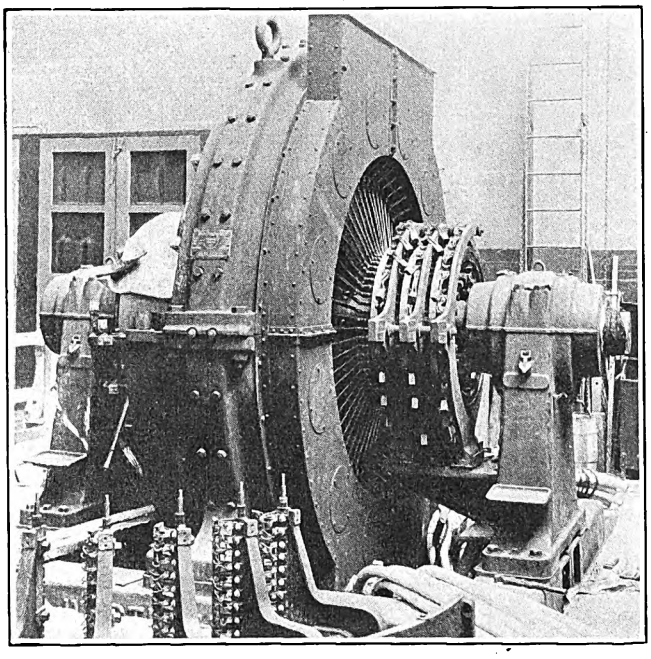
The separation of ingoing from outgoing air works satisfactorily as far as the new machine is concerned. Similar provision is now needed on the other machines since the heated air from them is now exhausted through the new machine.

Since the total station losses, with all machines at full load, amount to 500 kw., the movement of air required to avoid excessive temperature rise is considerable. For a temperature rise of 20 deg. F. the air must be moved into and out of the station at the rate of 75,000 cu.ft. per minute.

One of the older machines is now being experimentally inclosed. By this means all air will be taken, so far as possible, from above the floor and discharged below the floor. If this works out successfully it will mean reversal of the usual scheme of ventilation for such a station, outdoor air being drawn in through the roof monitor openings and discharged through the basement. To avoid passing the heated air from the air-blast transformers through the converters, the usual path of the air through them has also been reversed, the air being drawn in from the room through the tops of the transformers and discharged through their bases into a suction chamber, instead of a blast chamber. From there it is drawn by fans and discharged into another portion of the basement, where it joins the discharge from the converters and is delivered outdoors. This arrangement avoids discharge trunks over the transformers, where they would be in the way.

The converter frames are insulated from ground for the purpose of reducing the risk of a short circuit in case of a flashover from the positive brush rigging to the frame. The air trunk for the machine provided with directed ventilation is built of wallboard on a timber frame. This construction eliminates any chance of a ground and reduces the noise, which would be aggravated by a metal trunk. On account of its height the new 3,000-kw. unit is set with its base below the grade of the floor; an asphalt floor provides insulation at this point as well as safety to operators in case of an internal leak to the frame. The asphalt flooring has proved highly satisfactory. The same type of floor has now been laid in the Eighth Avenue substation.

The means usually adopted for starting small converters was chosen for the 3,000-kw. machine—namely, a starting switch in the secondary leads. This was found to be cheaper and simpler when the difficulties inherent to switching such large currents had been solved. The starting switch, rated at 4,000 amp. on each of its three poles, is of the double-single type operated by two handles, one-half of the blades making contact in the starting position and all of them in the running position, the two sets of blades being so mounted that they cannot make simultaneously both



The Nozzles for Directed Air Discharge on the A.C. End of the 3,000-Kw. Converter Are Shown in This Picture, Taken During Erection. The Nozzles on the D.C. End Are Not Yet in Place

running and starting contacts. This division of the switch into two separately operated parts makes it easy for one man to handle.

With the controller set for minimum delivered voltage the starting current of the 3,000-kw. machine is approximately 5,000 amp. per collector ring, or 105 amp. at 11,000 volts or 2,000 kva. This heavy secondary current is handled by the starting switch without burning or flashing. This current starts the machine from rest, and brings it up to synchronous speed in 38 seconds.

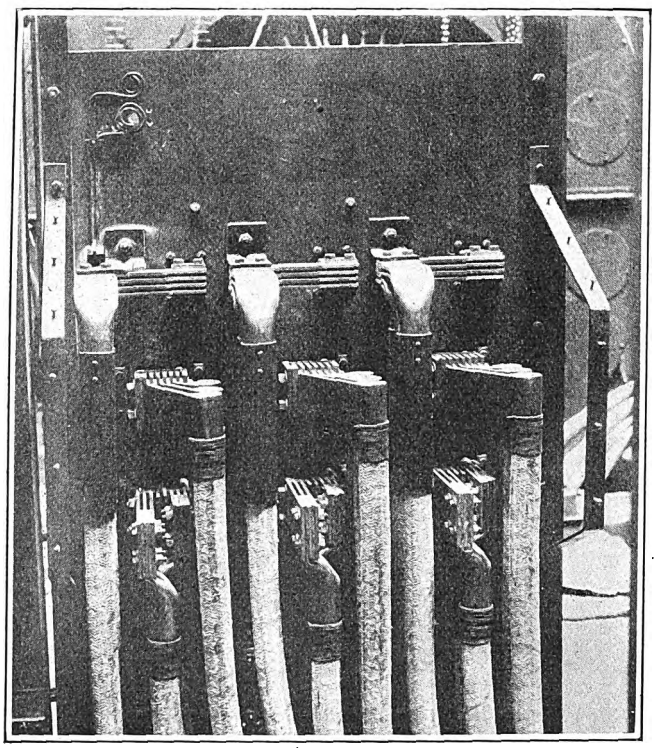
Sufficient study was made to determine that the low-tension connections between the transformers, the 3,000-kw. converter and the switchboard could be made more cheaply with cable than with bars, and that they could be made more safe. The total cross-section of copper to and from this converter aggregates 60,000,000 circ.mil. This is made up of three 2,000,000-circ.mil cables per phase of the six-phase circuit and six 2,000,000 cables for each d.c. terminal. Cables with a total cross-section of 48,000,000 circ.mil run to the starting switch for this machine. A careful design of the switch terminals was necessary in order to get the

Digitized by Google

cables to them with proper clearances and room to reach bolts and nuts with wrenches.

The modifications of the auxiliaries of the new equipment from those of the older units are as follows:

The field rheostats are connected between the shunt fields and the ground side of the machines instead of between the shunt fields and the positive side. This change has been made in order to avoid the dangers of a violent short circuit in case of failure of the insulation of a field rheostat. The field rheostat of the 3,000-kw. machine is motor driven on account of its size, and indication of the rheostat resistance is given on the switchboard by means of a d.c. voltmeter connected across it. Incidentally this gives an added means of checking the polarity when starting. On account of the practical impossibility of calibrating the scale markings of large overload d.c. circuit breakers



Rear View of Low-Voltage Starting Panel for 3,000-Kw. Converter, Showing Connections to 24 Cables, Each of 2,000,000 Circ.mils

the breaker of the 3,000-kw. machine is made automatic on overloads through a relay operated from the shunt. This relay can be checked at will with a millivoltmeter. The relay in turn acts on the low-voltage release attachment of the breaker.

The power factor of the new machines is determined by means of reactive volt-ammeters instead of reactive-factor indicators as with the older machines. The former instrument has simpler connections and does not give exaggerated indications at low loads. In order to avoid errors of current transformers in close proximity to heavy leads the reactive instrument is connected to a primary current transformer but takes potential from the secondary side of the main transformers. At an indicated power factor of unity this segregates the magnetization of the transformers to the converter, and the balance of the reactive component set up by the transformers to the line.

The Downtown substation was originally equipped with low-speed d.c. feeder circuit breakers. Several flashovers occurred due to the low resistance of short circuits when contact wires broke down, even with cast-grid protective resistances in the worst feeders. With the new equipment five high-speed feeder breakers were installed and all feeder protective resistances were removed. No flashovers have occurred since the new breakers were substituted, although there have been cases of trolley wires down not far from the substation, including a case when there was only one machine in operation.

One of the high-speed breakers supplies a so-called hospital bus to which any feeder can be transferred. This breaker is regularly used for testing suspected feeders, so that all danger of fireworks is removed. While the high-speed breakers operate frequently, due to sudden rise of current suspected to be far below their setting, they are readily restored within a few seconds, being of the trip-free type, and the frequent operation does not deteriorate the contacts or call for undue renewals.

A few ideas have been adopted from automatic substation design, although the operation of this equipment is manual. The closing wire of the electrically operated oil switch supplying any converter is carried through interlocks so that the oil switch cannot be closed unless the converter brushes are raised and the transformer dampers are open. The low-voltage release of the d.c. circuit breaker is also supplied through an interlocking contact on the brush-raising mechanism so that the breaker will not remain closed unless the brushes are lowered.

The fans for the air-blast transformers in the Downtown substation are driven by 550-volt d.c. motors in order to simplify their control and to permit the use of lower speed and higher efficiency than can economically be provided with induction motors. A small range of speed regulation by armature resistance is also provided for reducing fan losses when less output is required as when running one converter. A Franklin air-pressure relay is so connected as to ring an alarm in case the air pressure fails. The relay circuit is carried through an extra pole on each fan motor switch to stop the alarm when the station is shut down and to close the alarm circuit positively when the station is started.

In the Eighth Avenue station the blowers are induction-motor driven. Since they cannot be started until a converter is in operation, a Franklin air-pressure relay is connected through auxiliary switches so that the alarm will not ring if the station is shut down, but it will ring if any converter is connected to the direct-current bus with no pressure in the air-blast chamber.

Return current from pipes, cable sheaths and carrier tubes in the area where such portions of the circuit may become positive to ground is brought in to the Downtown station through cables aggregating 3,000,000 circ.mils. These are connected to the negative busbar through switches intended to be opened when the station is shut down. Auxiliary switches are so connected as to ring an alarm if any converter is connected to the d.c. bus, and the drainage switches are open, or if all converters are shut down and the drainage switches are closed.

The extensions of the stations and of the conduit system, the installation of the equipment and the alteration of the feeders were carried out under the supervision of Ford, Bacon & Davis, Inc., consulting engineers to the railway.

One Permanently Coupled Train of This Type Is Equipped with Material that Is Left Over from the Construction of Two Articulated Units

Rush-Hour Train Operation in Baltimore

United Railways & Electric Company Plans Soon to Have 292 Two-Car Units in Service—Permanently Coupled Trains Utilizing Remodeled Open Cars Are Equipped with Surplus Material from the Construction of Articulated Units—Multiple-Unit and Trailer Trains Are Also Used

EXTENSION of train operation by the United Railways & Electric Company of Baltimore, Md., has been found an effective means of reducing platform expense during rush hours. In recent years the morning and evening peaks have become sharper. The question of securing trainmen to operate the large number of tripper cars has consequently become more pressing. Two-car trains operated by three men are now being used in large numbers by this company to provide extra rush-hour capacity without a proportionate increase in labor cost. To carry this idea a step further, two-man articulated units are being built.

When the present building program is completed the railway will have 292 two-car units of various types. The following figures show the number of each type, the listing being in the chronological order in which they were placed in service:

TYPES OF TWO-CAR TRAINS USED IN BALTIMORE	
Trailer trains (100 trail cars and 105 motor cars)	100
Multiple-unit two-car trains	25
Peter Witt multiple-unit train	1
Articulated units	*110
Permanently coupled two-car train (experimental)	1
Permanently coupled two-car train	*55
Total	292

*Now under construction.

After a thorough study of the operation of articulated cars in Milwaukee it was decided to construct one such unit in Baltimore as an experiment. Two of the company's standard semi-convertible cars, each seating 44 passengers, were used. One vestibule was removed from each car and the truck nearest the removed vestibule was taken away. The two cars were then joined together permanently with a new truck common to both cars, thus forming a three-truck train. A hollow steel drum mounted directly over this truck forms a covered passageway between the cars. Rubber buffers form a tight joint, preventing entrance of air. This passage can be safely negotiated on any piece of straight or curved track on the system. A brief description of these cars was published in ELECTRIC RAILWAY JOURNAL for Dec. 6, 1924, page 964.

The leading body is provided with longitudinal seats, while the rear body is equipped with the maximum possible number of cross seats, together with a semi-circular seat on the rear platform. The total seating capacity of the articulated unit is 87.

The motorman is located at the center of the front platform and controls the double doors at that end, through which all passengers enter the car. The conductor is located at the front right-hand corner of the rear car, just back of the passageway between the first and second bodies. He collects all fares as passengers step from the drum into the second car and controls a double exit door at the front of the second car, through which all passengers leave the unit. Passengers in the forward body are, therefore, non-paid passengers, while those in the rear body have paid.

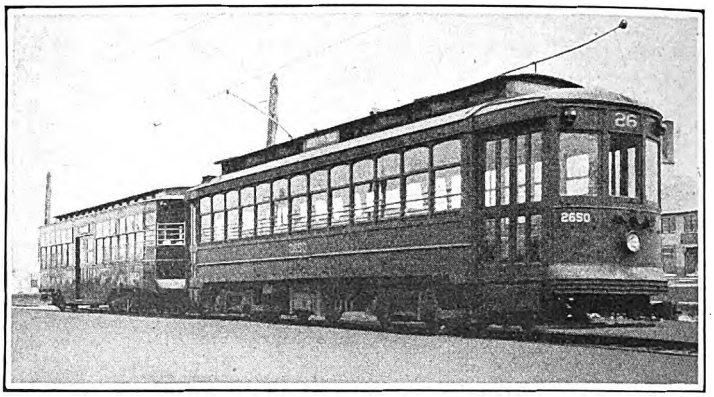
Multiple-Unit Cars Are Operated Singly During the Day and in Trains During the Rush



Standard Motor and Trail Car Train Used in Baltimore. A Second Trail Car Is Added When Riding Is Heavy

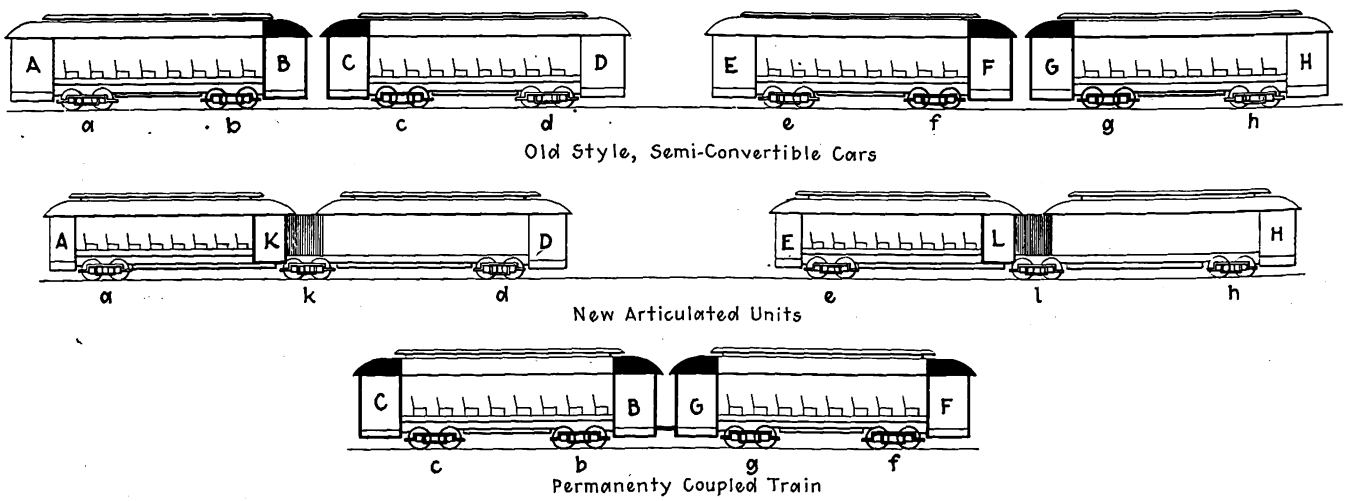
An emergency controller and air brake valve have been placed in a concealed position under the rear semi-circular seat for emergency operation in the reverse direction, and for shifting. A cadmium yellow color scheme used by the company to distinguish front-entrance cars has also been carried out in the articulated units.

The sample articulated car was placed in service in September, 1924, and its operation was closely watched for several months. The trial was entirely successful and construction was begun on nine more articulated units. It is expected to carry out an extensive program for building articulated cars during 1925, with the intention of constructing 110 units eventually. These articulated cars not only enable the company to handle its rush-hour traffic with a much smaller number of platform men than single cars would require but there is also a considerable economy in power and maintenance.

After constructing an articulated car there is left over as salvage two vestibules, two trucks, cross-seats from the leading body, motors, controllers and many other miscellaneous parts. One of the problems which had been confronting the company for several years was what to do with the 110 twelve-bench open bodies, which were no longer being used in summer service. These bodies had no equipment, the trucks, motors, controllers, etc., being transferred each spring and fall from and to the same number of closed bodies. The articulated car program suggested a plan whereby it would be economical to utilize these bodies, remodeling them into closed cars. Utilizing the salvaged parts on the open car bodies, a comparatively small additional amount was needed to close in the sides, build windows, etc., so as to turn out a first class closed car similar to the company's standard equipment.

One of the bodies was remodeled along with the construction of the sample articulated car and was placed in service on Dec. 8, 1924. This car was also observed very closely and was pronounced to be a complete success. It was later decided that these remodeled open cars could be successfully operated as two-car trains, coupled together permanently, and thus aid materially in the scheme of reducing the number of platform employees required for rush-hour service. Consequently, after the first open body had been converted into a single closed car, the succeeding bodies, as remodeled, were permanently coupled to form two-car trains. This necessitated multiple-unit instead of Type K control and different motor equipment, but it was found that the reduction of one employee per train would much more than offset the additional expense. Structural difficulties prevented the use of these bodies as articulated cars or there could have been a still further reduction in platform labor. The first permanently coupled two-car train of this type went into service Feb. 28, 1925.

How the various surplus parts of the cars made into articulated units were utilized in building the permanently coupled trains is shown in an accompanying diagram. The two vestibules remaining from the two semi-convertible cars forming an articulated unit were



One Permanently Coupled Train and Two Articulated Units Are Made from Four Semi-Convertible Cars and Two Open Car Bodies

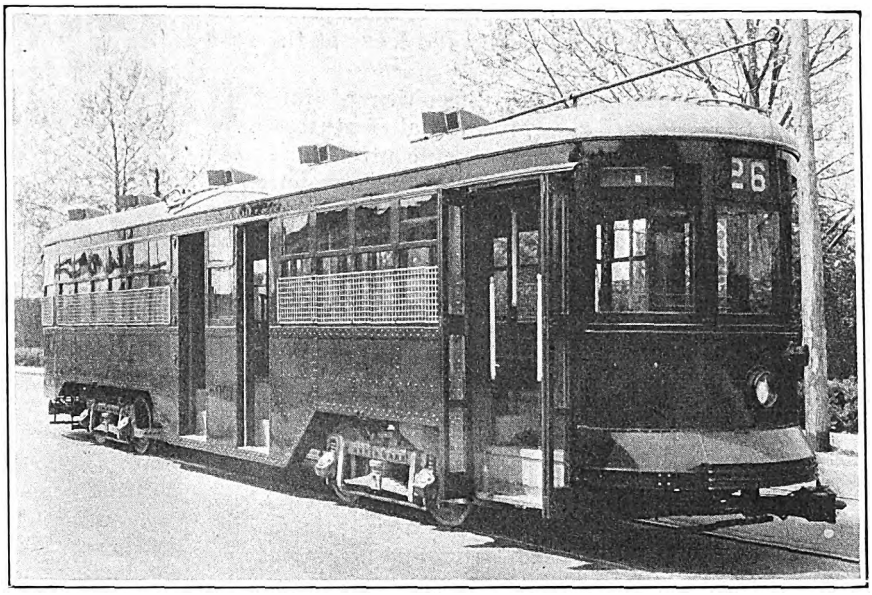
Letters indicate the original and final positions of trucks and vestibules. K and L are new center-exit doors; k and l are new trucks.

Cross seats are removed from the first cars of the articulated units and placed in the open car bodies of the permanently coupled train.

Digitized by Google

used on the two ends of the open car body. Thus the construction of two articulated trains provided sufficient vestibules for one permanently coupled train formed with two open car bodies. Similarly the two inner trucks from the pair of semi-convertible cars were used under each of the old open cars. The cross seats removed from the leading body of each articulated unit were installed in one of the open cars.

Old GE-80 motors with which the semi-convertible cars were originally equipped were retired, and Westinghouse 306-CV4 motors were installed on both types of remodeled units. On the articulated units two motors are mounted on each of the end trucks. The center or pivot truck is a trailer. On the permanently coupled trains the same change was made from GE-80 motors to Westinghouse 306-CV4 and one motor was placed on each truck.



Multiple-Unit Peter Witt Car. When Operated as the Second Car of a Train Entrance and Exit Are by Center Doors

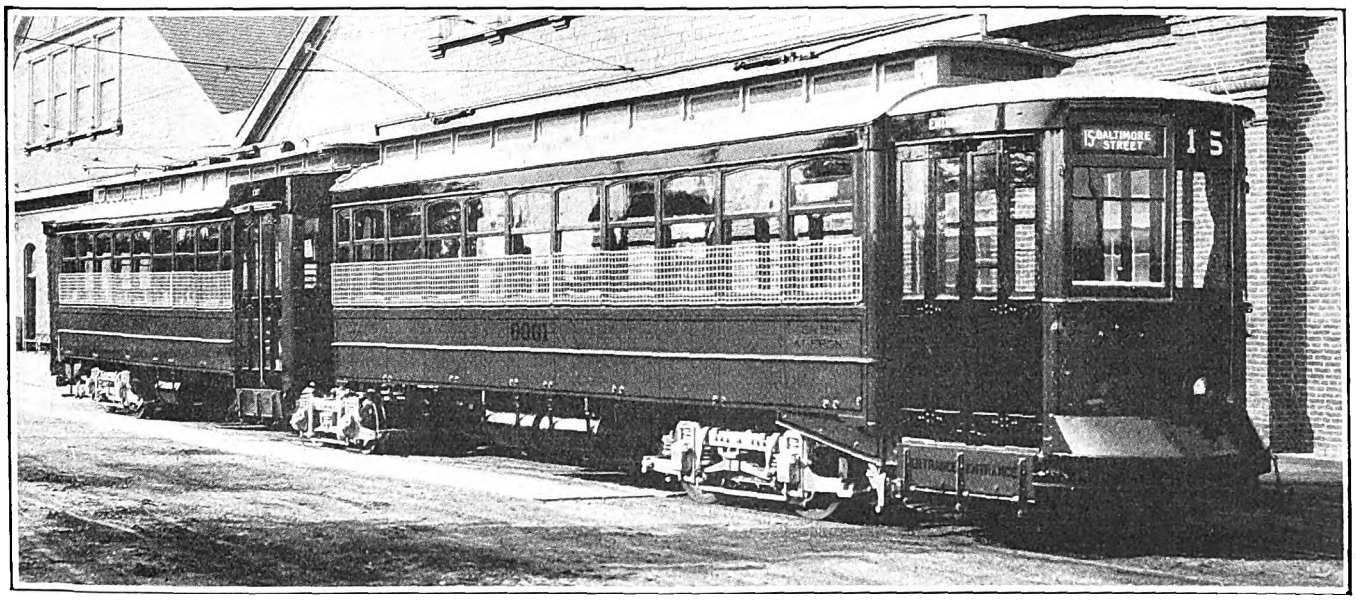
The idea of the permanently coupled two-car train did not originate with the remodeled open car construction. Previous to any consideration of such cars, it was decided to experiment with a permanently coupled two-car train, using closed cars which were the mates of the old twelve-bench open cars. These cars were small double-truck cars having a seating capacity of only 36 passengers, on longitudinal seats. They were hand-brake, two-motor cars, with old maximum traction type trucks.

Two cars of this lot were coupled together permanently, equipped with multiple-unit control and air brakes. The two center vestibules had to be lengthened to provide double doors for entrance or exit. This sample train was placed in service Nov. 24, 1924. While its operation has been entirely successful, it is doubtful if any more trains of the type will be built, as the expense involved very nearly offsets the saving effected through the elimination of one platform employee.

On both of these permanently coupled trains the leading car operates as a standard "pay-enter" car. Passengers board at the rear and leave at either the front or rear. On the rear car passengers board and leave at the front platform, paying fares on the "pay-enter" plan. Both types of permanently coupled trains are equipped for double-end operation.

Prior to the decision to use articulated units, the company considered the feasibility of operating Peter Witt multiple-unit trains. In the spring of 1923 an order was placed with the J. G. Brill Company for the construction of two sample Peter Witt cars, and an option was taken on 48 others, should the two sample cars prove successful.

These cars in many ways are a distinct departure from the railway's standard and also embody some features that are new to the Peter Witt design. They may be operated either as single cars or as two-car trains. Passengers enter through double doors on the front platform and leave by two separate doors at the center. The conductor is stationed between the two center doors and collects fares as passengers pass him, either to take seats in the rear half of the car or to alight from the forward half. When one of these cars is operated as the second car of a two-car train the same



The United Railways & Electric Company Is Building 110 Articulated Units of This Type

Digitized by Google

method of fare collection is used, but all passengers enter at the forward center door and leave at the rear center door.

In order to overcome the difficulties of inflexible single-end operation, several unusual features were added to these cars. An emergency controller and air brake valve are placed beneath the rear semicircular seat under a removable center section. An emergency door has been provided at the left side of the front vestibule. This can be worked manually from an emergency conductor's station just inside the front platform, thus permitting operation of the car in the reverse direction.

These cars were placed in service on May 12, 1924, and proved to be very satisfactory operating singly. On Aug. 25, 1924, they were transferred to another line, where they could be used to advantage as a two-car train during rush hours. They have been operating on this line ever since, running as a train during the morning and evening rush hours and as single cars during the mid-day. Although they have been entirely successful, the company did not exercise its option on the other 48 cars, preferring to build articulated units.

CARHOUSE LOCATION AIDS TRAIN OPERATION

A factor that has had an important bearing on the use of trains in Baltimore is the arrangement of routes and carhouses. There are in all 34 routes and 22 carhouses. The former are laid out in such a way that in many cases one route furnishes short line service on another route. Carhouses are comparatively small. Their locations are such that a majority of the lines have carhouses near both ends. Ordinarily both carhouses on a single line are under the same supervisor. This makes it possible to haul the trailers in the morning in the direction of the rush and drop them at the carhouse at the other end of the line. In the afternoon this process is reversed.

On the Sparrows Point line, where the riding is exceptionally heavy, two motor cars haul a single trailer in the rush hours. The train commences its outbound trip with one trailer, and when passing a carhouse in the outskirts of the city picks up a third car. The fact that many of the workers in the steel plants which this line serves live in the vicinity of the carhouse insures a good load for the additional car. This three-car train operation is convenient also on summer Sundays and holidays, when large crowds are going back and forth between the city and the beaches.

Operation of a second short line over parts of a long route facilitate the use of the permanently coupled trains and the articulated units. Rush-hour traffic requires roughly 2½ times the number of cars operated during the day. During the afternoon rush it is customary to transfer all the single units operating on a long route to the short line using the same track. An equal number of articulated units or trains is then placed in service on the long route, thus providing double carrying capacity on both routes. When the rush is over the large units are taken off and the single units are transferred back.

The Department of Public Works, Detroit, is using one of the trolley supply cars of the Department of Street Railways to haul filling material. The supply car has been reconstructed to hold about 50 cu.yd. Five other cars will be fitted up in the same way.

Control Equipment Mounted Inside Baggage Cars

Two New Cars of the Michigan Electric Railway Are Arranged to Haul Trailing Loads of 1,050 Tons in Addition to Baggage Compartment Load

BY C. R. SEYBOLD
Westinghouse Electric & Manufacturing Company

TWO new baggage cars have recently been placed in service by the Michigan Electric Railway, Jackson, Mich. These were built especially for service on the company's southern division and they will be operated between Jackson and Kalamazoo. The mechanical equipment for the cars was manufactured by the J. G. Brill Company and the electrical equipment by the Westinghouse Electric & Manufacturing Company. The cars were built by the Michigan Electric Railway in its shops at Albion, Mich., and the electrical equipment was installed by the regular shop forces of the railway company.

Engineers of the Michigan Electric Railway adopted an unusual scheme for mounting the control apparatus. Instead of the usual under-floor arrangement, this apparatus, including grid resistors, is mounted inside the car. A steel frame extending crosswise at one end of the car serves as an equipment support. This frame is 5 ft. 3 in. wide, 6 ft. high and extends 2 ft. 3 in. lengthwise of the car. A wooden partition separates the equipment and motorman's compartment from the baggage compartment. The neatness and compactness of the arrangement are shown in the accompanying illustration.

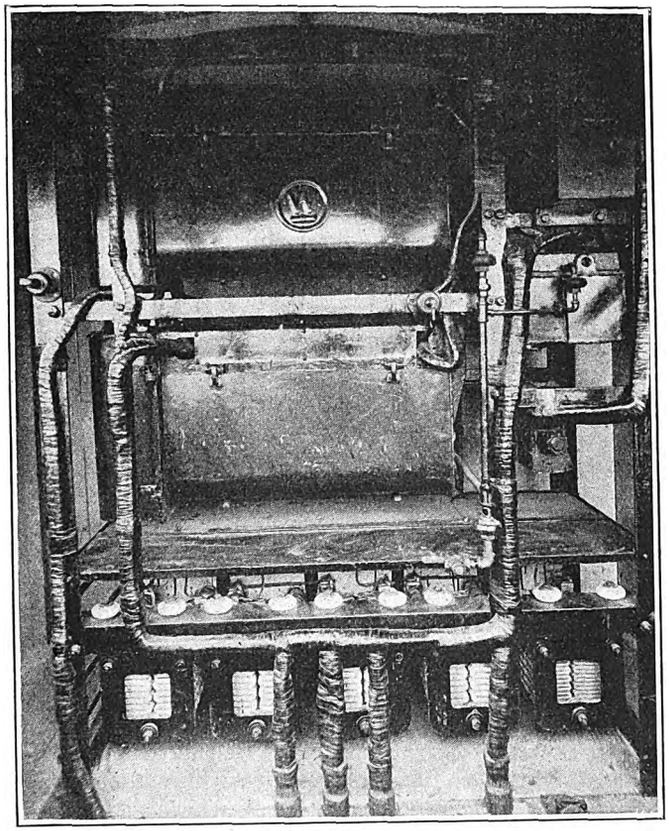
The grid resistors are located at the bottom of the frame near the floor. Directly above are mounted the two switch boxes, each containing eight Westinghouse pneumatic unit switches, arranged to give sixteen notches, including tapped field running points. The reverser, fuse box, motor cutout switches and overload relay are located at the side of the groups. The main knife switch, control resistor, lightning arrester, junction box and feed valve for air control are placed on the frame in readily accessible positions. Master controllers are provided in the cabs at either end of the car so as to permit of double-end operation.

The railway expects to obtain a number of advantages from this layout which will result in decreased maintenance and depreciation charges in the coming years. Apparatus mounted on the inside is free from wheel wash and road dirt. The deteriorative effects of weather are also minimized and all parts are accessible for inspection and maintenance. The total space taken up by this equipment is 78 cu.ft. This is less than 3 per cent of the total cubic space in the car available for baggage or express.

The baggage cars are equipped with Westinghouse type 562-A slow speed motors geared 17:60 to 37-in. wheels. Helical gears are used. Each motor develops 100 hp. at 600 volts. The slow-speed characteristics of this motor permit heavy loads to be hauled without undue load on the substation equipment. Smooth acceleration is obtained by the use of the sixteen-notch control.

The total weight of the new cars is 73,350 lb. Distribution of this weight among the different parts is shown in the following table:

Digitized by Google



Arrangement of Control Equipment Inside Car

Electrical equipment	23,000
Trucks, J. G. Brill M. C. B.	23,000
Air brakes, Westinghouse WD-3-F	3,100
Heaters	250
Car body	24,000

The cars contain 2,084 cu.ft. of baggage space and have capacity for carrying a load of 50,000 lb.

Since both third rail and overhead trolley are used on the southern division, it is necessary to have both trolley poles and third rail shoes. Main cable is brought from these current collectors to the jaws of a single-pole, double-throw switch. This is operated manually by the motorman to accomplish changeover.

These cars will develop sufficient tractive effort to haul considerable trailing load with relatively low current demands. When the baggage compartment is loaded to capacity they will start and accelerate a trailing load of 1,050 tons on a straight and level track, assuming 25 per cent adhesion, without excessive strain on the motors. Under similar conditions, with 600 volts on the trolley, a speed of 13.5 m.p.h. can be reached with this load.

Treatment of Burns

The Most Frequent Causes of Burns on a Public Utility Property Are Enumerated, and Helpful Suggestions Are Given About Each

BY J. J. WYMER, M.D.
Surgeon New Orleans Public Service, Inc.

ONE of the most frequent types of injuries which confront the surgeon of a large electric railway or other public utility corporation is that of burns. There are so many causes that hardly a week passes but some employees will present themselves to the medical department for treatment for burns. I will attempt briefly to consider all of the types that I have most frequently met and will treat them under three distinct headings: (a) The causative agent, (b) the anatomical parts involved, and (c) the extent of destruction of tissues.

Burns may be caused by chemicals, fire, steam or hot water, hot or molten metals, heat rays as from the sun or X-ray, welding and other machines, brush burns, and electric flash or contact with charged wires. The parts involved may be the entire body, or may be limited to any member.

To permit a wide degree of differentiation I have adopted a classification of six degrees of extent of burns as follows:

1. Simple redness or erythema.
2. Involving the superficial layers of the integument down to corium and associated with blisters.
3. Involving all the true skin and down to the muscles and associated with large blisters.
4. Destruction of all the tissues involving the muscles.
5. Destruction of the tissues down to and involving the bone.
6. Total destruction of the member (charring).

Digitized by Google

The following is suggested treatment for each of the kinds of burns enumerated:

Chemical Burns—Those most frequently met with are the result of acids and alkalies such as muriatic, nitric and sulphuric acids and caustic potash or soda (lye). They are found in garages where the testing and filling of batteries for autos is done, and in the meter repair rooms where old meters are cleaned during the process of repair.

As a rule these wounds involve the eye and face and occasionally the hands, and for the most part they are of the first degree. The burn may be limited as the result of prompt counteraction by another worker with a neutralizing agent which should always be kept near at hand. These wounds will result in a disability of from three to five days and are serious only where first-aid treatment has not been available.

Fire Burns—These usually result in the power station (or in the manufacturing department of a gas company) and are the result of explosion of gas in the gas generators or back fires in front of the firedoors of a steam boiler. Electric flashes also cause this type of burn, but I will take these up under the subject of electric burns. One great danger from fire burns is the possibility of clothing catching fire and the victim fanning the blaze in an attempt to get to someone who can assist him. If the clothing is not ignited, the burns will be limited to the exposed areas, such as the hands and face, and they rarely go beyond the third degree. Should the clothing catch fire and the trunk be burned, even though in a minor degree, caution should be used in giving a prognosis due to possible complications such as pneumonia, inflammations of the stomach and intestines, occasionally resulting in ulcers or acute nephritis (Bright's disease). These may be caused either from the elimination of the poisons or damage of the organs themselves and acute inflammation, and any one may terminate the case fatally, even though the injury at the beginning did not appear to be bad.

Minor fire burns may result from acetylene gas welding machines, explosions during the installation of gas meters, the stripping of gas meters during the process of repair, or the explosion of gasoline furnaces. The eyes appear to be the most frequent of all organs injured. The hands and face come next. The period of disability from these burns will extend from one day to three weeks.

Steam and Hot Water—Burns from this cause are usually of various degrees in the same individual and will run the gamut from simple erythema to death. The degree of the burn will depend on the time of the exposure. For instance, in the breaking of a high-pressure steam pipe, the victim may be caught in a trap, in which event he will be rendered unconscious and in a very short time will receive fatal burns. In another instance he may be able to get away with a superficial burn only. It must be borne in mind that this type of burn will frequently involve large areas, and even though superficial a very guarded prognosis should be given, as burns involving two-thirds of the body, even when of the first degree, may prove fatal. When a limited area is involved the disability will be from one to three weeks.

Hot and Molten Metals—The burns resulting from hot or molten metals are always deep and frequently are of the fifth degree. Most of the cases met with in my work are from hot solder, flying pieces of iron in the blacksmith shop and small ends of a welder's "stick."

These burns are generally about the feet, and the metal falling into the shoe results in a very deep burn before the victim is able to get the shoe off. Little or no bleeding results while the hot metal burns its way deep into the tissues. As a result, these burns are very painful, often requiring opiates. They are very sluggish in repair and frequently require treatment for five or more weeks.

In foundries and smelters, the wounds caused by these burns are frequently so extensive as to cause loss of life or limb.

Heat Rays—The burns resulting from heat rays are for the most part never beyond the third degree and will not cause disability.

Brush Burns—This is a term used to describe certain types of injuries resulting from a fall, the skin being scraped off from contact with a rough surface. While they are very painful at first, unless infection complicates the injury there is no disability, even though large areas are involved, and the patient makes a speedy recovery.

Electric Burns—This type of burn is the most deceptive with which I have had to deal. In my experience I have to differ with some authorities who believe that the extent of the burn depends on the duration of the contact and the voltage of the wire where the contact is made. I have seen many cases where individuals burned by 2,300 volts suffer only slight lesions, while others, under similar conditions, get very extensive ones. I quote from Moorehead: "An electric burn is an index of resistance of the tissue affected, and always indicates that the full strength of the current has not been received." In this I cannot agree with Dr. Moorehead, as I have seen very severe burns where the patient succumbed to electric shock, and others where the leg and hand would become gangrenous 12 in. above the point of contact and recover. It is also true that I have seen fatal cases with only slight evidence of contact, and it was only by careful search that I was able to discover a burn at all.

The electric burn is not nearly as painful at the beginning as the other types, and I have not been as successful in getting rapid responses to treatment as is claimed by some authors. Granulation has always been sluggish regardless of the treatment and frequently had to be stimulated and assisted for many days. One noticeable feature is the smoothness of the scar as well as its pliability. Contractures are not so marked, and the patients often get nearly complete restoration of function even in the deep types.

TREATMENT

No attempt will be made here to enter into the treatment as every textbook on surgery carries a complete chapter on the subject, but I cannot refrain from expressing a few words on the first aid. Every first-aid kit should be equipped with a lubricant. Personally I prefer plain or borated vaseline in sealed collapsible tubes. Every case, regardless of how slight it is, should be treated with this dressing and referred to the medical department for anti-tetanic serum. Ambrine presents one of the safest, least painful and most easily applied of all dressings in the surgeon's office. I never wash a burn, but will clean the tissues in the proximity, removing grease, etc., with benzine and alcohol. I never use iodine on a burn.

1,000 Ft. of Bridge Work, Reaching a Maximum Elevation of 38 Ft. Above the Surrounding Surface Level, Is Employed to Cross the Sanitary District Channel and the Various Railroad and Street Crossings at This Location

North Shore Line Completes $3,000,000 Extension

The Route from Howard Street to Niles Center Includes a Wide Variety of Construction, Including Open Cut, Earth Fill, Overhead Bridge and Surface Track—Trains Are Being Operated Temporarily by Chicago Rapid Transit Company

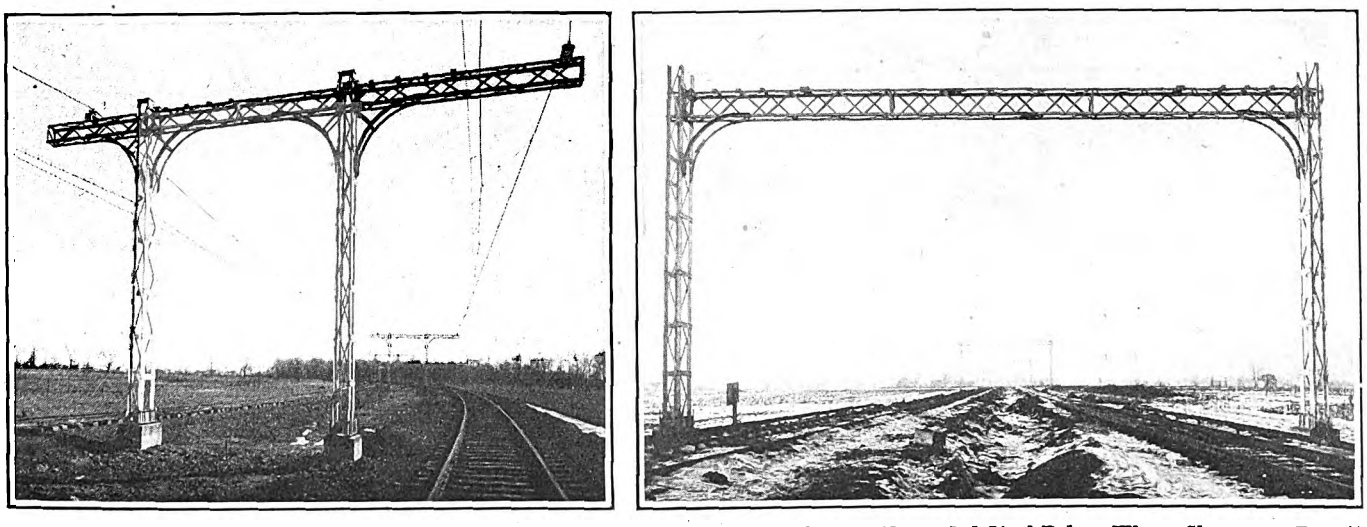
REGULAR service was opened on a new 5-mile extension by the Chicago Rapid Transit Company on March 28, following inaugural ceremonies at the terminal. Three special trains of company, city and village officials and business men's organizations were operated over the line previous to the opening. Airplanes, aerial bombs and other innovations thrilled the crowd of more than 2,000 persons.

Among those who talked at the opening were R. F. Clinch, vice-president of the Rapid Transit Company, who represented Samuel Insull, chairman, and Britton I. Budd, president; B. J. Fallon, vice-president in charge of operation, and C. E. Thompson, assistant to the president Chicago, North Shore & Milwaukee Railroad.

L. E. Myers, head of the construction company which built the new line; United States Representative Carl R. Chindblom, Congressman Tenth District, Illinois, and Mayors Harry Pearsons and John Brown of Evanston and Niles Center, respectively, the towns served, were also among the speakers of the occasion.

The first trial train was operated from the intersection with the present line at Howard Street to the Dempster Street terminal in Niles Center on Feb. 1. As outlined in the July 26, 1924, issue of ELECTRIC RAILWAY JOURNAL, this is the initial step in the construction of a new high-speed cutoff through the Skokie Valley to Waukegan. The article referred to included a map of the new line.

Construction designed for passenger service at high speed is a feature of the new line. It consists of a combination of open cut, permanent earth fill, open bridge work and surface construction. Stations are located on each of these sections. All of them are of



Heavy Overhead Catenary Construction Is Carried on Steel Towers Built Up of Bates Expanded Steel Poles. Where Clearances Permit, These Towers Are of Simple Overhead Bridge Type. At Other Locations the Supporting Columns Are Between the Tracks

Digitized by Google

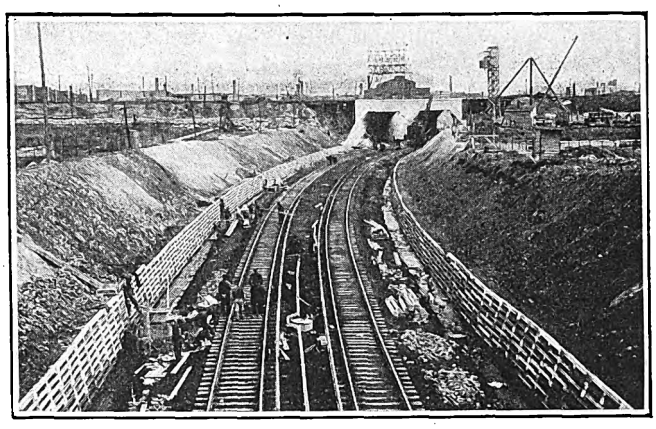
Digitized by Google

permanent decorative brick construction, ingeniously adapted to the individual grade conditions, and of a type of architecture in keeping with the general high-grade character of the entire development and with the reputation which the North Shore Line has established in the communities which it serves.

Some of the engineering and drainage problems which were involved in laying out the route were described in detail in the previous article. The method in which some of these conditions were treated is shown in various accompanying illustrations.

At Asbury Avenue and Ridge Avenue in Evanston the track is in open cut construction, passing under decorative concrete bridges at these streets. Similar stations at these two locations are arranged so that the buildings are on a level with the street, and straddle the two initial tracks below. Inclosed stairways lead to the loading platforms on the track level. Canopies extending from the building cover these platforms. It will be noted that the bridge abutments have been spaced wide enough to allow clearance for an additional track on the outside of each of the loading platforms, so as to make a four-track railroad when the new line is entirely completed. An interior view of the Ridge Avenue station shows the high-grade character of these buildings and the spacious accommodations provided for entering passengers. Another interior view shows the Dempster Street station, which for the time being will be the terminal of the line. Various concessions, including restaurant, news-stand, etc., will be located in this station.

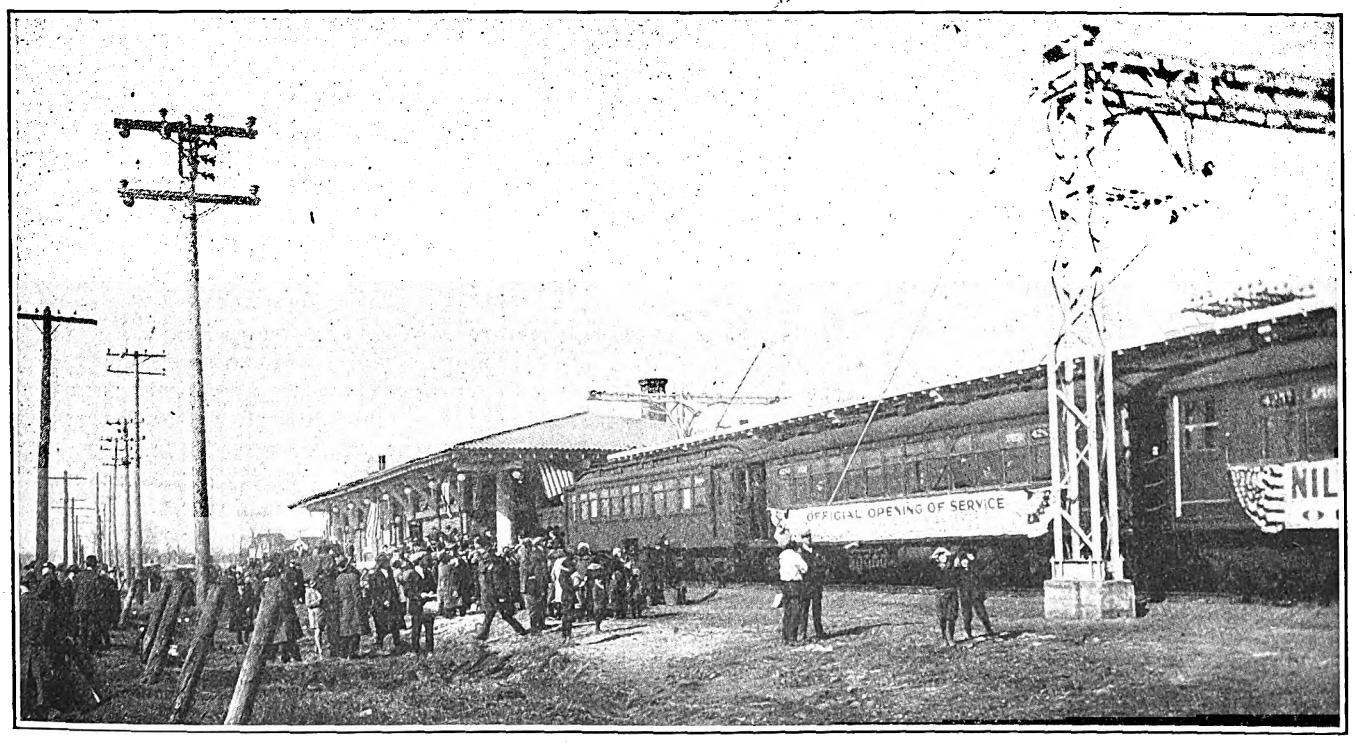
A typical station where tracks are on the surface is illustrated at Schreiber Road. The building is of pressed brick with tile roof, and the platform canopy is supported on large diameter pillars, giving a pergola effect. The elevated loading platform at Dodge Avenue, where the tracks are elevated above the cross street, is shown in another illustration. Here the station building is below the right-of-way pictured.



A Typical View of the Open Cut Construction of the New Line

Across the North Shore drainage channel and the Mayfair cutoff of the Chicago & Northwestern Railroad the tracks reach an elevation of 38 ft. above the natural ground level. This elevation was adopted in order to get legal clearances over the steam railroad, which also is elevated at this point. The conditions presented by this joint crossing of railroad and canal were further complicated by the necessity for providing spans for two future streets to be opened in this vicinity and for the new McCormick highway under construction by the Sanitary District. This combination of conditions led to the construction of approximately 1,000 ft. of continuous heavy steel bridgework. An accompanying illustration shows the appearance of this structure.

The electrical distribution system is of a new heavy type catenary construction designed to handle long trains at high speed. The primary messenger is made up of a composite strand consisting of a "copper weld" core and an outer layer of pure copper. Its diameter is 1.02 in., and it has a copper equivalent of 580,000 circ.mil. A copper feeder messenger below, which has



One of the Special Trains Run March 28 at the Inaugural of the Niles Center Extension of the North Shore Line. The Station Is Dempster Street, the New Terminal

Digitized by Google

a cross-section of 500,000 cir.mil, in turn supports the No. 0000 high-strength bronze trolley wire.

The overhead system is carried on fabricated towers built up with Bates expanded steel poles. These towers are spaced on 250-ft. and 300-ft. centers. All members are galvanized by the hot dip process. An article describing this overhead construction in detail will be published in a subsequent issue.

One Westinghouse automatic substation, with a single 2,000-kw. synchronous converter, is located 4½ miles from the Howard Street junction with the present main line. The Howard Street end of the line is fed from the present Calvary station of the Commonwealth Edison Company.

In order to comply with promises made to the officials of Evanston and Niles Center to have the line ready for operation on Feb. 1, it was necessary to carry on most of the heavy construction work under extreme winter weather conditions. Even with this handicap, the first train was operated on the date specified in the original agreement. For the time being the new line will be operated by the Chicago Rapid Transit Company under a lease arrangement, so as to give local transportation service to the new communities that are expected to develop rapidly along the new line.

The Readers' Forum

Comment on the St. Louis Street Railway-Motor Bus Situation

C. E. SMITH & COMPANY
Consulting Engineers

ST. LOUIS, MO., April 1, 1925.

To the Editor:

The analysis of the St. Louis street railway-motor bus situation by Mr. Buck and Mr. Stocks in the ELECTRIC RAILWAY JOURNAL for March 14 is such a complete, clear, unbiased statement of fact that little remains to be said; it was unnecessary to draw conclusions. They are obvious and self-evident.

In addition to picturing the St. Louis situation they picture as well the situation that may be expected in any large city under similar circumstances and conditions, and it may not be out of place to summarize briefly some of those conditions.

There is a very definite demand for motor bus service in addition to street railway service in districts adequately served by street railway lines as well as in intermediate and outlying districts not so served. This demand comes from those who have no automobiles and enjoy this opportunity to ride in an automobile at small cost; those who, particularly women, prefer not to drive their own automobiles through the congested districts and will not ride crowded street cars but will ride the buses; those who prefer to ride on a conveyance on which they will not be compelled to stand nor be embarrassed by other standees; those to whom the bus line may be a little closer and more convenient; and a small element of the riding public who have developed such animosity toward street car service that they welcome the opportunity to patronize a competitor.

It has long been my opinion that these various classes and any others who desire to pay more for a different class of transportation service, whether better or not, should be provided with that transportation to the extent to which it can be provided at the price they desire to pay for it, but that it should be established as a co-ordinated branch of the street railway service and not in competition with it. If co-ordinated it will be possible to work out a balance of service and an equitable transfer arrangement between the buses and the street cars, so that people may be transported for a single fare between points served by buses and points served by street railways, which is not possible when operated in competition without transfer privileges between separate companies.

On the other hand, it is surprising what a large element of the population, even including men of large affairs and big business, believe that competition in city transportation is beneficial and tends to reduce costs. Of course, it is axiomatic that to the extent to which competition brings about unnecessary duplication of service the costs will be increased, and the inevitable result will be an increased street car fare.

In every city there are certain street car lines that carry the cream of the traffic and are profitable. There are other lines that are unprofitable, but they are necessary in the whole transportation picture and must be operated, the loss being made up by the profits on the heavy traffic lines that carry the cream of the traffic. Motor buses cannot profitably serve those districts served by street cars that are operated at a loss. Motor buses can be operated profitably only in those districts where street cars carry the heavy traffic. When buses are operated as a parasite on the street railway system, reducing the profits on the profitable lines, the ability of the latter to carry the unprofitable street car lines is reduced to such an extent that fares must be increased over the entire street railway system.

There is a sociological question involved in the difference between a 7-cent fare and a 10-cent fare. The difference between these two rates means an average increase for transportation of about $50 per year per family. No doubt in any community 5 or 10 per cent of the families can easily absorb such increase, but I firmly believe that the great multitude of the families in any large city cannot contemplate or undertake with equanimity an increase of $50 in the family budget; to avoid that the cheaper means of mass transportation by street cars in the larger cities must be continued in full vigor and at the least cost. This cannot be done if they be subjected to unregulated competition of favored, subsidized motor bus lines.

The extent to which motor buses in St. Louis have been favored and subsidized is indicated by the fact that they are permitted to charge a 10-cent fare while the street railways are limited to a 7-cent fare; the street railway company contributes to the city somewhat more than 10 per cent of its gross revenues in various forms of taxation and paving costs, the motor bus company approximately 4 per cent; the motor bus company is not compelled to provide any particular quantity of service during the rush hours, but is permitted to choose the number of passengers for which it is willing to provide seats; the street railway is compelled to provide a fixed number of seats and a fixed area of standing room for all the passengers and carries the burden; the motor buses wear out pavements provided by others; the street car company pays for pavements used by others.

Digitized by Google

Contrary to the general understanding, motor buses in St. Louis do not provide faster transportation; two or three minutes saved per trip is offset by longer delays waiting for buses with an average loss by bus of five minutes per trip. They are noisy, smell oily, ride so roughly that newspapers may not be read, are irregular in operation, add to the congestion and delay all other traffic in the congested districts.

St. Louis was considerably overbuilt with street car lines in former years, and except to a very slight extent here and there no extensions were necessary. An increase in the company's investment of approximately 2 per cent for extensions would have satisfied that demand at any time and the company is properly subjected to very severe criticism for failing to provide and perform on such extensions the transportation service for which it had accepted a franchise. Under such conditions it is inevitable that competitive agencies of transportation may be expected not only to serve such unserved territories, but also to serve areas already served.

Although the first St. Louis bus lines served districts that have the best street railway service in the city, later service to outlying areas not previously served gave the bus company its firmest support for competition in St. Louis. Under the guise of serving small areas not previously served, rights were secured for most of the motor bus lines, 90 per cent of which operate either on streets having street car tracks or closely adjacent thereto. The original motor bus lines paralleling the heaviest street railway lines were profitable, but the later lines 7 to 8 miles long have changed the picture somewhat, as they are not as profitable as the original lines. There is very little short riding and apparently but little induced riding. Off-peak travel is light on all bus lines; during rush hours all seats are taken, but a seat is not provided for every one who would be a passenger.

The bus company cannot afford to provide enough equipment to carry all the business that would present itself during the short sharp peak morning and evening, and have the equipment and employees idle during the remainder of the day, but goes through the rush hours with only slightly increased service, while the street railway company must furnish seats and standing room for all. Thus, with the street railway as a stand-by to provide the costly service that has a low load factor, the buses have an opportunity of providing just enough service to get the highest load factor.

At one point in the city beyond the end of a street car line competitive motor buses are operated on the same street in the interest of the street railway company and also by its competitor. The competition bus service offers direct rides in and out of the business district and a certain measure of city-wide transfer service over bus lines. The street car company's buses exchange transfers with the street car lines (10 cents combined ride). On this street a clear picture is available of the preference of the people for the buses unified with the street railway system, since five times as many ride the street railway company's buses as the competitive buses.

It is futile to comment on means by which special privileges were secured from city officials by the motor bus company here. Suffice it to say that the officials who granted the rights justified their actions with strong support from those who desired the competitive service. Apparently that does not exceed 5 per cent of the riding public, but when operated as in St. Louis and other large cities even to that extent there must inevitably be decreased street car service or reduced wages or increased car fares to the 95 per cent who ride the street cars, or possibly a combination of those evils, and possibly ultimate purchase of the motor bus lines by the street railway company when the people demand co-ordination of service, as they have always done in the past where there have been separate competing unco-ordinated transportation agencies.

To avoid the repetition of past evils it behooves the people to see that motor bus companies, established as the one in St. Louis has been, do not secure special privileges in the way of high fares, low taxes, relief from regulation, pre-emptive rights or other special privileges to such an extent as to give them a considerable nuisance value at time of consolidation. In the long run it is not the street railway company that gets hurt but the car rider and the merchant.

C. E. SMITH,
Consulting Engineer Department of Public Utilities, City of St. Louis.

American Association News

Way Matters

CONSIDERABLE progress in the investigation of the various subjects assigned to sub-committees was shown in the reports presented at a meeting of the committee on way matters held at association headquarters in New York on April 1 and 2. In the matter of the review of existing standards the sub-committee suggested certain changes in the standard rail specifications and the specifications covering the manufacture of special trackwork. Efforts are being made to bring these specifications into harmony with the views of a committee of the American Railway Association. Suggested changes in the special trackwork specifications were referred back to the sub-committee with instructions to consult the manufacturers and report at the next meeting. A lively discussion took place regarding the permissible tolerances in punched tie rod holes. Nothing has yet been done concerning additions or corrections to the drawings in the manual.

To secure the opinion of the whole committee, the sub-committee on standardization of frogs and switches presented two designs of lug fastenings for switch tongues and described the merits and demerits of each type. A poll of the railway members indicated that opinion favored the same design which had been favored by the sub-committee.

A comprehensive report regarding the status of tests and research work in connection with welded rail joints was made by W. W. Wysor. He stated that the third progress report of this committee would soon be ready for distribution. Arrangements are now being made to publish this report and distribute it to the railway industry. An offer received from the General Electric Company to proceed at its own expense with the "educated tie" tests of rail joints in various stages of defectiveness was discussed. The committee considered this a good method of collecting data on the subject of rail joints and expressed the hope that the company would continue with the test.

Results obtained with the *in situ* process of surface hardening rails in Toronto were described by A. T. Spencer. His report was accompanied by photographs showing the appearance of rails after several years of service. Additional data on this subject are expected to be obtained in the near future from the Boston Elevated Railway and the United Railways & Electric Company of Baltimore.

More co-operation from the railway members was asked in connection with the investigation of welding rod speci-

Digitized by Google

fications. A questionnaire has been prepared and will soon be sent out to member companies. To enable the railways to use the information contained in the final report of the committee on way matters, it will be necessary to include practical data useful in directing and educating welders. It is hoped to secure this information from a number of railways before the report of the committee goes to press.

Slow progress is being made by the sub-committee on design of substitute ties. Questionnaires prepared at a meeting of the way committee in Cleveland on Jan. 22 were sent out on March 16, and 25 replies had been received prior to the New York meeting. Efforts will be made to follow up this matter and secure information from those companies which have not yet answered.

Responsibility for noise in car operation was thought by the sub-committee in charge of investigating this subject to be divided between the car and the track structure. Reduction of noise is 90 per cent a matter of maintenance and only about 10 per cent dependent upon the type of track construction, the committee believes. The committee suggested that this matter be taken up with the Bureau of Standards at Washington with a view to securing its assistance and possibly the use of instruments for measuring the volume of noise.

The sub-committee on design of limit of wear gage, wheel mounting, etc., reported that a meeting had been held on Jan. 29 in conjunction with a similar sub-committee of the equipment committee. This resulted in the making of several suggestions which are now being considered by the latter. The way committee requested its chairman to take up this matter and see if definite action could not be secured from the equipment committee. It was decided to recommend that in addition to the gage requirements definite maximum and minimum measurements back to back of wheels taken at the level of the wheel tread, should be specified and that wheels be removed from service when they do not conform to these requirements.

Reports were submitted by sub-committees on design of steam railroad crossings and of plain girder rails. Tentative designs were submitted covering three weights of 7-in. rail as prepared by the sectional committee of the A.E.S.C. and also some alternative designs suggested by E. M. T. Ryder. An expression of opinion was asked from the railway members, particularly with reference to the depth of head and retaining a fishing section in conformity with former association standards. The committee discussed the matter and it was agreed that the fishing section should be sacrificed if necessary in order to secure greater depth of rail head. It was thought undesirable to retain the present fishing section by increasing the depth of the rail section in order to give greater depth to the rail head.

A lively discussion occurred as to whether the next meeting of the committee should be held at French Lick Springs, Ind., or at Montreal. It was finally decided that the chairman should arrange for a letter ballot in order to give the absent members opportunity to express their views on this matter. Those present at the meeting were: E. M. T. Ryder, C. F. Gailor, V. Angerer, T. A. Ferneding, S. C. Baker, H. E. Bean, H. H. Dartt, E. B. Entwisle, R. B. Fisher, D. J. Graham, H. C. Heaton, N. M. Hench, M. M. Johnston, T. J. Lavan, E. L. Lockman, H. F. Merker, L. A. Mitchell, O. C. Rehfuss, A. T. Spencer, J. B. Tinnon, W. W. Wysor, and H. H. George, chairman.

COMING MEETINGS OF *Electric Railway and Allied Associations*

April 16—Wisconsin Utilities Association, Hotel Pfister, Milwaukee, Wis.

April 20-25—International Regional Planning Congress, Hotel Pennsylvania and Grand Central Palace, New York City.

May 5-8—Southwestern Public Service Association, Rice Hotel, Houston, Tex.

May 12-13—Public Utility Section, Associated Advertising Clubs of the World, Houston, Texas.

May 25-28—National Association of Purchasing Agents, Milwaukee, Wis.

May 26-27—Regional Motor Transport Conference, Chicago, Ill.

June 2-4—Central Electric Railway Association, French Lick Springs, Ind.

June 3-4—Iowa Electric Railway Association, Waterloo, Iowa.

June 10-12—Canadian Electric Railway Association, Montreal, Quebec.

June 26-27—New York Electric Railway Association, Hotel Champlain, Bluff Point, N. Y.

July 22-25—Pacific Claim Agents' Association, Hotel Biltmore, Los Angeles, Cal.

Oct. 5-9—American Electric Railway Association, annual convention and exhibits, Young's Million Dollar Pier, Atlantic City, N. J.

News of Other Associations

Wisconsin Convention April 16

THE program for the annual convention of the Wisconsin Utilities Association to be held on April 16 at the Hotel Pfister, Milwaukee, has been announced by Secretary John N. Cadby.

In addition to the annual address by President G. C. Neff, and reports from various standing committees, the program will include the following subjects:

"Some Recent Legal Phases of Regulation," by Lewis E. Gettle, chairman Wisconsin Railroad Commission.

"By Our Achievements We Must Justify Public Confidence," by Marshall E. Sampsell, Wisconsin Power & Light Company.

"Some Recent Developments of Public Utility Financing," by George E. Frazer of Frazer and Torbet, Chicago.

B. W. Arnold, manager motor coach division Chicago, North Shore & Milwaukee Railroad, is chairman of the entertainment committee. At the banquet to be held in the evening a musical program has been arranged to enliven the occasion. Harry F. Atwood, president of the Constitution Anniversary Association, Chicago, will deliver an address on the federal constitution.

Entertainment has also been provided for the women in attendance during the convention. This program has been in charge of Mrs. G. Post of Milwaukee, and will include a luncheon in the Fern Room of the Pfister Hotel and a bridge party during the afternoon.

Pipe Flanges and Fittings

THE sectional committee of the American Engineering Standards Committee dealing with the standardization of pipe flanges and fittings has approved a number of important standards applying to malleable-iron and cast-iron screw fittings. These will now be submitted for approval to the sponsor organizations, which are the American Society of Mechanical Engineers, the Manufacturers Standardization Society of the Valve and Fitting Industry and the Heating and Piping Contractors National Association.

Transportation Studies at Technical Schools

TRANSPORTATION at technical schools will be discussed in an address by Prof. Winthrop M. Daniels of Yale University, at a meeting of the New York Railroad Club to be held on April 17. The full title of the address to be presented is as follows: "What Branches of Transportation Should Technical Schools and Universities Attempt to Teach?"

Chicago Motor Transport Conference

"CO-ORDINATED Transportation" will be the theme of a regional motor transport conference to be held under arrangements made by the National Automobile Chamber of Commerce at Chicago on Tuesday and Wednesday, May 26 and 27.

Among the speakers will be leading automobile, railroad, trolley and shipping executives from Chicago and the Middle West. The program will be similar to that of the New England Motor Transport Conference held at Boston on Dec. 8-9, 1924.

Besides discussion of the place of the motor truck and motor bus in short-haul transportation, there will be statements from varying points of view upon the wisdom of federal regulation of common carrier vehicles, a subject which has become of unusual importance since recent decisions of the U. S. Supreme Court indicating that such motor vehicles are not subject to state regulation.

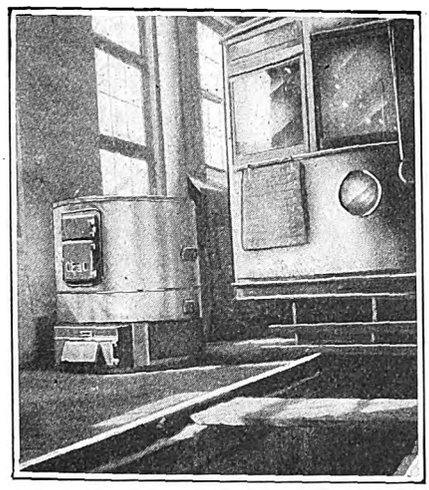
Maintenance of Equipment

Pipeless Furnace Keeps Car Shops Warm

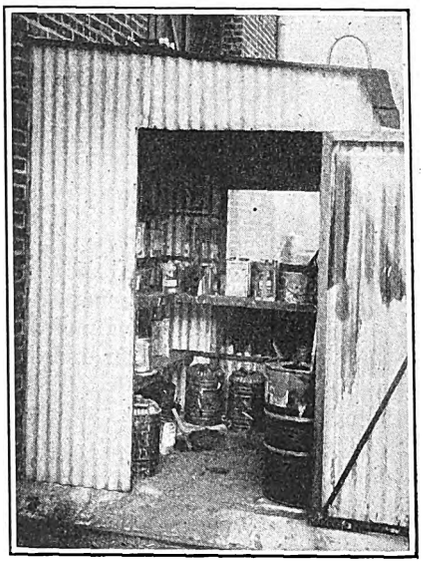
ONE of the problems which faced the management when operation was resumed on the New Haven & Shore Line Railway in 1923 was that of heating the car repair shops at Guilford. In the days of the predecessor company which operated this line until 1919, the repair shops were at Saybrook and the barn at Guilford was used only for storage purposes. On account of its location midway between the two ends of the line the Guilford structure was preferred by the new management as the location for doing maintenance and repair work. The heating problem was successfully solved by the installation of a Kelsey pipeless furnace, as shown in the accompanying illustration. This was done at a much lower cost than would have been required to install a steam-heating plant in this concrete building and has proved entirely satisfactory during the most severe winter weather.



A Pipeless Furnace Was Installed at Small Expense When This Carhouse Was Converted into a Repair Shop

Open Paint Storage Outside Shop

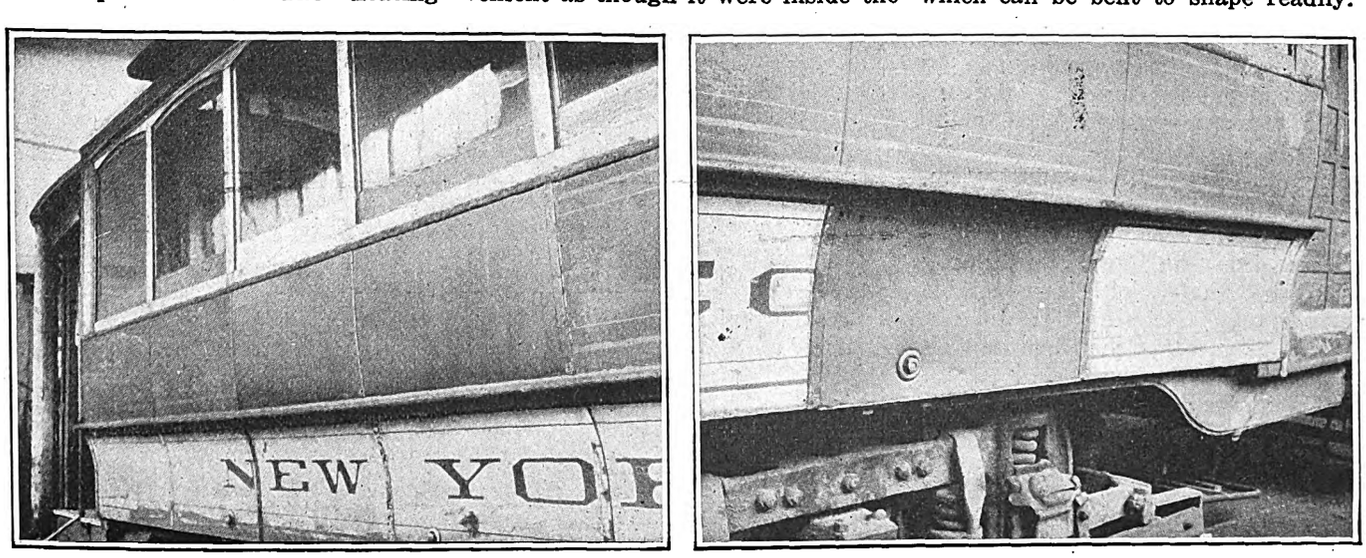
THE problem of providing a convenient fireproof storage for paints after the containers have been opened and they are in use has been solved in an effective manner at the 155th Street shop of the Eighth Avenue Railroad, New York City. A corrugated iron building 6 ft. x 6 ft. x 8 ft. high, with concrete floor, has been constructed just outside the paint shop and adjacent to the doorway. This building is provided with shelves for the storage of open paint and also has a bench around two sides for convenience in mixing paints. A window is provided in one side opposite the doorway so that during inclement weather the door may be kept closed and the interior still be efficiently lighted. During cold weather the building is heated by two electric heaters provided with Railway Utility Company's thermostatic control. This arrangement provides paint storage just as convenient as though it were inside the paint shop and at the same time removes the paints and oils from close proximity to cars.



Corrugated Iron Building Used for Open Paint Sotrage at the Eighth Avenue Railroad Shop

Repairing Car Panels with Sheet Steel

REPAIRS to car panels which have been damaged in accidents are made in the 155th Street shops of the New York & Harlem Railroad through the use of sheet steel. This method has been found much cheaper and consumes much less time in making repairs than the use of wood panels. No. 16 gage steel is used, which can be bent to shape readily.



Sheet Steel Is Used for Repairs to Upper and Lower Side Panels on the Eighth Avenue Railway's Cars

Digitized by Google

Where panels are split or otherwise damaged, the sheet is superimposed on the damaged parts.

In applying the sheets the Eighth Avenue Railway paints the material on the inside before it is applied. This gives the necessary protection against rust so as to minimize the danger of the panels deteriorating from rust starting on the inside. In painting the outside, the railway's standard method of painting is used. Very close inspection is required to detect the sheet steel paneling from the ordinary wooden structure previously used.

New Equipment Available

Narrow Drum Concrete Mixer

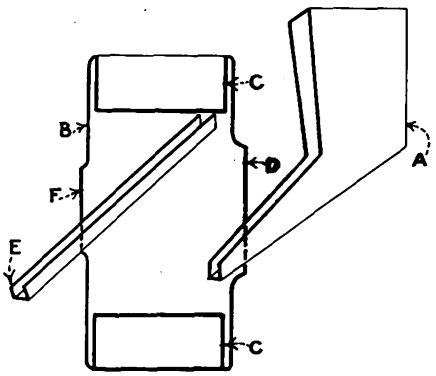
IMPORTANT saving in the time required for mixing concrete is the principal advantage claimed for a new, narrow drum mixer recently placed on the market by the Standard Scale & Supply Corporation, Pittsburgh, Pa. The charging hole has a diameter of 24 in. and the skip, when elevated, reaches such an angle that the charge drops almost vertically into the drum. The latter is deep enough to receive the entire charge in one shot, no part of the aggregate being held in the charging chute until the drum revolves.

To avoid the scattering of the load the walls of the drum were built close together, thus keeping the aggregate within the confines of a narrow space. When the drum is set in motion the buckets lift the aggregate up and with a scouring motion tumble it down again and again into one conglomerate mass. The aggregate need not be pushed from one side of the drum to the other, and it is claimed the mixture is completed in fewer revolutions of the drum than would otherwise be possible.

An 18-in. diameter discharge opening permits a wide discharge chute, the latter being just wide enough to have free movement in this opening. Because of the large opening and the narrow drum the chute can be tipped to a sharp angle, while the chute reaches near to the other side of the drum. As shown in the illustration, the far end of the chute is directly under the far end of the buckets. These drop the aggregate directly into the chute, with considerable momentum. Because of its momentum it is said that the concrete does not adhere to the chute.

This mixer is so built that the operator, without moving from his position, manipulates the power-loader lever, the discharge lever, and turns on the water for the mix. Through the 24-in. charging hole he can see into the drum and determine whether he has enough of each kind of material.

The mixer is very compact and can be easily transported from place to place. The front wheels pass under the frame, making short turns possible. Another feature is the interchangeability of the low charger and skip loader. If the user wishes to change from one to the other he can obtain a skip which is installed on the job, as holes have been drilled in the frame for attaching this equipment.



When Raised, the Skip Drops the Charge Almost Vertically into the Narrow Drum

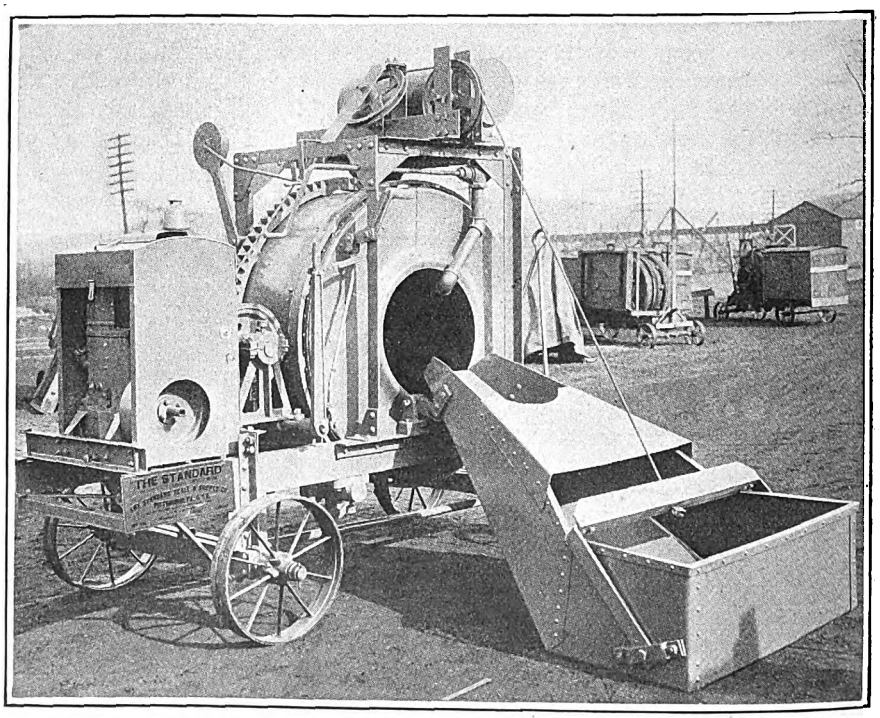
Disconnecting Switches

IN A NEW line of disconnecting switches known as Type LG-17, now being marketed by the General Electric Company, Schenectady, N. Y., the cantilever strength of the insulator unit has been greatly increased by a double crimped cap and the addition of a pin cast integral with the lower fitting. Both hinge and contact clips are cast integral with their blocks; the blade of the switch, being in two sections, possesses much more lateral rigidity than would be the case if the blade were of a single piece, and the use of bolts through the two sections of the blade, above and below the clip, provides a convenient means of adjustment or readjustment of contact pressure.

All forms of the switch are furnished with a new type of latch or safety catch. On double-throw switches there is a latch at each end. The action of the latch is positive and combines both latching and opening features. A new switch hook is also included in the development, incorporating both a special "V" hook for the LG-17 and a standard hook for operating other forms of disconnecting switches and latches.



Without Moving from His Place the Operator of This Concrete Mixer Controls Loading and Discharging. The Wide Opening Allows Him to Examine this Condition of the Mixture

The News of the Industry

Cleveland "Closed Shop" Void, Says Court of Appeals

On the grounds of public policy, the Court of Appeals, sitting in Cleveland, Ohio, has just decided unanimously that the closed shop agreement between the Cleveland Railway employees and the union is null and void. If the decision is not carried to the State Supreme Court, or is upheld by the State Supreme Court if carried there by the union, it means that further contracts between the Cleveland Railway and the union will not carry any "closed shop" agreement.

By a vote of two to one, the Court of Appeals also decided that the Cleveland Railway had a perfect right to withdraw, as it did, from the arbitration proceedings of last June. In these arbitration proceedings two of the arbiters granted the platform men of the Cleveland Railway an increase in pay of 12 cents an hour. The Court of Appeals upheld the lower courts in deciding that the sitting of James W. Holcomb as the third arbitrator in the case constituted "a legal fraud." The court ruled that Mr. Holcomb had disqualified himself as an arbiter in the case by his conduct and by the fact that the union had indorsed him for a federal position. In the lower courts the "closed shop" agreement between the company and union was held to be valid.

William S. Fitzgerald, one of the international vice-presidents of the Amalgamated, has gone to Cleveland to try to help the car men's local and determine what the union's next step shall be. A mass meeting of the men was scheduled for April 8, to determine what the union should do, by reason of the adverse court decisions, and also by reason of the fact that May 1 is the time for seeking a new wage agreement.

Central New York Railways After Bus Franchises

The establishment of an extensive network of bus lines in Central New York is forecast by the announcement that a new concern, the Mid-State Coach Lines, Inc., has filed articles of incorporation in Onondaga County. This concern will be owned by the Rochester & Syracuse Railroad, the Empire State Railroad, the Auburn & Syracuse Electric Railroad and the Syracuse Northern Electric Railway, Inc. These lines already are seeking bus line privileges in Oswego and Auburn, and on a route which would connect Syracuse and Oswego.

The purpose of the company is to operate buses as feeders to existing railway lines, the companies retaining separate identities for carrying on their railway operations.

In the meantime the Auburn & Syracuse Railroad officials are seeking bus privileges in Auburn in competition with an unnamed client of Frank J. Cregg, Syracuse corporation counsel, for the privilege of running buses in that city.

Talmadge C. Cherry, vice-president of the Auburn & Syracuse Electric Railroad, and vice-president and general manager of the Rochester & Syracuse Railroad, recently addressed the Common Council of Oswego on behalf of the bus line application. His buses would run on a 7-cent fare. James W. Dillon, Syracuse, who is operating buses successfully on a 5-cent fare in the neighboring city of Fulton, has offered to run the Oswego buses on a 5-cent fare.

The officials of the Mid-State Coach Lines, Inc., are: Directors, T. C. Cherry, Walter K. Zinsmeister and Harry C. Stanton, Syracuse, and Ray S. Messenger and William Harvie, Auburn. All are connected with the Auburn & Syracuse Electric Railroad.

Chicago and Milwaukee Grants Defeated

Elections Unfavorable to Proposed Settlements in Mid-West Cities—Third Vote in Chicago in Twelve Years—Milwaukee's Need Less Immediate than Chicago's

CHICAGO'S $500,000,000 transportation ordinance was beaten soundly in a referendum on April 7. It provided for co-ordination of surface and elevated lines and establishment of subways and bus lines under city management and eventual city ownership. The existing surface lines are now up against a franchise fight, the franchises expiring in 1927. The vote was a surprise. The final figures follow:

For adoption of ordinance	227,554
Against adoption	329,228
Majority opposed	101,674
For operation of lines	226,681
Against operation	327,543
Majority opposed	100,862

Analysis of the vote shows that while it could not be termed wholly intelligent, it was at least typical, and the record number of voters at a by-election can be taken to mean that Chicago is definitely against any municipal ventures in running transportation lines. It is the third defeat of a transportation referendum in twelve years. That the voters did not understand in some districts was shown by the fact that some persons voted against the establishment of the system but voted in favor of the city operating it.

Lined up against the measure and represented by the Hearst newspapers were scattered political organizations and the remnants of the old spoils gang which had a "5-cent fare" platform as its transportation policy. Hearst claimed a victory, but all the aldermanic candidates indorsed by him and by William Hale Thompson were beaten at the same time that the traction ordinance went down. They were all anti-ordinance. The separation of politics from the referendum was evident.

Mayor Dever said plans will go forward at once for a new ordinance drawn along different lines.

The campaign went into high gear four weeks before the election and like all other campaigns threatened to lose sight of the main issue. Mayor Dever, however, kept the proponents of the ordinance from hysteria. He proved to be an ideal campaigner, never making an unqualified statement he could not personally back up. This was one of the qualities that helped the pro side.

The personality and partisanship elements became important at the outset. William Randolph Hearst with two powerful newspapers, William Hale Thompson, a notorious demagogue who promised 5-cent fares while he was Mayor during the world post-war days and hired $100 a day "traction experts," and Governor Small, as well as many of their associates who were running mates of politicians tried lately on graft charges, were against the ordinance.

Roy D. Keehn, Hearst's personal representative, wrote to two internationally known bankers asking whether they would be under any obligation to purchase the Schwartz certificates, the medium of payment for the car lines. The bankers wrote that there was no obligation, but that the certificates would be readily salable if the lines were competently managed and they said they would recommend them to their investors.

This reply drew the headline "No Bank Cash for Car Lines," and the bankers indignantly demanded a retraction.

William Hale Thompson publicity sheets warned the public to "beat the biggest traction steal ever attempted." Said Mr. Thompson:

> This ordinance provides for an increase of car fares to not less than 15 cents. The new measure would relieve the traction monopoly from paying taxes and would saddle upon the taxpayers an outlay of $172,000,000.
>
> This ordinance would prohibit modern rapid transportation. It would bind the people of Chicago to the use of the present obsolete system. It would give control of Chicago's streets in perpetuity to the Morgan-Wall Street-Brennan financial pirates. . . . Lies. . . . sugar-coated promises . . . higher taxes . . . jammed through council . . . nefarious scheme to pick the pockets of the strap hangers . . . boodle.

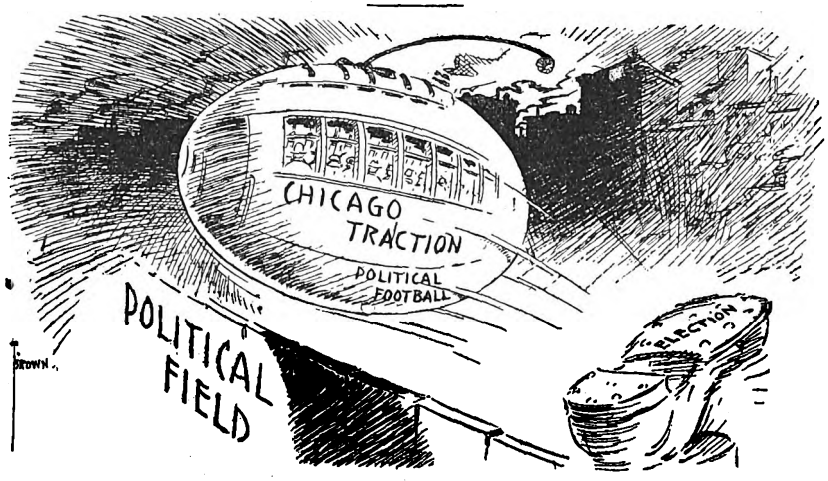
Digitized by Google

Henry A. Blair, president of the Chicago Surface Lines, after a first word of caution against the ordinance because of his mistrust of municipal operation, meticulously avoided mention of it as did his associate, Leonard A. Busby, head of the south side surface lines, a strong advocate of the co-ordination. Samuel Insull was out of the city for a month and returned on the last day with a statement that he indorsed the ordinance because its co-ordination and expansion program was necessary and could be had in no other way.

The Chicago Surface Lines is rounding out 18 years of service under an ordinance of which Mayor Dever, as an alderman, was part author. The lines ran for several years under separate managements, but were co-ordinated, and since that time have made steady progress until they have been able to show a good financial sheet despite the fact that 55 per cent of net earnings have been paid annually to the city.

The elevated lines have been slower to respond, although there has been good management with good public relations work and advertising. The elevated has charged a cash fare of 10 cents, a ticket fare of three for 25 cents and a weekly pass for $1. The Surface Lines fare is 7 cents.

BACK IN THE OLD FIELD AGAIN.



Chicago "Daily News" Sees Traction Matter Again Football of Politics

Milwaukee Agreement Defeated

By a majority of more than two to one the people of Milwaukee, Wis., on April 7 overwhelmingly expressed their opposition to the adoption of the proposed service-at-cost contract between the city and the Milwaukee Electric Railway & Light Company. Under the terms of the contract the city would have received the right to participate in the management of the affairs of the company in the metropolitan area and would have had the opportunity to obtain the credit on surplus earnings which were to be used to reduce the purchase price of the properties should it have been decided to purchase them at some future date. The vote in every ward was against the contract.

Such prominent proponents of the contract as Mayor D. W. Hoan and Fred S. Hunt, chairman of the Public Utilities Acquisition Committee, which spent five years in investigating and negotiating the contract, declare that the people unwisely passed up an excellent opportunity to bring about local regulation of their utilities in favor of a continuance of the present alleged unsatisfactory regulation by the Wisconsin Railroad Commission. These men feel that the people were misled and did not have a clear understanding of the contract. Two of the three local newspapers were in favor of the plan, while the other opposed it. All local civic organizations passed resolutions favoring the contract with the exception of the Engineers Society of Milwaukee.

Although the plan was defeated it is expected that out of it much good will come to the city in the way of facts and data which were brought out in the preparation of the contract. The city now has a better conception of the company's operating and financial affairs. Possession of these facts, it is maintained, will be of great value to the city in preparing its side of future service and rate cases.

In spite of the overwhelming defeat of the service-at-cost contract a new movement is on foot by city administration champions of the contract which is designed to accomplish their aims in a more sweeping manner. The new move is in the form of an out and out public ownership bill introduced in the Legislature by Assemblyman Thomas M. Duncan, Milwaukee Socialist leader and secretary to Mayor Hoan. Under this municipal ownership bill, power would be given to the city of Milwaukee or any other city in the state to take over its public utilities through the creation of so-called public service districts. Through the establishment of these districts in Milwaukee the present law limiting the city to an indebtedness not exceeding 5 per cent of its assessed property valuation would be evaded. This so-called district, by making its geographical lines vary slightly from Milwaukee's present city limits, could again bond itself up to 5 per cent of the assessed valuation of the area, thus paving the way for the public ownership, operation or control of the public utilities properties supplying service in such districts. Under the plan the municipal ownership question would be submitted to the voters.

Voters of Rockford, Ill., on April 7 defeated a proposition to grant a railway franchise to the Rockford Public Service Company, a newly formed corporation, indorsed by Mayor J. Herman Hallstrom. The traction situation is in a muddle as the result of the refusal of a franchise to the present company, the Rockford City Traction company. The latter company has been operating two years without a franchise. It is expected that the question of granting a franchise to the Rockford City Traction company will be submitted to a special election later in the year.

Springfield Union Rejects Proposal for Mayors to Arbitrate

Employees of the Springfield Street Railway, Springfield, Mass., recently asked for an increase of approximately $1 a day for regular men and rejected a proposal laid before them by President Clark V. Wood that questions in dispute be submitted to an arbitration board of five to include the Mayors of the city of Springfield and Worcester. The men said they had "no desire to place the transportation question in politics." President Wood said the company could not possibly continue to pay the wages now in effect and at the same time furnish the service to which the public was entitled.

The trolleymen want to establish an eight-hour workday to be completed inside of eleven hours. They want a maximum wage of $6.40 a day for a six-day week, assuring a maximum weekly wage of $38.40. The present wage of the trolleymen is $5.44 a day.

The cancellation of the contract, according to President Wood's proposal, makes it necessary to draft a new contract to become effective June 1. He suggests the appointment of an arbitration board, the company naming one arbitrator in five days from the date of the written agreement to arbitrate; the employees naming one within the same period. The Mayor of Springfield and the Mayor of Worcester will each be asked to act as an arbitrator, or to appoint some person as representative to act in his stead, and the two Mayors or their respective representatives will have the power to select the fifth member of the arbitration board to act as chairman. The decision of the majority of the board will bind both management and employees for a term of years beginning June 1, 1925, and not exceeding three years as the board may fix.

Railway Wants Bus Rights in New York City

Twenty-six applications for bus franchises were filed on April 9 with the franchise bureau of the Board of Estimate of New York City in accordance with the amended specifications suggested by the Board of Transportation. This is less than half the number of bids received under the first call for suggestions. The Interborough Rapid Transit Company, the Brooklyn-Manhattan Transit Corporation and the Third Avenue Railway, which had previously applied for franchises, failed to file new applications.

Of the existing transportation companies, other than those operating bus lines, only the New York Railways through a subsidiary filed a new appli-

Digitized by Google

cation. This application offered to surrender the perpetual franchises for five surface lines and substitute bus operation, if franchises were granted for 25 years or for a lesser period sufficient to amortize out of bus earnings the investment in the electric railway property abandoned.

The Manhattan Surface Coach Company made two applications, signed by its president, H. J. Sheeran, receiver for the New York Railways. One application stated that the New York Railways was willing to surrender its perpetual franchises for the following surface lines and substitute bus operation:

Seventh Avenue-Delancy Street line, Sixth Avenue line, Columbus-Lenox Avenue line, Eighth Street crosstown line and the 116th Street crosstown line.

In its proposal known as application No. 1 the company estimated the investment required to provide equipment and facilities to render the service contemplated on the 12 routes outlined by the Board of Transportation to be in the neighborhood of $6,455,000, made up as follows:

Buses	$3,579,000
Garage and maintenance equipment	2,226,000
Organization and other intangibles	350,000
Supplies and working capital	300,000
Total	$6,455,000

Proposal No. 2 places the number of double and single deck buses at 432, involving an investment of $4,108,500 in buses. A front-drive type of vehicle is proposed to be used. On crosstown east and west lines a fare of 5 cents per passenger is proposed, but on the longitudinal or north and south lines the fare would be 10 cents cash, with tokens sold at the rate of twelve for $1.

Steam and Electric Roads After Bus Privilege

The Eastern Massachusetts Street Railway has taken up the gauntlet of the Boston & Maine Railroad in the fight over the bus line which the street railway is maintaining between Boston and Lowell, Mass. The issue was fought in a preliminary skirmish in Woburn, where the electric's bus rights were revoked. Later the issue may have to be decided in other communities.

The Boston & Maine says that it should be carrying 1,000 passengers a day for full fare between Lowell and Boston; that it depends upon its full-fare passengers to enable it to maintain frequent service and low commutation rates, so that if the Eastern Massachusetts is permitted to maintain its bus line to take away the full-fare passengers it will be necessary for the Boston & Maine to raise its fares and to curtail its service. It declares further that when the Eastern Massachusetts takes away one $1 passenger the Boston & Maine loses $4, because it loses the passenger, but has to maintain the service.

The Eastern Massachusetts replies to this argument that it has prior rights in the field, because it asked for these licenses last summer. Having obtained its licenses from the several cities and towns it invested about $80,000 in buses and established a scheduled service which is carrying an average of 250 passengers a day between Boston and Lowell, and the income covers the cost of the service. In addition to this the Eastern Massachusetts has close to $5,000,000 invested in the Lowell district, and is obliged to protect this property. If it had not gone into the bus service some private concern would have entered the field.

Buses for Kansas City

Franchise Approved Under Which Railway Expects to Start Service Soon with 63 Vehicles—Attitude of Public Is Favorable

AUXILIARY bus service by the Kansas City Railways is apparently assured. On April 6 the City Council of Kansas City, Mo., passed the ordinance allowing the company a franchise for three years. The ordinance has been in the hands of the special bus committee and the City Council since Dec. 1, 1924.
